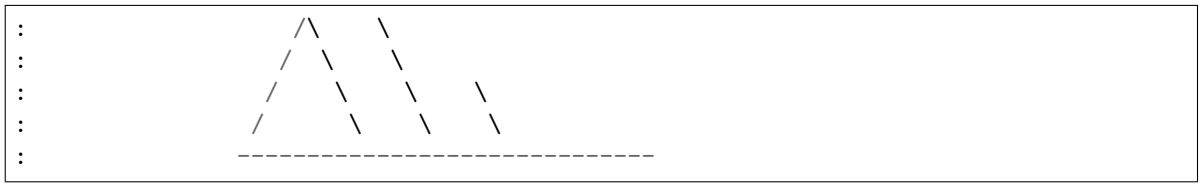
Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as show schematically below:



The largest increment is given by a triangle (or "flag"). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

See also https://en.wikipedia.org/wiki/Wind_barb.

Parameters

X, Y

[1D or 2D array-like, optional] The x and y coordinates of the barb locations. See *pivot* for how the barbs are drawn to the x, y positions.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If *X* and *Y* are 1D but *U*, *V* are 2D, *X*, *Y* are expanded to 2D using `X, Y = np.meshgrid(X, Y)`. In this case `len(X)` and `len(Y)` must match the column and row dimensions of *U* and *V*.

U, V

[1D or 2D array-like] The x and y components of the barb shaft.

C

[1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *barbcolor* instead.

length

[float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

pivot

[{'tip', 'middle'} or float, default: 'tip'] The part of the arrow that is anchored to the *X*, *Y* grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

barbcolor

[color or color sequence] The color of all parts of the barb except for the flags. This parameter is analogous to the *edgecolor* parameter for polygons, which can be used instead. However this parameter will override facecolor.

flagcolor

[color or color sequence] The color of any flags on the barb. This parameter is analogous to the *facecolor* parameter for polygons, which can be used instead. However, this parameter will override facecolor. If this is not set (and *C* has not either) then *flagcolor* will be set to match *barbcolor* so that the barb has a uniform color. If *C* has been set, *flagcolor* has no effect.

sizes

[dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- 'spacing' - space between features (flags, full/half barbs)
- 'height' - height (distance from shaft to top) of a flag or full barb
- 'width' - width of a flag, twice the width of a full barb
- 'emptybarb' - radius of the circle used for low magnitudes

fill_empty

[bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

rounding

[bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.

barb_increments

[dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.

- 'half' - half barbs (Default is 5)
- 'full' - full barbs (Default is 10)
- 'flag' - flags (default is 50)

flip_barb

[bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).

A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as *U* and *V*.

Returns

barbs

[*Barbs*]

Other Parameters

****kwargs**

The barbs can further be customized using *PolyCollection* keyword arguments:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool

Table 92 – continued from previous page

Property	Description
antialiased or aa or antialiaseds	bool or list of bools
array	ndarray
capstyle	{'butt', 'round', 'projecting'}
clim	(vmin: float, vmax: float)
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of rgba tuples
contains	unknown
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
norm	*Normalize* or None
offset_position	unknown
offsets	array-like (N, 2) or (2,)
path_effects	*AbstractPathEffect*
picker	None or bool or callable
pickradius	unknown
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.barbs`

- sphx_glr_gallery_images_contours_and_fields_barb_demo.py

matplotlib.axes.Axes.quiver

`Axes.quiver`(*self*, **args*, *data=None*, ***kw*)

Plot a 2D field of arrows.

Call signature:

```
quiver([X, Y], U, V, [C], **kw)
```

X, *Y* define the arrow locations, *U*, *V* define the arrow directions, and *C* optionally sets the color.

Arrow size

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the *scale* and *scale_units* parameters.

Arrow shape

The defaults give a slightly swept-back arrow; to make the head a triangle, make *headaxislength* the same as *headlength*. To make the arrow more pointed, reduce *headwidth* or increase *headlength* and *headaxislength*. To make the head smaller relative to the shaft, scale down all the head parameters. You will probably do best to leave minshaft alone.

Arrow outline

linewidths and *edgecolors* can be used to customize the arrow outlines.

Parameters

X, Y

[1D or 2D array-like, optional] The x and y coordinates of the arrow locations.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If *X* and *Y* are 1D but *U*, *V* are 2D, *X*, *Y* are expanded to 2D using `X, Y = np.meshgrid(X, Y)`. In this case `len(X)` and `len(Y)` must match the column and row dimensions of *U* and *V*.

U, V

[1D or 2D array-like] The x and y direction components of the arrow vectors.

They must have the same number of elements, matching the number of arrow locations. *U* and *V* may be masked. Only locations unmasked in *U*, *V*, and *C* will be drawn.

C

[1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *color* instead. The size of *C* must match the number of arrow locations.

units

[{'width', 'height', 'dots', 'inches', 'x', 'y' 'xy'}, default: 'width'] The arrow dimensions (except for *length*) are measured in multiples of this unit.

The following values are supported:

- 'width', 'height': The width or height of the axis.
- 'dots', 'inches': Pixels or inches based on the figure dpi.
- 'x', 'y', 'xy': *X*, *Y* or $\sqrt{X^2 + Y^2}$ in data units.

The arrows scale differently depending on the units. For 'x' or 'y', the arrows get larger as one zooms in; for other units, the arrow size is independent of the zoom state. For 'width or 'height', the arrow size increases with the width and height of the axes, respectively, when the window is resized; for 'dots' or 'inches', resizing does not change the arrows.

angles

[{'uv', 'xy'} or array-like, default: 'uv'] Method for determining the angle of the arrows.

- 'uv': The arrow axis aspect ratio is 1 so that if *U* == *V* the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).

  Use this if the arrows symbolize a quantity that is not based on *X*, *Y* data coordinates.

- 'xy': Arrows point from (x, y) to (x+u, y+v). Use this for plotting a gradient field, for example.
- Alternatively, arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.

  In this case *U*, *V* is only used to determine the length of the arrows.

Note: inverting a data axis will correspondingly invert the arrows only with `angles='xy'`.

scale

[float, optional] Number of data units per arrow length unit, e.g., m/s per plot width; a smaller scale parameter makes the arrow longer. Default is *None*.

If *None*, a simple autoscaling algorithm is used, based on the average vector length and the number of vectors. The arrow length unit is given by the *scale_units* parameter.

scale_units

[{'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, optional] If the *scale* kwarg is *None*, the arrow length unit. Default is *None*.

e.g. *scale_units* is 'inches', *scale* is 2.0, and `(u, v) = (1, 0)`, then the vector will be 0.5 inches long.

If *scale_units* is 'width' or 'height', then the vector will be half the width/height of the axes.

If *scale_units* is 'x' then the vector will be 0.5 x-axis units. To plot vectors in the x-y plane, with u and v having the same units as x and y, use `angles='xy', scale_units='xy', scale=1`.

width

[float, optional] Shaft width in arrow units; default depends on choice of units, above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

headwidth

[float, default: 3] Head width as multiple of shaft width.

headlength

[float, default: 5] Head length as multiple of shaft width.

headaxislength

[float, default: 4.5] Head length at shaft intersection.

minshaft

[float, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

minlength

[float, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

pivot

[{'tail', 'mid', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is anchored to the *X*, *Y* grid. The arrow rotates about this point.

'mid' is a synonym for 'middle'.

color

[color or color sequence, optional] Explicit color(s) for the arrows. If *C* has been set, *color* has no effect.

This is a synonym for the *PolyCollection* *facecolor* parameter.

Other Parameters

****kwargs**

[*PolyCollection* properties, optional] All other keyword arguments are passed on to *PolyCollection*:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	ndarray
capstyle	{'butt', 'round', 'projecting'}
clim	(vmin: float, vmax: float)
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of rgba tuples
contains	unknown
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str

Table 93 – continued from previous page

Property	Description
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
norm	*Normalize* or None
offset_position	unknown
offsets	array-like (N, 2) or (2,)
path_effects	*AbstractPathEffect*
picker	None or bool or callable
pickradius	unknown
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

See also:

Axes.quiverkey

Add a key to a quiver plot.

Examples using `matplotlib.axes.Axes.quiver`

- sphx_glr_gallery_images_contours_and_fields_quiver_demo.py
- sphx_glr_gallery_images_contours_and_fields_quiver_simple_demo.py
- sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py
- sphx_glr_gallery_mplot3d_quiver3d.py

matplotlib.axes.Axes.quiverkey

Axes.quiverkey(*self*, *Q*, *X*, *Y*, *U*, *label*, ***kw*)

Add a key to a quiver plot.

The positioning of the key depends on *X*, *Y*, *coordinates*, and *labelpos*. If *labelpos* is 'N' or 'S', *X*, *Y* give the position of the middle of the key arrow. If *labelpos* is 'E', *X*, *Y* positions the head, and if *labelpos* is 'W', *X*, *Y* positions the tail; in either of these two cases, *X*, *Y* is somewhere in the middle of the arrow+label key object.

Parameters

Q

[*matplotlib.quiver.Quiver*] A *Quiver* object as returned by a call to *quiver()*.

X, Y

[float] The location of the key.

U

[float] The length of the key.

label

[str] The key label (e.g., length and units of the key).

angle

[float, default: 0] The angle of the key arrow, in degrees anti-clockwise from the x-axis.

coordinates

[{'axes', 'figure', 'data', 'inches'}, default: 'axes'] Coordinate system and units for *X*, *Y*: 'axes' and 'figure' are normalized coordinate systems with (0, 0) in the lower left and (1, 1) in the upper right; 'data' are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); 'inches' is position in the figure in inches, with (0, 0) at the lower left corner.

color

[color] Overrides face and edge colors from *Q*.

labelpos

[{'N', 'S', 'E', 'W'}] Position the label above, below, to the right, to the left of the arrow, respectively.

labelsep

[float, default: 0.1] Distance in inches between the arrow and the label.

labelcolor

[color, default: `rcParams["text.color"]` (default: `'black'`)] Label color.

fontproperties

[dict, optional] A dictionary with keyword arguments accepted by the *FontProperties* initializer: *family*, *style*, *variant*, *size*, *weight*.

****kwargs**

Any additional keyword arguments are used to override vector properties taken from *Q*.

Examples using `matplotlib.axes.Axes.quiverkey`

- sphx_glr_gallery_images_contours_and_fields_quiver_demo.py
- sphx_glr_gallery_images_contours_and_fields_quiver_simple_demo.py

matplotlib.axes.Axes.streamplot

`Axes.streamplot`(*axes*, *x*, *y*, *u*, *v*, *density=1*, *linewidth=None*, *color=None*, *cmap=None*, *norm=None*, *arrowsize=1*, *arrowstyle='-|>'*, *minlength=0.1*, *transform=None*, *zorder=None*, *start_points=None*, *maxlength=4.0*, *integration_direction='both'*, ***, *data=None*)

Draw streamlines of a vector flow.

Parameters

x, y

[1D arrays] An evenly spaced grid.

u, v

[2D arrays] *x* and *y*-velocities. The number of rows and columns must match the length of *y* and *x*, respectively.

density

[float or (float, float)] Controls the closeness of streamlines. When `density = 1`, the domain is divided into a 30x30 grid. *density* linearly scales this grid. Each cell in the grid can have, at most, one traversing streamline. For different densities in each direction, use a tuple (density_x, density_y).

linewidth

[float or 2D array] The width of the stream lines. With a 2D array the line width can be varied across the grid. The array must have the same shape as *u* and *v*.

color

[color or 2D array] The streamline color. If given an array, its values are converted to colors using *cmap* and *norm*. The array must have the same shape as *u* and *v*.

cmap

[*Colormap*] Colormap used to plot streamlines and arrows. This is only used if *color* is an array.

norm

[*Normalize*] Normalize object used to scale luminance data to 0, 1. If `None`, stretch (min, max) to (0, 1). This is only used if *color* is an array.

arrowsize

[float] Scaling factor for the arrow size.

arrowstyle

[str] Arrow style specification. See *FancyArrowPatch*.

minlength

[float] Minimum length of streamline in axes coordinates.

start_points

[Nx2 array] Coordinates of starting points for the streamlines in data coordinates (the same coordinates as the *x* and *y* arrays).

zorder

[int] The zorder of the stream lines and arrows. Artists with lower zorder values are drawn first.

maxlength

[float] Maximum length of streamline in axes coordinates.

integration_direction

[{'forward', 'backward', 'both'}, default: 'both'] Integrate the streamline in forward, backward or both directions.

Returns

StreamplotSet

Container object with attributes

- `lines`: *LineCollection* of streamlines
- `arrows`: *PatchCollection* containing *FancyArrowPatch* objects representing the arrows half-way along stream lines.

This container will probably change in the future to allow changes to the colormap, alpha, etc. for both lines and arrows, but these changes should be backward compatible.

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*, *u*, *v*, *start_points*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.streamplot`

- sphx_glr_gallery_images_contours_and_fields_plot_streamplot.py

18.5.5 Clearing

Axes.cla	Clear the current axes.
Axes.clear	Clear the axes.

matplotlib.axes.Axes.cla

`Axes.cla(`*self*`)`
Clear the current axes.

Examples using `matplotlib.axes.Axes.cla`

- sphx_glr_gallery_animation_animation_demo.py
- sphx_glr_gallery_event_handling_data_browser.py
- sphx_glr_gallery_misc_custom_projection.py

matplotlib.axes.Axes.clear

Axes.clear(*self*)
Clear the axes.

Examples using `matplotlib.axes.Axes.clear`

18.5.6 Appearance

Axes.axis	Convenience method to get or set some axis properties.
Axes.set_axis_off	Turn the x- and y-axis off.
Axes.set_axis_on	Turn the x- and y-axis on.
Axes.set_frame_on	Set whether the axes rectangle patch is drawn.
Axes.get_frame_on	Get whether the axes rectangle patch is drawn.
Axes.set_axisbelow	Set whether axis ticks and gridlines are above or below most artists.
Axes.get_axisbelow	Get whether axis ticks and gridlines are above or below most artists.
Axes.grid	Configure the grid lines.
Axes.get_facecolor	Get the facecolor of the Axes.
Axes.set_facecolor	Set the facecolor of the Axes.

matplotlib.axes.Axes.axis

Axes.axis(*self*, **args*, *emit=True*, ***kwargs*)
Convenience method to get or set some axis properties.

Call signatures:

```
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])
xmin, xmax, ymin, ymax = axis(option)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

Parameters

xmin, xmax, ymin, ymax

[float, optional] The axis limits to be set. This can also be achieved using

```
ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
```

option

[bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

Value	Description
'on'	Turn on axis lines and labels. Same as `True`.
'off'	Turn off axis lines and labels. Same as `False`.
'equal'	Set equal scaling (i.e., make circles circular) by changing axis limits. This is the same as `ax.set_aspect('equal', adjustable='datalim')`. Explicit data limits may not be respected in this case.
'scaled'	Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as `ax.set_aspect('equal', adjustable='box', anchor='C')`. Additionally, further autoscaling will be disabled.
'tight'	Set limits just large enough to show all data, then disable further autoscaling.
'auto'	Automatic scaling (fill plot box with data).
'image'	'scaled' with axis limits equal to data limits.
'square'	Square plot; similar to 'scaled', but initially forcing `xmax-xmin == ymax-ymin`.

emit

[bool, default: True] Whether observers are notified of the axis limit change. This option is passed on to *set_xlim* and *set_ylim*.

Returns

xmin, xmax, ymin, ymax

[float] The axis limits.

matplotlib.axes.Axes.set_axis_off

Axes.**set_axis_off**(*self*)

Turn the x- and y-axis off.

This affects the axis lines, ticks, ticklabels, grid and axis labels.

Examples using `matplotlib.axes.Axes.set_axis_off`

- sphx_glr_gallery_lines_bars_and_markers_joinstyle.py
- sphx_glr_gallery_lines_bars_and_markers_marker_reference.py

- *Choosing Colormaps in Matplotlib*
- *Text properties and layout*

matplotlib.axes.Axes.set_axis_on

Axes.**set_axis_on**(*self*)

Turn the x- and y-axis on.

This affects the axis lines, ticks, ticklabels, grid and axis labels.

Examples using `matplotlib.axes.Axes.set_axis_on`

matplotlib.axes.Axes.set_frame_on

Axes.**set_frame_on**(*self*, *b*)

Set whether the axes rectangle patch is drawn.

Parameters

b

[bool]

Examples using `matplotlib.axes.Axes.set_frame_on`

matplotlib.axes.Axes.get_frame_on

`Axes.get_frame_on`(*self*)
Get whether the axes rectangle patch is drawn.

Examples using `matplotlib.axes.Axes.get_frame_on`

matplotlib.axes.Axes.set_axisbelow

`Axes.set_axisbelow`(*self*, *b*)
Set whether axis ticks and gridlines are above or below most artists.

This controls the zorder of the ticks and gridlines. For more information on the zorder see /gallery/misc/zorder_demo.

Parameters

b

[bool or 'line'] Possible values:

- *True* (zorder = 0.5): Ticks and gridlines are below all Artists.
- 'line' (zorder = 1.5): Ticks and gridlines are above patches (e.g. rectangles, with default zorder = 1) but still below lines and markers (with their default zorder = 2).
- *False* (zorder = 2.5): Ticks and gridlines are above patches and lines / markers.

See also:

get_axisbelow

Examples using `matplotlib.axes.Axes.set_axisbelow`

- sphx_glr_gallery_statistics_boxplot_demo.py

matplotlib.axes.Axes.get_axisbelow

Axes.get_axisbelow(*self*)

Get whether axis ticks and gridlines are above or below most artists.

Returns

bool or 'line'

See also:

set_axisbelow

Examples using matplotlib.axes.Axes.get_axisbelow

matplotlib.axes.Axes.grid

Axes.grid(*self*, *b=None*, *which='major'*, *axis='both'*, ***kwargs*)

Configure the grid lines.

Parameters

b

[bool or None, optional] Whether to show the grid lines. If any *kwargs* are supplied, it is assumed you want the grid on and *b* will be set to True.

If *b* is *None* and there are no *kwargs*, this toggles the visibility of the lines.

which

[{'major', 'minor', 'both'}, optional] The grid lines to apply the changes on.

axis

[{'both', 'x', 'y'}, optional] The axis to apply the changes on.

****kwargs**

[*Line2D* properties] Define the line properties of the grid, e.g.:

```
grid(color='r', linestyle='-', linewidth=2)
```

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value

Table 96 – continued from previous page

Property	Description
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

Notes

The axis is drawn as a unit, so the effective zorder for drawing the grid is determined by the zorder of each axis, not by the zorder of the *Line2D* objects comprising the grid. Therefore, to set grid zorder, use *set_axisbelow* or, for more control, call the *set_zorder* method of each axis.

Examples using `matplotlib.axes.Axes.grid`

matplotlib.axes.Axes.get_facecolor

Axes.**get_facecolor**(*self*)
Get the facecolor of the Axes.

Examples using `matplotlib.axes.Axes.get_facecolor`

matplotlib.axes.Axes.set_facecolor

Axes.**set_facecolor**(*self*, *color*)
Set the facecolor of the Axes.

Parameters

color

[color]

Examples using `matplotlib.axes.Axes.set_facecolor`

- sphx_glr_gallery_color_color_demo.py
- sphx_glr_gallery_color_color_cycle_default.py

18.5.7 Property cycle

Axes.set_prop_cycle	Set the property cycle of the Axes.

matplotlib.axes.Axes.set_prop_cycle

Axes.set_prop_cycle(*self*, **args*, ***kwargs*)

Set the property cycle of the Axes.

The property cycle controls the style properties such as color, marker and linestyle of future plot commands. The style properties of data already added to the Axes are not modified.

Call signatures:

```
set_prop_cycle(cycler)
set_prop_cycle(label=values[, label2=values2[, ...]])
set_prop_cycle(label, values)
```

Form 1 sets given `Cycler` object.

Form 2 creates a `Cycler` which cycles over one or more properties simultaneously and set it as the property cycle of the axes. If multiple properties are given, their value lists must have the same length. This is just a shortcut for explicitly creating a cycler and passing it to the function, i.e. it's short for `set_prop_cycle(cycler(label=values label2=values2, ...))`.

Form 3 creates a `Cycler` for a single property and set it as the property cycle of the axes. This form exists for compatibility with the original `cycler.cycler` interface. Its use is discouraged in favor of the kwarg form, i.e. `set_prop_cycle(label=values)`.

Parameters

cycler

[Cycler] Set the given Cycler. *None* resets to the cycle defined by the current style.

label

[str] The property key. Must be a valid *Artist* property. For example, 'color' or 'linestyle'. Aliases are allowed, such as 'c' for 'color' and 'lw' for 'linewidth'.

values

[iterable] Finite-length iterable of the property values. These values are validated and will raise a ValueError if invalid.

See also:

matplotlib.rcsetup.cycler

Convenience function for creating validated cyclers for properties.

cycler.cycler

The original function for creating unvalidated cyclers.

Examples

Setting the property cycle for a single property:

```
>>> ax.set_prop_cycle(color=['red', 'green', 'blue'])
```

Setting the property cycle for simultaneously cycling over multiple properties (e.g. red circle, green plus, blue cross):

```
>>> ax.set_prop_cycle(color=['red', 'green', 'blue'],
...                   marker=['o', '+', 'x'])
```

Examples using `matplotlib.axes.Axes.set_prop_cycle`

- sphx_glr_gallery_showcase_bachelors_degrees_by_gender.py
- *Styling with cycler*

18.5.8 Axis / limits

Axes.get_xaxis	Return the XAxis instance.
Axes.get_yaxis	Return the YAxis instance.

matplotlib.axes.Axes.get_xaxis

Axes.**get_xaxis**(*self*)
Return the XAxis instance.

Examples using `matplotlib.axes.Axes.get_xaxis`

- sphx_glr_gallery_lines_bars_and_markers_timeline.py
- sphx_glr_gallery_statistics_customized_violin.py
- sphx_glr_gallery_showcase_bachelors_degrees_by_gender.py

matplotlib.axes.Axes.get_yaxis

Axes.get_yaxis(*self*)
Return the YAxis instance.

Examples using matplotlib.axes.Axes.get_yaxis

- sphx_glr_gallery_lines_bars_and_markers_timeline.py
- sphx_glr_gallery_showcase_bachelors_degrees_by_gender.py

Axis Limits and direction

Axes.invert_xaxis	Invert the x-axis.
Axes.xaxis_inverted	Return whether the xaxis is oriented in the "inverse" direction.
Axes.invert_yaxis	Invert the y-axis.
Axes.yaxis_inverted	Return whether the yaxis is oriented in the "inverse" direction.
Axes.set_xlim	Set the x-axis view limits.
Axes.get_xlim	Return the x-axis view limits.
Axes.set_ylim	Set the y-axis view limits.
Axes.get_ylim	Return the y-axis view limits.
Axes.update_datalim	Extend the dataLim Bbox to include the given points.
Axes.update_datalim_bounds	[*Deprecated*] Extend the datalim Bbox to include the given *Bbox*.
Axes.set_xbound	Set the lower and upper numerical bounds of the x-axis.
Axes.get_xbound	Return the lower and upper x-axis bounds, in increasing order.
Axes.set_ybound	Set the lower and upper numerical bounds of the y-axis.
Axes.get_ybound	Return the lower and upper y-axis bounds, in increasing order.

matplotlib.axes.Axes.invert_xaxis

Axes.**invert_xaxis**(*self*)

Invert the x-axis.

See also:

xaxis_inverted

get_xlim, *set_xlim*

get_xbound, *set_xbound*

Examples using matplotlib.axes.Axes.invert_xaxis

matplotlib.axes.Axes.xaxis_inverted

Axes.**xaxis_inverted**(*self*)

Return whether the xaxis is oriented in the "inverse" direction.

The "normal" direction is increasing to the right for the x-axis and to the top for the y-axis; the "inverse" direction is increasing to the left for the x-axis and to the bottom for the y-axis.

Examples using matplotlib.axes.Axes.xaxis_inverted

matplotlib.axes.Axes.invert_yaxis

Axes.**invert_yaxis**(*self*)

Invert the y-axis.

See also:

yaxis_inverted

get_ylim, *set_ylim*

get_ybound, *set_ybound*

Examples using `matplotlib.axes.Axes.invert_yaxis`

- sphx_glr_gallery_lines_bars_and_markers_barh.py
- sphx_glr_gallery_lines_bars_and_markers_marker_reference.py

matplotlib.axes.Axes.yaxis_inverted

Axes.**yaxis_inverted**(*self*)

Return whether the yaxis is oriented in the "inverse" direction.

The "normal" direction is increasing to the right for the x-axis and to the top for the y-axis; the "inverse" direction is increasing to the left for the x-axis and to the bottom for the y-axis.

Examples using `matplotlib.axes.Axes.yaxis_inverted`

matplotlib.axes.Axes.set_xlim

Axes.**set_xlim**(*self*, *left=None*, *right=None*, *emit=True*, *auto=False*, ***, *xmin=None*, *xmax=None*)

Set the x-axis view limits.

Parameters

left

[float, optional] The left xlim in data coordinates. Passing *None* leaves the limit unchanged.

The left and right xlims may also be passed as the tuple (*left*, *right*) as the first positional argument (or as the *left* keyword argument).

right

[float, optional] The right xlim in data coordinates. Passing *None* leaves the limit unchanged.

emit

[bool, default: True] Whether to notify observers of limit change.

auto

[bool or None, default: False] Whether to turn on autoscaling of the x-axis. True turns on, False turns off, None leaves unchanged.

xmin, xmax

[float, optional] They are equivalent to left and right respectively, and it is an error to pass both *xmin* and *left* or *xmax* and *right*.

Returns

left, right

[(float, float)] The new x-axis limits in data coordinates.

See also:

get_xlim

set_xbound, *get_xbound*

invert_xaxis, *xaxis_inverted*

Notes

The *left* value may be greater than the *right* value, in which case the x-axis values will decrease from left to right.

Examples

```
>>> set_xlim(left, right)
>>> set_xlim((left, right))
>>> left, right = set_xlim(left, right)
```

One limit may be left unchanged.

```
>>> set_xlim(right=right_lim)
```

Limits may be passed in reverse order to flip the direction of the x-axis. For example, suppose *x* represents the number of years before present. The x-axis limits might be set like the following so 5000 years ago is on the left of the plot and the present is on the right.

```
>>> set_xlim(5000, 0)
```

matplotlib.axes.Axes.get_xlim

Axes.get_xlim(*self*)

Return the x-axis view limits.

Returns

left, right

[(float, float)] The current x-axis limits in data coordinates.

See also:

set_xlim

set_xbound, *get_xbound*

invert_xaxis, *xaxis_inverted*

Notes

The x-axis may be inverted, in which case the *left* value will be greater than the *right* value.

Examples using `matplotlib.axes.Axes.get_xlim`

- *Decay*

matplotlib.axes.Axes.set_ylim

`Axes.set_ylim`(*self*, *bottom=None*, *top=None*, *emit=True*, *auto=False*, *, *ymin=None*, *ymax=None*)

Set the y-axis view limits.

Parameters

bottom

[float, optional] The bottom ylim in data coordinates. Passing *None* leaves the limit unchanged.

The bottom and top ylims may also be passed as the tuple (*bottom*, *top*) as the first positional argument (or as the *bottom* keyword argument).

top

[float, optional] The top ylim in data coordinates. Passing *None* leaves the limit unchanged.

emit

[bool, default: True] Whether to notify observers of limit change.

auto

[bool or None, default: False] Whether to turn on autoscaling of the y-axis. *True* turns on, *False* turns off, *None* leaves unchanged.

ymin, ymax

[float, optional] They are equivalent to bottom and top respectively, and it is an error to pass both *ymin* and *bottom* or *ymax* and *top*.

Returns

bottom, top

[(float, float)] The new y-axis limits in data coordinates.

See also:

get_ylim

set_ybound, *get_ybound*

invert_yaxis, *yaxis_inverted*

Notes

The *bottom* value may be greater than the *top* value, in which case the y-axis values will decrease from *bottom* to *top*.

Examples

```
>>> set_ylim(bottom, top)
>>> set_ylim((bottom, top))
>>> bottom, top = set_ylim(bottom, top)
```

One limit may be left unchanged.

```
>>> set_ylim(top=top_lim)
```

Limits may be passed in reverse order to flip the direction of the y-axis. For example, suppose `y` represents depth of the ocean in m. The y-axis limits might be set like the following so 5000 m depth is at the bottom of the plot and the surface, 0 m, is at the top.

```
>>> set_ylim(5000, 0)
```

matplotlib.axes.Axes.get_ylim

Axes.get_ylim(*self*)

Return the y-axis view limits.

Returns

bottom, top

[(float, float)] The current y-axis limits in data coordinates.

See also:

set_ylim

set_ybound, *get_ybound*

invert_yaxis, *yaxis_inverted*

Notes

The y-axis may be inverted, in which case the *bottom* value will be greater than the *top* value.

Examples using matplotlib.axes.Axes.get_ylim

- sphx_glr_gallery_shapes_and_collections_collections.py

matplotlib.axes.Axes.update_datalim

Axes.update_datalim(*self*, *xys*, *updatex=True*, *updatey=True*)

Extend the dataLim Bbox to include the given points.

If no data is set currently, the Bbox will ignore its limits and set the bound to be the bounds of the xydata (*xys*). Otherwise, it will compute the bounds of the union of its current data and the data in *xys*.

Parameters

xys

[2D array-like] The points to include in the data limits Bbox. This can be either a list of (x, y) tuples or a Nx2 array.

updatex, updatey

[bool, default: True] Whether to update the x/y limits.

Examples using `matplotlib.axes.Axes.update_datalim`

matplotlib.axes.Axes.update_datalim_bounds

`Axes.update_datalim_bounds`(*self*, *bounds*)

[*Deprecated*] Extend the `datalim` Bbox to include the given *Bbox*.

Parameters

bounds

[*Bbox*]

Notes

Deprecated since version 3.3.

Examples using `matplotlib.axes.Axes.update_datalim_bounds`

matplotlib.axes.Axes.set_xbound

`Axes.set_xbound`(*self*, *lower=None*, *upper=None*)

Set the lower and upper numerical bounds of the x-axis.

This method will honor axes inversion regardless of parameter order. It will not change the autoscaling setting (*get_autoscalex_on()*).

Parameters

lower, upper

[float or None] The lower and upper bounds. If *None*, the respective axis bound is not modified.

See also:

get_xbound

get_xlim, *set_xlim*

invert_xaxis, *xaxis_inverted*

Examples using `matplotlib.axes.Axes.set_xbound`

matplotlib.axes.Axes.get_xbound

`Axes.get_xbound`(*self*)

Return the lower and upper x-axis bounds, in increasing order.

See also:

set_xbound

get_xlim, *set_xlim*

invert_xaxis, *xaxis_inverted*

Examples using `matplotlib.axes.Axes.get_xbound`

matplotlib.axes.Axes.set_ybound

`Axes.set_ybound`(*self*, *lower=None*, *upper=None*)

Set the lower and upper numerical bounds of the y-axis.

This method will honor axes inversion regardless of parameter order. It will not change the autoscaling setting (*get_autoscaley_on()*).

Parameters

lower, upper

[float or None] The lower and upper bounds. If *None*, the respective axis bound is not modified.

See also:

get_ybound

get_ylim, *set_ylim*

invert_yaxis, *yaxis_inverted*

Examples using `matplotlib.axes.Axes.set_ybound`

matplotlib.axes.Axes.get_ybound

`Axes.get_ybound`(*self*)

Return the lower and upper y-axis bounds, in increasing order.

See also:

set_ybound

get_ylim, *set_ylim*

invert_yaxis, *yaxis_inverted*

Examples using `matplotlib.axes.Axes.get_ybound`

Axis Labels, title, and legend

Axes.set_xlabel	Set the label for the x-axis.
Axes.get_xlabel	Get the xlabel text string.
Axes.set_ylabel	Set the label for the y-axis.
Axes.get_ylabel	Get the ylabel text string.
Axes.set_title	Set a title for the axes.
Axes.get_title	Get an axes title.
Axes.legend	Place a legend on the axes.
Axes.get_legend	Return the *Legend* instance, or None if no legend is defined.
Axes.get_legend_handles_labels	Return handles and labels for legend

matplotlib.axes.Axes.set_xlabel

Axes.**set_xlabel**(*self*, *xlabel*, *fontdict=None*, *labelpad=None*, ***, *loc=None*, ***kwargs*)

Set the label for the x-axis.

Parameters

xlabel

[str] The label text.

labelpad

[float, default: None] Spacing in points from the axes bounding box including ticks and tick labels.

loc

[{'left', 'center', 'right'}, default: `rcParams["xaxis.labellocation"]` (default: `'center'`)] The label position. This is a high-level alternative for passing parameters *x* and *horizontalalignment*.

Other Parameters

****kwargs**

[*Text* properties] *Text* properties control the appearance of the label.

matplotlib.axes.Axes.get_xlabel

Axes.**get_xlabel**(*self*)
Get the xlabel text string.

Examples using `matplotlib.axes.Axes.get_xlabel`

matplotlib.axes.Axes.set_ylabel

Axes.**set_ylabel**(*self*, *ylabel*, *fontdict=None*, *labelpad=None*, *, *loc=None*, ***kwargs*)
Set the label for the y-axis.

Parameters

ylabel

[str] The label text.

labelpad

[float, default: None] Spacing in points from the axes bounding box including ticks and tick labels.

loc

[{'bottom', 'center', 'top'}, default: `rcParams["yaxis.labellocation"]` (default: `'center'`)] The label position. This is a high-level alternative for passing parameters *y* and *horizontalalignment*.

Other Parameters

****kwargs**

[*Text* properties] *Text* properties control the appearance of the label.

matplotlib.axes.Axes.get_ylabel

Axes.get_ylabel(*self*)
Get the ylabel text string.

Examples using matplotlib.axes.Axes.get_ylabel

matplotlib.axes.Axes.set_title

Axes.set_title(*self*, *label*, *fontdict=None*, *loc=None*, *pad=None*, *, *y=None*, ***kwargs*)
Set a title for the axes.

Set one of the three available axes titles. The available titles are positioned above the axes in the center, flush with the left edge, and flush with the right edge.

Parameters

label

[str] Text to use for the title

fontdict

[dict] A dictionary controlling the appearance of the title text, the default *fontdict* is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'color': rcParams['axes.titlecolor'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

loc

[{'center', 'left', 'right'}, default: rcParams["axes.titlelocation"] (default: 'center')] Which title to set.

y

[float, default: rcParams["axes.titley"] (default: None)] Vertical axes loation for the title (1.0 is the top). If None (the default), y is determined automatically to avoid decorators on the axes.

pad

[float, default: rcParams["axes.titlepad"] (default: 6.0)] The offset of the title from the top of the axes, in points.

Returns

Text

The matplotlib text instance representing the title

Other Parameters

****kwargs**

[*Text* properties] Other keyword arguments are text properties, see *Text* for a list of valid text properties.

matplotlib.axes.Axes.get_title

Axes.get_title(*self*, *loc='center'*)

Get an axes title.

Get one of the three available axes titles. The available titles are positioned above the axes in the center, flush with the left edge, and flush with the right edge.

Parameters

loc

[{'center', 'left', 'right'}, str, default: 'center'] Which title to return.

Returns

str

The title text string.

Examples using `matplotlib.axes.Axes.get_title`

matplotlib.axes.Axes.legend

Axes.**legend**(*self*, **args*, ***kwargs*)

Place a legend on the axes.

Call signatures:

```
legend()
legend(labels)
legend(handles, labels)
```

The call signatures correspond to three different ways how to use this method.

1. Automatic detection of elements to be shown in the legend

The elements to be added to the legend are automatically determined, when you do not pass in any extra arguments.

In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the *set_label()* method on the artist:

```
line, = ax.plot([1, 2, 3], label='Inline label')
ax.legend()
```

or:

```
line, = ax.plot([1, 2, 3])
line.set_label('Label via method')
ax.legend()
```

Specific lines can be excluded from the automatic legend element selection by defining a label starting with an underscore. This is default for all artists, so calling *Axes.legend* without any arguments and without setting the labels manually will result in no legend being drawn.

2. Labeling existing plot elements

To make a legend for lines which already exist on the axes (via plot for instance), simply call this function with an iterable of strings, one for each legend item. For example:

```
ax.plot([1, 2, 3])
ax.legend(['A simple line'])
```

Note: This way of using is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

3. Explicitly defining the elements in the legend

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```
legend((line1, line2, line3), ('label1', 'label2', 'label3'))
```

Parameters

handles

[sequence of *Artist*, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with *labels*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

labels

[list of str, optional] A list of labels to show next to the artists. Use this together with *handles*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

Returns

Legend

Other Parameters

loc

[str or pair of floats, default: `rcParams["legend.loc"]` (default: `'best'`) ('best' for axes, 'upper right' for figures)] The location of the legend.

The strings `'upper left'`, `'upper right'`, `'lower left'`, `'lower right'` place the legend at the corresponding corner of the axes/figure.

The strings `'upper center'`, `'lower center'`, `'center left'`, `'center right'` place the legend at the center of the corresponding edge of the axes/figure.

The string `'center'` places the legend at the center of the axes/figure.

The string `'best'` places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case *bbox_to_anchor* will be ignored).

For back-compatibility, `'center right'` (but no other location) can also be spelled `'right'`, and each "string" locations can also be given as a numeric value:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*. Defaults to `axes.bbox` (if called as a method to *Axes.legend*) or `figure.bbox` (if *Figure.legend*). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by *bbox_transform*, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox `(x, y, width, height)` that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple `(x, y)` places the corner of the legend specified by *loc* at x, y. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

ncol

[int, default: 1] The number of columns that the legend has.

prop

[None or *matplotlib.font_manager.FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

labelcolor

[str or list] Sets the color of the text in the legend. Can be a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

numpoints

[int, default: `rcParams["legend.numpoints"]` (default: `1`)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).

scatterpoints

[int, default: `rcParams["legend.scatterpoints"]` (default: `1`)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).

scatteryoffsets

[iterable of floats, default: `[0.375, 0.5, 0.3125]`] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to `[0.5]`.

markerscale

[float, default: `rcParams["legend.markerscale"]` (default: `1.0`)] The relative size of legend markers compared with the originally drawn ones.

markerfirst

[bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

frameon

[bool, default: `rcParams["legend.frameon"]` (default: `True`)] Whether the legend should be drawn on a patch (frame).

fancybox

[bool, default: rcParams["legend.fancybox"] (default: True)] Whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend's background.

shadow

[bool, default: rcParams["legend.shadow"] (default: False)] Whether to draw a shadow behind the legend.

framealpha

[float, default: rcParams["legend.framealpha"] (default: 0.8)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is None, the default value is ignored.

facecolor

["inherit" or color, default: rcParams["legend.facecolor"] (default: 'inherit')] The legend's background color. If "inherit", use rcParams["axes.facecolor"] (default: 'white').

edgecolor

["inherit" or color, default: rcParams["legend.edgecolor"] (default: '0.8')] The legend's background patch edge color. If "inherit", use take rcParams["axes.edgecolor"] (default: 'black').

mode

[{"expand", None}] If *mode* is set to "expand" the legend will be horizontally expanded to fill the axes area (or *bbox_to_anchor* if defines the legend's size).

bbox_transform

[None or *matplotlib.transforms.Transform*] The transform for the bounding box (*bbox_to_anchor*). For a value of None (default) the Axes' transAxes transform will be used.

title

[str or None] The legend's title. Default is no title (None).

title_fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: rcParams["legend.title_fontsize"] (default: None)] The font size of the legend's title.

borderpad

[float, default: rcParams["legend.borderpad"] (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

labelspacing

[float, default: `rcParams["legend.labelspacing"]` (default: `0.5`)]
The vertical space between the legend entries, in font-size units.

handlelength

[float, default: `rcParams["legend.handlelength"]` (default: `2.0`)]
The length of the legend handles, in font-size units.

handletextpad

[float, default: `rcParams["legend.handletextpad"]` (default: `0.8`)]
The pad between the legend handle and text, in font-size units.

borderaxespad

[float, default: `rcParams["legend.borderaxespad"]` (default: `0.5`)]
The pad between the axes and legend border, in font-size units.

columnspacing

[float, default: `rcParams["legend.columnspacing"]` (default: `2.0`)]
The spacing between columns, in font-size units.

handler_map

[dict or None] The custom dictionary mapping instances or types to a legend handler. This *handler_map* updates the default handler map found at *matplotlib.legend.Legend.get_legend_handler_map*.

Notes

Some artists are not supported by this function. See *Legend guide* for details.

matplotlib.axes.Axes.get_legend

Axes.**get_legend**(*self*)
Return the *Legend* instance, or None if no legend is defined.

Examples using `matplotlib.axes.Axes.get_legend`

matplotlib.axes.Axes.get_legend_handles_labels

Axes.**get_legend_handles_labels**(*self*, *legend_handler_map=None*)
Return handles and labels for legend

`ax.legend()` is equivalent to

```
h, l = ax.get_legend_handles_labels()
ax.legend(h, l)
```

Examples using `matplotlib.axes.Axes.get_legend_handles_labels`

- *Legend guide*

Axis scales

Axes.set_xscale	Set the x-axis scale.
Axes.get_xscale	Return the xaxis' scale (as a str).
Axes.set_yscale	Set the y-axis scale.
Axes.get_yscale	Return the yaxis' scale (as a str).

matplotlib.axes.Axes.set_xscale

`Axes.set_xscale`(*self*, *value*, ***kwargs*)

Set the x-axis scale.

Parameters

value

[{"linear", "log", "symlog", "logit", ...}] The axis scale type to apply.

****kwargs**

Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- *matplotlib.scale.LinearScale*
- *matplotlib.scale.LogScale*
- *matplotlib.scale.SymmetricalLogScale*
- *matplotlib.scale.LogitScale*

Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using *matplotlib.scale.register_scale*. These scales can then also be used here.

Examples using `matplotlib.axes.Axes.set_xscale`

- sphx_glr_gallery_lines_bars_and_markers_markevery_demo.py
- sphx_glr_gallery_text_labels_and_annotations_engineering_formatter.py
- sphx_glr_gallery_axes_grid1_inset_locator_demo.py
- sphx_glr_gallery_scales_aspect_loglog.py
- sphx_glr_gallery_scales_log_demo.py
- sphx_glr_gallery_scales_scales.py
- *Transformations Tutorial*

matplotlib.axes.Axes.get_xscale

Axes.**get_xscale**(*self*)
Return the xaxis' scale (as a str).

Examples using `matplotlib.axes.Axes.get_xscale`

matplotlib.axes.Axes.set_yscale

Axes.**set_yscale**(*self*, *value*, ***kwargs*)
Set the y-axis scale.

Parameters

value

[{"linear", "log", "symlog", "logit", ...}] The axis scale type to apply.

****kwargs**

Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- *matplotlib.scale.LinearScale*
- *matplotlib.scale.LogScale*
- *matplotlib.scale.SymmetricalLogScale*
- *matplotlib.scale.LogitScale*

Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using *matplotlib.scale.register_scale*. These scales can then also be used here.

Examples using `matplotlib.axes.Axes.set_yscale`

- sphx_glr_gallery_lines_bars_and_markers_markevery_demo.py
- sphx_glr_gallery_statistics_boxplot.py
- sphx_glr_gallery_statistics_bxp.py
- sphx_glr_gallery_statistics_errorbar_features.py
- sphx_glr_gallery_scales_aspect_loglog.py
- sphx_glr_gallery_scales_log_bar.py
- sphx_glr_gallery_scales_log_demo.py
- sphx_glr_gallery_scales_scales.py

matplotlib.axes.Axes.get_yscale

`Axes.get_yscale`(*self*)
Return the yaxis' scale (as a str).

Examples using `matplotlib.axes.Axes.get_yscale`

Autoscaling and margins

Axes.use_sticky_edges	When autoscaling, whether to obey all `Artist.sticky_edges`.
Axes.margins	Set or retrieve autoscaling margins.
Axes.set_xmargin	Set padding of X data limits prior to autoscaling.
Axes.set_ymargin	Set padding of Y data limits prior to autoscaling.
Axes.relim	Recompute the data limits based on current artists.
Axes.autoscale	Autoscale the axis view to the data (toggle).

continues on next page

Table 102 – continued from previous page

Axes.autoscale_view	Autoscale the view limits using the data limits.
Axes.set_autoscale_on	Set whether autoscaling is applied on plot commands
Axes.get_autoscale_on	Get whether autoscaling is applied for both axes on plot commands
Axes.set_autoscalex_on	Set whether autoscaling for the x-axis is applied on plot commands
Axes.get_autoscalex_on	Get whether autoscaling for the x-axis is applied on plot commands
Axes.set_autoscaley_on	Set whether autoscaling for the y-axis is applied on plot commands
Axes.get_autoscaley_on	Get whether autoscaling for the y-axis is applied on plot commands

matplotlib.axes.Axes.use_sticky_edges

property Axes.use_sticky_edges

When autoscaling, whether to obey all `Artist.sticky_edges`.

Default is `True`.

Setting this to `False` ensures that the specified margins will be applied, even if the plot includes an image, for example, which would otherwise force a view limit to coincide with its data limit.

The changing this property does not change the plot until *autoscale* or *autoscale_view* is called.

matplotlib.axes.Axes.margins

Axes.margins(*self*, **margins*, *x=None*, *y=None*, *tight=True*)

Set or retrieve autoscaling margins.

The padding added to each limit of the axes is the *margin* times the data interval. All input parameters must be floats within the range [0, 1]. Passing both positional and keyword arguments is invalid and will raise a TypeError. If no arguments (positional or otherwise) are provided, the current margins will remain in place and simply be returned.

Specifying any margin changes only the autoscaling; for example, if *xmargin* is not None, then *xmargin* times the X data interval will be added to each end of that interval before it is used in autoscaling.

Parameters

***margins**

[float, optional] If a single positional argument is provided, it specifies both margins of the x-axis and y-axis limits. If two positional arguments are provided, they will be interpreted as *xmargin*, *ymargin*. If setting the margin on a single axis is desired, use the keyword arguments described below.

x, y

[float, optional] Specific margin values for the x-axis and y-axis, respectively. These cannot be used with positional arguments, but can be used individually to alter on e.g., only the y-axis.

tight

[bool or None, default: True] The *tight* parameter is passed to *autoscale_view()*, which is executed after a margin is changed; the default here is *True*, on the assumption that when margins are specified, no additional padding to match tick marks is usually desired. Set *tight* to *None* will preserve the previous setting.

Returns

xmargin, ymargin

[float]

Notes

If a previously used Axes method such as *pcolor()* has set *use_sticky_edges* to `True`, only the limits not set by the "sticky artists" will be modified. To force all of the margins to be set, set *use_sticky_edges* to `False` before calling *margins()*.

Examples using `matplotlib.axes.Axes.margins`

- sphx_glr_gallery_lines_bars_and_markers_marker_reference.py
- sphx_glr_gallery_lines_bars_and_markers_timeline.py
- sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py
- sphx_glr_gallery_subplots_axes_and_figures_axes_margins.py
- sphx_glr_gallery_style_sheets_ggplot.py
- sphx_glr_gallery_widgets_slider_demo.py

matplotlib.axes.Axes.set_xmargin

Axes.**set_xmargin**(*self*, *m*)

Set padding of X data limits prior to autoscaling.

m times the data interval will be added to each end of that interval before it is used in autoscaling. For example, if your data is in the range [0, 2], a factor of `m = 0.1` will result in a range [-0.2, 2.2].

Negative values -0.5 < m < 0 will result in clipping of the data range. I.e. for a data range [0, 2], a factor of `m = -0.1` will result in a range [0.2, 1.8].

Parameters

m

[float greater than -0.5]

Examples using `matplotlib.axes.Axes.set_xmargin`

matplotlib.axes.Axes.set_ymargin

Axes.**set_ymargin**(*self*, *m*)

Set padding of Y data limits prior to autoscaling.

m times the data interval will be added to each end of that interval before it is used in autoscaling. For example, if your data is in the range [0, 2], a factor of `m = 0.1` will result in a range [-0.2, 2.2].

Negative values -0.5 < m < 0 will result in clipping of the data range. I.e. for a data range [0, 2], a factor of `m = -0.1` will result in a range [0.2, 1.8].

Parameters

m

[float greater than -0.5]

Examples using `matplotlib.axes.Axes.set_ymargin`

matplotlib.axes.Axes.relim

Axes.**relim**(*self*, *visible_only=False*)

Recompute the data limits based on current artists.

At present, *Collection* instances are not supported.

Parameters

visible_only

[bool, default: False] Whether to exclude invisible artists.

Examples using `matplotlib.axes.Axes.relim`

- sphx_glr_gallery_widgets_textbox.py

matplotlib.axes.Axes.autoscale

`Axes.autoscale`(*self*, *enable=True*, *axis='both'*, *tight=None*)

Autoscale the axis view to the data (toggle).

Convenience method for simple axis view autoscaling. It turns autoscaling on or off, and then, if autoscaling for either axis is on, it performs the autoscaling on the specified axis or axes.

Parameters

enable

[bool or None, default: True] True turns autoscaling on, False turns it off. None leaves the autoscaling state unchanged.

axis

[{'both', 'x', 'y'}, default: 'both'] Which axis to operate on.

tight

[bool or None, default: None] If True, first set the margins to zero. Then, this argument is forwarded to *autoscale_view* (regardless of its value); see the description of its behavior there.

Examples using `matplotlib.axes.Axes.autoscale`

- sphx_glr_gallery_subplots_axes_and_figures_axes_box_aspect.py

matplotlib.axes.Axes.autoscale_view

`Axes.autoscale_view`(*self*, *tight=None*, *scalex=True*, *scaley=True*)

Autoscale the view limits using the data limits.

Parameters

tight

[bool or None] If *True*, only expand the axis limits using the margins. Note that unlike for *autoscale*, `tight=True` does *not* set the margins to zero.

If *False* and `rcParams["axes.autolimit_mode"]` (default: `'data'`) is 'round_numbers', then after expansion by the margins, further expand the axis limits using the axis major locator.

If None (the default), reuse the value set in the previous call to *autoscale_view* (the initial value is False, but the default style sets `rcParams["axes.autolimit_mode"]` (default: `'data'`) to 'data', in which case this behaves like True).

scalex

[bool, default: True] Whether to autoscale the x axis.

scaley

[bool, default: True] Whether to autoscale the y axis.

Notes

The autoscaling preserves any preexisting axis direction reversal.

The data limits are not updated automatically when artist data are changed after the artist has been added to an Axes instance. In that case, use *matplotlib.axes.Axes.relim()* prior to calling autoscale_view.

If the views of the axes are fixed, e.g. via *set_xlim*, they will not be changed by autoscale_view(). See *matplotlib.axes.Axes.autoscale()* for an alternative.

Examples using `matplotlib.axes.Axes.autoscale_view`

- sphx_glr_gallery_shapes_and_collections_collections.py
- sphx_glr_gallery_shapes_and_collections_compound_path.py
- sphx_glr_gallery_shapes_and_collections_ellipse_collection.py
- sphx_glr_gallery_units_bar_unit_demo.py
- sphx_glr_gallery_widgets_textbox.py

matplotlib.axes.Axes.set_autoscale_on

Axes.set_autoscale_on(*self*, *b*)
Set whether autoscaling is applied on plot commands

Parameters

b

[bool]

Examples using matplotlib.axes.Axes.set_autoscale_on

- sphx_glr_gallery_event_handling_resample.py

matplotlib.axes.Axes.get_autoscale_on

Axes.get_autoscale_on(*self*)
Get whether autoscaling is applied for both axes on plot commands

Examples using matplotlib.axes.Axes.get_autoscale_on

matplotlib.axes.Axes.set_autoscalex_on

Axes.set_autoscalex_on(*self*, *b*)
Set whether autoscaling for the x-axis is applied on plot commands

Parameters

b

[bool]

Examples using matplotlib.axes.Axes.set_autoscalex_on

matplotlib.axes.Axes.get_autoscalex_on

Axes.get_autoscalex_on(*self*)
Get whether autoscaling for the x-axis is applied on plot commands

Examples using `matplotlib.axes.Axes.get_autoscalex_on`

matplotlib.axes.Axes.set_autoscaley_on

`Axes.set_autoscaley_on(`*self*, *b*`)`

Set whether autoscaling for the y-axis is applied on plot commands

Parameters

b

[bool]

Examples using `matplotlib.axes.Axes.set_autoscaley_on`

matplotlib.axes.Axes.get_autoscaley_on

`Axes.get_autoscaley_on(`*self*`)`

Get whether autoscaling for the y-axis is applied on plot commands

Examples using `matplotlib.axes.Axes.get_autoscaley_on`

Aspect ratio

Axes.apply_aspect	Adjust the Axes for a specified data aspect ratio.
Axes.set_aspect	Set the aspect of the axis scaling, i.e.
Axes.get_aspect	
Axes.set_box_aspect	Set the axes box aspect.
Axes.get_box_aspect	Get the axes box aspect.
Axes.set_adjustable	Set how the Axes adjusts to achieve the required aspect ratio.
Axes.get_adjustable	Return whether the Axes will adjust its physical dimension ('box') or its data limits ('datalim') to achieve the desired aspect ratio.

matplotlib.axes.Axes.apply_aspect

Axes.apply_aspect(*self*, *position=None*)

Adjust the Axes for a specified data aspect ratio.

Depending on *get_adjustable* this will modify either the Axes box (position) or the view limits. In the former case, *get_anchor* will affect the position.

See also:

matplotlib.axes.Axes.set_aspect

For a description of aspect ratio handling.

matplotlib.axes.Axes.set_adjustable

Set how the Axes adjusts to achieve the required aspect ratio.

matplotlib.axes.Axes.set_anchor

Set the position in case of extra space.

Notes

This is called automatically when each Axes is drawn. You may need to call it yourself if you need to update the Axes position and/or view limits before the Figure is drawn.

Examples using `matplotlib.axes.Axes.apply_aspect`

matplotlib.axes.Axes.set_aspect

Axes.set_aspect(*self*, *aspect*, *adjustable=None*, *anchor=None*, *share=False*)

Set the aspect of the axis scaling, i.e. the ratio of y-unit to x-unit.

Parameters

aspect

[{'auto'} or num] Possible values:

value	description
'auto'	automatic; fill the position rectangle with data.
num	a circle will be stretched such that the height is *num* times the width. 'equal' is a synonym for `aspect=1`, i.e. same scaling for x and y.

adjustable

[None or {'box', 'datalim'}, optional] If not `None`, this defines which parameter will be adjusted to meet the required aspect. See *set_adjustable* for further details.

anchor

[None or str or 2-tuple of float, optional] If not `None`, this defines where the Axes will be drawn if there is extra space due to aspect constraints. The most common way to to specify the anchor are abbreviations of cardinal directions:

value	description
'C'	centered
'SW'	lower left corner
'S'	middle of bottom edge
'SE'	lower right corner
etc.	

See *set_anchor* for further details.

share

[bool, default: False] If `True`, apply the settings to all shared Axes.

See also:

matplotlib.axes.Axes.set_adjustable

Set how the Axes adjusts to achieve the required aspect ratio.

matplotlib.axes.Axes.set_anchor

Set the position in case of extra space.

matplotlib.axes.Axes.get_aspect

`Axes.get_aspect(`*self*`)`

Examples using `matplotlib.axes.Axes.get_aspect`

matplotlib.axes.Axes.set_box_aspect

`Axes.set_box_aspect(`*self*, *aspect=None*`)`

Set the axes box aspect. The box aspect is the ratio of the axes height to the axes width in physical units. This is not to be confused with the data aspect, set via *set_aspect*.

Parameters

aspect

[None, or a number] Changes the physical dimensions of the Axes, such that the ratio of the axes height to the axes width in physical units is equal to *aspect*. If *None*, the axes geometry will not be adjusted.

Note that calling this function with a number changes the *adjustable*

to *datalim*.

See also:

matplotlib.axes.Axes.set_aspect

for a description of aspect handling.

Examples using `matplotlib.axes.Axes.set_box_aspect`

- sphx_glr_gallery_subplots_axes_and_figures_axes_box_aspect.py

matplotlib.axes.Axes.get_box_aspect

`Axes.get_box_aspect(`*self*`)`

Get the axes box aspect. Will be `None` if not explicitly specified.

See also:

matplotlib.axes.Axes.set_box_aspect

for a description of box aspect.

matplotlib.axes.Axes.set_aspect

for a description of aspect handling.

Examples using `matplotlib.axes.Axes.get_box_aspect`

matplotlib.axes.Axes.set_adjustable

`Axes.set_adjustable(`*self*, *adjustable*, *share=False*`)`

Set how the Axes adjusts to achieve the required aspect ratio.

Parameters

adjustable

[{'box', 'datalim'}] If 'box', change the physical dimensions of the Axes. If 'datalim', change the `x` or `y` data limits.

share

[bool, default: False] If `True`, apply the settings to all shared Axes.

See also:

matplotlib.axes.Axes.set_aspect

For a description of aspect handling.

Notes

Shared Axes (of which twinned Axes are a special case) impose restrictions on how aspect ratios can be imposed. For twinned Axes, use 'datalim'. For Axes that share both x and y, use 'box'. Otherwise, either 'datalim' or 'box' may be used. These limitations are partly a requirement to avoid over-specification, and partly a result of the particular implementation we are currently using, in which the adjustments for aspect ratios are done sequentially and independently on each Axes as it is drawn.

Examples using `matplotlib.axes.Axes.set_adjustable`

- sphx_glr_gallery_scales_aspect_loglog.py

matplotlib.axes.Axes.get_adjustable

`Axes.get_adjustable`(*self*)

Return whether the Axes will adjust its physical dimension ('box') or its data limits ('datalim') to achieve the desired aspect ratio.

See also:

matplotlib.axes.Axes.set_adjustable

Set how the Axes adjusts to achieve the required aspect ratio.

matplotlib.axes.Axes.set_aspect

For a description of aspect handling.

Examples using `matplotlib.axes.Axes.get_adjustable`

Ticks and tick labels

Axes.set_xticks	Set the xaxis' tick locations.
Axes.get_xticks	Return the xaxis' tick locations in data coordinates.
Axes.set_xticklabels	Set the xaxis' labels with list of string labels.
Axes.get_xticklabels	Get the xaxis' tick labels.

continues on next page

Table 104 – continued from previous page

Axes.get_xmajorticklabels	Return the xaxis' major tick labels, as a list of *Text*.
Axes.get_xminorticklabels	Return the xaxis' minor tick labels, as a list of *Text*.
Axes.get_xgridlines	Return the xaxis' grid lines as a list of *Line2D*s.
Axes.get_xticklines	Return the xaxis' tick lines as a list of *Line2D*s.
Axes.xaxis_date	Sets up axis ticks and labels to treat data along the xaxis as dates.
Axes.set_yticks	Set the yaxis' tick locations.
Axes.get_yticks	Return the yaxis' tick locations in data coordinates.
Axes.set_yticklabels	Set the yaxis' labels with list of string labels.
Axes.get_yticklabels	Get the yaxis' tick labels.
Axes.get_ymajorticklabels	Return the yaxis' major tick labels, as a list of *Text*.
Axes.get_yminorticklabels	Return the yaxis' minor tick labels, as a list of *Text*.
Axes.get_ygridlines	Return the yaxis' grid lines as a list of *Line2D*s.
Axes.get_yticklines	Return the yaxis' tick lines as a list of *Line2D*s.
Axes.yaxis_date	Sets up axis ticks and labels to treat data along the yaxis as dates.
Axes.minorticks_off	Remove minor ticks from the axes.
Axes.minorticks_on	Display minor ticks on the axes.
Axes.ticklabel_format	Configure the *ScalarFormatter* used by default for linear axes.
Axes.tick_params	Change the appearance of ticks, tick labels, and gridlines.
Axes.locator_params	Control behavior of major tick locators.

matplotlib.axes.Axes.set_xticks

`Axes.set_xticks`(*self*, *ticks*, *, *minor=False*)

Set the xaxis' tick locations.

Parameters

ticks

[list of floats] List of tick locations.

minor

[bool, default: False] If `False`, set the major ticks; if `True`, the minor ticks.

Examples using `matplotlib.axes.Axes.set_xticks`

- sphx_glr_gallery_lines_bars_and_markers_barchart.py

- *The Lifecycle of a Plot*

matplotlib.axes.Axes.get_xticks

Axes.get_xticks(*self*, *, *minor=False*)
Return the xaxis' tick locations in data coordinates.

Examples using matplotlib.axes.Axes.get_xticks

matplotlib.axes.Axes.set_xticklabels

Axes.set_xticklabels(*self*, *labels*, *, *fontdict=None*, *minor=False*, ***kwargs*)
Set the xaxis' labels with list of string labels.

Warning: This method should only be used after fixing the tick positions using *Axes.set_xticks*. Otherwise, the labels may end up in unexpected positions.

Parameters

labels

[list of str] The label texts.

fontdict

[dict, optional] A dictionary controlling the appearance of the ticklabels. The default *fontdict* is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

minor

[bool, default: False] Whether to set the minor ticklabels rather than the major ones.

Returns

list of *Text*

The labels.

Other Parameters

****kwargs**

[*Text* properties.]

Examples using `matplotlib.axes.Axes.set_xticklabels`

- sphx_glr_gallery_lines_bars_and_markers_barchart.py
- sphx_glr_gallery_images_contours_and_fields_image_annotated_heatmap.py

- sphx_glr_gallery_units_bar_unit_demo.py
- *Constrained Layout Guide*

matplotlib.axes.Axes.get_xticklabels

`Axes.get_xticklabels`(*self*, *minor=False*, *which=None*)

Get the xaxis' tick labels.

Parameters

minor

[bool] Whether to return the minor or the major ticklabels.

which

[None, ('minor', 'major', 'both')] Overrides *minor*.

Selects which ticklabels to return

Returns

list of *Text*

Notes

The tick label strings are not populated until a `draw` method has been called.

See also: *draw* and *draw*.

Examples using `matplotlib.axes.Axes.get_xticklabels`

- sphx_glr_gallery_lines_bars_and_markers_timeline.py
- sphx_glr_gallery_images_contours_and_fields_image_annotated_heatmap.py
- sphx_glr_gallery_subplots_axes_and_figures_align_labels_demo.py

- sphx_glr_gallery_units_evans_test.py
- *The Lifecycle of a Plot*

matplotlib.axes.Axes.get_xmajorticklabels

`Axes.get_xmajorticklabels(`*self*`)`

Return the xaxis' major tick labels, as a list of *Text*.

Examples using `matplotlib.axes.Axes.get_xmajorticklabels`

matplotlib.axes.Axes.get_xminorticklabels

`Axes.get_xminorticklabels`(*self*)
Return the xaxis' minor tick labels, as a list of *Text*.

Examples using `matplotlib.axes.Axes.get_xminorticklabels`

matplotlib.axes.Axes.get_xgridlines

`Axes.get_xgridlines`(*self*)
Return the xaxis' grid lines as a list of *Line2D*s.

Examples using `matplotlib.axes.Axes.get_xgridlines`

matplotlib.axes.Axes.get_xticklines

`Axes.get_xticklines`(*self*, *minor=False*)
Return the xaxis' tick lines as a list of *Line2D*s.

Examples using `matplotlib.axes.Axes.get_xticklines`

matplotlib.axes.Axes.xaxis_date

`Axes.xaxis_date`(*self*, *tz=None*)
Sets up axis ticks and labels to treat data along the xaxis as dates.

Parameters

tz

[str or `datetime.tzinfo`, default: `rcParams["timezone"]` (default: `'UTC'`)] The timezone used to create date labels.

Examples using `matplotlib.axes.Axes.xaxis_date`

matplotlib.axes.Axes.set_yticks

`Axes.set_yticks`(*self*, *ticks*, *, *minor=False*)

Set the yaxis' tick locations.

Parameters

ticks

[list of floats] List of tick locations.

minor

[bool, default: False] If `False`, set the major ticks; if `True`, the minor ticks.

Examples using `matplotlib.axes.Axes.set_yticks`

- sphx_glr_gallery_lines_bars_and_markers_barh.py
- sphx_glr_gallery_lines_bars_and_markers_broken_barh.py
- sphx_glr_gallery_lines_bars_and_markers_psd_demo.py

- sphx_glr_gallery_ticks_and_spines_spines_bounds.py

matplotlib.axes.Axes.get_yticks

Axes.get_yticks(*self*, *, *minor=False*)
Return the yaxis' tick locations in data coordinates.

Examples using matplotlib.axes.Axes.get_yticks

matplotlib.axes.Axes.set_yticklabels

Axes.set_yticklabels(*self*, *labels*, *, *fontdict=None*, *minor=False*, ***kwargs*)
Set the yaxis' labels with list of string labels.

> **Warning:** This method should only be used after fixing the tick positions using *Axes.set_yticks*. Otherwise, the labels may end up in unexpected positions.

Parameters

labels

[list of str] The label texts.

fontdict

[dict, optional] A dictionary controlling the appearance of the ticklabels. The default *fontdict* is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

minor

[bool, default: False] Whether to set the minor ticklabels rather than the major ones.

Returns

list of *Text*

The labels.

Other Parameters

****kwargs**

[*Text* properties.]

Examples using `matplotlib.axes.Axes.set_yticklabels`

- sphx_glr_gallery_lines_bars_and_markers_barh.py
- sphx_glr_gallery_lines_bars_and_markers_broken_barh.py
- sphx_glr_gallery_images_contours_and_fields_image_annotated_heatmap.py
- sphx_glr_gallery_subplots_axes_and_figures_zoom_inset_axes.py
- sphx_glr_gallery_statistics_boxplot.py
- sphx_glr_gallery_statistics_bxp.py
- sphx_glr_gallery_statistics_violinplot.py
- sphx_glr_gallery_text_labels_and_annotations_tex_demo.py
- sphx_glr_gallery_pyplots_auto_subplots_adjust.py
- sphx_glr_gallery_axes_grid1_make_room_for_ylabel_using_axesgrid.py
- sphx_glr_gallery_axisartist_demo_ticklabel_alignment.py
- sphx_glr_gallery_specialty_plots_mri_with_eeg.py
- sphx_glr_gallery_ticks_and_spines_colorbar_tick_labelling_demo.py
- *Constrained Layout Guide*

matplotlib.axes.Axes.get_yticklabels

`Axes.get_yticklabels(`*self*, *minor=False*, *which=None*`)`

Get the yaxis' tick labels.

Parameters

minor

[bool] Whether to return the minor or the major ticklabels.

which

[None, ('minor', 'major', 'both')] Overrides *minor*.

Selects which ticklabels to return

Returns

list of *Text*

Notes

The tick label strings are not populated until a `draw` method has been called.

See also: *draw* and *draw*.

Examples using `matplotlib.axes.Axes.get_yticklabels`

- sphx_glr_gallery_axes_grid1_inset_locator_demo2.py
- sphx_glr_gallery_recipes_fill_between_alpha.py

matplotlib.axes.Axes.get_ymajorticklabels

Axes.**get_ymajorticklabels**(*self*)
Return the yaxis' major tick labels, as a list of *Text*.

Examples using `matplotlib.axes.Axes.get_ymajorticklabels`

matplotlib.axes.Axes.get_yminorticklabels

Axes.**get_yminorticklabels**(*self*)
Return the yaxis' minor tick labels, as a list of *Text*.

Examples using `matplotlib.axes.Axes.get_yminorticklabels`

matplotlib.axes.Axes.get_ygridlines

Axes.**get_ygridlines**(*self*)
Return the yaxis' grid lines as a list of *Line2D*s.

Examples using `matplotlib.axes.Axes.get_ygridlines`

matplotlib.axes.Axes.get_yticklines

Axes.**get_yticklines**(*self*, *minor=False*)
Return the yaxis' tick lines as a list of *Line2D*s.

Examples using `matplotlib.axes.Axes.get_yticklines`

matplotlib.axes.Axes.yaxis_date

Axes.**yaxis_date**(*self*, *tz=None*)
Sets up axis ticks and labels to treat data along the yaxis as dates.

Parameters

tz

[str or `datetime.tzinfo`, default: `rcParams["timezone"]` (default: `'UTC'`)] The timezone used to create date labels.

Examples using `matplotlib.axes.Axes.yaxis_date`

matplotlib.axes.Axes.minorticks_off

Axes.**minorticks_off**(*self*)
Remove minor ticks from the axes.

Examples using `matplotlib.axes.Axes.minorticks_off`

matplotlib.axes.Axes.minorticks_on

Axes.**minorticks_on**(*self*)
Display minor ticks on the axes.

Displaying minor ticks may reduce performance; you may turn them off using *minorticks_off()* if drawing speed is a problem.

Examples using `matplotlib.axes.Axes.minorticks_on`

- sphx_glr_gallery_specialty_plots_mri_with_eeg.py

matplotlib.axes.Axes.ticklabel_format

Axes.ticklabel_format(*self*, ***, *axis='both'*, *style=''*, *scilimits=None*, *useOffset=None*, *useLocale=None*, *useMathText=None*)

Configure the *ScalarFormatter* used by default for linear axes.

If a parameter is not set, the corresponding property of the formatter is left unchanged.

Parameters

axis

[{'x', 'y', 'both'}, default: 'both'] The axes to configure. Only major ticks are affected.

style

[{'sci', 'scientific', 'plain'}] Whether to use scientific notation. The formatter default is to use scientific notation.

scilimits

[pair of ints (m, n)] Scientific notation is used only for numbers outside the range 10^m to 10^n (and only if the formatter is configured to use scientific notation at all). Use (0, 0) to include all numbers. Use (m, m) where m != 0 to fix the order of magnitude to 10^m. The formatter default is `rcParams["axes.formatter.limits"]` (default: `[-5, 6]`).

useOffset

[bool or float] If True, the offset is calculated as needed. If False, no offset is used. If a numeric value, it sets the offset. The formatter default is `rcParams["axes.formatter.useoffset"]` (default: `True`).

useLocale

[bool] Whether to format the number using the current locale or using the C (English) locale. This affects e.g. the decimal separator. The formatter default is `rcParams["axes.formatter.use_locale"]` (default: `False`).

useMathText

[bool] Render the offset and scientific notation in mathtext. The formatter default is `rcParams["axes.formatter.use_mathtext"]` (default: `False`).

Raises

AttributeError

If the current formatter is not a *ScalarFormatter*.

Examples using `matplotlib.axes.Axes.ticklabel_format`

- sphx_glr_gallery_ticks_and_spines_scalarformatter.py

matplotlib.axes.Axes.tick_params

`Axes.tick_params`(*self*, *axis='both'*, ***kwargs*)

Change the appearance of ticks, tick labels, and gridlines.

Tick properties that are not explicitly set using the keyword arguments remain unchanged unless *reset* is True.

Parameters

axis

[{'x', 'y', 'both'}, default: 'both'] The axis to which the parameters are applied.

which

[{'major', 'minor', 'both'}, default: 'major'] The group of ticks to which the parameters are applied.

reset

[bool, default: False] Whether to reset the ticks to defaults before updating them.

Other Parameters

direction

[{'in', 'out', 'inout'}] Puts ticks inside the axes, outside the axes, or both.

length

[float] Tick length in points.

width

[float] Tick width in points.

color

[color] Tick color.

pad

[float] Distance in points between tick and label.

labelsize

[float or str] Tick label font size in points or as a string (e.g., 'large').

labelcolor

[color] Tick label color.

colors

[color] Tick color and label color.

zorder

[float] Tick and label zorder.

bottom, top, left, right

[bool] Whether to draw the respective ticks.

labelbottom, labeltop, labelleft, labelright

[bool] Whether to draw the respective tick labels.

labelrotation

[float] Tick label rotation

grid_color

[color] Gridline color.

grid_alpha

[float] Transparency of gridlines: 0 (transparent) to 1 (opaque).

grid_linewidth

[float] Width of gridlines in points.

grid_linestyle

[str] Any valid *Line2D* line style spec.

Examples

```
ax.tick_params(direction='out', length=6, width=2, colors='r',
               grid_color='r', grid_alpha=0.5)
```

This will make all major ticks be red, pointing out of the box, and with dimensions 6 points by 2 points. Tick labels will also be red. Gridlines will be red and translucent.

Examples using `matplotlib.axes.Axes.tick_params`

- sphx_glr_gallery_lines_bars_and_markers_scatter_hist.py
- sphx_glr_gallery_images_contours_and_fields_image_annotated_heatmap.py

- *Text in Matplotlib Plots*

matplotlib.axes.Axes.locator_params

Axes.locator_params(*self*, *axis='both'*, *tight=None*, ***kwargs*)

Control behavior of major tick locators.

Because the locator is involved in autoscaling, *autoscale_view* is called automatically after the parameters are changed.

Parameters

axis

[{'both', 'x', 'y'}, default: 'both'] The axis on which to operate.

tight

[bool or None, optional] Parameter passed to *autoscale_view*. Default is None, for no change.

Other Parameters

****kwargs**

Remaining keyword arguments are passed to directly to the `set_params()` method of the locator. Supported keywords depend on the type of the locator. See for example *set_params* for the *ticker.MaxNLocator* used by default for linear axes.

Examples

When plotting small subplots, one might want to reduce the maximum number of ticks and use tight bounds, for example:

```
ax.locator_params(tight=True, nbins=4)
```

Examples using `matplotlib.axes.Axes.locator_params`

- sphx_glr_gallery_images_contours_and_fields_contourf_demo.py
- *Constrained Layout Guide*
- *Tight Layout guide*

18.5.9 Units

Axes.convert_xunits	Convert *x* using the unit type of the xaxis.
Axes.convert_yunits	Convert *y* using the unit type of the yaxis.
Axes.have_units	Return *True* if units are set on any axis.

matplotlib.axes.Axes.convert_xunits

`Axes.convert_xunits`(*self*, *x*)

Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

Examples using `matplotlib.axes.Axes.convert_xunits`

matplotlib.axes.Axes.convert_yunits

`Axes.convert_yunits`(*self*, *y*)
Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

Examples using `matplotlib.axes.Axes.convert_yunits`

matplotlib.axes.Axes.have_units

`Axes.have_units`(*self*)
Return *True* if units are set on any axis.

Examples using `matplotlib.axes.Axes.have_units`

18.5.10 Adding Artists

Axes.add_artist	Add an *Artist* to the axes, and return the artist.
Axes.add_child_axes	Add an `AxesBase` to the axes' children; return the child axes.
Axes.add_collection	Add a *Collection* to the axes' collections; return the collection.
Axes.add_container	Add a *Container* to the axes' containers; return the container.
Axes.add_image	Add an *AxesImage* to the axes' images; return the image.
Axes.add_line	Add a *Line2D* to the axes' lines; return the line.
Axes.add_patch	Add a *Patch* to the axes' patches; return the patch.
Axes.add_table	Add a *Table* to the axes' tables; return the table.

matplotlib.axes.Axes.add_artist

Axes.add_artist(*self*, *a*)

Add an *Artist* to the axes, and return the artist.

Use *add_artist* only for artists for which there is no dedicated "add" method; and if necessary, use a method such as *update_datalim* to manually update the dataLim if the artist is to be included in autoscaling.

If no `transform` has been specified when creating the artist (e.g. `artist.get_transform() == None`) then the transform is set to `ax.transData`.

Examples using `matplotlib.axes.Axes.add_artist`

- sphx_glr_gallery_lines_bars_and_markers_scatter_with_legend.py
- sphx_glr_gallery_images_contours_and_fields_demo_bboximage.py

- sphx_glr_gallery_userdemo_simple_legend02.py

matplotlib.axes.Axes.add_child_axes

Axes.add_child_axes(*self*, *ax*)
Add an AxesBase to the axes' children; return the child axes.

This is the lowlevel version. See *axes.Axes.inset_axes*.

Examples using matplotlib.axes.Axes.add_child_axes

matplotlib.axes.Axes.add_collection

Axes.add_collection(*self*, *collection*, *autolim=True*)
Add a *Collection* to the axes' collections; return the collection.

Examples using matplotlib.axes.Axes.add_collection

- sphx_glr_gallery_lines_bars_and_markers_eventcollection_demo.py
- sphx_glr_gallery_lines_bars_and_markers_span_regions.py

- sphx_glr_gallery_specialty_plots_mri_with_eeg.py
- sphx_glr_gallery_units_artist_tests.py

matplotlib.axes.Axes.add_container

Axes.add_container(*self*, *container*)
Add a *Container* to the axes' containers; return the container.

Examples using `matplotlib.axes.Axes.add_container`

matplotlib.axes.Axes.add_image

Axes.add_image(*self*, *image*)
Add an *AxesImage* to the axes' images; return the image.

Examples using `matplotlib.axes.Axes.add_image`

matplotlib.axes.Axes.add_line

Axes.add_line(*self*, *line*)
Add a *Line2D* to the axes' lines; return the line.

Examples using `matplotlib.axes.Axes.add_line`

- sphx_glr_gallery_text_labels_and_annotations_line_with_text.py

matplotlib.axes.Axes.add_patch

Axes.add_patch(*self*, *p*)
Add a *Patch* to the axes' patches; return the patch.

Examples using `matplotlib.axes.Axes.add_patch`

- sphx_glr_gallery_lines_bars_and_markers_curve_error_band.py
- sphx_glr_gallery_images_contours_and_fields_image_demo.py

matplotlib.axes.Axes.add_table

Axes.add_table(*self*, *tab*)
Add a *Table* to the axes' tables; return the table.

Examples using matplotlib.axes.Axes.add_table

18.5.11 Twinning and sharing

Axes.twinx	Create a twin Axes sharing the xaxis.
Axes.twiny	Create a twin Axes sharing the yaxis.
Axes.sharex	Share the x-axis with *other*.
Axes.sharey	Share the y-axis with *other*.
Axes.get_shared_x_axes	Return a reference to the shared axes Grouper object for x axes.
Axes.get_shared_y_axes	Return a reference to the shared axes Grouper object for y axes.

matplotlib.axes.Axes.twinx

Axes.twinx(*self*)
Create a twin Axes sharing the xaxis.

Create a new Axes with an invisible x-axis and an independent y-axis positioned opposite to the original one (i.e. at right). The x-axis autoscale setting will be inherited from the original Axes. To ensure that the tick marks of both y-axes align, see *LinearLocator*.

Returns

Axes

The newly created Axes instance

Notes

For those who are 'picking' artists while using twinx, pick events are only called for the artists in the top-most axes.

Examples using `matplotlib.axes.Axes.twinx`

- sphx_glr_gallery_subplots_axes_and_figures_axes_box_aspect.py
- sphx_glr_gallery_subplots_axes_and_figures_two_scales.py
- sphx_glr_gallery_statistics_barchart_demo.py
- sphx_glr_gallery_axes_grid1_parasite_simple.py
- sphx_glr_gallery_axisartist_demo_parasite_axes2.py
- sphx_glr_gallery_ticks_and_spines_multiple_yaxis_with_spines.py

matplotlib.axes.Axes.twiny

`Axes.twiny`(*self*)

Create a twin Axes sharing the yaxis.

Create a new Axes with an invisible y-axis and an independent x-axis positioned opposite to the original one (i.e. at top). The y-axis autoscale setting will be inherited from the original Axes. To ensure that the tick marks of both x-axes align, see *LinearLocator*.

Returns

Axes

The newly created Axes instance

Notes

For those who are 'picking' artists while using twiny, pick events are only called for the artists in the top-most axes.

Examples using `matplotlib.axes.Axes.twiny`

- sphx_glr_gallery_subplots_axes_and_figures_two_scales.py

matplotlib.axes.Axes.sharex

Axes.**sharex**(*self*, *other*)
Share the x-axis with *other*.

This is equivalent to passing `sharex=other` when constructing the axes, and cannot be used if the x-axis is already being shared with another axes.

Examples using `matplotlib.axes.Axes.sharex`

matplotlib.axes.Axes.sharey

Axes.**sharey**(*self*, *other*)
Share the y-axis with *other*.

This is equivalent to passing `sharey=other` when constructing the axes, and cannot be used if the y-axis is already being shared with another axes.

Examples using `matplotlib.axes.Axes.sharey`

matplotlib.axes.Axes.get_shared_x_axes

Axes.**get_shared_x_axes**(*self*)
Return a reference to the shared axes Grouper object for x axes.

Examples using `matplotlib.axes.Axes.get_shared_x_axes`

matplotlib.axes.Axes.get_shared_y_axes

Axes.**get_shared_y_axes**(*self*)
Return a reference to the shared axes Grouper object for y axes.

Examples using `matplotlib.axes.Axes.get_shared_y_axes`

18.5.12 Axes Position

Axes.get_anchor	Get the anchor location.
Axes.set_anchor	Define the anchor location.
Axes.get_axes_locator	Return the axes_locator.
Axes.set_axes_locator	Set the axes locator.

continues on next page

Table 108 – continued from previous page

Axes.reset_position	Reset the active position to the original position.
Axes.get_position	Get a copy of the axes rectangle as a *Bbox*.
Axes.set_position	Set the axes position.

matplotlib.axes.Axes.get_anchor

Axes.get_anchor(*self*)

Get the anchor location.

See also:

matplotlib.axes.Axes.set_anchor

for a description of the anchor.

matplotlib.axes.Axes.set_aspect

for a description of aspect handling.

Examples using matplotlib.axes.Axes.get_anchor

matplotlib.axes.Axes.set_anchor

Axes.set_anchor(*self*, *anchor*, *share=False*)

Define the anchor location.

The actual drawing area (active position) of the Axes may be smaller than the Bbox (original position) when a fixed aspect is required. The anchor defines where the drawing area will be located within the available space.

Parameters

anchor

[2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}] The anchor position may be either:

- a sequence (*cx*, *cy*). *cx* and *cy* may range from 0 to 1, where 0 is left or bottom and 1 is right or top.
- a string using cardinal directions as abbreviation:
  - 'C' for centered
  - 'S' (south) for bottom-center
  - 'SW' (south west) for bottom-left

- etc.

Here is an overview of the possible positions:

'NW'	'N'	'NE'
'W'	'C'	'E'
'SW'	'S'	'SE'

share

[bool, default: False] If `True`, apply the settings to all shared Axes.

See also:

matplotlib.axes.Axes.set_aspect

for a description of aspect handling.

Examples using `matplotlib.axes.Axes.set_anchor`

matplotlib.axes.Axes.get_axes_locator

`Axes.get_axes_locator`(*self*)

Return the axes_locator.

Examples using `matplotlib.axes.Axes.get_axes_locator`

matplotlib.axes.Axes.set_axes_locator

`Axes.set_axes_locator`(*self*, *locator*)

Set the axes locator.

Parameters

locator

[Callable[[Axes, Renderer], Bbox]]

Examples using `matplotlib.axes.Axes.set_axes_locator`

- sphx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py

matplotlib.axes.Axes.reset_position

Axes.**reset_position**(*self*)
Reset the active position to the original position.

This resets the a possible position change due to aspect constraints. For an explanation of the positions see *set_position*.

Examples using `matplotlib.axes.Axes.reset_position`

matplotlib.axes.Axes.get_position

Axes.**get_position**(*self*, *original=False*)
Get a copy of the axes rectangle as a *Bbox*.

Parameters

original

[bool] If `True`, return the original position. Otherwise return the active position. For an explanation of the positions see *set_position*.

Returns

Bbox

Examples using `matplotlib.axes.Axes.get_position`

- sphx_glr_gallery_images_contours_and_fields_contour_demo.py
- *Choosing Colormaps in Matplotlib*

matplotlib.axes.Axes.set_position

Axes.set_position(*self*, *pos*, *which='both'*)

Set the axes position.

Axes have two position attributes. The 'original' position is the position allocated for the Axes. The 'active' position is the position the Axes is actually drawn at. These positions are usually the same unless a fixed aspect is set to the Axes. See *set_aspect* for details.

Parameters

pos

[[left, bottom, width, height] or *Bbox*] The new position of the in *Figure* coordinates.

which

[{'both', 'active', 'original'}, default: 'both'] Determines which position variables to change.

Examples using matplotlib.axes.Axes.set_position

- sphx_glr_gallery_images_contours_and_fields_contour_demo.py

18.5.13 Async/Event based

Axes.stale	Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.
Axes.pchanged	Call all of the registered callbacks.
Axes.add_callback	Add a callback function that will be called whenever one of the *Artist*'s properties changes.
Axes.remove_callback	Remove a callback based on its observer id.

matplotlib.axes.Axes.stale

property Axes.stale
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

matplotlib.axes.Axes.pchanged

Axes.pchanged(*self*)
Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback

remove_callback

Examples using matplotlib.axes.Axes.pchanged

matplotlib.axes.Axes.add_callback

Axes.add_callback(*self*, *func*)
Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

Examples using `matplotlib.axes.Axes.add_callback`

matplotlib.axes.Axes.remove_callback

`Axes.remove_callback`(*self*, *oid*)

Remove a callback based on its observer id.

See also:

add_callback

Examples using `matplotlib.axes.Axes.remove_callback`

18.5.14 Interactive

Axes.can_pan	Return *True* if this axes supports any pan/zoom button functionality.
Axes.can_zoom	Return *True* if this axes supports the zoom box button functionality.
Axes.get_navigate	Get whether the axes responds to navigation commands
Axes.set_navigate	Set whether the axes responds to navigation toolbar commands
Axes.get_navigate_mode	Get the navigation toolbar button status: 'PAN', 'ZOOM', or None
Axes.set_navigate_mode	Set the navigation toolbar button status;
Axes.start_pan	Called when a pan operation has started.
Axes.drag_pan	Called when the mouse moves during a pan operation.
Axes.end_pan	Called when a pan operation completes (when the mouse button is up.)
Axes.format_coord	Return a format string formatting the *x*, *y* coordinates.
Axes.format_cursor_data	Return a string representation of *data*.
Axes.format_xdata	Return *x* formatted as an x-value.
Axes.format_ydata	Return *y* formatted as an y-value.
Axes.mouseover	If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.
Axes.in_axes	Return *True* if the given *mouseevent* (in display coords) is in the Axes
Axes.pick	Process a pick event.
Axes.pickable	Return whether the artist is pickable.

continues on next page

Table 110 – continued from previous page

Axes.get_picker	Return the picking behavior of the artist.
Axes.set_picker	Define the picking behavior of the artist.
Axes.set_contains	[*Deprecated*] Define a custom contains test for the artist.
Axes.get_contains	[*Deprecated*] Return the custom contains function of the artist if set, or *None*.
Axes.contains	Test whether the artist contains the mouse event.
Axes.contains_point	Return whether *point* (pair of pixel coordinates) is inside the axes patch.
Axes.get_cursor_data	Return the cursor data for a given event.

matplotlib.axes.Axes.can_pan

Axes.**can_pan**(*self*)
Return *True* if this axes supports any pan/zoom button functionality.

Examples using matplotlib.axes.Axes.can_pan

matplotlib.axes.Axes.can_zoom

Axes.**can_zoom**(*self*)
Return *True* if this axes supports the zoom box button functionality.

Examples using matplotlib.axes.Axes.can_zoom

matplotlib.axes.Axes.get_navigate

Axes.**get_navigate**(*self*)
Get whether the axes responds to navigation commands

Examples using matplotlib.axes.Axes.get_navigate

matplotlib.axes.Axes.set_navigate

Axes.**set_navigate**(*self*, *b*)
Set whether the axes responds to navigation toolbar commands

Parameters

b

[bool]

Examples using `matplotlib.axes.Axes.set_navigate`

matplotlib.axes.Axes.get_navigate_mode

`Axes.get_navigate_mode(`*self*`)`
Get the navigation toolbar button status: 'PAN', 'ZOOM', or None

Examples using `matplotlib.axes.Axes.get_navigate_mode`

matplotlib.axes.Axes.set_navigate_mode

`Axes.set_navigate_mode(`*self*, *b*`)`
Set the navigation toolbar button status;

> **Warning:** this is not a user-API function.

Examples using `matplotlib.axes.Axes.set_navigate_mode`

matplotlib.axes.Axes.start_pan

`Axes.start_pan(`*self*, *x*, *y*, *button*`)`
Called when a pan operation has started.

Parameters

x, y

[float] The mouse coordinates in display coords.

button

[*MouseButton*] The pressed mouse button.

Notes

This is intended to be overridden by new projection types.

Examples using `matplotlib.axes.Axes.start_pan`

matplotlib.axes.Axes.drag_pan

Axes.drag_pan(*self*, *button*, *key*, *x*, *y*)
Called when the mouse moves during a pan operation.

Parameters

button

[*MouseButton*] The pressed mouse button.

key

[str or None] The pressed key, if any.

x, y

[float] The mouse coordinates in display coords.

Notes

This is intended to be overridden by new projection types.

Examples using `matplotlib.axes.Axes.drag_pan`

matplotlib.axes.Axes.end_pan

Axes.end_pan(*self*)
Called when a pan operation completes (when the mouse button is up.)

Notes

This is intended to be overridden by new projection types.

Examples using `matplotlib.axes.Axes.end_pan`

matplotlib.axes.Axes.format_coord

`Axes.format_coord`(*self*, *x*, *y*)
Return a format string formatting the *x*, *y* coordinates.

Examples using `matplotlib.axes.Axes.format_coord`

- sphx_glr_gallery_images_contours_and_fields_image_zcoord.py

matplotlib.axes.Axes.format_cursor_data

`Axes.format_cursor_data`(*self*, *data*)
Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

Examples using `matplotlib.axes.Axes.format_cursor_data`

matplotlib.axes.Axes.format_xdata

`Axes.format_xdata`(*self*, *x*)
Return *x* formatted as an x-value.

This function will use the `fmt_xdata` attribute if it is not None, else will fall back on the xaxis major formatter.

Examples using `matplotlib.axes.Axes.format_xdata`

matplotlib.axes.Axes.format_ydata

`Axes.format_ydata`(*self*, *y*)

Return *y* formatted as an y-value.

This function will use the `fmt_ydata` attribute if it is not None, else will fall back on the yaxis major formatter.

Examples using `matplotlib.axes.Axes.format_ydata`

matplotlib.axes.Axes.mouseover

`property Axes.mouseover`

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also *get_cursor_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

matplotlib.axes.Axes.in_axes

`Axes.in_axes`(*self*, *mouseevent*)

Return *True* if the given *mouseevent* (in display coords) is in the Axes

Examples using `matplotlib.axes.Axes.in_axes`

matplotlib.axes.Axes.pick

`Axes.pick`(*self*, *mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

Examples using `matplotlib.axes.Axes.pick`

matplotlib.axes.Axes.pickable

`Axes.pickable`(*self*)
Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

Examples using `matplotlib.axes.Axes.pickable`

matplotlib.axes.Axes.get_picker

`Axes.get_picker`(*self*)
Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, *pickable*, *pick*

Examples using `matplotlib.axes.Axes.get_picker`

matplotlib.axes.Axes.set_picker

`Axes.set_picker`(*self*, *picker*)
Define the picking behavior of the artist.

Parameters

picker

[None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set_pickradius* instead.

Examples using `matplotlib.axes.Axes.set_picker`

matplotlib.axes.Axes.set_contains

`Axes.set_contains`(*self*, *picker*)

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

Parameters

picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

Examples using `matplotlib.axes.Axes.set_contains`

matplotlib.axes.Axes.get_contains

`Axes.get_contains`(*self*)

[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

See also:

set_contains

Notes

Deprecated since version 3.3.

Examples using `matplotlib.axes.Axes.get_contains`

matplotlib.axes.Axes.contains

`Axes.contains`(*self*, *mouseevent*)
Test whether the artist contains the mouse event.

Parameters

mouseevent

[*matplotlib.backend_bases.MouseEvent*]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

Examples using `matplotlib.axes.Axes.contains`

matplotlib.axes.Axes.contains_point

`Axes.contains_point`(*self*, *point*)
Return whether *point* (pair of pixel coordinates) is inside the axes patch.

Examples using `matplotlib.axes.Axes.contains_point`

matplotlib.axes.Axes.get_cursor_data

Axes.get_cursor_data(*self*, *event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*matplotlib.backend_bases.MouseEvent*]

See also:

format_cursor_data

Examples using `matplotlib.axes.Axes.get_cursor_data`

18.5.15 Children

Axes.get_children	Return a list of the child *Artist*s of this *Artist*.
Axes.get_images	Return a list of *AxesImage*s contained by the Axes.
Axes.get_lines	Return a list of lines contained by the Axes.
Axes.findobj	Find artist objects.

matplotlib.axes.Axes.get_children

Axes.get_children(*self*)
Return a list of the child *Artist*s of this *Artist*.

Examples using matplotlib.axes.Axes.get_children

matplotlib.axes.Axes.get_images

Axes.get_images(*self*)
Return a list of *AxesImage*s contained by the Axes.

Examples using matplotlib.axes.Axes.get_images

matplotlib.axes.Axes.get_lines

Axes.get_lines(*self*)
Return a list of lines contained by the Axes.

Examples using matplotlib.axes.Axes.get_lines

matplotlib.axes.Axes.findobj

Axes.findobj(*self, match=None, include_self=True*)
Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

Examples using `matplotlib.axes.Axes.findobj`

18.5.16 Drawing

Axes.draw	Draw the Artist (and its children) using the given renderer.
Axes.draw_artist	Efficiently redraw a single artist.
Axes.redraw_in_frame	Efficiently redraw Axes data, but not axis ticks, labels, etc.
Axes.get_renderer_cache	
Axes.get_rasterization_zorder	Return the zorder value below which artists will be rasterized.
Axes.set_rasterization_zorder	**Parameters**
Axes.get_window_extent	Return the axes bounding box in display space; *args* and *kwargs* are empty.
Axes.get_tightbbox	Return the tight bounding box of the axes, including axis and their decorators (xlabel, title, etc).

matplotlib.axes.Axes.draw

`Axes.draw`(*self*, *renderer=None*, *inframe=<deprecated parameter>*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

Examples using `matplotlib.axes.Axes.draw`

matplotlib.axes.Axes.draw_artist

`Axes.draw_artist`(*self*, *a*)

Efficiently redraw a single artist.

This method can only be used after an initial draw which caches the renderer.

Examples using `matplotlib.axes.Axes.draw_artist`

- *Blitting tutorial*

matplotlib.axes.Axes.redraw_in_frame

`Axes.redraw_in_frame`(*self*)

Efficiently redraw Axes data, but not axis ticks, labels, etc.

This method can only be used after an initial draw which caches the renderer.

Examples using `matplotlib.axes.Axes.redraw_in_frame`

matplotlib.axes.Axes.get_renderer_cache

`Axes.get_renderer_cache`(*self*)

Examples using `matplotlib.axes.Axes.get_renderer_cache`

matplotlib.axes.Axes.get_rasterization_zorder

`Axes.get_rasterization_zorder`(*self*)

Return the zorder value below which artists will be rasterized.

Examples using `matplotlib.axes.Axes.get_rasterization_zorder`

matplotlib.axes.Axes.set_rasterization_zorder

`Axes.set_rasterization_zorder`(*self*, *z*)

Parameters

z

[float or None] zorder below which artists are rasterized. `None` means that artists do not get rasterized based on zorder.

Examples using `matplotlib.axes.Axes.set_rasterization_zorder`

- sphx_glr_gallery_misc_rasterization_demo.py

matplotlib.axes.Axes.get_window_extent

`Axes.get_window_extent`(*self*, **args*, ***kwargs*)

Return the axes bounding box in display space; *args* and *kwargs* are empty.

This bounding box does not include the spines, ticks, ticklables, or other labels. For a bounding box including these elements use *get_tightbbox*.

See also:

matplotlib.axes.Axes.get_tightbbox

matplotlib.axis.Axis.get_tightbbox

`matplotlib.spines.get_window_extent`

Examples using `matplotlib.axes.Axes.get_window_extent`

matplotlib.axes.Axes.get_tightbbox

`Axes.get_tightbbox`(*self*, *renderer*, *call_axes_locator=True*, *bbox_extra_artists=None*, ***, *for_layout_only=False*)

Return the tight bounding box of the axes, including axis and their decorators (xlabel, title, etc).

Artists that have `artist.set_in_layout(False)` are not included in the bbox.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

bbox_extra_artists

[list of *Artist* or `None`] List of artists to include in the tight bounding box. If `None` (default), then all artist children of the axes are included in the tight bounding box.

call_axes_locator

[bool, default: True] If *call_axes_locator* is `False`, it does not call the `_axes_locator` attribute, which is necessary to get the correct bounding box. `call_axes_locator=False` can be used if the caller is only interested in the relative size of the tightbbox compared to the axes bbox.

for_layout_only

[default: False] The bounding box will *not* include the x-extent of the title and the xlabel, or the y-extent of the ylabel.

Returns

BboxBase

Bounding box in figure pixel coordinates.

See also:

matplotlib.axes.Axes.get_window_extent

matplotlib.axis.Axis.get_tightbbox

matplotlib.spines.Spine.get_window_extent

Examples using `matplotlib.axes.Axes.get_tightbbox`

18.5.17 Projection

Methods used by *Axis* that must be overridden for non-rectilinear Axes.

Axes.name	
Axes.get_xaxis_transform	Get the transformation used for drawing x-axis labels, ticks and gridlines.
Axes.get_yaxis_transform	Get the transformation used for drawing y-axis labels, ticks and gridlines.
Axes.get_data_ratio	Return the aspect ratio of the scaled data.
Axes.get_data_ratio_log	[*Deprecated*] Return the aspect ratio of the raw data in log scale.
Axes.get_xaxis_text1_transform	**Returns**
Axes.get_xaxis_text2_transform	**Returns**

continues on next page

Table 113 – continued from previous page

Axes.get_yaxis_text1_transform	**Returns**
Axes.get_yaxis_text2_transform	**Returns**

matplotlib.axes.Axes.name

```
Axes.name = 'rectilinear'
```

matplotlib.axes.Axes.get_xaxis_transform

Axes.**get_xaxis_transform**(*self*, *which='grid'*)

Get the transformation used for drawing x-axis labels, ticks and gridlines. The x-direction is in data coordinates and the y-direction is in axis coordinates.

Note: This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Examples using `matplotlib.axes.Axes.get_xaxis_transform`

- sphx_glr_gallery_lines_bars_and_markers_fill_between_demo.py
- sphx_glr_gallery_lines_bars_and_markers_vline_hline_demo.py
- sphx_glr_gallery_statistics_boxplot_demo.py
- sphx_glr_gallery_recipes_centered_spines_with_arrows.py
- *Transformations Tutorial*

matplotlib.axes.Axes.get_yaxis_transform

Axes.**get_yaxis_transform**(*self*, *which='grid'*)

Get the transformation used for drawing y-axis labels, ticks and gridlines. The x-direction is in axis coordinates and the y-direction is in data coordinates.

Note: This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements

in different locations.

Examples using `matplotlib.axes.Axes.get_yaxis_transform`

- sphx_glr_gallery_recipes_centered_spines_with_arrows.py
- sphx_glr_gallery_userdemo_connect_simple01.py
- *Transformations Tutorial*

matplotlib.axes.Axes.get_data_ratio

`Axes.get_data_ratio`(*self*)

Return the aspect ratio of the scaled data.

Notes

This method is intended to be overridden by new projection types.

Examples using `matplotlib.axes.Axes.get_data_ratio`

matplotlib.axes.Axes.get_data_ratio_log

`Axes.get_data_ratio_log`(*self*)

[*Deprecated*] Return the aspect ratio of the raw data in log scale.

Notes

Will be used when both axis are in log scale.

Deprecated since version 3.2.

Examples using `matplotlib.axes.Axes.get_data_ratio_log`

matplotlib.axes.Axes.get_xaxis_text1_transform

`Axes.get_xaxis_text1_transform`(*self*, *pad_points*)

Returns

transform

[Transform] The transform used for drawing x-axis labels, which will add *pad_points* of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis corrdinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Examples using `matplotlib.axes.Axes.get_xaxis_text1_transform`

matplotlib.axes.Axes.get_xaxis_text2_transform

`Axes.get_xaxis_text2_transform`(*self*, *pad_points*)

Returns

transform

[Transform] The transform used for drawing secondary x-axis labels, which will add *pad_points* of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis corrdinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Examples using `matplotlib.axes.Axes.get_xaxis_text2_transform`

matplotlib.axes.Axes.get_yaxis_text1_transform

`Axes.get_yaxis_text1_transform`(*self*, *pad_points*)

Returns

transform

[Transform] The transform used for drawing y-axis labels, which will add *pad_points* of padding (in points) between the axes and the label. The x-direction is in axis coordinates and the y-direction is in data corrdinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Examples using `matplotlib.axes.Axes.get_yaxis_text1_transform`

matplotlib.axes.Axes.get_yaxis_text2_transform

`Axes.get_yaxis_text2_transform`(*self*, *pad_points*)

Returns

transform

[Transform] The transform used for drawing secondart y-axis labels, which will add *pad_points* of padding (in points) between

the axes and the label. The x-direction is in axis coordinates and the y-direction is in data corrdinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Examples using `matplotlib.axes.Axes.get_yaxis_text2_transform`

18.5.18 Other

Axes.zorder	
Axes.get_default_bbox_extra_artists	Return a default list of artists that are used for the bounding box calculation.
Axes.get_transformed_clip_path_and_affine	Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.
Axes.has_data	Return *True* if any artists have been added to axes.

matplotlib.axes.Axes.zorder

```
Axes.zorder = 0
```

matplotlib.axes.Axes.get_default_bbox_extra_artists

Axes.get_default_bbox_extra_artists(*self*)
Return a default list of artists that are used for the bounding box calculation.

Artists are excluded either by not being visible or `artist.set_in_layout(False)`.

Examples using `matplotlib.axes.Axes.get_default_bbox_extra_artists`

matplotlib.axes.Axes.get_transformed_clip_path_and_affine

Axes.get_transformed_clip_path_and_affine(*self*)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

Examples using `matplotlib.axes.Axes.get_transformed_clip_path_and_affine`

matplotlib.axes.Axes.has_data

Axes.has_data(*self*)
Return *True* if any artists have been added to axes.

This should not be used to determine whether the *dataLim* need to be updated, and may not actually be useful for anything.

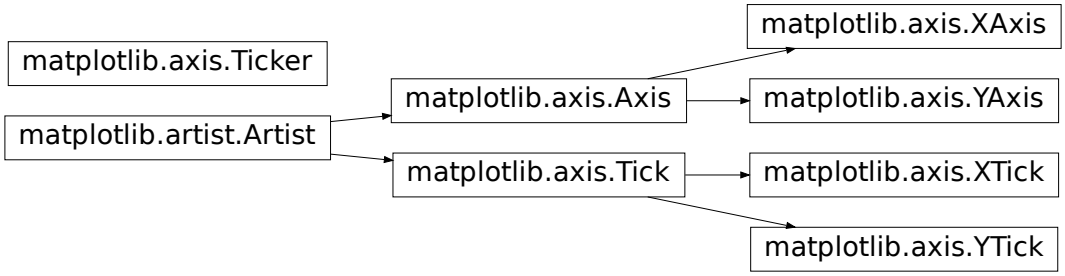
Examples using `matplotlib.axes.Axes.has_data`

18.6 matplotlib.axis

Table of Contents

Classes for the ticks and x and y axis.

18.6.1 Inheritance



18.6.2 `Axis` objects

`class matplotlib.axis.Axis(`*axes, pickradius=15*`)`

Base class for *XAxis* and *YAxis*.

Attributes

isDefault_label

[bool]

axes

[*matplotlib.axes.Axes*] The *Axes* instance the artist resides in, or *None*.

major

[*matplotlib.axis.Ticker*] Determines the major tick positions and their label format.

minor

[*matplotlib.axis.Ticker*] Determines the minor tick positions and their label format.

callbacks

[*matplotlib.cbook.CallbackRegistry*]

label

[*Text*] The axis label.

labelpad

[float] The distance between the axis label and the tick labels. Defaults to `rcParams["axes.labelpad"]` (default: `4.0`) = 4.

offsetText

[*Text*] A *Text* object containing the data offset of the ticks (if any).

pickradius

[float] The acceptance radius for containment tests. See also *Axis.contains*.

majorTicks

[list of *Tick*] The major ticks.

minorTicks

[list of *Tick*] The minor ticks.

Parameters

axes

[*matplotlib.axes.Axes*] The *Axes* to which the created Axis belongs.

pickradius

[float] The acceptance radius for containment tests. See also *Axis.contains*.

`class matplotlib.axis.XAxis(*args, **kwargs)`

Parameters

axes

[*matplotlib.axes.Axes*] The *Axes* to which the created Axis belongs.

pickradius

[float] The acceptance radius for containment tests. See also *Axis.contains*.

class matplotlib.axis.YAxis(*args, **kwargs)

Parameters

axes

[*matplotlib.axes.Axes*] The *Axes* to which the created Axis belongs.

pickradius

[float] The acceptance radius for containment tests. See also *Axis.contains*.

class matplotlib.axis.Ticker

A container for the objects defining tick position and format.

Attributes

locator

[*matplotlib.ticker.Locator* subclass] Determines the positions of the ticks.

formatter

[*matplotlib.ticker.Formatter* subclass] Determines the format of the tick labels.

Axis.cla	Clear this axis.
Axis.get_scale	Return this Axis' scale (as a str).

matplotlib.axis.Axis.cla

Axis.cla(*self*)

Clear this axis.

Examples using `matplotlib.axis.Axis.cla`

matplotlib.axis.Axis.get_scale

Axis.get_scale(*self*)
Return this Axis' scale (as a str).

Examples using `matplotlib.axis.Axis.get_scale`

Formatters and Locators

Axis.get_major_formatter	Get the formatter of the major ticker.
Axis.get_major_locator	Get the locator of the major ticker.
Axis.get_minor_formatter	Get the formatter of the minor ticker.
Axis.get_minor_locator	Get the locator of the minor ticker.
Axis.set_major_formatter	Set the formatter of the major ticker.
Axis.set_major_locator	Set the locator of the major ticker.
Axis.set_minor_formatter	Set the formatter of the minor ticker.
Axis.set_minor_locator	Set the locator of the minor ticker.
Axis.remove_overlapping_locs	If minor ticker locations that overlap with major ticker locations should be trimmed.
Axis.get_remove_overlapping_locs	
Axis.set_remove_overlapping_locs	

matplotlib.axis.Axis.get_major_formatter

Axis.get_major_formatter(*self*)
Get the formatter of the major ticker.

Examples using `matplotlib.axis.Axis.get_major_formatter`

matplotlib.axis.Axis.get_major_locator

Axis.get_major_locator(*self*)
Get the locator of the major ticker.

Examples using `matplotlib.axis.Axis.get_major_locator`

- sphx_glr_gallery_axes_grid1_inset_locator_demo2.py

matplotlib.axis.Axis.get_minor_formatter

`Axis.get_minor_formatter`(*self*)
Get the formatter of the minor ticker.

Examples using `matplotlib.axis.Axis.get_minor_formatter`

matplotlib.axis.Axis.get_minor_locator

`Axis.get_minor_locator`(*self*)
Get the locator of the minor ticker.

Examples using `matplotlib.axis.Axis.get_minor_locator`

matplotlib.axis.Axis.set_major_formatter

`Axis.set_major_formatter`(*self*, *formatter*)
Set the formatter of the major ticker.

In addition to a *Formatter* instance, this also accepts a `str` or function.

For a `str` a *StrMethodFormatter* is used. The field used for the value must be labeled `'x'` and the field used for the position must be labeled `'pos'`. See the *StrMethodFormatter* documentation for more information.

For a function, a *FuncFormatter* is used. The function must take two inputs (a tick value `x` and a position `pos`), and return a string containing the corresponding tick label. See the *FuncFormatter* documentation for more information.

Parameters

formatter

[*Formatter*, `str`, or function]

Examples using `matplotlib.axis.Axis.set_major_formatter`

- sphx_glr_gallery_lines_bars_and_markers_timeline.py
- sphx_glr_gallery_text_labels_and_annotations_date.py
- sphx_glr_gallery_text_labels_and_annotations_date_index_formatter.py

- sphx_glr_gallery_ticks_and_spines_tick_labels_from_values.py
- *The Lifecycle of a Plot*
- *Artist tutorial*
- *Choosing Colormaps in Matplotlib*
- *Text in Matplotlib Plots*

matplotlib.axis.Axis.set_major_locator

`Axis.set_major_locator`(*self*, *locator*)

Set the locator of the major ticker.

Parameters

locator

[*Locator*]

Examples using `matplotlib.axis.Axis.set_major_locator`

- sphx_glr_gallery_lines_bars_and_markers_filled_step.py
- sphx_glr_gallery_lines_bars_and_markers_timeline.py
- sphx_glr_gallery_text_labels_and_annotations_date.py
- sphx_glr_gallery_showcase_anatomy.py
- sphx_glr_gallery_mplot3d_surface3d.py
- sphx_glr_gallery_mplot3d_surface3d_3.py
- sphx_glr_gallery_scales_scales.py
- sphx_glr_gallery_specialty_plots_mri_with_eeg.py
- sphx_glr_gallery_specialty_plots_skewt.py
- sphx_glr_gallery_ticks_and_spines_centered_ticklabels.py
- sphx_glr_gallery_ticks_and_spines_date_concise_formatter.py
- sphx_glr_gallery_ticks_and_spines_date_demo_convert.py
- sphx_glr_gallery_ticks_and_spines_date_demo_rrule.py
- sphx_glr_gallery_ticks_and_spines_major_minor_demo.py
- sphx_glr_gallery_ticks_and_spines_tick-formatters.py
- sphx_glr_gallery_ticks_and_spines_tick_labels_from_values.py
- *Choosing Colormaps in Matplotlib*
- *Text in Matplotlib Plots*

matplotlib.axis.Axis.set_minor_formatter

`Axis.set_minor_formatter`(*self*, *formatter*)

Set the formatter of the minor ticker.

In addition to a *Formatter* instance, this also accepts a `str` or function. See *Axis.set_major_formatter* for more information.

Parameters

formatter

[*Formatter*, `str`, or function]

Examples using `matplotlib.axis.Axis.set_minor_formatter`

- sphx_glr_gallery_showcase_anatomy.py
- sphx_glr_gallery_scales_scales.py
- sphx_glr_gallery_specialty_plots_skewt.py
- sphx_glr_gallery_ticks_and_spines_centered_ticklabels.py

matplotlib.axis.Axis.set_minor_locator

`Axis.set_minor_locator`(*self*, *locator*)

Set the locator of the minor ticker.

Parameters

locator

[*Locator*]

Examples using `matplotlib.axis.Axis.set_minor_locator`

- sphx_glr_gallery_subplots_axes_and_figures_secondary_axis.py
- sphx_glr_gallery_text_labels_and_annotations_date.py
- sphx_glr_gallery_showcase_anatomy.py
- sphx_glr_gallery_ticks_and_spines_centered_ticklabels.py
- sphx_glr_gallery_ticks_and_spines_date_demo_convert.py
- sphx_glr_gallery_ticks_and_spines_major_minor_demo.py
- sphx_glr_gallery_ticks_and_spines_tick-formatters.py

matplotlib.axis.Axis.remove_overlapping_locs

`property Axis.remove_overlapping_locs`

If minor ticker locations that overlap with major ticker locations should be trimmed.

matplotlib.axis.Axis.get_remove_overlapping_locs

Axis.get_remove_overlapping_locs(*self*)

Examples using matplotlib.axis.Axis.get_remove_overlapping_locs

matplotlib.axis.Axis.set_remove_overlapping_locs

Axis.set_remove_overlapping_locs(*self*, *val*)

Examples using matplotlib.axis.Axis.set_remove_overlapping_locs

Axis Label

Axis.set_label_coords	Set the coordinates of the label.
Axis.set_label_position	Set the label position (top or bottom)
Axis.set_label_text	Set the text value of the axis label.
Axis.get_label_position	Return the label position (top or bottom)
Axis.get_label_text	Get the text of the label.

matplotlib.axis.Axis.set_label_coords

Axis.set_label_coords(*self*, *x*, *y*, *transform=None*)

Set the coordinates of the label.

By default, the x coordinate of the y label and the y coordinate of the x label are determined by the tick label bounding boxes, but this can lead to poor alignment of multiple labels if there are multiple axes.

You can also specify the coordinate system of the label with the transform. If None, the default coordinate system will be the axes coordinate system: (0, 0) is bottom left, (0.5, 0.5) is center, etc.

Examples using matplotlib.axis.Axis.set_label_coords

- sphx_glr_gallery_pyplots_align_ylabels.py

matplotlib.axis.Axis.set_label_position

Axis.set_label_position(*self*, *position*)
Set the label position (top or bottom)

Parameters

position

[{'top', 'bottom'}]

Examples using matplotlib.axis.Axis.set_label_position

- sphx_glr_gallery_text_labels_and_annotations_titles_demo.py

matplotlib.axis.Axis.set_label_text

Axis.set_label_text(*self*, *label*, *fontdict=None*, ***kwargs*)
Set the text value of the axis label.

Parameters

label

[str] Text string.

fontdict

[dict] Text properties.

****kwargs**

Merged into fontdict.

Examples using matplotlib.axis.Axis.set_label_text

matplotlib.axis.Axis.get_label_position

Axis.get_label_position(*self*)
Return the label position (top or bottom)

Examples using `matplotlib.axis.Axis.get_label_position`

matplotlib.axis.Axis.get_label_text

Axis.**get_label_text**(*self*)
Get the text of the label.

Examples using `matplotlib.axis.Axis.get_label_text`

Ticks, tick labels and Offset text

Axis.get_major_ticks	Return the list of major *Tick*s.
Axis.get_majorticklabels	Return this Axis' major tick labels, as a list of *Text*.
Axis.get_majorticklines	Return this Axis' major tick lines as a list of *Line2D*s.
Axis.get_majorticklocs	Return this Axis' major tick locations in data coordinates.
Axis.get_minor_ticks	Return the list of minor *Tick*s.
Axis.get_minorticklabels	Return this Axis' minor tick labels, as a list of *Text*.
Axis.get_minorticklines	Return this Axis' minor tick lines as a list of *Line2D*s.
Axis.get_minorticklocs	Return this Axis' minor tick locations in data coordinates.
Axis.get_offset_text	Return the axis offsetText as a Text instance.
Axis.get_tick_padding	
Axis.get_ticklabels	Get this Axis' tick labels.
Axis.get_ticklines	Return this Axis' tick lines as a list of *Line2D*s.
Axis.get_ticklocs	Return this Axis' tick locations in data coordinates.
Axis.get_gridlines	Return this Axis' grid lines as a list of *Line2D*s.
Axis.grid	Configure the grid lines.
Axis.set_tick_params	Set appearance parameters for ticks, ticklabels, and gridlines.
Axis.axis_date	Sets up axis ticks and labels to treat data along this Axis as dates.

matplotlib.axis.Axis.get_major_ticks

Axis.get_major_ticks(*self*, *numticks=None*)
Return the list of major *Tick*s.

Examples using matplotlib.axis.Axis.get_major_ticks

- sphx_glr_gallery_pyplots_dollar_ticks.py
- *Artist tutorial*

matplotlib.axis.Axis.get_majorticklabels

Axis.get_majorticklabels(*self*)
Return this Axis' major tick labels, as a list of *Text*.

Examples using matplotlib.axis.Axis.get_majorticklabels

- sphx_glr_gallery_ticks_and_spines_date_precision_and_epochs.py

matplotlib.axis.Axis.get_majorticklines

Axis.get_majorticklines(*self*)
Return this Axis' major tick lines as a list of *Line2D*s.

Examples using matplotlib.axis.Axis.get_majorticklines

matplotlib.axis.Axis.get_majorticklocs

Axis.get_majorticklocs(*self*)
Return this Axis' major tick locations in data coordinates.

Examples using matplotlib.axis.Axis.get_majorticklocs

matplotlib.axis.Axis.get_minor_ticks

Axis.get_minor_ticks(*self*, *numticks=None*)
Return the list of minor *Tick*s.

Examples using `matplotlib.axis.Axis.get_minor_ticks`

- sphx_glr_gallery_ticks_and_spines_centered_ticklabels.py

matplotlib.axis.Axis.get_minorticklabels

`Axis.get_minorticklabels(`*self*`)`
Return this Axis' minor tick labels, as a list of *Text*.

Examples using `matplotlib.axis.Axis.get_minorticklabels`

matplotlib.axis.Axis.get_minorticklines

`Axis.get_minorticklines(`*self*`)`
Return this Axis' minor tick lines as a list of *Line2D*s.

Examples using `matplotlib.axis.Axis.get_minorticklines`

matplotlib.axis.Axis.get_minorticklocs

`Axis.get_minorticklocs(`*self*`)`
Return this Axis' minor tick locations in data coordinates.

Examples using `matplotlib.axis.Axis.get_minorticklocs`

matplotlib.axis.Axis.get_offset_text

`Axis.get_offset_text(`*self*`)`
Return the axis offsetText as a Text instance.

Examples using `matplotlib.axis.Axis.get_offset_text`

matplotlib.axis.Axis.get_tick_padding

`Axis.get_tick_padding(`*self*`)`

Examples using `matplotlib.axis.Axis.get_tick_padding`

matplotlib.axis.Axis.get_ticklabels

`Axis.get_ticklabels`(*self*, *minor=False*, *which=None*)
Get this Axis' tick labels.

Parameters

minor

[bool] Whether to return the minor or the major ticklabels.

which

[None, ('minor', 'major', 'both')] Overrides *minor*.

Selects which ticklabels to return

Returns

list of *Text*

Notes

The tick label strings are not populated until a `draw` method has been called.

See also: *draw* and *draw*.

Examples using `matplotlib.axis.Axis.get_ticklabels`

- sphx_glr_gallery_images_contours_and_fields_image_masked.py
- sphx_glr_gallery_pyplots_fig_axes_customize_simple.py
- *Artist tutorial*

matplotlib.axis.Axis.get_ticklines

`Axis.get_ticklines`(*self*, *minor=False*)
Return this Axis' tick lines as a list of *Line2D*s.

Examples using `matplotlib.axis.Axis.get_ticklines`

- sphx_glr_gallery_pyplots_fig_axes_customize_simple.py
- *Artist tutorial*

matplotlib.axis.Axis.get_ticklocs

`Axis.get_ticklocs`(*self*, *, *minor=False*)
Return this Axis' tick locations in data coordinates.

Examples using `matplotlib.axis.Axis.get_ticklocs`

- *Artist tutorial*

matplotlib.axis.Axis.get_gridlines

`Axis.get_gridlines`(*self*)
Return this Axis' grid lines as a list of *Line2D*s.

Examples using `matplotlib.axis.Axis.get_gridlines`

matplotlib.axis.Axis.grid

`Axis.grid`(*self*, *b=None*, *which='major'*, ***kwargs*)
Configure the grid lines.

Parameters

b

[bool or None] Whether to show the grid lines. If any *kwargs* are supplied, it is assumed you want the grid on and *b* will be set to True.

If *b* is *None* and there are no *kwargs*, this toggles the visibility of the lines.

which

[{'major', 'minor', 'both'}] The grid lines to apply the changes on.

****kwargs**

[*Line2D* properties] Define the line properties of the grid, e.g.:

```
grid(color='r', linestyle='-', linewidth=2)
```

Examples using `matplotlib.axis.Axis.grid`

- sphx_glr_gallery_statistics_boxplot_color.py
- sphx_glr_gallery_statistics_boxplot_demo.py
- sphx_glr_gallery_statistics_boxplot_vs_violin.py

matplotlib.axis.Axis.set_tick_params

Axis.**set_tick_params**(*self*, *which='major'*, *reset=False*, ***kw*)
Set appearance parameters for ticks, ticklabels, and gridlines.

For documentation of keyword arguments, see *matplotlib.axes.Axes.tick_params()*.

Examples using `matplotlib.axis.Axis.set_tick_params`

- sphx_glr_gallery_pyplots_dollar_ticks.py
- sphx_glr_gallery_axes_grid1_scatter_hist_locatable_axes.py
- sphx_glr_gallery_misc_pythonic_matplotlib.py
- sphx_glr_gallery_ticks_and_spines_date_demo_rrule.py
- *Choosing Colormaps in Matplotlib*

matplotlib.axis.Axis.axis_date

Axis.**axis_date**(*self*, *tz=None*)
Sets up axis ticks and labels to treat data along this Axis as dates.

Parameters

tz

[str or `datetime.tzinfo`, default: `rcParams["timezone"]` (default: `'UTC'`)] The timezone used to create date labels.

Examples using `matplotlib.axis.Axis.axis_date`

Data and view intervals

Axis.get_data_interval	Return the Interval instance for this axis data limits.
Axis.get_view_interval	Return the view limits `(min, max)` of this axis.
Axis.set_data_interval	Set the axis data limits.
Axis.set_view_interval	Set the axis view limits.

matplotlib.axis.Axis.get_data_interval

`Axis.get_data_interval`(*self*)
Return the Interval instance for this axis data limits.

Examples using `matplotlib.axis.Axis.get_data_interval`

matplotlib.axis.Axis.get_view_interval

`Axis.get_view_interval`(*self*)
Return the view limits `(min, max)` of this axis.

Examples using `matplotlib.axis.Axis.get_view_interval`

matplotlib.axis.Axis.set_data_interval

`Axis.set_data_interval`(*self*, *vmin*, *vmax*, *ignore=False*)
Set the axis data limits. This method is for internal use.

If *ignore* is False (the default), this method will never reduce the preexisting data limits, only expand them if *vmin* or *vmax* are not within them. Moreover, the order of *vmin* and *vmax* does not matter; the orientation of the axis will not change.

If *ignore* is True, the data limits will be set exactly to `(vmin, vmax)` in that order.

Examples using `matplotlib.axis.Axis.set_data_interval`

matplotlib.axis.Axis.set_view_interval

Axis.**set_view_interval**(*self*, *vmin*, *vmax*, *ignore=False*)

Set the axis view limits. This method is for internal use; Matplotlib users should typically use e.g. *set_xlim* or *set_ylim*.

If *ignore* is False (the default), this method will never reduce the preexisting view limits, only expand them if *vmin* or *vmax* are not within them. Moreover, the order of *vmin* and *vmax* does not matter; the orientation of the axis will not change.

If *ignore* is True, the view limits will be set exactly to `(vmin, vmax)` in that order.

Examples using `matplotlib.axis.Axis.set_view_interval`

Rendering helpers

Axis.get_minpos	
Axis.get_tick_space	Return the estimated number of ticks that can fit on the axis.
Axis.get_ticklabel_extents	Get the extents of the tick labels on either side of the axes.
Axis.get_tightbbox	Return a bounding box that encloses the axis.

matplotlib.axis.Axis.get_minpos

Axis.**get_minpos**(*self*)

Examples using `matplotlib.axis.Axis.get_minpos`

matplotlib.axis.Axis.get_tick_space

Axis.**get_tick_space**(*self*)

Return the estimated number of ticks that can fit on the axis.

Examples using `matplotlib.axis.Axis.get_tick_space`

matplotlib.axis.Axis.get_ticklabel_extents

`Axis.get_ticklabel_extents`(*self*, *renderer*)
Get the extents of the tick labels on either side of the axes.

Examples using `matplotlib.axis.Axis.get_ticklabel_extents`

matplotlib.axis.Axis.get_tightbbox

`Axis.get_tightbbox`(*self*, *renderer*, *, *for_layout_only=False*)
Return a bounding box that encloses the axis. It only accounts tick labels, axis label, and offsetText.

If *for_layout_only* is True, then the width of the label (if this is an x-axis) or the height of the label (if this is a y-axis) is collapsed to near zero. This allows tight/constrained_layout to ignore too-long labels when doing their layout.

Examples using `matplotlib.axis.Axis.get_tightbbox`

Interactive

Axis.contains	Test whether the artist contains the mouse event.
Axis.get_pickradius	Return the depth of the axis used by the picker.
Axis.set_pickradius	Set the depth of the axis used by the picker.

matplotlib.axis.Axis.contains

`Axis.contains`(*self*, *mouseevent*)
Test whether the artist contains the mouse event.

Parameters

mouseevent

[*matplotlib.backend_bases.MouseEvent*]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

Examples using `matplotlib.axis.Axis.contains`

matplotlib.axis.Axis.get_pickradius

`Axis.get_pickradius`(*self*)
Return the depth of the axis used by the picker.

Examples using `matplotlib.axis.Axis.get_pickradius`

matplotlib.axis.Axis.set_pickradius

`Axis.set_pickradius`(*self*, *pickradius*)
Set the depth of the axis used by the picker.

Parameters

pickradius

[float]

Examples using `matplotlib.axis.Axis.set_pickradius`

Units

Axis.convert_units	
Axis.set_units	Set the units for axis.
Axis.get_units	Return the units for axis.
Axis.update_units	Introspect *data* for units converter and update the axis.converter instance if necessary.

matplotlib.axis.Axis.convert_units

Axis.convert_units(*self*, *x*)

Examples using matplotlib.axis.Axis.convert_units

matplotlib.axis.Axis.set_units

Axis.set_units(*self*, *u*)

Set the units for axis.

Parameters

u

[units tag]

Examples using matplotlib.axis.Axis.set_units

- sphx_glr_gallery_units_artist_tests.py
- sphx_glr_gallery_units_bar_unit_demo.py
- sphx_glr_gallery_units_units_scatter.py

matplotlib.axis.Axis.get_units

Axis.get_units(*self*)

Return the units for axis.

Examples using matplotlib.axis.Axis.get_units

matplotlib.axis.Axis.update_units

Axis.update_units(*self*, *data*)

Introspect *data* for units converter and update the axis.converter instance if necessary. Return *True* if *data* is registered for unit conversion.

Examples using `matplotlib.axis.Axis.update_units`

Incremental navigation

Axis.pan	[*Deprecated*] Pan by *numsteps* (can be positive or negative).
Axis.zoom	[*Deprecated*] Zoom in/out on axis; if *direction* is >0 zoom in, else zoom out.

matplotlib.axis.Axis.pan

Axis.**pan**(*self*, *numsteps*)

[*Deprecated*] Pan by *numsteps* (can be positive or negative).

Notes

Deprecated since version 3.3.

Examples using `matplotlib.axis.Axis.pan`

matplotlib.axis.Axis.zoom

Axis.**zoom**(*self*, *direction*)

[*Deprecated*] Zoom in/out on axis; if *direction* is >0 zoom in, else zoom out.

Notes

Deprecated since version 3.3.

Examples using `matplotlib.axis.Axis.zoom`

XAxis Specific

XAxis.axis_name	Read-only name identifying the axis.
XAxis.get_text_heights	Return how much space should be reserved for text above and below the axes, as a pair of floats.

continues on next page

Table 124 – continued from previous page

XAxis.get_ticks_position	Return the ticks position ("top", "bottom", "default", or "unknown").
XAxis.set_ticks_position	Set the ticks position.
XAxis.tick_bottom	Move ticks and ticklabels (if present) to the bottom of the axes.
XAxis.tick_top	Move ticks and ticklabels (if present) to the top of the axes.

matplotlib.axis.XAxis.axis_name

XAxis.**axis_name** = 'x'
Read-only name identifying the axis.

matplotlib.axis.XAxis.get_text_heights

XAxis.**get_text_heights**(*self*, *renderer*)
Return how much space should be reserved for text above and below the axes, as a pair of floats.

Examples using matplotlib.axis.XAxis.get_text_heights

matplotlib.axis.XAxis.get_ticks_position

XAxis.**get_ticks_position**(*self*)
Return the ticks position ("top", "bottom", "default", or "unknown").

Examples using matplotlib.axis.XAxis.get_ticks_position

matplotlib.axis.XAxis.set_ticks_position

XAxis.**set_ticks_position**(*self*, *position*)
Set the ticks position.

Parameters

position

[{'top', 'bottom', 'both', 'default', 'none'}] 'both' sets the ticks to appear on both positions, but does not change the tick labels. 'default' resets the tick positions to the default: ticks on both positions, labels at bottom. 'none' can be used if you don't want any ticks. 'none' and 'both' affect only the ticks, not the labels.

Examples using `matplotlib.axis.XAxis.set_ticks_position`

- sphx_glr_gallery_statistics_customized_violin.py
- sphx_glr_gallery_pyplots_whats_new_99_spines.py
- sphx_glr_gallery_axes_grid1_demo_colorbar_with_axes_divider.py
- sphx_glr_gallery_axes_grid1_demo_colorbar_with_inset_locator.py
- sphx_glr_gallery_showcase_integral.py
- sphx_glr_gallery_showcase_xkcd.py
- sphx_glr_gallery_ticks_and_spines_spine_placement_demo.py
- sphx_glr_gallery_ticks_and_spines_spines.py
- sphx_glr_gallery_ticks_and_spines_spines_bounds.py
- sphx_glr_gallery_ticks_and_spines_spines_dropped.py
- sphx_glr_gallery_ticks_and_spines_tick-formatters.py
- *Choosing Colormaps in Matplotlib*

matplotlib.axis.XAxis.tick_bottom

`XAxis.tick_bottom(`*self*`)`
Move ticks and ticklabels (if present) to the bottom of the axes.

Examples using `matplotlib.axis.XAxis.tick_bottom`

- sphx_glr_gallery_subplots_axes_and_figures_broken_axis.py
- sphx_glr_gallery_showcase_bachelors_degrees_by_gender.py

matplotlib.axis.XAxis.tick_top

`XAxis.tick_top(`*self*`)`
Move ticks and ticklabels (if present) to the top of the axes.

Examples using `matplotlib.axis.XAxis.tick_top`

- sphx_glr_gallery_subplots_axes_and_figures_broken_axis.py
- sphx_glr_gallery_text_labels_and_annotations_titles_demo.py

YAxis Specific

YAxis.axis_name	Read-only name identifying the axis.
YAxis.get_text_widths	
YAxis.get_ticks_position	Return the ticks position ("left", "right", "default", or "unknown").
YAxis.set_offset_position	**Parameters**
YAxis.set_ticks_position	Set the ticks position.
YAxis.tick_left	Move ticks and ticklabels (if present) to the left of the axes.
YAxis.tick_right	Move ticks and ticklabels (if present) to the right of the axes.

matplotlib.axis.YAxis.axis_name

YAxis.**axis_name** = 'y'
Read-only name identifying the axis.

matplotlib.axis.YAxis.get_text_widths

YAxis.**get_text_widths**(*self*, *renderer*)

Examples using `matplotlib.axis.YAxis.get_text_widths`

matplotlib.axis.YAxis.get_ticks_position

YAxis.**get_ticks_position**(*self*)
Return the ticks position ("left", "right", "default", or "unknown").

Examples using `matplotlib.axis.YAxis.get_ticks_position`

matplotlib.axis.YAxis.set_offset_position

`YAxis.set_offset_position(`*self*, *position*`)`

Parameters

position

[{'left', 'right'}]

Examples using `matplotlib.axis.YAxis.set_offset_position`

matplotlib.axis.YAxis.set_ticks_position

`YAxis.set_ticks_position(`*self*, *position*`)`

Set the ticks position.

Parameters

position

[{'left', 'right', 'both', 'default', 'none'}] 'both' sets the ticks to appear on both positions, but does not change the tick labels. 'default' resets the tick positions to the default: ticks on both positions, labels at left. 'none' can be used if you don't want any ticks. 'none' and 'both' affect only the ticks, not the labels.

Examples using `matplotlib.axis.YAxis.set_ticks_position`

- sphx_glr_gallery_pyplots_whats_new_99_spines.py
- sphx_glr_gallery_ticks_and_spines_spine_placement_demo.py
- sphx_glr_gallery_ticks_and_spines_spines.py
- sphx_glr_gallery_ticks_and_spines_spines_bounds.py
- sphx_glr_gallery_ticks_and_spines_spines_dropped.py
- sphx_glr_gallery_ticks_and_spines_tick-formatters.py

matplotlib.axis.YAxis.tick_left

YAxis.**tick_left**(*self*)
Move ticks and ticklabels (if present) to the left of the axes.

Examples using matplotlib.axis.YAxis.tick_left

- sphx_glr_gallery_showcase_bachelors_degrees_by_gender.py
- sphx_glr_gallery_ticks_and_spines_tick_label_right.py

matplotlib.axis.YAxis.tick_right

YAxis.**tick_right**(*self*)
Move ticks and ticklabels (if present) to the right of the axes.

Examples using matplotlib.axis.YAxis.tick_right

Other

Axis.OFFSETTEXTPAD	
Axis.axes	The *Axes* instance the artist resides in, or *None*.
Axis.limit_range_for_scale	
Axis.reset_ticks	Re-initialize the major and minor Tick lists.
Axis.set_default_intervals	Set the default limits for the axis data and view interval if they have not been not mutated yet.
Axis.get_smart_bounds	[*Deprecated*] Return whether the axis has smart bounds.
Axis.set_smart_bounds	[*Deprecated*] Set the axis to have smart bounds.

matplotlib.axis.Axis.OFFSETTEXTPAD

```
Axis.OFFSETTEXTPAD = 3
```

matplotlib.axis.Axis.axes

```
property Axis.axes
```
The *Axes* instance the artist resides in, or *None*.

matplotlib.axis.Axis.limit_range_for_scale

```
Axis.limit_range_for_scale(self, vmin, vmax)
```

Examples using matplotlib.axis.Axis.limit_range_for_scale

matplotlib.axis.Axis.reset_ticks

```
Axis.reset_ticks(self)
```
Re-initialize the major and minor Tick lists.

Each list starts with a single fresh Tick.

Examples using matplotlib.axis.Axis.reset_ticks

matplotlib.axis.Axis.set_default_intervals

```
Axis.set_default_intervals(self)
```
Set the default limits for the axis data and view interval if they have not been not mutated yet.

Examples using matplotlib.axis.Axis.set_default_intervals

matplotlib.axis.Axis.get_smart_bounds

```
Axis.get_smart_bounds(self)
```
[*Deprecated*] Return whether the axis has smart bounds.

Notes

Deprecated since version 3.2.

Examples using `matplotlib.axis.Axis.get_smart_bounds`

matplotlib.axis.Axis.set_smart_bounds

`Axis.set_smart_bounds`(*self*, *value*)
[*Deprecated*] Set the axis to have smart bounds.

Notes

Deprecated since version 3.2.

Examples using `matplotlib.axis.Axis.set_smart_bounds`

Discouraged

These methods should be used together with care, calling `set_ticks` to specify the desired tick locations **before** calling `set_ticklabels` to specify a matching series of labels. Calling `set_ticks` makes a *FixedLocator*; it's list of locations is then used by `set_ticklabels` to make an appropriate *FuncFormatter*.

Axis.set_ticks	Set this Axis' tick locations.
Axis.set_ticklabels	Set the text values of the tick labels.

matplotlib.axis.Axis.set_ticks

`Axis.set_ticks`(*self*, *ticks*, *, *minor=False*)
Set this Axis' tick locations.

Parameters

ticks

[list of floats] List of tick locations.

minor

[bool, default: False] If `False`, set the major ticks; if `True`, the minor ticks.

Examples using `matplotlib.axis.Axis.set_ticks`

- sphx_glr_gallery_pyplots_whats_new_99_spines.py
- sphx_glr_gallery_ticks_and_spines_spine_placement_demo.py

matplotlib.axis.Axis.set_ticklabels

`Axis.set_ticklabels`(*self*, *ticklabels*, *, *minor=False*, ***kwargs*)

Set the text values of the tick labels.

> **Warning:** This method should only be used after fixing the tick positions using *Axis.set_ticks*. Otherwise, the labels may end up in unexpected positions.

Parameters

ticklabels

[sequence of str or of *Text*s] Texts for labeling each tick location in the sequence set by *Axis.set_ticks*; the number of labels must match the number of locations.

minor

[bool] If True, set minor ticks instead of major ticks.

****kwargs**

Text properties.

Returns

list of *Text*s

For each tick, includes `tick.label1` if it is visible, then `tick.label2` if it is visible, in that order.

Examples using `matplotlib.axis.Axis.set_ticklabels`

18.6.3 `Tick` objects

`class matplotlib.axis.Tick(`*axes*, *loc*, *label=<deprecated parameter>*, *size=None*, *width=None*, *color=None*, *tickdir=None*, *pad=None*, *labelsize=None*, *labelcolor=None*, *zorder=None*, *gridOn=None*, *tick1On=True*, *tick2On=True*, *label1On=True*, *label2On=False*, *major=True*, *labelrotation=0*, *grid_color=None*, *grid_linestyle=None*, *grid_linewidth=None*, *grid_alpha=None*, ***kw*`)`

Abstract base class for the axis ticks, grid lines and labels.

Ticks mark a position on an Axis. They contain two lines as markers and two labels; one each for the bottom and top positions (in case of an *XAxis*) or for the left and right positions (in case of a *YAxis*).

Attributes

tick1line

[*Line2D*] The left/bottom tick marker.

tick2line

[*Line2D*] The right/top tick marker.

gridline

[*Line2D*] The grid line associated with the label position.

label1

[*Text*] The left/bottom tick label.

label2

[*Text*] The right/top tick label.

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

`class matplotlib.axis.XTick(`**args*, ***kwargs*`)`

Contains all the Artists needed to make an x tick - the tick line, the label text and the grid line

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

`class matplotlib.axis.YTick(`**args*, ***kwargs*`)`

Contains all the Artists needed to make a Y tick - the tick line, the label text and the grid line

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

Tick.apply_tickdir	Calculate `self._pad` and `self._tickmarkers`.
Tick.get_loc	Return the tick location (data coords) as a scalar.
Tick.get_pad	Get the value of the tick label pad in points.
Tick.get_pad_pixels	
Tick.get_tick_padding	Get the length of the tick outside of the axes.
Tick.get_tickdir	
Tick.get_view_interval	Return the view limits `(min, max)` of the axis the tick belongs to.
Tick.set_label1	Set the label1 text.
Tick.set_label2	Set the label2 text.
Tick.set_pad	Set the tick label pad in points
Tick.update_position	Set the location of tick in data coords with scalar *loc*.

matplotlib.axis.Tick.apply_tickdir

Tick.**apply_tickdir**(*self*, *tickdir*)

Calculate `self._pad` and `self._tickmarkers`.

Examples using `matplotlib.axis.Tick.apply_tickdir`

matplotlib.axis.Tick.get_loc

Tick.**get_loc**(*self*)

Return the tick location (data coords) as a scalar.

Examples using `matplotlib.axis.Tick.get_loc`

matplotlib.axis.Tick.get_pad

Tick.**get_pad**(*self*)

Get the value of the tick label pad in points.

Examples using `matplotlib.axis.Tick.get_pad`

matplotlib.axis.Tick.get_pad_pixels

`Tick.get_pad_pixels(self)`

Examples using `matplotlib.axis.Tick.get_pad_pixels`

matplotlib.axis.Tick.get_tick_padding

`Tick.get_tick_padding(self)`
Get the length of the tick outside of the axes.

Examples using `matplotlib.axis.Tick.get_tick_padding`

matplotlib.axis.Tick.get_tickdir

`Tick.get_tickdir(self)`

Examples using `matplotlib.axis.Tick.get_tickdir`

matplotlib.axis.Tick.get_view_interval

`Tick.get_view_interval(self)`
Return the view limits `(min, max)` of the axis the tick belongs to.

Examples using `matplotlib.axis.Tick.get_view_interval`

matplotlib.axis.Tick.set_label1

`Tick.set_label1(self, s)`
Set the label1 text.

Parameters

s

[str]

Examples using `matplotlib.axis.Tick.set_label1`

matplotlib.axis.Tick.set_label2

`Tick.set_label2`(*self*, *s*)
Set the label2 text.

Parameters

s

[str]

Examples using `matplotlib.axis.Tick.set_label2`

matplotlib.axis.Tick.set_pad

`Tick.set_pad`(*self*, *val*)
Set the tick label pad in points

Parameters

val

[float]

Examples using `matplotlib.axis.Tick.set_pad`

matplotlib.axis.Tick.update_position

`Tick.update_position`(*self*, *loc*)
Set the location of tick in data coords with scalar *loc*.

Examples using `matplotlib.axis.Tick.update_position`

18.7 matplotlib.backend_bases

Abstract base classes define the primitives that renderers and graphics contexts must implement to serve as a Matplotlib backend.

RendererBase

An abstract base class to handle drawing/rendering operations.

FigureCanvasBase

The abstraction layer that separates the *Figure* from the backend specific details like a user interface drawing area.

GraphicsContextBase

An abstract base class that provides color, line styles, etc.

Event

The base class for all of the Matplotlib event handling. Derived classes such as *KeyEvent* and *MouseEvent* store the meta data like keys and buttons pressed, x and y locations in pixel and *Axes* coordinates.

ShowBase

The base class for the `Show` class of each interactive backend; the 'show' callable is then set to `Show.__call__`.

ToolContainerBase

The base class for the Toolbar class of each interactive backend.

class matplotlib.backend_bases.**CloseEvent**(*name*, *canvas*, *guiEvent=None*)

Bases: *matplotlib.backend_bases.Event*

An event triggered by a figure being closed.

class matplotlib.backend_bases.**DrawEvent**(*name*, *canvas*, *renderer*)

Bases: *matplotlib.backend_bases.Event*

An event triggered by a draw operation on the canvas

In most backends callbacks subscribed to this callback will be fired after the rendering is complete but before the screen is updated. Any extra artists drawn to the canvas's renderer will be reflected without an explicit call to `blit`.

> **Warning:** Calling `canvas.draw` and `canvas.blit` in these callbacks may not be safe with all backends and may cause infinite recursion.

In addition to the *Event* attributes, the following event attributes are defined:

Attributes

renderer

[*RendererBase*] The renderer for the draw event.

class matplotlib.backend_bases.**Event**(*name*, *canvas*, *guiEvent=None*)

Bases: `object`

A Matplotlib event. Attach additional attributes as defined in *FigureCanvasBase.mpl_connect()*. The following attributes are defined and shown with their default values

Attributes

name

[str] The event name.

canvas

[*FigureCanvasBase*] The backend-specific canvas instance generating the event.

guiEvent

The GUI event that triggered the Matplotlib event.

class matplotlib.backend_bases.**FigureCanvasBase**(*figure*)

Bases: object

The canvas the figure renders into.

Attributes

figure

[*matplotlib.figure.Figure*] A high-level figure instance.

blit(*self*, *bbox=None*)

Blit the canvas in bbox (default entire canvas).

button_press_event(*self*, *x*, *y*, *button*, *dblclick=False*, *guiEvent=None*)

Callback processing for mouse button press events.

Backend derived classes should call this function on any mouse button press. (*x*, *y*) are the canvas coords ((0, 0) is lower left). button and key are as defined in *MouseEvent*.

This method will call all functions connected to the 'button_press_event' with a *MouseEvent* instance.

button_release_event(*self*, *x*, *y*, *button*, *guiEvent=None*)

Callback processing for mouse button release events.

Backend derived classes should call this function on any mouse button release.

This method will call all functions connected to the 'button_release_event' with a *MouseEvent* instance.

Parameters

x

[float] The canvas coordinates where 0=left.

y

[float] The canvas coordinates where 0=bottom.

guiEvent

The native UI event that generated the Matplotlib event.

`close_event`(*self*, *guiEvent=None*)
Pass a *CloseEvent* to all functions connected to `close_event`.

`draw`(*self*, **args*, ***kwargs*)
Render the *Figure*.

`draw_cursor`(*self*, *event*)
[*Deprecated*] Draw a cursor in the event.axes if inaxes is not None. Use native GUI drawing for efficiency if possible

Notes

Deprecated since version 3.2.

`draw_event`(*self*, *renderer*)
Pass a *DrawEvent* to all functions connected to `draw_event`.

`draw_idle`(*self*, **args*, ***kwargs*)
Request a widget redraw once control returns to the GUI event loop.

Even if multiple calls to *draw_idle* occur before control returns to the GUI event loop, the figure will only be rendered once.

Notes

Backends may choose to override the method and implement their own strategy to prevent multiple renderings.

`enter_notify_event`(*self*, *guiEvent=None*, *xy=None*)
Callback processing for the mouse cursor entering the canvas.

Backend derived classes should call this function when entering canvas.

Parameters

guiEvent

The native UI event that generated the Matplotlib event.

xy

[(float, float)] The coordinate location of the pointer when the canvas is entered.

```
events = ['resize_event', 'draw_event', 'key_press_event', 'key_release_event', 'button_pr
```

```
filetypes = {'eps': 'Encapsulated Postscript', 'jpeg': 'Joint Photographic Experts Group'
```

```
fixed_dpi = None
```

`flush_events`(*self*)
Flush the GUI events for the figure.

Interactive backends need to reimplement this method.

`get_default_filename`(*self*)
Return a string, which includes extension, suitable for use as a default filename.

`classmethod get_default_filetype`()
Return the default savefig file format as specified in `rcParams["savefig.format"]` (default: `'png'`).

The returned string does not include a period. This method is overridden in backends that only support a single file type.

`classmethod get_supported_filetypes`()
Return dict of savefig file formats supported by this backend.

`classmethod get_supported_filetypes_grouped`()
Return a dict of savefig file formats supported by this backend, where the keys are a file type name, such as 'Joint Photographic Experts Group', and the values are a list of filename extensions used for that filetype, such as ['jpg', 'jpeg'].

`get_width_height`(*self*)
Return the figure width and height in points or pixels (depending on the backend), truncated to integers.

`get_window_title`(*self*)
Return the title text of the window containing the figure, or None if there is no window (e.g., a PS backend).

`grab_mouse`(*self*, *ax*)
Set the child *Axes* which is grabbing the mouse events.

Usually called by the widgets themselves. It is an error to call this if the mouse is already grabbed by another axes.

`inaxes`(*self*, *xy*)
Return the topmost visible *Axes* containing the point *xy*.

Parameters

xy

[(float, float)] (x, y) pixel positions from left/bottom of the canvas.

Returns

Axes **or None**

The topmost visible axes containing the point, or None if no axes.

`is_saving`(*self*)
Return whether the renderer is in the process of saving to a file, rather than rendering for an on-screen buffer.

`key_press_event`(*self*, *key*, *guiEvent=None*)
Pass a *KeyEvent* to all functions connected to `key_press_event`.

`key_release_event`(*self*, *key*, *guiEvent=None*)
Pass a *KeyEvent* to all functions connected to `key_release_event`.

`leave_notify_event`(*self*, *guiEvent=None*)
Callback processing for the mouse cursor leaving the canvas.

Backend derived classes should call this function when leaving canvas.

Parameters

guiEvent

The native UI event that generated the Matplotlib event.

`motion_notify_event`(*self*, *x*, *y*, *guiEvent=None*)
Callback processing for mouse movement events.

Backend derived classes should call this function on any motion-notify-event.

This method will call all functions connected to the 'motion_notify_event' with a *MouseEvent* instance.

Parameters

x

[float] The canvas coordinates where 0=left.

y

[float] The canvas coordinates where 0=bottom.

guiEvent

The native UI event that generated the Matplotlib event.

`mpl_connect`(*self*, *s*, *func*)
Bind function *func* to event *s*.

Parameters

s

[str] One of the following events ids:

- 'button_press_event'
- 'button_release_event'
- 'draw_event'

- 'key_press_event'
- 'key_release_event'
- 'motion_notify_event'
- 'pick_event'
- 'resize_event'
- 'scroll_event'
- 'figure_enter_event',
- 'figure_leave_event',
- 'axes_enter_event',
- 'axes_leave_event'
- 'close_event'.

func

[callable] The callback function to be executed, which must have the signature:

```
def func(event: Event) -> Any
```

For the location events (button and key press/release), if the mouse is over the axes, the `inaxes` attribute of the event will be set to the *Axes* the event occurs is over, and additionally, the variables `xdata` and `ydata` attributes will be set to the mouse location in data coordinates. See *KeyEvent* and *MouseEvent* for more info.

Returns

cid

A connection id that can be used with *FigureCanvasBase.mpl_disconnect*.

Examples

```
def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = canvas.mpl_connect('button_press_event', on_press)
```

`mpl_disconnect`(*self*, *cid*)

Disconnect the callback with id *cid*.

Examples

```
cid = canvas.mpl_connect('button_press_event', on_press)
# ... later
canvas.mpl_disconnect(cid)
```

`new_timer`(*self*, *interval=None*, *callbacks=None*)
Create a new backend-specific subclass of `Timer`.

This is useful for getting periodic events through the backend's native event loop. Implemented only for backends with GUIs.

Parameters

interval

[int] Timer interval in milliseconds.

callbacks

[List[Tuple[callable, Tuple, Dict]]] Sequence of (func, args, kwargs) where `func(*args, **kwargs)` will be executed by the timer every *interval*.

Callbacks which return `False` or `0` will be removed from the timer.

Examples

```
>>> timer = fig.canvas.new_timer(callbacks=[(f1, (1,), {'a': 3})])
```

`pick`(*self*, *mouseevent*)

`pick_event`(*self*, *mouseevent*, *artist*, ***kwargs*)
Callback processing for pick events.

This method will be called by artists who are picked and will fire off *PickEvent* callbacks registered listeners.

`print_figure`(*self*, *filename*, *dpi=None*, *facecolor=None*, *edgecolor=None*, *orientation='portrait'*, *format=None*, ***, *bbox_inches=None*, *pad_inches=None*, *bbox_extra_artists=None*, *backend=None*, ***kwargs*)
Render the figure to hardcopy. Set the figure patch face and edge colors. This is useful because some of the GUIs have a gray figure face color background and you'll probably want to override this on hardcopy.

Parameters

filename

[str or path-like or file-like] The file where the figure is saved.

dpi

[float, default: `rcParams["savefig.dpi"]` (default: `'figure'`)] The dots per inch to save the figure in.

facecolor

[color or 'auto', default: `rcParams["savefig.facecolor"]` (default: `'auto'`)] The facecolor of the figure. If 'auto', use the current figure facecolor.

edgecolor

[color or 'auto', default: `rcParams["savefig.edgecolor"]` (default: `'auto'`)] The edgecolor of the figure. If 'auto', use the current figure edgecolor.

orientation

[{'landscape', 'portrait'}, default: 'portrait'] Only currently applies to PostScript printing.

format

[str, optional] Force a specific file format. If not given, the format is inferred from the *filename* extension, and if that fails from `rcParams["savefig.format"]` (default: `'png'`).

bbox_inches

['tight' or *Bbox*, default: `rcParams["savefig.bbox"]` (default: `None`)] Bounding box in inches: only the given portion of the figure is saved. If 'tight', try to figure out the tight bbox of the figure.

pad_inches

[float, default: `rcParams["savefig.pad_inches"]` (default: `0.1`)] Amount of padding around the figure when *bbox_inches* is 'tight'.

bbox_extra_artists

[list of *Artist*, optional] A list of extra artists that will be considered when the tight bbox is calculated.

backend

[str, optional] Use a non-default backend to render the file, e.g. to render a png file with the "cairo" backend rather than the default "agg", or a pdf file with the "pgf" backend rather than the default "pdf". Note that the default backend is normally sufficient. See *The builtin backends* for a list of valid backends for each file format. Custom backends can be referenced as "module://...".

`release_mouse`(*self*, *ax*)
Release the mouse grab held by the *Axes* *ax*.

Usually called by the widgets. It is ok to call this even if *ax* doesn't have the mouse grab currently.

`required_interactive_framework = None`

`resize`(*self*, *w*, *h*)
Set the canvas size in pixels.

`resize_event`(*self*)
Pass a *ResizeEvent* to all functions connected to `resize_event`.

`scroll_event`(*self*, *x*, *y*, *step*, *guiEvent=None*)
Callback processing for scroll events.

Backend derived classes should call this function on any scroll wheel event. (*x*, *y*) are the canvas coords ((0, 0) is lower left). button and key are as defined in *MouseEvent*.

This method will call all functions connected to the 'scroll_event' with a *MouseEvent* instance.

`set_window_title`(*self*, *title*)
Set the title text of the window containing the figure. Note that this has no effect if there is no window (e.g., a PS backend).

`start_event_loop`(*self*, *timeout=0*)
Start a blocking event loop.

Such an event loop is used by interactive functions, such as *ginput* and *waitforbuttonpress*, to wait for events.

The event loop blocks until a callback function triggers *stop_event_loop*, or *timeout* is reached.

If *timeout* is 0 or negative, never timeout.

Only interactive backends need to reimplement this method and it relies on *flush_events* being properly implemented.

Interactive backends should implement this in a more native way.

`stop_event_loop`(*self*)
Stop the current blocking event loop.

Interactive backends need to reimplement this to match *start_event_loop*

`supports_blit = False`

`switch_backends`(*self*, *FigureCanvasClass*)
Instantiate an instance of FigureCanvasClass

This is used for backend switching, e.g., to instantiate a FigureCanvasPS from a FigureCanvasGTK. Note, deep copying is not done, so any changes to

one of the instances (e.g., setting figure size or line props), will be reflected in the other

class matplotlib.backend_bases.**FigureManagerBase**(*canvas*, *num*)

Bases: object

A backend-independent abstraction of a figure container and controller.

The figure manager is used by pyplot to interact with the window in a backend-independent way. It's an adapter for the real (GUI) framework that represents the visual figure on screen.

GUI backends define from this class to translate common operations such as *show* or *resize* to the GUI-specific code. Non-GUI backends do not support these operations an can just use the base class.

This following basic operations are accessible:

Window operations

- *show*
- *destroy*
- *full_screen_toggle*
- *resize*
- *get_window_title*
- *set_window_title*

Key and mouse button press handling

The figure manager sets up default key and mouse button press handling by hooking up the *key_press_handler* to the matplotlib event system. This ensures the same shortcuts and mouse actions across backends.

Other operations

Subclasses will have additional attributes and functions to access additional functionality. This is of course backend-specific. For example, most GUI backends have `window` and `toolbar` attributes that give access to the native GUI widgets of the respective framework.

Attributes

canvas

[*FigureCanvasBase*] The backend-specific canvas instance.

num

[int or str] The figure number.

key_press_handler_id

[int] The default key handler cid, when using the toolmanager. To disable the default key press handling use:

```
figure.canvas.mpl_disconnect(
    figure.canvas.manager.key_press_handler_id)
```

button_press_handler_id

[int] The default mouse button handler cid, when using the toolmanager. To disable the default button press handling use:

```
figure.canvas.mpl_disconnect(
    figure.canvas.manager.button_press_handler_id)
```

`button_press`(*self*, *event*)
The default Matplotlib button actions for extra mouse buttons.

`destroy`(*self*)

`full_screen_toggle`(*self*)

`get_window_title`(*self*)
Return the title text of the window containing the figure, or None if there is no window (e.g., a PS backend).

`key_press`(*self*, *event*)
Implement the default Matplotlib key bindings defined at *Navigation Keyboard Shortcuts*.

`resize`(*self*, *w*, *h*)
For GUI backends, resize the window (in pixels).

`set_window_title`(*self*, *title*)
Set the title text of the window containing the figure.

This has no effect for non-GUI (e.g., PS) backends.

`show`(*self*)
For GUI backends, show the figure window and redraw. For non-GUI backends, raise an exception, unless running headless (i.e. on Linux with an unset DISPLAY); this exception is converted to a warning in *Figure.show*.

`property statusbar`

`class matplotlib.backend_bases.GraphicsContextBase`
Bases: `object`

An abstract base class that provides color, line styles, etc.

`copy_properties`(*self*, *gc*)
Copy properties from *gc* to self.

`get_alpha`(*self*)
Return the alpha value used for blending - not supported on all backends.

`get_antialiased`(*self*)
Return whether the object should try to do antialiased rendering.

get_capstyle(*self*)
Return the capstyle as a string in ('butt', 'round', 'projecting').

get_clip_path(*self*)
Return the clip path in the form (path, transform), where path is a *Path* instance, and transform is an affine transform to apply to the path before clipping.

get_clip_rectangle(*self*)
Return the clip rectangle as a *Bbox* instance.

get_dashes(*self*)
Return the dash style as an (offset, dash-list) pair.

The dash list is a even-length list that gives the ink on, ink off in points. See p. 107 of to PostScript blue book for more info.

Default value is (None, None).

get_forced_alpha(*self*)
Return whether the value given by get_alpha() should be used to override any other alpha-channel values.

get_gid(*self*)
Return the object identifier if one is set, None otherwise.

get_hatch(*self*)
Get the current hatch style.

get_hatch_color(*self*)
Get the hatch color.

get_hatch_linewidth(*self*)
Get the hatch linewidth.

get_hatch_path(*self*, *density=6.0*)
Return a *Path* for the current hatch.

get_joinstyle(*self*)
Return the line join style as one of ('miter', 'round', 'bevel').

get_linewidth(*self*)
Return the line width in points.

get_rgb(*self*)
Return a tuple of three or four floats from 0-1.

get_sketch_params(*self*)
Return the sketch parameters for the artist.

Returns

tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

`get_snap`(*self*)
Return the snap setting, which can be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

`get_url`(*self*)
Return a url if one is set, None otherwise.

`restore`(*self*)
Restore the graphics context from the stack - needed only for backends that save graphics contexts on a stack.

`set_alpha`(*self*, *alpha*)
Set the alpha value used for blending - not supported on all backends.

If `alpha=None` (the default), the alpha components of the foreground and fill colors will be used to set their respective transparencies (where applicable); otherwise, `alpha` will override them.

`set_antialiased`(*self*, *b*)
Set whether object should be drawn with antialiased rendering.

`set_capstyle`(*self*, *cs*)
Set the capstyle to be one of ('butt', 'round', 'projecting').

`set_clip_path`(*self*, *path*)
Set the clip path and transformation.

Parameters

path

[*TransformedPath* or None]

`set_clip_rectangle`(*self*, *rectangle*)
Set the clip rectangle with sequence (left, bottom, width, height)

`set_dashes`(*self*, *dash_offset*, *dash_list*)
Set the dash style for the gc.

Parameters

dash_offset

[float or None] The offset (usually 0).

dash_list

[array-like or None] The on-off sequence as points.

Notes

`(None, None)` specifies a solid line.

See p. 107 of to PostScript blue book for more info.

`set_foreground`(*self*, *fg*, *isRGBA=False*)
Set the foreground color.

Parameters

fg

[color]

isRGBA

[bool] If *fg* is known to be an `(r, g, b, a)` tuple, *isRGBA* can be set to True to improve performance.

`set_gid`(*self*, *id*)
Set the id.

`set_hatch`(*self*, *hatch*)
Set the hatch style (for fills).

`set_hatch_color`(*self*, *hatch_color*)
Set the hatch color.

`set_joinstyle`(*self*, *js*)
Set the join style to be one of ('miter', 'round', 'bevel').

`set_linewidth`(*self*, *w*)
Set the linewidth in points.

`set_sketch_params`(*self*, *scale=None*, *length=None*, *randomness=None*)
Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, default: 128] The length of the wiggle along the line, in pixels.

randomness

[float, default: 16] The scale factor by which the length is shrunken or expanded.

`set_snap`(*self*, *snap*)
Set the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

`set_url`(*self*, *url*)
Set the url for links in compatible backends.

class matplotlib.backend_bases.**KeyEvent**(*name*, *canvas*, *key*, *x=0*, *y=0*, *guiEvent=None*)

Bases: *matplotlib.backend_bases.LocationEvent*

A key event (key press, key release).

Attach additional attributes as defined in *FigureCanvasBase.mpl_connect()*.

In addition to the *Event* and *LocationEvent* attributes, the following attributes are defined:

Notes

Modifier keys will be prefixed to the pressed key and will be in the order "ctrl", "alt", "super". The exception to this rule is when the pressed key is itself a modifier key, therefore "ctrl+alt" and "alt+control" can both be valid key values.

Examples

```
def on_key(event):
    print('you pressed', event.key, event.xdata, event.ydata)

cid = fig.canvas.mpl_connect('key_press_event', on_key)
```

Attributes

key

[None or str] the key(s) pressed. Could be **None**, a single case sensitive ascii character ("g", "G", "#", etc.), a special key ("control", "shift", "f1", "up", etc.) or a combination of the above (e.g., "ctrl+alt+g", "ctrl+alt+G").

(*x*, *y*) in figure coords ((0, 0) = bottom left).

class matplotlib.backend_bases.LocationEvent(*name*, *canvas*, *x*, *y*, *guiEvent=None*)

Bases: *matplotlib.backend_bases.Event*

An event that has a screen location.

The following additional attributes are defined and shown with their default values.

In addition to the *Event* attributes, the following event attributes are defined:

Attributes

x

[int] x position - pixels from left of canvas.

y

[int] y position - pixels from bottom of canvas.

inaxes

[*Axes* or None] The *Axes* instance over which the mouse is, if any.

xdata

[float or None] x data coordinate of the mouse.

ydata

[float or None] y data coordinate of the mouse.

(*x*, *y*) in figure coords ((0, 0) = bottom left).

lastevent = None

class matplotlib.backend_bases.MouseButton(*value*)

Bases: enum.IntEnum

An enumeration.

BACK = 8

FORWARD = 9

LEFT = 1

MIDDLE = 2

RIGHT = 3

class matplotlib.backend_bases.MouseEvent(*name*, *canvas*, *x*, *y*, *button=None*, *key=None*, *step=0*, *dblclick=False*, *guiEvent=None*)

Bases: *matplotlib.backend_bases.LocationEvent*

A mouse event ('button_press_event',

'button_release_event', 'scroll_event', 'motion_notify_event').

In addition to the *Event* and *LocationEvent* attributes, the following attributes are defined:

Examples

```
def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = fig.canvas.mpl_connect('button_press_event', on_press)
```

Attributes

button

[None or *MouseButton* or {'up', 'down'}] The button pressed. 'up' and 'down' are used for scroll events. Note that in the nbagg backend, both the middle and right clicks return RIGHT since right clicking will bring up the context menu in some browsers. Note that LEFT and RIGHT actually refer to the "primary" and "secondary" buttons, i.e. if the user inverts their left and right buttons ("left-handed setting") then the LEFT button will be the one physically on the right.

key

[None or str] The key pressed when the mouse event triggered, e.g. 'shift'. See *KeyEvent*.

> **Warning:** This key is currently obtained from the last 'key_press_event' or 'key_release_event' that occurred within the canvas. Thus, if the last change of keyboard state occurred while the canvas did not have focus, this attribute will be wrong.

step

[float] The number of scroll steps (positive for 'up', negative for 'down'). This applies only to 'scroll_event' and defaults to 0 otherwise.

dblclick

[bool] Whether the event is a double-click. This applies only to 'button_press_event' and is False otherwise. In particular, it's not used in 'button_release_event'.

(*x*, *y*) in figure coords ((0, 0) = bottom left) button pressed None, 1, 2, 3, 'up', 'down'

class matplotlib.backend_bases.**NavigationToolbar2**(*canvas*)

Bases: object

Base class for the navigation cursor, version 2.

Backends must implement a canvas that handles connections for 'button_press_event' and 'button_release_event'. See *FigureCanvasBase.mpl_connect()* for more information.

They must also define

save_figure()

save the current figure

set_cursor()

if you want the pointer icon to change

draw_rubberband() **(optional)**

draw the zoom to rect "rubberband" rectangle

set_message() **(optional)**

display message

set_history_buttons() **(optional)**

you can change the history back / forward buttons to indicate disabled / enabled state.

and override `__init__` to set up the toolbar -- without forgetting to call the base-class init. Typically, `__init__` needs to set up toolbar buttons connected to the *home*, *back*, *forward*, *pan*, *zoom*, and *save_figure* methods and using standard icons in the "images" subdirectory of the data path.

That's it, we'll do the rest!

back(*self*, **args*)

Move back up the view lim stack.

For convenience of being directly connected as a GUI callback, which often get passed additional parameters, this method accepts arbitrary parameters, but does not use them.

drag_pan(*self*, *event*)

Callback for dragging in pan/zoom mode.

`drag_zoom`(*self*, *event*)
Callback for dragging in zoom mode.

`draw`(*self*)
[*Deprecated*] Redraw the canvases, update the locators.

Notes

Deprecated since version 3.3.

`draw_rubberband`(*self*, *event*, *x0*, *y0*, *x1*, *y1*)
Draw a rectangle rubberband to indicate zoom limits.

Note that it is not guaranteed that `x0 <= x1` and `y0 <= y1`.

`forward`(*self*, **args*)
Move forward in the view lim stack.

For convenience of being directly connected as a GUI callback, which often get passed additional parameters, this method accepts arbitrary parameters, but does not use them.

`home`(*self*, **args*)
Restore the original view.

For convenience of being directly connected as a GUI callback, which often get passed additional parameters, this method accepts arbitrary parameters, but does not use them.

`mouse_move`(*self*, *event*)

`pan`(*self*, **args*)
Toggle the pan/zoom tool.

Pan with left button, zoom with right.

`press`(*self*, *event*)
[*Deprecated*] Called whenever a mouse button is pressed.

Notes

Deprecated since version 3.3.

`press_pan`(*self*, *event*)
Callback for mouse button press in pan/zoom mode.

`press_zoom`(*self*, *event*)
Callback for mouse button press in zoom to rect mode.

`push_current`(*self*)
Push the current view limits and position onto the stack.

release(*self*, *event*)
[*Deprecated*] Callback for mouse button release.

Notes

Deprecated since version 3.3.

release_pan(*self*, *event*)
Callback for mouse button release in pan/zoom mode.

release_zoom(*self*, *event*)
Callback for mouse button release in zoom to rect mode.

remove_rubberband(*self*)
Remove the rubberband.

save_figure(*self*, **args*)
Save the current figure.

set_cursor(*self*, *cursor*)
Set the current cursor to one of the `Cursors` enums values.

If required by the backend, this method should trigger an update in the backend event loop after the cursor is set, as this method may be called e.g. before a long-running task during which the GUI is not updated.

set_history_buttons(*self*)
Enable or disable the back/forward button.

set_message(*self*, *s*)
Display a message on toolbar or in status bar.

toolitems = (('Home', 'Reset original view', 'home', 'home'), ('Back', 'Back to previous v

update(*self*)
Reset the axes stack.

zoom(*self*, **args*)
Toggle zoom to rect mode.

exception matplotlib.backend_bases.**NonGuiException**
Bases: `Exception`

Raised when trying show a figure in a non-GUI backend.

class matplotlib.backend_bases.**PickEvent**(*name*, *canvas*, *mouseevent*, *artist*, *guiEvent=None*, ***kwargs*)
Bases: *matplotlib.backend_bases.Event*

A pick event, fired when the user picks a location on the canvas sufficiently close to an artist.

Attrs: all the *Event* attributes plus

Examples

Bind a function `on_pick()` to pick events, that prints the coordinates of the picked data point:

```
ax.plot(np.rand(100), 'o', picker=5)  # 5 points tolerance

def on_pick(event):
    line = event.artist
    xdata, ydata = line.get_data()
    ind = event.ind
    print('on pick line:', np.array([xdata[ind], ydata[ind]]).T)

cid = fig.canvas.mpl_connect('pick_event', on_pick)
```

Attributes

mouseevent

[*MouseEvent*] The mouse event that generated the pick.

artist

[*matplotlib.artist.Artist*] The picked artist.

other

Additional attributes may be present depending on the type of the picked object; e.g., a *Line2D* pick may define different extra attributes than a *PatchCollection* pick.

class matplotlib.backend_bases.**RendererBase**

Bases: `object`

An abstract base class to handle drawing/rendering operations.

The following methods must be implemented in the backend for full functionality (though just implementing *draw_path()* alone would give a highly capable backend):

- *draw_path()*
- *draw_image()*
- *draw_gouraud_triangle()*

The following methods *should* be implemented in the backend for optimization reasons:

- *draw_text()*
- *draw_markers()*
- *draw_path_collection()*
- *draw_quad_mesh()*

`close_group`(*self*, *s*)
Close a grouping element with label *s*.

Only used by the SVG renderer.

`draw_gouraud_triangle`(*self*, *gc*, *points*, *colors*, *transform*)
Draw a Gouraud-shaded triangle.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

points

[array-like, shape=(3, 2)] Array of (x, y) points for the triangle.

colors

[array-like, shape=(3, 4)] RGBA colors for each point of the triangle.

transform

[*matplotlib.transforms.Transform*] An affine transform to apply to the points.

`draw_gouraud_triangles`(*self*, *gc*, *triangles_array*, *colors_array*, *transform*)
Draw a series of Gouraud triangles.

Parameters

points

[array-like, shape=(N, 3, 2)] Array of *N* (x, y) points for the triangles.

colors

[array-like, shape=(N, 3, 4)] Array of *N* RGBA colors for each point of the triangles.

transform

[*matplotlib.transforms.Transform*] An affine transform to apply to the points.

`draw_image`(*self*, *gc*, *x*, *y*, *im*, *transform=None*)
Draw an RGBA image.

Parameters

gc

[*GraphicsContextBase*] A graphics context with clipping information.

x

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

y

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

im

[array-like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.

transform

[*matplotlib.transforms.Affine2DBase*] If and only if the concrete backend is written such that *option_scale_image()* returns `True`, an affine transformation (i.e., an *Affine2DBase*) *may* be passed to *draw_image()*. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

`draw_markers`(*self*, *gc*, *marker_path*, *marker_trans*, *path*, *trans*, *rgbFace=None*)

Draw a marker at each of the vertices in path.

This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of draw_markers that makes multiple calls to *draw_path()*. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

marker_trans

[*matplotlib.transforms.Transform*] An affine transform applied to the marker.

trans

[*matplotlib.transforms.Transform*] An affine transform applied to the path.

draw_path(*self*, *gc*, *path*, *transform*, *rgbFace=None*)
Draw a *Path* instance using the given affine transform.

draw_path_collection(*self*, *gc*, *master_transform*, *paths*, *all_transforms*, *offsets*, *offsetTrans*, *facecolors*, *edgecolors*, *linewidths*, *linestyles*, *antialiaseds*, *urls*, *offset_position*)
Draw a collection of paths selecting drawing properties from the lists *facecolors*, *edgecolors*, *linewidths*, *linestyles* and *antialiaseds*. *offsets* is a list of offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied.

offset_position may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of *draw_path_collection()* that makes multiple calls to *draw_path()*. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of *draw_path_collection()* can be made globally.

draw_quad_mesh(*self*, *gc*, *master_transform*, *meshWidth*, *meshHeight*, *coordinates*, *offsets*, *offsetTrans*, *facecolors*, *antialiased*, *edgecolors*)
Fallback implementation of *draw_quad_mesh()* that generates paths and then calls *draw_path_collection()*.

draw_tex(*self*, *gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=<deprecated parameter>*, *mtext=None*)

draw_text(*self*, *gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=False*, *mtext=None*)
Draw the text instance.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The text string.

prop

[*matplotlib.font_manager.FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

mtext

[*matplotlib.text.Text*] The original text object to be rendered.

Notes

Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

`flipy`(*self*)
Return whether y values increase from top to bottom.

Note that this only affects drawing of texts and images.

`get_canvas_width_height`(*self*)
Return the canvas width and height in display coords.

`get_image_magnification`(*self*)
Get the factor by which to magnify images passed to *draw_image()*. Allows a backend to have images at a different resolution to other artists.

`get_texmanager`(*self*)
Return the *TexManager* instance.

`get_text_width_height_descent`(*self*, *s*, *prop*, *ismath*)
Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with *FontProperties* *prop*.

`new_gc`(*self*)
Return an instance of a *GraphicsContextBase*.

`open_group`(*self*, *s*, *gid=None*)
Open a grouping element with label *s* and *gid* (if set) as id.

Only used by the SVG renderer.

`option_image_nocomposite`(*self*)
Return whether image composition by Matplotlib should be skipped.

Raster backends should usually return False (letting the C-level rasterizer take care of image composition); vector backends should usually return `not rcParams["image.composite_image"]`.

option_scale_image(*self*)
Return whether arbitrary affine transformations in *draw_image()* are supported (True for most vector backends).

points_to_pixels(*self*, *points*)
Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72 * dpi/72
```

Parameters

points

[float or array-like] a float or a numpy array of float

Returns

Points converted to pixels

start_filter(*self*)
Switch to a temporary renderer for image filtering effects.

Currently only supported by the agg renderer.

start_rasterizing(*self*)
Switch to the raster renderer.

Used by *MixedModeRenderer*.

stop_filter(*self*, *filter_func*)
Switch back to the original renderer. The contents of the temporary renderer is processed with the *filter_func* and is drawn on the original renderer as an image.

Currently only supported by the agg renderer.

stop_rasterizing(*self*)
Switch back to the vector renderer and draw the contents of the raster renderer as an image on the vector renderer.

Used by *MixedModeRenderer*.

class matplotlib.backend_bases.**ResizeEvent**(*name*, *canvas*)
Bases: *matplotlib.backend_bases.Event*

An event triggered by a canvas resize

In addition to the *Event* attributes, the following event attributes are defined:

Attributes

width

[int] Width of the canvas in pixels.

height

[int] Height of the canvas in pixels.

class matplotlib.backend_bases.**ShowBase**

Bases: matplotlib.backend_bases._Backend

Simple base class to generate a `show()` function in backends.

Subclass must override `mainloop()` method.

class matplotlib.backend_bases.**StatusbarBase**(***kwargs*)

Bases: object

[*Deprecated*] Base class for the statusbar.

Notes

Deprecated since version 3.3.

set_message(*self*, *s*)

Display a message on toolbar or in status bar.

Parameters

s

[str] Message text.

class matplotlib.backend_bases.**TimerBase**(*interval=None*, *callbacks=None*)

Bases: object

A base class for providing timer events, useful for things animations. Backends need to implement a few specific methods in order to use their own timing mechanisms so that the timer events are integrated into their event loops.

Subclasses must override the following methods:

- `_timer_start`: Backend-specific code for starting the timer.
- `_timer_stop`: Backend-specific code for stopping the timer.

Subclasses may additionally override the following methods:

- `_timer_set_single_shot`: Code for setting the timer to single shot operating mode, if supported by the timer object. If not, the `Timer` class itself will store the flag and the `_on_timer` method should be overridden to support such behavior.
- `_timer_set_interval`: Code for setting the interval on the timer, if there is a method for doing so on the timer object.

- `_on_timer`: The internal function that any timer object should call, which will handle the task of running all callbacks that have been set.

  Parameters

  interval

  [int, default: 1000ms] The time between timer events in milliseconds. Will be stored as `timer.interval`.

  callbacks

  [List[Tuple[callable, Tuple, Dict]]] List of (func, args, kwargs) tuples that will be called upon timer events. This list is accessible as `timer.callbacks` and can be manipulated directly, or the functions *add_callback* and *remove_callback* can be used.

`add_callback`(*self*, *func*, **args*, ***kwargs*)
: Register *func* to be called by timer when the event fires. Any additional arguments provided will be passed to *func*.

  This function returns *func*, which makes it possible to use it as a decorator.

`property interval`
: The time between timer events, in milliseconds.

`remove_callback`(*self*, *func*, **args*, ***kwargs*)
: Remove *func* from list of callbacks.

  args and *kwargs* are optional and used to distinguish between copies of the same function registered to be called with different arguments. This behavior is deprecated. In the future, `*args, **kwargs` won't be considered anymore; to keep a specific callback removable by itself, pass it to *add_callback* as a `functools.partial` object.

`property single_shot`
: Whether this timer should stop after a single run.

`start`(*self*, *interval=None*)
: Start the timer object.

  Parameters

  interval

  [int, optional] Timer interval in milliseconds; overrides a previously set interval if provided.

`stop`(*self*)
: Stop the timer.

`class matplotlib.backend_bases.ToolContainerBase`(*toolmanager*)
: Bases: `object`

Base class for all tool containers, e.g. toolbars.

Attributes

toolmanager

[*ToolManager*] The tools with which this `ToolContainer` wants to communicate.

`add_tool`(*self*, *tool*, *group*, *position=- 1*)
Add a tool to this container.

Parameters

tool

[tool_like] The tool to add, see *ToolManager.get_tool*.

group

[str] The name of the group to add this tool to.

position

[int, default: -1] The position within the group to place this tool.

`add_toolitem`(*self*, *name*, *group*, *position*, *image*, *description*, *toggle*)
Add a toolitem to the container.

This method must be implemented per backend.

The callback associated with the button click event, must be *exactly* `self.trigger_tool(name)`.

Parameters

name

[str] Name of the tool to add, this gets used as the tool's ID and as the default label of the buttons.

group

[str] Name of the group that this tool belongs to.

position

[int] Position of the tool within its group, if -1 it goes at the end.

image_file

[str] Filename of the image for the button or `None`.

description

[str] Description of the tool, used for the tooltips.

toggle

[bool]

- `True` : The button is a toggle (change the pressed/unpressed state between consecutive clicks).
- `False` : The button is a normal button (returns to unpressed state after release).

`remove_toolitem`(*self*, *name*)
Remove a toolitem from the `ToolContainer`.

This method must get implemented per backend.

Called when *`ToolManager`* emits a `tool_removed_event`.

Parameters

name

[str] Name of the tool to remove.

`set_message`(*self*, *s*)
Display a message on the toolbar.

Parameters

s

[str] Message text.

`toggle_toolitem`(*self*, *name*, *toggled*)
Toggle the toolitem without firing event.

Parameters

name

[str] Id of the tool to toggle.

toggled

[bool] Whether to set this tool as toggled or not.

`trigger_tool`(*self*, *name*)
Trigger the tool.

Parameters

name

[str] Name (id) of the tool triggered from within the container.

matplotlib.backend_bases.**button_press_handler**(*event*, *canvas=None*, *toolbar=None*)

The default Matplotlib button actions for extra mouse buttons.

Parameters are as for *key_press_handler*, except that *event* is a *MouseEvent*.

matplotlib.backend_bases.**get_registered_canvas_class**(*format*)

Return the registered default canvas for given file format. Handles deferred import of required backend.

matplotlib.backend_bases.**key_press_handler**(*event*, *canvas=None*, *toolbar=None*)

Implement the default Matplotlib key bindings for the canvas and toolbar described at *Navigation Keyboard Shortcuts*.

Parameters

event

[*KeyEvent*] A key press/release event.

canvas

[*FigureCanvasBase*, default: `event.canvas`] The backend-specific canvas instance. This parameter is kept for back-compatibility, but, if set, should always be equal to `event.canvas`.

toolbar

[*NavigationToolbar2*, default: `event.canvas.toolbar`] The navigation cursor toolbar. This parameter is kept for back-compatibility, but, if set, should always be equal to `event.canvas.toolbar`.

matplotlib.backend_bases.**register_backend**(*format*, *backend*, *description=None*)

Register a backend for saving to a given file format.

Parameters

format

[str] File extension

backend

[module string or canvas class] Backend for handling file output

description

[str, default: ""] Description of the file type.

18.8 matplotlib.backend_managers

class matplotlib.backend_managers.**ToolEvent**(*name*, *sender*, *tool*, *data=None*)

Bases: object

Event for tool manipulation (add/remove).

class matplotlib.backend_managers.**ToolManager**(*figure=None*)

Bases: object

Manager for actions triggered by user interactions (key press, toolbar clicks, ...) on a Figure.

Attributes

figure

[*Figure*] Figure that holds the canvas.

keypresslock

[*LockDraw*] *LockDraw* object to know if the *canvas* key_press_event is locked.

messagelock

[*LockDraw*] *LockDraw* object to know if the message is available to write.

property **active_toggle**

Currently toggled tools.

add_tool(*self*, *name*, *tool*, **args*, ***kwargs*)

Add *tool* to *ToolManager*.

If successful, adds a new event `tool_trigger_{name}` where `{name}` is the *name* of the tool; the event is fired every time the tool is triggered.

Parameters

name

[str] Name of the tool, treated as the ID, has to be unique.

tool

[class_like, i.e. str or type] Reference to find the class of the Tool to added.

See also:

matplotlib.backend_tools.ToolBase

The base class for tools.

Notes

args and kwargs get passed directly to the tools constructor.

`property canvas`
Canvas managed by FigureManager.

`property figure`
Figure that holds the canvas.

`get_tool(self, name, warn=True)`
Return the tool object with the given name.

For convenience, this passes tool objects through.

Parameters

name

[str or *ToolBase*] Name of the tool, or the tool itself.

warn

[bool, default: True] Whether a warning should be emitted it no tool with the given name exists.

Returns

ToolBase **or None**

The tool or None if no tool with the given name exists.

`get_tool_keymap(self, name)`
Return the keymap associated with the specified tool.

Parameters

name

[str] Name of the Tool.

Returns

list of str

List of keys associated with the tool.

`message_event(self, message, sender=None)`
Emit a *ToolManagerMessageEvent*.

`remove_tool(self, name)`
Remove tool named *name*.

Parameters

name

[str] Name of the tool.

`set_figure`(*self*, *figure*, *update_tools=True*)
Bind the given figure to the tools.

Parameters

figure

[*Figure*]

update_tools

[bool, default: True] Force tools to update figure.

`toolmanager_connect`(*self*, *s*, *func*)
Connect event with string *s* to *func*.

Parameters

s

[str] The name of the event. The following events are recognized:

- 'tool_message_event'
- 'tool_removed_event'
- 'tool_added_event'

For every tool added a new event is created

- 'tool_trigger_TOOLNAME', where TOOLNAME is the id of the tool.

func

[callable] Callback function for the toolmanager event with signature:

```
def func(event: ToolEvent) -> Any
```

Returns

cid

The callback id for the connection. This can be used in *toolmanager_disconnect*.

`toolmanager_disconnect`(*self*, *cid*)
Disconnect callback id *cid*.

Example usage:

```
cid = toolmanager.toolmanager_connect('tool_trigger_zoom', onpress)
#...later
toolmanager.toolmanager_disconnect(cid)
```

property tools
A dict mapping tool name -> controlled tool.

trigger_tool(*self*, *name*, *sender=None*, *canvasevent=None*, *data=None*)
Trigger a tool and emit the tool_trigger_{name} event.

Parameters

name

[str] Name of the tool.

sender

[object] Object that wishes to trigger the tool.

canvasevent

[Event] Original Canvas event or None.

data

[object] Extra data to pass to the tool when triggering.

update_keymap(*self*, *name*, *key*, **args*)
Set the keymap to associate with the specified tool.

Parameters

name

[str] Name of the Tool.

keys

[str or list of str] Keys to associate with the tool.

class matplotlib.backend_managers.ToolManagerMessageEvent(*name*, *sender*, *message*)
Bases: object

Event carrying messages from toolmanager.

Messages usually get displayed to the user by the toolbar.

class matplotlib.backend_managers.ToolTriggerEvent(*name*, *sender*, *tool*, *canvasevent=None*, *data=None*)
Bases: *matplotlib.backend_managers.ToolEvent*

Event to inform that a tool has been triggered.

18.9 matplotlib.backend_tools

Abstract base classes define the primitives for Tools. These tools are used by *matplotlib.backend_managers.ToolManager*

ToolBase

Simple stateless tool

ToolToggleBase

Tool that has two states, only one Toggle tool can be active at any given time for the same *matplotlib.backend_managers.ToolManager*

class matplotlib.backend_tools.**AxisScaleBase**(**args*, ***kwargs*)

Bases: *matplotlib.backend_tools.ToolToggleBase*

Base Tool to toggle between linear and logarithmic.

disable(*self*, *event*)

Disable the toggle tool.

trigger call this method when `toggled` is True.

This can happen in different circumstances.

- Click on the toolbar tool button.
- Call to *matplotlib.backend_managers.ToolManager.trigger_tool*.
- Another *ToolToggleBase* derived tool is triggered (from the same *ToolManager*).

enable(*self*, *event*)

Enable the toggle tool.

trigger calls this method when `toggled` is False.

trigger(*self*, *sender*, *event*, *data=None*)

Calls *enable* or *disable* based on `toggled` value.

class matplotlib.backend_tools.**ConfigureSubplotsBase**(*toolmanager*, *name*)

Bases: *matplotlib.backend_tools.ToolBase*

Base tool for the configuration of subplots.

description = 'Configure subplots'

image = 'subplots'

class matplotlib.backend_tools.**Cursors**(*value*)

Bases: `enum.IntEnum`

Backend-independent cursor types.

HAND = 0

MOVE = 3

POINTER = 1

SELECT_REGION = 2

WAIT = 4

class matplotlib.backend_tools.**RubberbandBase**(*toolmanager*, *name*)

Bases: *matplotlib.backend_tools.ToolBase*

Draw and remove a rubberband.

draw_rubberband(*self*, **data*)

Draw rubberband.

This method must get implemented per backend.

remove_rubberband(*self*)

Remove rubberband.

This method should get implemented per backend.

trigger(*self*, *sender*, *event*, *data*)

Call *draw_rubberband* or *remove_rubberband* based on data.

class matplotlib.backend_tools.**SaveFigureBase**(*toolmanager*, *name*)

Bases: *matplotlib.backend_tools.ToolBase*

Base tool for figure saving.

default_keymap = ['s', 'ctrl+s']

description = 'Save the figure'

image = 'filesave'

class matplotlib.backend_tools.**SetCursorBase**(**args*, ***kwargs*)

Bases: *matplotlib.backend_tools.ToolBase*

Change to the current cursor while inaxes.

This tool, keeps track of all *ToolToggleBase* derived tools, and calls *set_cursor* when a tool gets triggered.

set_cursor(*self*, *cursor*)

Set the cursor.

This method has to be implemented per backend.

set_figure(*self*, *figure*)

Assign a figure to the tool.

Parameters

figure

[*Figure*]

class matplotlib.backend_tools.ToolBack(*toolmanager*, *name*)

Bases: *matplotlib.backend_tools.ViewsPositionsBase*

Move back up the view limits stack.

default_keymap = ['left', 'c', 'backspace', 'MouseButton.BACK']

description = 'Back to previous view'

image = 'back'

class matplotlib.backend_tools.ToolBase(*toolmanager*, *name*)

Bases: object

Base tool class.

A base tool, only implements *trigger* method or not method at all. The tool is instantiated by *matplotlib.backend_managers.ToolManager*.

Attributes

toolmanager

[*matplotlib.backend_managers.ToolManager*] ToolManager that controls this Tool.

figure

[FigureCanvas] Figure instance that is affected by this Tool.

name

[str] Tool Id.

property canvas

default_keymap = None

Keymap to associate with this tool.

String: List of comma separated keys that will be used to call this tool when the keypress event of `self.figure.canvas` is emitted.

description = None

Description of the Tool.

String: If the Tool is included in the Toolbar this text is used as a Tooltip.

destroy(*self*)

Destroy the tool.

This method is called when the tool is removed by *matplotlib.backend_managers.ToolManager.remove_tool*.

property figure

image = None

Filename of the image.

String: Filename of the image to use in the toolbar. If None, the *name* is used as a label in the toolbar button.

property name
Tool Id.

set_figure(*self*, *figure*)
Assign a figure to the tool.

Parameters

figure

[*Figure*]

property toolmanager

trigger(*self*, *sender*, *event*, *data=None*)
Called when this tool gets used.

This method is called by *matplotlib.backend_managers.ToolManager.trigger_tool*.

Parameters

event

[*Event*] The canvas event that caused this tool to be called.

sender

[object] Object that requested the tool to be triggered.

data

[object] Extra data.

matplotlib.backend_tools.ToolCopyToClipboard
alias of *matplotlib.backend_tools.ToolCopyToClipboardBase*

class matplotlib.backend_tools.ToolCopyToClipboardBase(*toolmanager*, *name*)
Bases: *matplotlib.backend_tools.ToolBase*

Tool to copy the figure to the clipboard.

default_keymap = ['ctrl+c', 'cmd+c']

description = 'Copy the canvas figure to clipboard'

trigger(*self*, **args*, ***kwargs*)
Called when this tool gets used.

This method is called by *matplotlib.backend_managers.ToolManager.trigger_tool*.

Parameters

event

[*Event*] The canvas event that caused this tool to be called.

sender

[object] Object that requested the tool to be triggered.

data

[object] Extra data.

class matplotlib.backend_tools.**ToolCursorPosition**(**args*, ***kwargs*)

Bases: *matplotlib.backend_tools.ToolBase*

Send message with the current pointer position.

This tool runs in the background reporting the position of the cursor.

send_message(*self*, *event*)

Call *matplotlib.backend_managers.ToolManager.message_event*.

set_figure(*self*, *figure*)

Assign a figure to the tool.

Parameters

figure

[*Figure*]

class matplotlib.backend_tools.**ToolEnableAllNavigation**(***kwargs*)

Bases: matplotlib.backend_tools._ToolEnableAllNavigation

[*Deprecated*]

Notes

Deprecated since version 3.3:

class matplotlib.backend_tools.**ToolEnableNavigation**(***kwargs*)

Bases: matplotlib.backend_tools._ToolEnableNavigation

[*Deprecated*]

Notes

Deprecated since version 3.3:

class matplotlib.backend_tools.**ToolForward**(*toolmanager*, *name*)

Bases: *matplotlib.backend_tools.ViewsPositionsBase*

Move forward in the view lim stack.

```
default_keymap = ['right', 'v', 'MouseButton.FORWARD']
```

```
description = 'Forward to next view'
```

```
image = 'forward'
```

class matplotlib.backend_tools.**ToolFullScreen**(**args*, ***kwargs*)

Bases: *matplotlib.backend_tools.ToolToggleBase*

Tool to toggle full screen.

```
default_keymap = ['f', 'ctrl+f']
```

```
description = 'Toggle fullscreen mode'
```

disable(*self*, *event*)

Disable the toggle tool.

`trigger` call this method when `toggled` is True.

This can happen in different circumstances.

- Click on the toolbar tool button.
- Call to *matplotlib.backend_managers.ToolManager.trigger_tool*.
- Another *ToolToggleBase* derived tool is triggered (from the same *ToolManager*).

enable(*self*, *event*)

Enable the toggle tool.

`trigger` calls this method when `toggled` is False.

class matplotlib.backend_tools.**ToolGrid**(*toolmanager*, *name*)

Bases: *matplotlib.backend_tools.ToolBase*

Tool to toggle the major grids of the figure.

```
default_keymap = ['g']
```

```
description = 'Toggle major grids'
```

trigger(*self*, *sender*, *event*, *data=None*)

Called when this tool gets used.

This method is called by *matplotlib.backend_managers.ToolManager.trigger_tool*.

Parameters

event

[*Event*] The canvas event that caused this tool to be called.

sender

[object] Object that requested the tool to be triggered.

data

[object] Extra data.

class matplotlib.backend_tools.ToolHelpBase(*toolmanager*, *name*)

Bases: *matplotlib.backend_tools.ToolBase*

default_keymap = ['f1']

description = 'Print tool list, shortcuts and description'

static format_shortcut(*key_sequence*)

Converts a shortcut string from the notation used in rc config to the standard notation for displaying shortcuts, e.g. 'ctrl+a' -> 'Ctrl+A'.

image = 'help'

class matplotlib.backend_tools.ToolHome(*toolmanager*, *name*)

Bases: *matplotlib.backend_tools.ViewsPositionsBase*

Restore the original view limits.

default_keymap = ['h', 'r', 'home']

description = 'Reset original view'

image = 'home'

class matplotlib.backend_tools.ToolMinorGrid(*toolmanager*, *name*)

Bases: *matplotlib.backend_tools.ToolBase*

Tool to toggle the major and minor grids of the figure.

default_keymap = ['G']

description = 'Toggle major and minor grids'

trigger(*self*, *sender*, *event*, *data=None*)

Called when this tool gets used.

This method is called by *matplotlib.backend_managers.ToolManager.trigger_tool*.

Parameters

event

[*Event*] The canvas event that caused this tool to be called.

sender

[object] Object that requested the tool to be triggered.

data

[object] Extra data.

class matplotlib.backend_tools.**ToolPan**(**args*)

Bases: *matplotlib.backend_tools.ZoomPanBase*

Pan axes with left mouse, zoom with right.

```
cursor = 3
```

```
default_keymap = ['p']
```

```
description = 'Pan axes with left mouse, zoom with right'
```

```
image = 'move'
```

```
radio_group = 'default'
```

class matplotlib.backend_tools.**ToolQuit**(*toolmanager*, *name*)

Bases: *matplotlib.backend_tools.ToolBase*

Tool to call the figure manager destroy method.

```
default_keymap = ['ctrl+w', 'cmd+w', 'q']
```

```
description = 'Quit the figure'
```

trigger(*self*, *sender*, *event*, *data=None*)

Called when this tool gets used.

This method is called by *matplotlib.backend_managers.ToolManager.trigger_tool*.

Parameters

event

[*Event*] The canvas event that caused this tool to be called.

sender

[object] Object that requested the tool to be triggered.

data

[object] Extra data.

class matplotlib.backend_tools.**ToolQuitAll**(*toolmanager*, *name*)

Bases: *matplotlib.backend_tools.ToolBase*

Tool to call the figure manager destroy method.

```
default_keymap = []
```

```
description = 'Quit all figures'
```

`trigger`(*self*, *sender*, *event*, *data=None*)
Called when this tool gets used.

This method is called by *matplotlib.backend_managers.ToolManager.trigger_tool*.

Parameters

event

[*Event*] The canvas event that caused this tool to be called.

sender

[object] Object that requested the tool to be triggered.

data

[object] Extra data.

`class matplotlib.backend_tools.ToolToggleBase`(**args*, ***kwargs*)
Bases: *matplotlib.backend_tools.ToolBase*

Toggleable tool.

Every time it is triggered, it switches between enable and disable.

Parameters

``*args``

Variable length argument to be used by the Tool.

``**kwargs``

toggled if present and True, sets the initial state of the Tool Arbitrary keyword arguments to be consumed by the Tool

`cursor = None`
Cursor to use when the tool is active.

`default_toggled = False`
Default of toggled state.

`disable`(*self*, *event=None*)
Disable the toggle tool.

trigger call this method when *toggled* is True.

This can happen in different circumstances.

- Click on the toolbar tool button.
- Call to *matplotlib.backend_managers.ToolManager.trigger_tool*.
- Another *ToolToggleBase* derived tool is triggered (from the same *ToolManager*).

`enable`(*self*, *event=None*)
Enable the toggle tool.

trigger calls this method when *toggled* is False.

`radio_group = None`
Attribute to group 'radio' like tools (mutually exclusive).

String that identifies the group or **None** if not belonging to a group.

`set_figure`(*self*, *figure*)
Assign a figure to the tool.

Parameters

figure

[*Figure*]

`property toggled`
State of the toggled tool.

`trigger`(*self*, *sender*, *event*, *data=None*)
Calls *enable* or *disable* based on *toggled* value.

`class matplotlib.backend_tools.ToolViewsPositions`(**args*, ***kwargs*)
Bases: *matplotlib.backend_tools.ToolBase*

Auxiliary Tool to handle changes in views and positions.

Runs in the background and should get used by all the tools that need to access the figure's history of views and positions, e.g.

- *ToolZoom*
- *ToolPan*
- *ToolHome*
- *ToolBack*
- *ToolForward*

`add_figure`(*self*, *figure*)
Add the current figure to the stack of views and positions.

`back`(*self*)
Back one step in the stack of views and positions.

`clear`(*self*, *figure*)
Reset the axes stack.

`forward`(*self*)
Forward one step in the stack of views and positions.

`home`(*self*)
Recall the first view and position from the stack.

`push_current`(*self*, *figure=None*)
Push the current view limits and position onto their respective stacks.

`refresh_locators`(*self*)
[*Deprecated*] Redraw the canvases, update the locators.

Notes

Deprecated since version 3.3.

`update_home_views`(*self*, *figure=None*)
Make sure that `self.home_views` has an entry for all axes present in the figure.

`update_view`(*self*)
Update the view limits and position for each axes from the current stack position. If any axes are present in the figure that aren't in the current stack position, use the home view limits for those axes and don't update *any* positions.

class `matplotlib.backend_tools.ToolXScale`(**args*, ***kwargs*)
Bases: *matplotlib.backend_tools.AxisScaleBase*

Tool to toggle between linear and logarithmic scales on the X axis.

`default_keymap = ['k', 'L']`

`description = 'Toggle scale X axis'`

`set_scale`(*self*, *ax*, *scale*)

class `matplotlib.backend_tools.ToolYScale`(**args*, ***kwargs*)
Bases: *matplotlib.backend_tools.AxisScaleBase*

Tool to toggle between linear and logarithmic scales on the Y axis.

`default_keymap = ['l']`

`description = 'Toggle scale Y axis'`

`set_scale`(*self*, *ax*, *scale*)

class `matplotlib.backend_tools.ToolZoom`(**args*)
Bases: *matplotlib.backend_tools.ZoomPanBase*

A Tool for zooming using a rectangle selector.

`cursor = 2`

`default_keymap = ['o']`

`description = 'Zoom to rectangle'`

`image = 'zoom_to_rect'`

`radio_group = 'default'`

class matplotlib.backend_tools.**ViewsPositionsBase**(*toolmanager*, *name*)

Bases: *matplotlib.backend_tools.ToolBase*

Base class for *ToolHome*, *ToolBack* and *ToolForward*.

trigger(*self*, *sender*, *event*, *data=None*)

Called when this tool gets used.

This method is called by *matplotlib.backend_managers.ToolManager.trigger_tool*.

Parameters

event

[*Event*] The canvas event that caused this tool to be called.

sender

[object] Object that requested the tool to be triggered.

data

[object] Extra data.

class matplotlib.backend_tools.**ZoomPanBase**(**args*)

Bases: *matplotlib.backend_tools.ToolToggleBase*

Base class for *ToolZoom* and *ToolPan*.

disable(*self*, *event*)

Release the canvas and disconnect press/release events.

enable(*self*, *event*)

Connect press/release events and lock the canvas.

scroll_zoom(*self*, *event*)

trigger(*self*, *sender*, *event*, *data=None*)

Calls *enable* or *disable* based on `toggled` value.

matplotlib.backend_tools.**add_tools_to_container**(*container*, *tools=[['navigation', ['home', 'back', 'forward']], ['zoompan', ['pan', 'zoom', 'subplots']], ['io', ['save', 'help']]]*)

Add multiple tools to the container.

Parameters

container

[Container] `backend_bases.ToolContainerBase` object that will get the tools added.

tools

[list, optional] List in the form `[[group1, [tool1, tool2 ...]], [group2, [...]]]` where the tools `[tool1, tool2, ...]` will display in group1. See `add_tool` for details.

matplotlib.backend_tools.**add_tools_to_manager**(*toolmanager, tools={'home': <class 'matplotlib.backend_tools.ToolHome'>, 'back': <class 'matplotlib.backend_tools.ToolBack'>, 'forward': <class 'matplotlib.backend_tools.ToolForward'>, 'zoom': <class 'matplotlib.backend_tools.ToolZoom'>, 'pan': <class 'matplotlib.backend_tools.ToolPan'>, 'subplots': 'ToolConfigureSubplots', 'save': 'ToolSaveFigure', 'grid': <class 'matplotlib.backend_tools.ToolGrid'>, 'grid_minor': <class 'matplotlib.backend_tools.ToolMinorGrid'>, 'fullscreen': <class 'matplotlib.backend_tools.ToolFullScreen'>, 'quit': <class 'matplotlib.backend_tools.ToolQuit'>, 'quit_all': <class 'matplotlib.backend_tools.ToolQuitAll'>, 'allnav': <class 'matplotlib.backend_tools._ToolEnableAllNavigation'>, 'nav': <class 'matplotlib.backend_tools._ToolEnableNavigation'>, 'xscale': <class 'matplotlib.backend_tools.ToolXScale'>, 'yscale': <class 'matplotlib.backend_tools.ToolYScale'>, 'position': <class 'matplotlib.backend_tools.ToolCursorPosition'>, 'viewpos': <class 'matplotlib.backend_tools.ToolViewsPositions'>, 'cursor': 'ToolSetCursor', 'rubberband': 'ToolRubberband', 'help': 'ToolHelp', 'copy': 'ToolCopyToClipboard'}*)

Add multiple tools to a *ToolManager*.

Parameters

toolmanager

[*backend_managers.ToolManager*] Manager to which the tools are added.

tools

[{str: class_like}, optional] The tools to add in a {name: tool} dict, see `add_tool` for more info.

matplotlib.backend_tools.**cursors**
alias of *matplotlib.backend_tools.Cursors*

matplotlib.backend_tools.**default_toolbar_tools** = [['navigation', ['home', 'back', 'forward']],
Default tools in the toolbar

matplotlib.backend_tools.**default_tools** = {'allnav': <class 'matplotlib.backend_tools._ToolEnab
Default tools

18.10 matplotlib.backends

18.10.1 matplotlib.backends.backend_mixed

class matplotlib.backends.backend_mixed.**MixedModeRenderer**(*figure*, *width*, *height*, *dpi*, *vector_renderer*, *raster_renderer_class=None*, *bbox_inches_restore=None*)

Bases: `object`

A helper class to implement a renderer that switches between vector and raster drawing. An example may be a PDF writer, where most things are drawn with PDF vector commands, but some very complex objects, such as quad meshes, are rasterised and then output as images.

Parameters

figure

[*matplotlib.figure.Figure*] The figure instance.

width

[scalar] The width of the canvas in logical units

height

[scalar] The height of the canvas in logical units

dpi

[float] The dpi of the canvas

vector_renderer

[*matplotlib.backend_bases.RendererBase*] An instance of a subclass of *RendererBase* that will be used for the vector drawing.

raster_renderer_class

[*matplotlib.backend_bases.RendererBase*] The renderer class to use for the raster drawing. If not provided, this will use the Agg backend (which is currently the only viable option anyway.)

`start_rasterizing`(*self*)
Enter "raster" mode. All subsequent drawing commands (until *stop_rasterizing* is called) will be drawn with the raster backend.

`stop_rasterizing`(*self*)
Exit "raster" mode. All of the drawing that was done since the last *start_rasterizing* call will be copied to the vector backend by calling draw_image.

If *start_rasterizing* has been called multiple times, *stop_rasterizing* must be called the same number of times before "raster" mode is exited.

18.10.2 matplotlib.backends.backend_template

A fully functional, do-nothing backend intended as a template for backend writers. It is fully functional in that you can select it as a backend e.g. with

```
import matplotlib
matplotlib.use("template")
```

and your program will (should!) run without error, though no output is produced. This provides a starting point for backend writers; you can selectively implement drawing methods (*draw_path*, *draw_image*, etc.) and slowly see your figure come to life instead having to have a full blown implementation before getting any results.

Copy this file to a directory outside of the Matplotlib source tree, somewhere where Python can import it (by adding the directory to your `sys.path` or by packaging it as a normal Python package); if the backend is importable as `import my.backend` you can then select it using

```
import matplotlib
matplotlib.use("module://my.backend")
```

If your backend implements support for saving figures (i.e. has a `print_xyz` method), you can register it as the default handler for a given file type:

```
from matplotlib.backend_bases import register_backend
register_backend('xyz', 'my_backend', 'XYZ File Format')
...
plt.savefig("figure.xyz")
```

matplotlib.backends.backend_template.**FigureCanvas**
alias of *matplotlib.backends.backend_template.FigureCanvasTemplate*

class matplotlib.backends.backend_template.**FigureCanvasTemplate**(*figure*)
Bases: *matplotlib.backend_bases.FigureCanvasBase*

The canvas the figure renders into. Calls the draw and print fig methods, creates the renderers, etc.

Note: GUI templates will want to connect events for button presses, mouse movements and key presses to functions that call the base class methods button_press_event, button_release_event, motion_notify_event, key_press_event, and key_release_event. See the implementations of the interactive backends for examples.

Attributes

figure

[*matplotlib.figure.Figure*] A high-level Figure instance

draw(*self*)
Draw the figure using the renderer.

filetypes = {'eps': 'Encapsulated Postscript', 'foo': 'My magic Foo format', 'jpeg': 'Joi

get_default_filetype(*self*)
Return the default savefig file format as specified in `rcParams["savefig.format"]` (default: `'png'`).

The returned string does not include a period. This method is overridden in backends that only support a single file type.

print_foo(*self*, *filename*, **args*, ***kwargs*)
Write out format foo. The dpi, facecolor and edgecolor are restored to their original values after this call, so you don't need to save and restore them.

matplotlib.backends.backend_template.**FigureManager**
alias of *matplotlib.backends.backend_template.FigureManagerTemplate*

class matplotlib.backends.backend_template.**FigureManagerTemplate**(*canvas*, *num*)
Bases: *matplotlib.backend_bases.FigureManagerBase*

Helper class for pyplot mode, wraps everything up into a neat bundle.

For non-interactive backends, the base class is sufficient.

class matplotlib.backends.backend_template.**GraphicsContextTemplate**
Bases: *matplotlib.backend_bases.GraphicsContextBase*

The graphics context provides the color, line styles, etc... See the cairo and postscript backends for examples of mapping the graphics context attributes (cap styles, join styles, line widths, colors) to a particular backend. In cairo this is done by wrapping a cairo.Context object and forwarding the appropriate calls

to it using a dictionary mapping styles to gdk constants. In Postscript, all the work is done by the renderer, mapping line styles to postscript calls.

If it's more appropriate to do the mapping at the renderer level (as in the postscript backend), you don't need to override any of the GC methods. If it's more appropriate to wrap an instance (as in the cairo backend) and do the mapping here, you'll need to override several of the setter methods.

The base GraphicsContext stores colors as a RGB tuple on the unit interval, e.g., (0.5, 0.0, 1.0). You may need to map this to colors appropriate for your backend.

class matplotlib.backends.backend_template.**RendererTemplate**(*dpi*)

Bases: *matplotlib.backend_bases.RendererBase*

The renderer handles drawing/rendering operations.

This is a minimal do-nothing class that can be used to get started when writing a new backend. Refer to `backend_bases.RendererBase` for documentation of the methods.

draw_image(*self*, *gc*, *x*, *y*, *im*)

Draw an RGBA image.

Parameters

gc

[*GraphicsContextBase*] A graphics context with clipping information.

x

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

y

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

im

[array-like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.

transform

[*matplotlib.transforms.Affine2DBase*] If and only if the concrete backend is written such that `option_scale_image()` returns `True`, an affine transformation (i.e., an *Affine2DBase*) *may* be passed to *draw_image()*. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

`draw_path`(*self*, *gc*, *path*, *transform*, *rgbFace=None*)
Draw a *Path* instance using the given affine transform.

`draw_text`(*self*, *gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=False*, *mtext=None*)
Draw the text instance.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The text string.

prop

[*matplotlib.font_manager.FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

mtext

[*matplotlib.text.Text*] The original text object to be rendered.

Notes

Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

`flipy`(*self*)
Return whether y values increase from top to bottom.

Note that this only affects drawing of texts and images.

`get_canvas_width_height`(*self*)
Return the canvas width and height in display coords.

get_text_width_height_descent(*self*, *s*, *prop*, *ismath*)
Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with *FontProperties* *prop*.

new_gc(*self*)
Return an instance of a *GraphicsContextBase*.

points_to_pixels(*self*, *points*)
Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72 * dpi/72
```

Parameters

points

[float or array-like] a float or a numpy array of float

Returns

Points converted to pixels

matplotlib.backends.backend_template.**draw_if_interactive**()
For image backends - is not required. For GUI backends - this should be overridden if drawing should be done in interactive python mode.

matplotlib.backends.backend_template.**new_figure_manager**(*num*, **args*, *FigureClass=<class 'matplotlib.figure.Figure'>*, ***kwargs*)
Create a new figure manager instance.

matplotlib.backends.backend_template.**new_figure_manager_given_figure**(*num*, *figure*)
Create a new figure manager instance for the given figure.

matplotlib.backends.backend_template.**show**(*, *block=None*)
For image backends - is not required. For GUI backends - show() is usually the last line of a pyplot script and tells the backend that it is time to draw. In interactive mode, this should do nothing.

18.10.3 matplotlib.backends.backend_agg

An agg backend.

Features that are implemented:

- capstyles and join styles
- dashes
- linewidth
- lines, rectangles, ellipses
- clipping to a rectangle
- output to RGBA and Pillow-supported image formats
- alpha blending
- DPI scaling properly - everything scales properly (dashes, linewidths, etc)
- draw polygon
- freetype2 w/ ft2font

TODO:

- integrate screen dpi w/ ppi and text

matplotlib.backends.backend_agg.**FigureCanvas**
alias of *matplotlib.backends.backend_agg.FigureCanvasAgg*

class matplotlib.backends.backend_agg.**FigureCanvasAgg**(*figure*)
Bases: *matplotlib.backend_bases.FigureCanvasBase*

buffer_rgba(*self*)
Get the image as a memoryview to the renderer's buffer.

draw must be called at least once before this function will work and to update the renderer for any subsequent changes to the Figure.

copy_from_bbox(*self*, *bbox*)

draw(*self*)
Render the *Figure*.

get_renderer(*self*, *cleared=False*)

print_jpeg(*self*, *filename_or_obj*, **args*, *dryrun=<deprecated parameter>*, *pil_kwargs=None*, ***kwargs*)
Write the figure to a JPEG file.

Parameters

filename_or_obj

[str or path-like or file-like] The file to write to.

Other Parameters

quality

[int, default: `rcParams["savefig.jpeg_quality"]` (default: `95`)] The image quality, on a scale from 1 (worst) to 95 (best). Values above 95 should be avoided; 100 disables portions of the JPEG compression algorithm, and results in large files with hardly any gain in image quality. This parameter is deprecated.

optimize

[bool, default: False] Whether the encoder should make an extra pass over the image in order to select optimal encoder settings. This parameter is deprecated.

progressive

[bool, default: False] Whether the image should be stored as a progressive JPEG file. This parameter is deprecated.

pil_kwargs

[dict, optional] Additional keyword arguments that are passed to `PIL.Image.Image.save` when saving the figure. These take precedence over *quality*, *optimize* and *progressive*.

`print_jpg`(*self*, *filename_or_obj*, **args*, *dryrun=<deprecated parameter>*, *pil_kwargs=None*, ***kwargs*)

Write the figure to a JPEG file.

Parameters

filename_or_obj

[str or path-like or file-like] The file to write to.

Other Parameters

quality

[int, default: `rcParams["savefig.jpeg_quality"]` (default: `95`)] The image quality, on a scale from 1 (worst) to 95 (best). Values above 95 should be avoided; 100 disables portions of the JPEG compression algorithm, and results in large files with hardly any gain in image quality. This parameter is deprecated.

optimize

[bool, default: False] Whether the encoder should make an extra pass over the image in order to select optimal encoder settings. This parameter is deprecated.

progressive

[bool, default: False] Whether the image should be stored as a progressive JPEG file. This parameter is deprecated.

pil_kwargs

[dict, optional] Additional keyword arguments that are passed to `PIL.Image.Image.save` when saving the figure. These take precedence over *quality*, *optimize* and *progressive*.

`print_png`(*self*, *filename_or_obj*, **args*, *metadata=None*, *pil_kwargs=None*)

Write the figure to a PNG file.

Parameters

filename_or_obj

[str or path-like or file-like] The file to write to.

metadata

[dict, optional] Metadata in the PNG file as key-value pairs of bytes or latin-1 encodable strings. According to the PNG specification, keys must be shorter than 79 chars.

The PNG specification defines some common keywords that may be used as appropriate:

- Title: Short (one line) title or caption for image.
- Author: Name of image's creator.
- Description: Description of image (possibly long).
- Copyright: Copyright notice.
- Creation Time: Time of original image creation (usually RFC 1123 format).
- Software: Software used to create the image.
- Disclaimer: Legal disclaimer.
- Warning: Warning of nature of content.
- Source: Device used to create the image.
- Comment: Miscellaneous comment; conversion from other image format.

Other keywords may be invented for other purposes.

If 'Software' is not given, an autogenerated value for Matplotlib will be used. This can be removed by setting it to *None*.

For more details see the PNG specification.

pil_kwargs

[dict, optional] Keyword arguments passed to `PIL.Image.Image.save`.

If the 'pnginfo' key is present, it completely overrides *metadata*, including the default 'Software' key.

`print_raw`(*self*, *filename_or_obj*, **args*)

`print_rgba`(*self*, *filename_or_obj*, **args*)

`print_tif`(*self*, *filename_or_obj*, ***, *dryrun=<deprecated parameter>*, *pil_kwargs=None*)

`print_tiff`(*self*, *filename_or_obj*, ***, *dryrun=<deprecated parameter>*, *pil_kwargs=None*)

`print_to_buffer`(*self*)

`restore_region`(*self*, *region*, *bbox=None*, *xy=None*)

`tostring_argb`(*self*)
Get the image as ARGB `bytes`.

draw must be called at least once before this function will work and to update the renderer for any subsequent changes to the Figure.

`tostring_rgb`(*self*)
Get the image as RGB `bytes`.

draw must be called at least once before this function will work and to update the renderer for any subsequent changes to the Figure.

class matplotlib.backends.backend_agg.**RendererAgg**(*width*, *height*, *dpi*)
Bases: *matplotlib.backend_bases.RendererBase*

The renderer handles all the drawing primitives using a graphics context instance that controls the colors/styles

`buffer_rgba`(*self*)

`clear`(*self*)

`draw_mathtext`(*self*, *gc*, *x*, *y*, *s*, *prop*, *angle*)
Draw mathtext using *matplotlib.mathtext*.

`draw_path`(*self*, *gc*, *path*, *transform*, *rgbFace=None*)
Draw a *Path* instance using the given affine transform.

`draw_path_collection`(*self*, *gc*, *master_transform*, *paths*, *all_transforms*, *offsets*, *offsetTrans*, *facecolors*, *edgecolors*, *linewidths*, *linestyles*, *antialiaseds*, *urls*, *offset_position*)
Draw a collection of paths selecting drawing properties from the lists *facecolors*, *edgecolors*, *linewidths*, *linestyles* and *antialiaseds*. *offsets* is a list of offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied.

offset_position may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of *draw_path_collection()* that makes multiple calls to *draw_path()*. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of *draw_path_collection()* can be made globally.

`draw_tex`(*self*, *gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=<deprecated parameter>*, *mtext=None*)

`draw_text`(*self*, *gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=False*, *mtext=None*)

Draw the text instance.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The text string.

prop

[*matplotlib.font_manager.FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

mtext

[*matplotlib.text.Text*] The original text object to be rendered.

Notes

Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

`get_canvas_width_height`(*self*)
Return the canvas width and height in display coords.

`get_text_width_height_descent`(*self*, *s*, *prop*, *ismath*)
Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with *FontProperties* *prop*.

`lock = <unlocked _thread.RLock object owner=0 count=0>`

`option_image_nocomposite`(*self*)
Return whether image composition by Matplotlib should be skipped.

Raster backends should usually return False (letting the C-level rasterizer take care of image composition); vector backends should usually return `not rcParams["image.composite_image"]`.

`option_scale_image`(*self*)
Return whether arbitrary affine transformations in `draw_image()` are supported (True for most vector backends).

`points_to_pixels`(*self*, *points*)
Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72 * dpi/72
```

Parameters

points

[float or array-like] a float or a numpy array of float

Returns

Points converted to pixels

restore_region(*self*, *region*, *bbox=None*, *xy=None*)
Restore the saved region. If bbox (instance of BboxBase, or its extents) is given, only the region specified by the bbox will be restored. *xy* (a pair of floats) optionally specifies the new position (the LLC of the original region, not the LLC of the bbox) where the region will be restored.

```
>>> region = renderer.copy_from_bbox()
>>> x1, y1, x2, y2 = region.get_extents()
>>> renderer.restore_region(region, bbox=(x1+dx, y1, x2, y2),
...                         xy=(x1-dx, y1))
```

start_filter(*self*)
Start filtering. It simply create a new canvas (the old one is saved).

stop_filter(*self*, *post_processing*)
Save the plot in the current canvas as a image and apply the *post_processing* function.

def post_processing(image, dpi):

ny, nx, depth = image.shape # image (numpy array) has RGBA channels and has a depth of 4. ... # create a new_image (numpy array of 4 channels, size can be # different). The resulting image may have offsets from # lower-left corner of the original image return new_image, offset_x, offset_y

The saved renderer is restored and the returned image from post_processing is plotted (using draw_image) on it.

tostring_argb(*self*)

tostring_rgb(*self*)

tostring_rgba_minimized(*self*)

matplotlib.backends.backend_agg.get_hinting_flag()

18.10.4 matplotlib.backends.backend_cairo

A Cairo backend for matplotlib

Author

Steve Chaplin and others

This backend depends on cairocffi or pycairo.

matplotlib.backends.backend_cairo.FigureCanvas
alias of *matplotlib.backends.backend_cairo.FigureCanvasCairo*

class matplotlib.backends.backend_cairo.FigureCanvasCairo(*figure*)
Bases: *matplotlib.backend_bases.FigureCanvasBase*

copy_from_bbox(*self*, *bbox*)

print_pdf(*self*, *fobj*, **args*, ***kwargs*)

print_png(*self*, *fobj*)

print_ps(*self*, *fobj*, **args*, ***kwargs*)

print_raw(*self*, *fobj*)

print_rgba(*self*, *fobj*)

print_svg(*self*, *fobj*, **args*, ***kwargs*)

print_svgz(*self*, *fobj*, **args*, ***kwargs*)

restore_region(*self*, *region*)

class matplotlib.backends.backend_cairo.GraphicsContextCairo(*renderer*)

Bases: *matplotlib.backend_bases.GraphicsContextBase*

get_rgb(*self*)

Return a tuple of three or four floats from 0-1.

restore(*self*)

Restore the graphics context from the stack - needed only for backends that save graphics contexts on a stack.

set_alpha(*self*, *alpha*)

Set the alpha value used for blending - not supported on all backends.

If `alpha=None` (the default), the alpha components of the foreground and fill colors will be used to set their respective transparencies (where applicable); otherwise, `alpha` will override them.

set_capstyle(*self*, *cs*)

Set the capstyle to be one of ('butt', 'round', 'projecting').

set_clip_path(*self*, *path*)

Set the clip path and transformation.

Parameters

path

[*TransformedPath* or None]

set_clip_rectangle(*self*, *rectangle*)

Set the clip rectangle with sequence (left, bottom, width, height)

set_dashes(*self*, *offset*, *dashes*)

Set the dash style for the gc.

Parameters

dash_offset

[float or None] The offset (usually 0).

dash_list

[array-like or None] The on-off sequence as points.

Notes

`(None, None)` specifies a solid line.

See p. 107 of to PostScript blue book for more info.

`set_foreground`(*self*, *fg*, *isRGBA=None*)
Set the foreground color.

Parameters

fg

[color]

isRGBA

[bool] If *fg* is known to be an `(r, g, b, a)` tuple, *isRGBA* can be set to True to improve performance.

`set_joinstyle`(*self*, *js*)
Set the join style to be one of ('miter', 'round', 'bevel').

`set_linewidth`(*self*, *w*)
Set the linewidth in points.

`class matplotlib.backends.backend_cairo.RendererCairo`(*dpi*)
Bases: *matplotlib.backend_bases.RendererBase*

`draw_image`(*self*, *gc*, *x*, *y*, *im*)
Draw an RGBA image.

Parameters

gc

[*GraphicsContextBase*] A graphics context with clipping information.

x

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

y

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

im

[array-like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.

transform

[*matplotlib.transforms.Affine2DBase*] If and only if the concrete backend is written such that `option_scale_image()` returns `True`, an affine transformation (i.e., an *Affine2DBase*) *may* be passed to *draw_image()*. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

`draw_markers`(*self*, *gc*, *marker_path*, *marker_trans*, *path*, *transform*, *rgbFace=None*)

Draw a marker at each of the vertices in path.

This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of draw_markers that makes multiple calls to *draw_path()*. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

marker_trans

[*matplotlib.transforms.Transform*] An affine transform applied to the marker.

trans

[*matplotlib.transforms.Transform*] An affine transform applied to the path.

`draw_path`(*self*, *gc*, *path*, *transform*, *rgbFace=None*)

Draw a *Path* instance using the given affine transform.

`draw_text`(*self*, *gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=False*, *mtext=None*)

Draw the text instance.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The text string.

prop

[*matplotlib.font_manager.FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

mtext

[*matplotlib.text.Text*] The original text object to be rendered.

Notes

Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

`property fontangles`

`property fontweights`

`get_canvas_width_height`(*self*)
Return the canvas width and height in display coords.

`get_text_width_height_descent`(*self*, *s*, *prop*, *ismath*)
Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with *FontProperties* *prop*.

`new_gc`(*self*)
Return an instance of a *GraphicsContextBase*.

`points_to_pixels`(*self*, *points*)
Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72 * dpi/72
```

Parameters

points

[float or array-like] a float or a numpy array of float

Returns

Points converted to pixels

`set_ctx_from_surface`(*self*, *surface*)

`set_width_height`(*self*, *width*, *height*)

18.10.5 matplotlib.backends.backend_gtk3agg

TODO We'll add this later, importing the gtk3 backends requires an active X-session, which is not compatible with cron jobs.

18.10.6 matplotlib.backends.backend_gtk3cairo

TODO We'll add this later, importing the gtk3 backends requires an active X-session, which is not compatible with cron jobs.

18.10.7 matplotlib.backends.backend_nbagg

Interactive figures in the IPython notebook

`class matplotlib.backends.backend_nbagg.CommSocket`(*manager*)

Bases: `object`

Manages the Comm connection between IPython and the browser (client).

Comms are 2 way, with the CommSocket being able to publish a message via the send_json method, and handle a message with on_message. On the JS side figure.send_message and figure.ws.onmessage do the sending and receiving respectively.

`is_open`(*self*)

`on_close`(*self*)

`on_message`(*self*, *message*)

`send_binary`(*self*, *blob*)

`send_json`(*self*, *content*)

matplotlib.backends.backend_nbagg.**FigureCanvas**
alias of *matplotlib.backends.backend_nbagg.FigureCanvasNbAgg*

class matplotlib.backends.backend_nbagg.**FigureCanvasNbAgg**(**args*, ***kwargs*)
Bases: matplotlib.backends.backend_webagg_core.FigureCanvasWebAggCore

matplotlib.backends.backend_nbagg.**FigureManager**
alias of *matplotlib.backends.backend_nbagg.FigureManagerNbAgg*

class matplotlib.backends.backend_nbagg.**FigureManagerNbAgg**(*canvas*, *num*)
Bases: matplotlib.backends.backend_webagg_core.FigureManagerWebAgg

ToolbarCls
alias of *NavigationIPy*

clearup_closed(*self*)
Clear up any closed Comms.

property connected

destroy(*self*)

display_js(*self*)

classmethod get_javascript(*stream=None*)

remove_comm(*self*, *comm_id*)

reshow(*self*)
A special method to re-show the figure in the notebook.

show(*self*)
For GUI backends, show the figure window and redraw. For non-GUI backends, raise an exception, unless running headless (i.e. on Linux with an unset DISPLAY); this exception is converted to a warning in *Figure.show*.

class matplotlib.backends.backend_nbagg.**NavigationIPy**(*canvas*)
Bases: matplotlib.backends.backend_webagg_core.NavigationToolbar2WebAgg

toolitems = [('Home', 'Reset original view', 'fa fa-home icon-home', 'home'), ('Back', 'Ba

matplotlib.backends.backend_nbagg.**connection_info**()
Return a string showing the figure and connection status for the backend.

This is intended as a diagnostic tool, and not for general use.

matplotlib.backends.backend_nbagg.**new_figure_manager_given_figure**(*num*, *figure*)
Create a new figure manager instance for the given figure.

matplotlib.backends.backend_nbagg.**show**(*block=None*)
Show all figures.

show blocks by calling `mainloop` if *block* is `True`, or if it is `None` and we are neither in IPython's `%pylab` mode, nor in `interactive` mode.

18.10.8 matplotlib.backends.backend_pdf

A PDF matplotlib backend Author: Jouni K Seppänen <jks@iki.fi>

matplotlib.backends.backend_pdf.**FigureCanvas**
alias of *matplotlib.backends.backend_pdf.FigureCanvasPdf*

class matplotlib.backends.backend_pdf.**FigureCanvasPdf**(*figure*)
Bases: *matplotlib.backend_bases.FigureCanvasBase*

The canvas the figure renders into. Calls the draw and print fig methods, creates the renderers, etc...

Attributes

figure

[*matplotlib.figure.Figure*] A high-level Figure instance

filetypes = {'pdf': 'Portable Document Format'}

fixed_dpi = 72

get_default_filetype(*self*)
Return the default savefig file format as specified in `rcParams["savefig.format"]` (default: `'png'`).

The returned string does not include a period. This method is overridden in backends that only support a single file type.

print_pdf(*self*, *filename*, ***, *dpi=72*, *bbox_inches_restore=None*, *metadata=None*)

class matplotlib.backends.backend_pdf.**GraphicsContextPdf**(*file*)
Bases: *matplotlib.backend_bases.GraphicsContextBase*

alpha_cmd(*self*, *alpha*, *forced*, *effective_alphas*)

capstyle_cmd(*self*, *style*)

capstyles = {'butt': 0, 'projecting': 2, 'round': 1}

clip_cmd(*self*, *cliprect*, *clippath*)
Set clip rectangle. Calls *pop()* and *push()*.

commands = ((('_cliprect', '_clippath'), <function GraphicsContextPdf.clip_cmd>), (('_alph

copy_properties(*self*, *other*)
Copy properties of other into self.

dash_cmd(*self*, *dashes*)

delta(*self*, *other*)
Copy properties of other into self and return PDF commands needed to transform self into other.

fill(*self*, **args*)
Predicate: does the path need to be filled?

An optional argument can be used to specify an alternative _fillcolor, as needed by RendererPdf.draw_markers.

fillcolor_cmd(*self*, *rgb*)

finalize(*self*)
Make sure every pushed graphics state is popped.

hatch_cmd(*self*, *hatch*, *hatch_color*)

joinstyle_cmd(*self*, *style*)

joinstyles = {'bevel': 2, 'miter': 0, 'round': 1}

linewidth_cmd(*self*, *width*)

paint(*self*)
Return the appropriate pdf operator to cause the path to be stroked, filled, or both.

pop(*self*)

push(*self*)

rgb_cmd(*self*, *rgb*)

stroke(*self*)
Predicate: does the path need to be stroked (its outline drawn)? This tests for the various conditions that disable stroking the path, in which case it would presumably be filled.

class matplotlib.backends.backend_pdf.Name(*name*)
Bases: object

PDF name object.

static hexify(*match*)

name

pdfRepr(*self*)

class matplotlib.backends.backend_pdf.Operator(*op*)
Bases: object

PDF operator object.

op

pdfRepr(*self*)

class matplotlib.backends.backend_pdf.PdfFile(*filename*, *metadata=None*)
Bases: object

PDF file object.

Parameters

filename

[str or path-like or file-like] Output target; if a string, a file will be opened for writing.

metadata

[dict from strings to strings and dates] Information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary'), e.g.: `{'Creator': 'My software', 'Author': 'Me', 'Title': 'Awesome'}`.

The standard keys are 'Title', 'Author', 'Subject', 'Keywords', 'Creator', 'Producer', 'CreationDate', 'ModDate', and 'Trapped'. Values have been predefined for 'Creator', 'Producer' and 'CreationDate'. They can be removed by setting them to `None`.

`addGouraudTriangles`(*self*, *points*, *colors*)

Add a Gouraud triangle shading.

Parameters

points

[np.ndarray] Triangle vertices, shape (n, 3, 2) where n = number of triangles, 3 = vertices, 2 = x, y.

colors

[np.ndarray] Vertex colors, shape (n, 3, 1) or (n, 3, 4) as with points, but last dimension is either (gray,) or (r, g, b, alpha).

Returns

Name, Reference

`alphaState`(*self*, *alpha*)

Return name of an ExtGState that sets alpha to the given value.

`beginStream`(*self*, *id*, *len*, *extra=None*, *png=None*)

`close`(*self*)

Flush all buffers and free all resources.

`createType1Descriptor`(*self*, *t1font*, *fontfile*)

`dviFontName`(*self*, *dvifont*)

Given a dvi font object, return a name suitable for Op.selectfont. This registers the font information in `self.dviFontInfo` if not yet registered.

`embedTTF`(*self*, *filename*, *characters*)

Embed the TTF font from the named file into the document.

`endStream`(*self*)

finalize(*self*)
Write out the various deferred objects and the pdf end matter.

fontName(*self*, *fontprop*)
Select a font based on fontprop and return a name suitable for Op.selectfont. If fontprop is a string, it will be interpreted as the filename of the font.

hatchPattern(*self*, *hatch_style*)

imageObject(*self*, *image*)
Return name of an image XObject representing the given image.

markerObject(*self*, *path*, *trans*, *fill*, *stroke*, *lw*, *joinstyle*, *capstyle*)
Return name of a marker XObject representing the given path.

newPage(*self*, *width*, *height*)

newTextnote(*self*, *text*, *positionRect=[- 100, - 100, 0, 0]*)

output(*self*, **data*)

pathCollectionObject(*self*, *gc*, *path*, *trans*, *padding*, *filled*, *stroked*)

static pathOperations(*path*, *transform*, *clip=None*, *simplify=None*, *sketch=None*)

recordXref(*self*, *id*)

reserveObject(*self*, *name=''*)
Reserve an ID for an indirect object.

The name is used for debugging in case we forget to print out the object with writeObject.

property used_characters

write(*self*, *data*)

writeExtGSTates(*self*)

writeFonts(*self*)

writeGouraudTriangles(*self*)

writeHatches(*self*)

writeImages(*self*)

writeInfoDict(*self*)
Write out the info dictionary, checking it for good form

writeMarkers(*self*)

writeObject(*self*, *object*, *contents*)

writePath(*self*, *path*, *transform*, *clip=False*, *sketch=None*)

writePathCollectionTemplates(*self*)

`writeTrailer`(*self*)
Write out the PDF trailer.

`writeXref`(*self*)
Write out the xref table.

class matplotlib.backends.backend_pdf.`PdfPages`(*filename*, *keep_empty=True*, *metadata=None*)

Bases: `object`

A multi-page PDF file.

Notes

In reality *PdfPages* is a thin wrapper around *PdfFile*, in order to avoid confusion when using *savefig* and forgetting the format argument.

Examples

```
>>> import matplotlib.pyplot as plt
>>> # Initialize:
>>> with PdfPages('foo.pdf') as pdf:
...     # As many times as you like, create a figure fig and save it:
...     fig = plt.figure()
...     pdf.savefig(fig)
...     # When no figure is specified the current figure is saved
...     pdf.savefig()
```

Create a new PdfPages object.

Parameters

filename

[str or path-like or file-like] Plots using *PdfPages.savefig* will be written to a file at this location. The file is opened at once and any older file with the same name is overwritten.

keep_empty

[bool, optional] If set to False, then empty pdf files will be deleted automatically when closed.

metadata

[dict, optional] Information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary'), e.g.: `{'Creator': 'My software', 'Author': 'Me', 'Title': 'Awesome'}`.

The standard keys are 'Title', 'Author', 'Subject', 'Keywords', 'Creator', 'Producer', 'CreationDate', 'ModDate', and 'Trapped'.

Values have been predefined for 'Creator', 'Producer' and 'CreationDate'. They can be removed by setting them to `None`.

`attach_note`(*self*, *text*, *positionRect=[- 100, - 100, 0, 0]*)
Add a new text note to the page to be saved next. The optional positionRect specifies the position of the new note on the page. It is outside the page per default to make sure it is invisible on printouts.

`close`(*self*)
Finalize this object, making the underlying file a complete PDF file.

`get_pagecount`(*self*)
Return the current number of pages in the multipage pdf file.

`infodict`(*self*)
Return a modifiable information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary').

`keep_empty`

`savefig`(*self*, *figure=None*, ***kwargs*)
Save a *Figure* to this file as a new page.

Any other keyword arguments are passed to *savefig*.

Parameters

figure

[*Figure* or int, optional] Specifies what figure is saved to file. If not specified, the active figure is saved. If a *Figure* instance is provided, this figure is saved. If an int is specified, the figure instance to save is looked up by number.

class `matplotlib.backends.backend_pdf.Reference`(*id*)
Bases: `object`

PDF reference object.

Use PdfFile.reserveObject() to create References.

`pdfRepr`(*self*)

`write`(*self*, *contents*, *file*)

class `matplotlib.backends.backend_pdf.RendererPdf`(*file*, *image_dpi*, *height*, *width*)
Bases: `matplotlib.backends._backend_pdf_ps.RendererPDFPSBase`

`check_gc`(*self*, *gc*, *fillcolor=None*)

`draw_gouraud_triangle`(*self*, *gc*, *points*, *colors*, *trans*)
Draw a Gouraud-shaded triangle.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

points

[array-like, shape=(3, 2)] Array of (x, y) points for the triangle.

colors

[array-like, shape=(3, 4)] RGBA colors for each point of the triangle.

transform

[*matplotlib.transforms.Transform*] An affine transform to apply to the points.

`draw_gouraud_triangles`(*self*, *gc*, *points*, *colors*, *trans*)

Draw a series of Gouraud triangles.

Parameters

points

[array-like, shape=(N, 3, 2)] Array of *N* (x, y) points for the triangles.

colors

[array-like, shape=(N, 3, 4)] Array of *N* RGBA colors for each point of the triangles.

transform

[*matplotlib.transforms.Transform*] An affine transform to apply to the points.

`draw_image`(*self*, *gc*, *x*, *y*, *im*, *transform=None*)

Draw an RGBA image.

Parameters

gc

[*GraphicsContextBase*] A graphics context with clipping information.

x

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

y

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

im

[array-like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.

transform

[*matplotlib.transforms.Affine2DBase*] If and only if the concrete backend is written such that `option_scale_image()` returns `True`, an affine transformation (i.e., an *Affine2DBase*) *may* be passed to *draw_image()*. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

`draw_markers`(*self*, *gc*, *marker_path*, *marker_trans*, *path*, *trans*, *rgbFace=None*)

Draw a marker at each of the vertices in path.

This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of draw_markers that makes multiple calls to *draw_path()*. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

marker_trans

[*matplotlib.transforms.Transform*] An affine transform applied to the marker.

trans

[*matplotlib.transforms.Transform*] An affine transform applied to the path.

`draw_mathtext`(*self*, *gc*, *x*, *y*, *s*, *prop*, *angle*)

`draw_path`(*self*, *gc*, *path*, *transform*, *rgbFace=None*)

Draw a *Path* instance using the given affine transform.

`draw_path_collection`(*self*, *gc*, *master_transform*, *paths*, *all_transforms*, *offsets*, *offsetTrans*, *facecolors*, *edgecolors*, *linewidths*, *linestyles*, *antialiaseds*, *urls*, *offset_position*)

Draw a collection of paths selecting drawing properties from the lists *facecolors*, *edgecolors*, *linewidths*, *linestyles* and *antialiaseds*. *offsets* is a list of

offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied.

offset_position may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of *draw_path_collection()* that makes multiple calls to *draw_path()*. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of *draw_path_collection()* can be made globally.

`draw_tex`(*self*, *gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=<deprecated parameter>*, *mtext=None*)

`draw_text`(*self*, *gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=False*, *mtext=None*)

Draw the text instance.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The text string.

prop

[*matplotlib.font_manager.FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

mtext

[*matplotlib.text.Text*] The original text object to be rendered.

Notes

Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

`encode_string`(*self*, *s*, *fonttype*)

`finalize`(*self*)

`get_image_magnification`(*self*)
Get the factor by which to magnify images passed to *draw_image()*. Allows a backend to have images at a different resolution to other artists.

`merge_used_characters`(*self*, **args*, ***kwargs*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`new_gc`(*self*)
Return an instance of a *GraphicsContextBase*.

`track_characters`(*self*, **args*, ***kwargs*)
[*Deprecated*] Keep track of which characters are required from each font.

Notes

Deprecated since version 3.3.

class matplotlib.backends.backend_pdf.`Stream`(*id*, *len*, *file*, *extra=None*, *png=None*)

Bases: `object`

PDF stream object.

This has no pdfRepr method. Instead, call begin(), then output the contents of the stream by calling write(), and finally call end().

Parameters

id

[int] Object id of the stream.

len

[Reference or None] An unused Reference object for the length of the stream; None means to use a memory buffer so the length can be inlined.

file

[PdfFile] The underlying object to write the stream to.

extra

[dict from Name to anything, or None] Extra key-value pairs to include in the stream header.

png

[dict or None] If the data is already png encoded, the decode parameters.

`compressobj`

`end`(*self*)
Finalize stream.

`extra`

`file`

`id`

`len`

`pdfFile`

`pos`

`write`(*self*, *data*)
Write some data on the stream.

`class matplotlib.backends.backend_pdf.Verbatim`(*x*)
Bases: `object`

Store verbatim PDF command content for later inclusion in the stream.

`pdfRepr`(*self*)

`matplotlib.backends.backend_pdf.fill`(*strings*, *linelen=75*)
Make one string from sequence of strings, with whitespace in between.

The whitespace is chosen to form lines of at most *linelen* characters, if possible.

`matplotlib.backends.backend_pdf.pdfRepr`(*obj*)
Map Python objects to PDF syntax.

18.10.9 matplotlib.backends.backend_pgf

matplotlib.backends.backend_pgf.**FigureCanvas**
alias of *matplotlib.backends.backend_pgf.FigureCanvasPgf*

class matplotlib.backends.backend_pgf.**FigureCanvasPgf**(*figure*)
Bases: *matplotlib.backend_bases.FigureCanvasBase*

filetypes = {'pdf': 'LaTeX compiled PGF picture', 'pgf': 'LaTeX PGF picture', 'png': 'Por

get_default_filetype(*self*)
Return the default savefig file format as specified in `rcParams["savefig.format"]` (default: `'png'`).

The returned string does not include a period. This method is overridden in backends that only support a single file type.

get_renderer(*self*)

print_pdf(*self*, *fname_or_fh*, **args*, ***kwargs*)
Use LaTeX to compile a Pgf generated figure to PDF.

print_pgf(*self*, *fname_or_fh*, **args*, ***kwargs*)
Output pgf macros for drawing the figure so it can be included and rendered in latex documents.

print_png(*self*, *fname_or_fh*, **args*, ***kwargs*)
Use LaTeX to compile a pgf figure to pdf and convert it to png.

class matplotlib.backends.backend_pgf.**GraphicsContextPgf**(***kwargs*)
Bases: *matplotlib.backend_bases.GraphicsContextBase*

[*Deprecated*]

Notes

Deprecated since version 3.3:

exception matplotlib.backends.backend_pgf.**LatexError**(*message*, *latex_output=''*)
Bases: `Exception`

class matplotlib.backends.backend_pgf.**LatexManager**
Bases: `object`

The LatexManager opens an instance of the LaTeX application for determining the metrics of text elements. The LaTeX environment can be modified by setting fonts and/or a custom preamble in *rcParams*.

get_width_height_descent(*self*, *text*, *prop*)
Get the width, total height and descent for a text typeset by the current LaTeX environment.

latex_stdin_utf8(*self*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

class matplotlib.backends.backend_pgf.PdfPages(*filename*, *, *keep_empty=True*, *metadata=None*)

Bases: object

A multi-page PDF file using the pgf backend

Examples

```
>>> import matplotlib.pyplot as plt
>>> # Initialize:
>>> with PdfPages('foo.pdf') as pdf:
...     # As many times as you like, create a figure fig and save it:
...     fig = plt.figure()
...     pdf.savefig(fig)
...     # When no figure is specified the current figure is saved
...     pdf.savefig()
```

Create a new PdfPages object.

Parameters

filename

[str or path-like] Plots using *PdfPages.savefig* will be written to a file at this location. Any older file with the same name is overwritten.

keep_empty

[bool, default: True] If set to False, then empty pdf files will be deleted automatically when closed.

metadata

[dict, optional] Information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary'), e.g.: `{'Creator': 'My software', 'Author': 'Me', 'Title': 'Awesome'}`.

The standard keys are 'Title', 'Author', 'Subject', 'Keywords', 'Creator', 'Producer', 'CreationDate', 'ModDate', and 'Trapped'. Values have been predefined for 'Creator', 'Producer' and 'CreationDate'. They can be removed by setting them to None.

close(*self*)
Finalize this object, running LaTeX in a temporary directory and moving the final pdf file to *filename*.

get_pagecount(*self*)
Return the current number of pages in the multipage pdf file.

keep_empty

property metadata

savefig(*self*, *figure=None*, ***kwargs*)
Save a *Figure* to this file as a new page.

Any other keyword arguments are passed to *savefig*.

Parameters

figure

[*Figure* or int, optional] Specifies what figure is saved to file. If not specified, the active figure is saved. If a *Figure* instance is provided, this figure is saved. If an int is specified, the figure instance to save is looked up by number.

class matplotlib.backends.backend_pgf.RendererPgf(*figure*, *fh*, *dummy=<deprecated parameter>*)
Bases: *matplotlib.backend_bases.RendererBase*

Create a new PGF renderer that translates any drawing instruction into text commands to be interpreted in a latex pgfpicture environment.

Attributes

figure

[*matplotlib.figure.Figure*] Matplotlib figure to initialize height, width and dpi from.

fh

[file-like] File handle for the output of the drawing commands.

draw_image(*self*, *gc*, *x*, *y*, *im*, *transform=None*)
Draw an RGBA image.

Parameters

gc

[*GraphicsContextBase*] A graphics context with clipping information.

x

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

y

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

im

[array-like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.

transform

[*matplotlib.transforms.Affine2DBase*] If and only if the concrete backend is written such that *option_scale_image()* returns `True`, an affine transformation (i.e., an *Affine2DBase*) *may* be passed to *draw_image()*. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

`draw_markers`(*self*, *gc*, *marker_path*, *marker_trans*, *path*, *trans*, *rgbFace=None*)

Draw a marker at each of the vertices in path.

This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of draw_markers that makes multiple calls to *draw_path()*. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

marker_trans

[*matplotlib.transforms.Transform*] An affine transform applied to the marker.

trans

[*matplotlib.transforms.Transform*] An affine transform applied to the path.

`draw_path`(*self*, *gc*, *path*, *transform*, *rgbFace=None*)
Draw a *Path* instance using the given affine transform.

`draw_tex`(*self*, *gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath='TeX!'*, *mtext=None*)

`draw_text`(*self*, *gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=False*, *mtext=None*)
Draw the text instance.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The text string.

prop

[*matplotlib.font_manager.FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

mtext

[*matplotlib.text.Text*] The original text object to be rendered.

Notes

Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

`flipy`(*self*)
Return whether y values increase from top to bottom.

Note that this only affects drawing of texts and images.

`get_canvas_width_height`(*self*)
Return the canvas width and height in display coords.

get_text_width_height_descent(*self*, *s*, *prop*, *ismath*)
Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with *FontProperties* *prop*.

property latexManager

option_image_nocomposite(*self*)
Return whether image composition by Matplotlib should be skipped.

Raster backends should usually return False (letting the C-level rasterizer take care of image composition); vector backends should usually return `not rcParams["image.composite_image"]`.

option_scale_image(*self*)
Return whether arbitrary affine transformations in *draw_image()* are supported (True for most vector backends).

points_to_pixels(*self*, *points*)
Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72 * dpi/72
```

Parameters

points

[float or array-like] a float or a numpy array of float

Returns

Points converted to pixels

class matplotlib.backends.backend_pgf.TmpDirCleaner
Bases: object

static add(*tmpdir*)

static cleanup_remaining_tmpdirs()

remaining_tmpdirs = {}

matplotlib.backends.backend_pgf.common_texification(*text*)
Do some necessary and/or useful substitutions for texts to be included in LaTeX documents.

This distinguishes text-mode and math-mode by replacing the math separator `$` with `\(\displaystyle %s\)`. Escaped math separators (`\$`) are ignored.

The following characters are escaped in text segments: `_^$%`

matplotlib.backends.backend_pgf.**get_fontspec**()
Build fontspec preamble from rc.

matplotlib.backends.backend_pgf.**get_preamble**()
Get LaTeX preamble from rc.

matplotlib.backends.backend_pgf.**make_pdf_to_png_converter**()
Return a function that converts a pdf file to a png file.

matplotlib.backends.backend_pgf.**repl_escapetext**(*m*)
[*Deprecated*]

Notes

Deprecated since version 3.2:

matplotlib.backends.backend_pgf.**repl_mathdefault**(*m*)
[*Deprecated*]

Notes

Deprecated since version 3.2:

matplotlib.backends.backend_pgf.**writeln**(*fh*, *line*)

18.10.10 matplotlib.backends.backend_ps

A PostScript backend, which can produce both PostScript .ps and .eps.

matplotlib.backends.backend_ps.**FigureCanvas**
alias of *matplotlib.backends.backend_ps.FigureCanvasPS*

class matplotlib.backends.backend_ps.**FigureCanvasPS**(*figure*)
Bases: *matplotlib.backend_bases.FigureCanvasBase*

filetypes = {'eps': 'Encapsulated Postscript', 'ps': 'Postscript'}

fixed_dpi = 72

get_default_filetype(*self*)
Return the default savefig file format as specified in `rcParams["savefig.format"]` (default: `'png'`).

The returned string does not include a period. This method is overridden in backends that only support a single file type.

print_eps(*self*, *outfile*, **args*, ***kwargs*)

print_ps(*self*, *outfile*, **args*, ***kwargs*)

class matplotlib.backends.backend_ps.**GraphicsContextPS**
Bases: *matplotlib.backend_bases.GraphicsContextBase*

get_capstyle(*self*)
Return the capstyle as a string in ('butt', 'round', 'projecting').

get_joinstyle(*self*)
Return the line join style as one of ('miter', 'round', 'bevel').

class matplotlib.backends.backend_ps.**PsBackendHelper**
Bases: object

class matplotlib.backends.backend_ps.**RendererPS**(*width*, *height*, *pswriter*, *imagedpi=72*)
Bases: matplotlib.backends._backend_pdf_ps.RendererPDFPSBase

The renderer handles all the drawing primitives using a graphics context instance that controls the colors/styles.

create_hatch(*self*, *hatch*)

draw_gouraud_triangle(*self*, *gc*, *points*, *colors*, *trans*)
Draw a Gouraud-shaded triangle.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

points

[array-like, shape=(3, 2)] Array of (x, y) points for the triangle.

colors

[array-like, shape=(3, 4)] RGBA colors for each point of the triangle.

transform

[*matplotlib.transforms.Transform*] An affine transform to apply to the points.

draw_gouraud_triangles(*self*, *gc*, *points*, *colors*, *trans*)
Draw a series of Gouraud triangles.

Parameters

points

[array-like, shape=(N, 3, 2)] Array of *N* (x, y) points for the triangles.

colors

[array-like, shape=(N, 3, 4)] Array of *N* RGBA colors for each point of the triangles.

transform

[*matplotlib.transforms.Transform*] An affine transform to apply to the points.

`draw_image`(*self*, *gc*, *x*, *y*, *im*, *transform=None*)

Draw an RGBA image.

Parameters

gc

[*GraphicsContextBase*] A graphics context with clipping information.

x

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

y

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

im

[array-like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.

transform

[*matplotlib.transforms.Affine2DBase*] If and only if the concrete backend is written such that `option_scale_image()` returns `True`, an affine transformation (i.e., an *Affine2DBase*) *may* be passed to *draw_image()*. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

`draw_markers`(*self*, *gc*, *marker_path*, *marker_trans*, *path*, *trans*, *rgbFace=None*)

Draw a marker at each of the vertices in path.

This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of draw_markers that makes multiple calls to *draw_path()*. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

marker_trans

[*matplotlib.transforms.Transform*] An affine transform applied to the marker.

trans

[*matplotlib.transforms.Transform*] An affine transform applied to the path.

`draw_mathtext`(*self*, *gc*, *x*, *y*, *s*, *prop*, *angle*)
Draw the math text using matplotlib.mathtext.

`draw_path`(*self*, *gc*, *path*, *transform*, *rgbFace=None*)
Draw a *Path* instance using the given affine transform.

`draw_path_collection`(*self*, *gc*, *master_transform*, *paths*, *all_transforms*, *offsets*, *offsetTrans*, *facecolors*, *edgecolors*, *linewidths*, *linestyles*, *antialiaseds*, *urls*, *offset_position*)
Draw a collection of paths selecting drawing properties from the lists *facecolors*, *edgecolors*, *linewidths*, *linestyles* and *antialiaseds*. *offsets* is a list of offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied.

offset_position may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of *draw_path_collection()* that makes multiple calls to *draw_path()*. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of *draw_path_collection()* can be made globally.

`draw_tex`(*self*, *gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=<deprecated parameter>*, *mtext=None*)

`draw_text`(*self*, *gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=False*, *mtext=None*)
Draw the text instance.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The text string.

prop

[*matplotlib.font_manager.FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

mtext

[*matplotlib.text.Text*] The original text object to be rendered.

Notes

Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

`get_image_magnification`(*self*)
Get the factor by which to magnify images passed to draw_image. Allows a backend to have images at a different resolution to other artists.

`merge_used_characters`(*self*, **args*, ***kwargs*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`new_gc`(*self*)
Return an instance of a *GraphicsContextBase*.

`set_color`(*self*, *r*, *g*, *b*, *store=True*)

`set_font`(*self*, *fontname*, *fontsize*, *store=True*)

`set_linecap`(*self*, *linecap*, *store=True*)

`set_linedash`(*self*, *offset*, *seq*, *store=True*)

`set_linejoin`(*self*, *linejoin*, *store=True*)

set_linewidth(*self*, *linewidth*, *store=True*)

track_characters(*self*, **args*, ***kwargs*)

[*Deprecated*] Keep track of which characters are required from each font.

Notes

Deprecated since version 3.3.

property used_characters

matplotlib.backends.backend_ps.**convert_psfrags**(*tmpfile*, *psfrags*, *font_preamble*, *custom_preamble*, *paper_width*, *paper_height*, *orientation*)

When we want to use the LaTeX backend with postscript, we write PSFrag tags to a temporary postscript file, each one marking a position for LaTeX to render some text. convert_psfrags generates a LaTeX document containing the commands to convert those tags to text. LaTeX/dvips produces the postscript file that includes the actual text.

matplotlib.backends.backend_ps.**get_bbox_header**(*lbrt*, *rotated=False*)

Return a postscript header string for the given bbox lbrt=(l, b, r, t). Optionally, return rotate command.

matplotlib.backends.backend_ps.**gs_distill**(*tmpfile*, *eps=False*, *ptype='letter'*, *bbox=None*, *rotated=False*)

Use ghostscript's pswrite or epswrite device to distill a file. This yields smaller files without illegal encapsulated postscript operators. The output is low-level, converting text to outlines.

matplotlib.backends.backend_ps.**pstoeps**(*tmpfile*, *bbox=None*, *rotated=False*)

Convert the postscript to encapsulated postscript. The bbox of the eps file will be replaced with the given *bbox* argument. If None, original bbox will be used.

matplotlib.backends.backend_ps.**quote_ps_string**(*s*)

Quote dangerous characters of S for use in a PostScript string constant.

matplotlib.backends.backend_ps.**xpdf_distill**(*tmpfile*, *eps=False*, *ptype='letter'*, *bbox=None*, *rotated=False*)

Use ghostscript's ps2pdf and xpdf's/poppler's pdftops to distill a file. This yields smaller files without illegal encapsulated postscript operators. This distiller is preferred, generating high-level postscript output that treats text as text.

18.10.11 matplotlib.backends.backend_qt4agg

NOTE Not included, to avoid adding a dependency to building the docs.

18.10.12 matplotlib.backends.backend_qt4cairo

NOTE Not included, to avoid adding a dependency to building the docs.

18.10.13 matplotlib.backends.backend_qt5agg

NOTE Not included, to avoid adding a dependency to building the docs.

18.10.14 matplotlib.backends.backend_qt5cairo

NOTE Not included, to avoid adding a dependency to building the docs.

18.10.15 matplotlib.backends.backend_svg

matplotlib.backends.backend_svg.**FigureCanvas**
alias of *matplotlib.backends.backend_svg.FigureCanvasSVG*

class matplotlib.backends.backend_svg.**FigureCanvasSVG**(*figure*)
Bases: *matplotlib.backend_bases.FigureCanvasBase*

filetypes = {'svg': 'Scalable Vector Graphics', 'svgz': 'Scalable Vector Graphics'}

fixed_dpi = 72

get_default_filetype(*self*)
Return the default savefig file format as specified in `rcParams["savefig.format"]` (default: `'png'`).

The returned string does not include a period. This method is overridden in backends that only support a single file type.

print_svg(*self*, *filename*, **args*, ***kwargs*)

Parameters

filename

[str or path-like or file-like] Output target; if a string, a file will be opened for writing.

metadata

[Dict[str, Any], optional] Metadata in the SVG file defined as key-value pairs of strings, datetimes, or lists

of strings, e.g., `{'Creator': 'My software', 'Contributor': ['Me', 'My Friend'], 'Title': 'Awesome'}`.

The standard keys and their value types are:

- *str*: `'Coverage'`, `'Description'`, `'Format'`, `'Identifier'`, `'Language'`, `'Relation'`, `'Source'`, `'Title'`, and `'Type'`.
- *str* or *list of str*: `'Contributor'`, `'Creator'`, `'Keywords'`, `'Publisher'`, and `'Rights'`.
- *str*, *date*, *datetime*, or *tuple* of same: `'Date'`. If a non-*str*, then it will be formatted as ISO 8601.

Values have been predefined for `'Creator'`, `'Date'`, `'Format'`, and `'Type'`. They can be removed by setting them to `None`.

Information is encoded as Dublin Core Metadata.

`print_svgz`(*self*, *filename*, **args*, ***kwargs*)

class matplotlib.backends.backend_svg.**RendererSVG**(*width*, *height*, *svgwriter*, *basename=None*, *image_dpi=72*, ***, *metadata=None*)

Bases: *matplotlib.backend_bases.RendererBase*

`close_group`(*self*, *s*)

Close a grouping element with label *s*.

Only used by the SVG renderer.

`draw_gouraud_triangle`(*self*, *gc*, *points*, *colors*, *trans*)

Draw a Gouraud-shaded triangle.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

points

[array-like, shape=(3, 2)] Array of (x, y) points for the triangle.

colors

[array-like, shape=(3, 4)] RGBA colors for each point of the triangle.

transform

[*matplotlib.transforms.Transform*] An affine transform to apply to the points.

`draw_gouraud_triangles`(*self*, *gc*, *triangles_array*, *colors_array*, *transform*)

Draw a series of Gouraud triangles.

Parameters

points

[array-like, shape=(N, 3, 2)] Array of *N* (x, y) points for the triangles.

colors

[array-like, shape=(N, 3, 4)] Array of *N* RGBA colors for each point of the triangles.

transform

[*matplotlib.transforms.Transform*] An affine transform to apply to the points.

`draw_image`(*self*, *gc*, *x*, *y*, *im*, *transform=None*)

Draw an RGBA image.

Parameters

gc

[*GraphicsContextBase*] A graphics context with clipping information.

x

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

y

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

im

[array-like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.

transform

[*matplotlib.transforms.Affine2DBase*] If and only if the concrete backend is written such that *option_scale_image()* returns `True`, an affine transformation (i.e., an *Affine2DBase*) *may* be passed to *draw_image()*. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

`draw_markers`(*self*, *gc*, *marker_path*, *marker_trans*, *path*, *trans*, *rgbFace=None*)

Draw a marker at each of the vertices in path.

This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of draw_markers that makes multiple calls to *draw_path()*. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

marker_trans

[*matplotlib.transforms.Transform*] An affine transform applied to the marker.

trans

[*matplotlib.transforms.Transform*] An affine transform applied to the path.

`draw_path`(*self*, *gc*, *path*, *transform*, *rgbFace=None*)

Draw a *Path* instance using the given affine transform.

`draw_path_collection`(*self*, *gc*, *master_transform*, *paths*, *all_transforms*, *offsets*, *offsetTrans*, *facecolors*, *edgecolors*, *linewidths*, *linestyles*, *antialiaseds*, *urls*, *offset_position*)

Draw a collection of paths selecting drawing properties from the lists *facecolors*, *edgecolors*, *linewidths*, *linestyles* and *antialiaseds*. *offsets* is a list of offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied.

offset_position may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of *draw_path_collection()* that makes multiple calls to *draw_path()*. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of *draw_path_collection()* can be made globally.

`draw_tex`(*self*, *gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=<deprecated parameter>*, *mtext=None*)

`draw_text`(*self*, *gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=False*, *mtext=None*)

Draw the text instance.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The text string.

prop

[*matplotlib.font_manager.FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

mtext

[*matplotlib.text.Text*] The original text object to be rendered.

Notes

Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

`finalize`(*self*)

`flipy`(*self*)
Return whether y values increase from top to bottom.

Note that this only affects drawing of texts and images.

`get_canvas_width_height`(*self*)
Return the canvas width and height in display coords.

`get_image_magnification`(*self*)
Get the factor by which to magnify images passed to *draw_image()*. Allows a backend to have images at a different resolution to other artists.

`get_text_width_height_descent`(*self*, *s*, *prop*, *ismath*)
Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with *FontProperties* *prop*.

`open_group`(*self*, *s*, *gid=None*)
Open a grouping element with label *s* and *gid* (if set) as id.

Only used by the SVG renderer.

`option_image_nocomposite`(*self*)
Return whether image composition by Matplotlib should be skipped.

Raster backends should usually return False (letting the C-level rasterizer take care of image composition); vector backends should usually return `not rcParams["image.composite_image"]`.

`option_scale_image`(*self*)
Return whether arbitrary affine transformations in *draw_image()* are supported (True for most vector backends).

`class matplotlib.backends.backend_svg.XMLWriter`(*file*)
Bases: `object`

Parameters

file

[writable text file-like object]

`close`(*self*, *id*)
Close open elements, up to (and including) the element identified by the given identifier.

Parameters

id

Element identifier, as returned by the *start()* method.

`comment`(*self*, *comment*)
Add a comment to the output stream.

Parameters

comment

[str] Comment text.

`data`(*self*, *text*)
Add character data to the output stream.

Parameters

text

[str] Character data.

element(*self*, *tag*, *text=None*, *attrib={}*, ***extra*)
Add an entire element. This is the same as calling *start()*, *data()*, and *end()* in sequence. The *text* argument can be omitted.

end(*self*, *tag=None*, *indent=True*)
Close the current element (opened by the most recent call to *start()*).

Parameters

tag

Element tag. If given, the tag must match the start tag. If omitted, the current element is closed.

flush(*self*)
Flush the output stream.

start(*self*, *tag*, *attrib={}*, ***extra*)
Open a new element. Attributes can be given as keyword arguments, or as a string/string dictionary. The method returns an opaque identifier that can be passed to the *close()* method, to close all open elements up to and including this one.

Parameters

tag

Element tag.

attrib

Attribute dictionary. Alternatively, attributes can be given as keyword arguments.

Returns

An element identifier.

matplotlib.backends.backend_svg.**escape_attrib**(*s*)

matplotlib.backends.backend_svg.**escape_cdata**(*s*)

matplotlib.backends.backend_svg.**escape_comment**(*s*)

matplotlib.backends.backend_svg.**generate_css**(*attrib={}*)

matplotlib.backends.backend_svg.**generate_transform**(*transform_list=[]*)

matplotlib.backends.backend_svg.**short_float_fmt**(*x*)
Create a short string representation of a float, which is %f formatting with trailing zeros and the decimal point removed.

18.10.16 matplotlib.backends.backend_tkagg

matplotlib.backends.backend_tkagg.**FigureCanvas**
alias of *matplotlib.backends.backend_tkagg.FigureCanvasTkAgg*

class matplotlib.backends.backend_tkagg.**FigureCanvasTkAgg**(*figure*, *master=None*, *resize_callback=None*)
Bases: *matplotlib.backends.backend_agg.FigureCanvasAgg*, matplotlib.backends._backend_tk.FigureCanvasTk

blit(*self*, *bbox=None*)
Blit the canvas in bbox (default entire canvas).

draw(*self*)
Render the *Figure*.

18.10.17 matplotlib.backends.backend_webagg

Note: The WebAgg backend is not documented here, in order to avoid adding Tornado to the doc build requirements.

18.10.18 matplotlib.backends.backend_wxagg

NOTE Not included, to avoid adding a dependency to building the docs.

18.11 matplotlib.bezier

A module providing some utility functions regarding Bezier path manipulation.

class matplotlib.bezier.**BezierSegment**(*control_points*)
Bases: object

A d-dimensional Bezier segment.

Parameters

control_points

[(N, d) array] Location of the *N* control points.

axis_aligned_extrema(*self*)
Return the dimension and location of the curve's interior extrema.

The extrema are the points along the curve where one of its partial derivatives is zero.

Returns

dims

[int, array_like] Index i of the partial derivative which is zero at each interior extrema.

dzeros

[float, array_like] Of same size as dims. The t such that $d/dx_i B(t) = 0$

property control_points
The control points of the curve.

property degree
Degree of the polynomial. One less the number of control points.

property dimension
The dimension of the curve.

point_at_t(*self*, *t*)
Evaluate curve at a single point *t*. Returns a Tuple[float*d].

property polynomial_coefficients
The polynomial coefficients of the Bezier curve.

Warning: Follows opposite convention from `numpy.polyval`.

Returns

float, (n+1, d) array_like

Coefficients after expanding in polynomial basis, where n is the degree of the bezier curve and d its dimension. These are the numbers (C_j) such that the curve can be written $\sum_{j=0}^{n} C_j t^j$.

Notes

The coefficients are calculated as

$$\binom{n}{j} \sum_{i=0}^{j} (-1)^{i+j} \binom{j}{i} P_i$$

where P_i are the control points of the curve.

exception matplotlib.bezier.NonIntersectingPathException
Bases: `ValueError`

matplotlib.bezier.**check_if_parallel**(*dx1*, *dy1*, *dx2*, *dy2*, *tolerance=1e-05*)

Check if two lines are parallel.

Parameters

dx1, dy1, dx2, dy2

[float] The gradients *dy*/*dx* of the two lines.

tolerance

[float] The angular tolerance in radians up to which the lines are considered parallel.

Returns

is_parallel

- 1 if two lines are parallel in same direction.
- -1 if two lines are parallel in opposite direction.
- False otherwise.

matplotlib.bezier.**concatenate_paths**(*paths*)

[*Deprecated*] Concatenate a list of paths into a single path.

Notes

Deprecated since version 3.3.

matplotlib.bezier.**find_bezier_t_intersecting_with_closedpath**(*bezier_point_at_t*, *inside_closedpath*, *t0=0.0*, *t1=1.0*, *tolerance=0.01*)

Find the intersection of the Bezier curve with a closed path.

The intersection point *t* is approximated by two parameters *t0*, *t1* such that *t0* <= *t* <= *t1*.

Search starts from *t0* and *t1* and uses a simple bisecting algorithm therefore one of the end points must be inside the path while the other doesn't. The search stops when the distance of the points parametrized by *t0* and *t1* gets smaller than the given *tolerance*.

Parameters

bezier_point_at_t

[callable] A function returning x, y coordinates of the Bezier at parameter *t*. It must have the signature:

```
bezier_point_at_t(t: float) -> Tuple[float, float]
```

inside_closedpath

[callable] A function returning True if a given point (x, y) is inside the closed path. It must have the signature:

```
inside_closedpath(point: Tuple[float, float]) -> bool
```

t0, t1

[float] Start parameters for the search.

tolerance

[float] Maximal allowed distance between the final points.

Returns

t0, t1

[float] The Bezier path parameters.

matplotlib.bezier.**find_control_points**(*c1x*, *c1y*, *mmx*, *mmy*, *c2x*, *c2y*)
Find control points of the Bezier curve passing through (*c1x*, *c1y*), (*mmx*, *mmy*), and (*c2x*, *c2y*), at parametric values 0, 0.5, and 1.

matplotlib.bezier.**get_cos_sin**(*x0*, *y0*, *x1*, *y1*)

matplotlib.bezier.**get_intersection**(*cx1*, *cy1*, *cos_t1*, *sin_t1*, *cx2*, *cy2*, *cos_t2*, *sin_t2*)
Return the intersection between the line through (*cx1*, *cy1*) at angle *t1* and the line through (*cx2*, *cy2*) at angle *t2*.

matplotlib.bezier.**get_normal_points**(*cx*, *cy*, *cos_t*, *sin_t*, *length*)
For a line passing through (*cx*, *cy*) and having an angle *t*, return locations of the two points located along its perpendicular line at the distance of *length*.

matplotlib.bezier.**get_parallels**(*bezier2*, *width*)
Given the quadratic Bezier control points *bezier2*, returns control points of quadratic Bezier lines roughly parallel to given one separated by *width*.

matplotlib.bezier.**inside_circle**(*cx*, *cy*, *r*)
Return a function that checks whether a point is in a circle with center (*cx*, *cy*) and radius *r*.

The returned function has the signature:

```
f(xy: Tuple[float, float]) -> bool
```

matplotlib.bezier.**make_path_regular**(*p*)

[*Deprecated*] If the `codes` attribute of *Path* *p* is None, return a copy of *p* with `codes` set to (MOVETO, LINETO, LINETO, ..., LINETO); otherwise return *p* itself.

Notes

Deprecated since version 3.3.

matplotlib.bezier.**make_wedged_bezier2**(*bezier2*, *width*, *w1=1.0*, *wm=0.5*, *w2=0.0*)

Being similar to get_parallels, returns control points of two quadratic Bezier lines having a width roughly parallel to given one separated by *width*.

matplotlib.bezier.**split_bezier_intersecting_with_closedpath**(*bezier*, *inside_closedpath*, *tolerance=0.01*)

Split a Bezier curve into two at the intersection with a closed path.

Parameters

bezier

[array-like(N, 2)] Control points of the Bezier segment. See *BezierSegment*.

inside_closedpath

[callable] A function returning True if a given point (x, y) is inside the closed path. See also *find_bezier_t_intersecting_with_closedpath*.

tolerance

[float] The tolerance for the intersection. See also *find_bezier_t_intersecting_with_closedpath*.

Returns

left, right

Lists of control points for the two Bezier segments.

matplotlib.bezier.**split_de_casteljau**(*beta*, *t*)

Split a Bezier segment defined by its control points *beta* into two separate segments divided at *t* and return their control points.

matplotlib.bezier.**split_path_inout**(*path*, *inside*, *tolerance=0.01*, *reorder_inout=False*)

Divide a path into two segments at the point where `inside(x, y)` becomes False.

18.12 matplotlib.blocking_input

Classes used for blocking interaction with figure windows:

BlockingInput

Creates a callable object to retrieve events in a blocking way for interactive sessions. Base class of the other classes listed here.

BlockingKeyMouseInput

Creates a callable object to retrieve key or mouse clicks in a blocking way for interactive sessions. Used by *waitforbuttonpress*.

BlockingMouseInput

Creates a callable object to retrieve mouse clicks in a blocking way for interactive sessions. Used by *ginput*.

BlockingContourLabeler

Creates a callable object to retrieve mouse clicks in a blocking way that will then be used to place labels on a *ContourSet*. Used by *clabel*.

class matplotlib.blocking_input.**BlockingContourLabeler**(*cs*)

Bases: *matplotlib.blocking_input.BlockingMouseInput*

Callable for retrieving mouse clicks and key presses in a blocking way.

Used to place contour labels.

add_click(*self*, *event*)

Add the coordinates of an event to the list of clicks.

Parameters

event

[*MouseEvent*]

button1(*self*, *event*)

Process an button-1 event (add a label to a contour).

Parameters

event

[*MouseEvent*]

button3(*self*, *event*)

Process an button-3 event (remove a label if not in inline mode).

Unfortunately, if one is doing inline labels, then there is currently no way to fix the broken contour - once humpty-dumpty is broken, he can't be put back together. In inline mode, this does nothing.

Parameters

event

[*MouseEvent*]

`pop_click`(*self*, *event*, *index=- 1*)
Remove a click (by default, the last) from the list of clicks.

Parameters

event

[*MouseEvent*]

`class matplotlib.blocking_input.BlockingInput`(*fig*, *eventslist=()*)
Bases: `object`

Callable for retrieving events in a blocking way.

`add_event`(*self*, *event*)
For base class, this just appends an event to events.

`cleanup`(*self*)
Disconnect all callbacks.

`on_event`(*self*, *event*)
Event handler; will be passed to the current figure to retrieve events.

`pop`(*self*, *index=- 1*)
Remove an event from the event list -- by default, the last.

Note that this does not check that there are events, much like the normal pop method. If no events exist, this will throw an exception.

`pop_event`(*self*, *index=- 1*)
Remove an event from the event list -- by default, the last.

Note that this does not check that there are events, much like the normal pop method. If no events exist, this will throw an exception.

`post_event`(*self*)
For baseclass, do nothing but collect events.

`class matplotlib.blocking_input.BlockingKeyMouseInput`(*fig*)
Bases: *matplotlib.blocking_input.BlockingInput*

Callable for retrieving mouse clicks and key presses in a blocking way.

`post_event`(*self*)
Determine if it is a key event.

class matplotlib.blocking_input.BlockingMouseInput(*fig*, *mouse_add=<MouseButton.LEFT: 1>*, *mouse_pop=<MouseButton.RIGHT: 3>*, *mouse_stop=<MouseButton.MIDDLE: 2>*)

Bases: *matplotlib.blocking_input.BlockingInput*

Callable for retrieving mouse clicks in a blocking way.

This class will also retrieve keypresses and map them to mouse clicks: delete and backspace are a right click, enter is like a middle click, and all others are like a left click.

add_click(*self*, *event*)

Add the coordinates of an event to the list of clicks.

Parameters

event

[*MouseEvent*]

button_add = 1

button_pop = 3

button_stop = 2

cleanup(*self*, *event=None*)

Parameters

event

[*MouseEvent*, optional] Not used

key_event(*self*)

Process a key press event, mapping keys to appropriate mouse clicks.

mouse_event(*self*)

Process a mouse click event.

mouse_event_add(*self*, *event*)

Process an button-1 event (add a click if inside axes).

Parameters

event

[*MouseEvent*]

mouse_event_pop(*self*, *event*)

Process an button-3 event (remove the last click).

Parameters

event

[*MouseEvent*]

`mouse_event_stop`(*self*, *event*)
Process an button-2 event (end blocking input).

Parameters

event

[*MouseEvent*]

`pop`(*self*, *event*, *index=- 1*)
Remove a click and the associated event from the list of clicks.

Defaults to the last click.

`pop_click`(*self*, *event*, *index=- 1*)
Remove a click (by default, the last) from the list of clicks.

Parameters

event

[*MouseEvent*]

`post_event`(*self*)
Process an event.

18.13 matplotlib.category

Plotting of string "category" data: `plot(['d', 'f', 'a'], [1, 2, 3])` will plot three points with x-axis values of 'd', 'f', 'a'.

See /gallery/lines_bars_and_markers/categorical_variables for an example.

The module uses Matplotlib's *matplotlib.units* mechanism to convert from strings to integers and provides a tick locator, a tick formatter, and the *UnitData* class that creates and stores the string-to-integer mapping.

class matplotlib.category.**StrCategoryConverter**
Bases: *matplotlib.units.ConversionInterface*

`static axisinfo`(*unit*, *axis*)
Set the default axis ticks and labels.

Parameters

unit

[*UnitData*] object string unit information for value

axis

[*Axis*] axis for which information is being set

Returns

AxisInfo

Information to support default tick labeling

`static convert(`*value*, *unit*, *axis*`)`

Convert strings in *value* to floats using mapping information stored in the *unit* object.

Parameters

value

[str or iterable] Value or list of values to be converted.

unit

[*UnitData*] An object mapping strings to integers.

axis

[*Axis*] The axis on which the converted value is plotted.

Note: *axis* is unused.

Returns

float or ndarray[float]

`static default_units(`*data*, *axis*`)`

Set and update the *Axis* units.

Parameters

data

[str or iterable of str]

axis

[*Axis*] axis on which the data is plotted

Returns

UnitData

object storing string to integer mapping

class matplotlib.category.**StrCategoryFormatter**(*units_mapping*)

Bases: *matplotlib.ticker.Formatter*

String representation of the data at every tick.

Parameters

units_mapping

[dict] Mapping of category names (str) to indices (int).

format_ticks(*self*, *values*)

Return the tick labels for all the ticks at once.

class matplotlib.category.**StrCategoryLocator**(*units_mapping*)

Bases: *matplotlib.ticker.Locator*

Tick at every integer mapping of the string data.

Parameters

units_mapping

[dict] Mapping of category names (str) to indices (int).

tick_values(*self*, *vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

class matplotlib.category.**UnitData**(*data=None*)

Bases: object

Create mapping between unique categorical values and integer ids.

Parameters

data

[iterable] sequence of string values

update(*self*, *data*)

Map new values to integer identifiers.

Parameters

data

[iterable of str or bytes]

Raises

TypeError

If elements in *data* are neither str nor bytes.

18.14 matplotlib.cbook

A collection of utility functions and classes. Originally, many (but not all) were from the Python Cookbook -- hence the name cbook.

This module is safe to import from anywhere within Matplotlib; it imports Matplotlib only at runtime.

class matplotlib.cbook.CallbackRegistry(*exception_handler=<function _exception_printer>*)

Bases: object

Handle registering and disconnecting for a set of signals and callbacks:

```
>>> def oneat(x):
...     print('eat', x)
>>> def ondrink(x):
...     print('drink', x)
```

```
>>> from matplotlib.cbook import CallbackRegistry
>>> callbacks = CallbackRegistry()
```

```
>>> id_eat = callbacks.connect('eat', oneat)
>>> id_drink = callbacks.connect('drink', ondrink)
```

```
>>> callbacks.process('drink', 123)
drink 123
>>> callbacks.process('eat', 456)
eat 456
>>> callbacks.process('be merry', 456) # nothing will be called
>>> callbacks.disconnect(id_eat)
>>> callbacks.process('eat', 456)      # nothing will be called
```

In practice, one should always disconnect all callbacks when they are no longer needed to avoid dangling references (and thus memory leaks). However, real

code in Matplotlib rarely does so, and due to its design, it is rather difficult to place this kind of code. To get around this, and prevent this class of memory leaks, we instead store weak references to bound methods only, so when the destination object needs to die, the CallbackRegistry won't keep it alive.

Parameters

exception_handler

[callable, optional] If provided must have signature

```
def handler(exc: Exception) -> None:
```

If not None this function will be called with any `Exception` subclass raised by the callbacks in *CallbackRegistry.process*. The handler may either consume the exception or re-raise.

The callable must be pickle-able.

The default handler is

```
def h(exc):
    traceback.print_exc()
```

`connect`(*self*, *s*, *func*)
Register *func* to be called when signal *s* is generated.

`disconnect`(*self*, *cid*)
Disconnect the callback registered with callback id *cid*.

`process`(*self*, *s*, **args*, ***kwargs*)
Process signal *s*.

All of the functions registered to receive callbacks on *s* will be called with `*args` and `**kwargs`.

`class matplotlib.cbook.Grouper`(*init=()*)
Bases: `object`

A disjoint-set data structure.

Objects can be joined using *join()*, tested for connectedness using *joined()*, and all disjoint sets can be retrieved by using the object as an iterator.

The objects being joined must be hashable and weak-referenceable.

Examples

```
>>> from matplotlib.cbook import Grouper
>>> class Foo:
...     def __init__(self, s):
...         self.s = s
...     def __repr__(self):
...         return self.s
...
>>> a, b, c, d, e, f = [Foo(x) for x in 'abcdef']
>>> grp = Grouper()
>>> grp.join(a, b)
>>> grp.join(b, c)
>>> grp.join(d, e)
>>> sorted(map(tuple, grp))
[(a, b, c), (d, e)]
>>> grp.joined(a, b)
True
>>> grp.joined(a, c)
True
>>> grp.joined(a, d)
False
```

clean(*self*)
Clean dead weak references from the dictionary.

get_siblings(*self*, *a*)
Return all of the items joined with *a*, including itself.

join(*self*, *a*, **args*)
Join given arguments into the same set. Accepts one or more arguments.

joined(*self*, *a*, *b*)
Return whether *a* and *b* are members of the same set.

remove(*self*, *a*)

exception matplotlib.cbook.**IgnoredKeywordWarning**(**args*, ***kwargs*)
Bases: UserWarning

[*Deprecated*] A class for issuing warnings about keyword arguments that will be ignored by Matplotlib.

Notes

Deprecated since version 3.3.

class matplotlib.cbook.**Stack**(*default=None*)
Bases: object

Stack of elements with a movable cursor.

Mimics home/back/forward in a web browser.

`back`(*self*)
Move the position back and return the current element.

`bubble`(*self*, *o*)
Raise all references of *o* to the top of the stack, and return it.

Raises

ValueError

If *o* is not in the stack.

`clear`(*self*)
Empty the stack.

`empty`(*self*)
Return whether the stack is empty.

`forward`(*self*)
Move the position forward and return the current element.

`home`(*self*)
Push the first element onto the top of the stack.

The first element is returned.

`push`(*self*, *o*)
Push *o* to the stack at current position. Discard all later elements.

o is returned.

`remove`(*self*, *o*)
Remove *o* from the stack.

Raises

ValueError

If *o* is not in the stack.

`matplotlib.cbook.boxplot_stats`(*X*, *whis=1.5*, *bootstrap=None*, *labels=None*, *autorange=False*)
Return a list of dictionaries of statistics used to draw a series of box and whisker plots using *bxp*.

Parameters

X

[array-like] Data that will be represented in the boxplots. Should have 2 or fewer dimensions.

whis

[float or (float, float), default: 1.5] The position of the whiskers.

If a float, the lower whisker is at the lowest datum above `Q1 - whis*(Q3-Q1)`, and the upper whisker at the highest datum below `Q3 + whis*(Q3-Q1)`, where Q1 and Q3 are the first and third quartiles. The default value of `whis = 1.5` corresponds to Tukey's original definition of boxplots.

If a pair of floats, they indicate the percentiles at which to draw the whiskers (e.g., (5, 95)). In particular, setting this to (0, 100) results in whiskers covering the whole range of the data. "range" is a deprecated synonym for (0, 100).

In the edge case where `Q1 == Q3`, *whis* is automatically set to (0, 100) (cover the whole range of the data) if *autorange* is True.

Beyond the whiskers, data are considered outliers and are plotted as individual points.

bootstrap

[int, optional] Number of times the confidence intervals around the median should be bootstrapped (percentile method).

labels

[array-like, optional] Labels for each dataset. Length must be compatible with dimensions of *X*.

autorange

[bool, optional (False)] When `True` and the data are distributed such that the 25th and 75th percentiles are equal, `whis` is set to (0, 100) such that the whisker ends are at the minimum and maximum of the data.

Returns

list of dict

A list of dictionaries containing the results for each column of data. Keys of each dictionary are the following:

Key	Value Description
label	tick label for the boxplot
mean	arithmetic mean value
med	50th percentile
q1	first quartile (25th percentile)
q3	third quartile (75th percentile)
cilo	lower notch around the median
cihi	upper notch around the median
whislo	end of the lower whisker
whishi	end of the upper whisker
fliers	outliers

Notes

Non-bootstrapping approach to confidence interval uses Gaussian-based asymptotic approximation:

$$\mathrm{med} \pm 1.57 \times \frac{\mathrm{iqr}}{\sqrt{N}}$$

General approach from: McGill, R., Tukey, J.W., and Larsen, W.A. (1978) "Variations of Boxplots", The American Statistician, 32:12-16.

`matplotlib.cbook.`**`contiguous_regions`**(*mask*)

Return a list of (ind0, ind1) such that `mask[ind0:ind1].all()` is True and we cover all such regions.

`matplotlib.cbook.`**`delete_masked_points`**(**args*)

Find all masked and/or non-finite points in a set of arguments, and return the arguments with only the unmasked points remaining.

Arguments can be in any of 5 categories:

1) 1-D masked arrays
2) 1-D ndarrays
3) ndarrays with more than one dimension
4) other non-string iterables
5) anything else

The first argument must be in one of the first four categories; any argument with a length differing from that of the first argument (and hence anything in category 5) then will be passed through unchanged.

Masks are obtained from all arguments of the correct length in categories 1, 2, and 4; a point is bad if masked in a masked array or if it is a nan or inf. No attempt is made to extract a mask from categories 2, 3, and 4 if `numpy.isfinite` does not yield a Boolean array.

All input arguments that are not passed unchanged are returned as ndarrays after removing the points or rows corresponding to masks in any of the arguments.

A vastly simpler version of this function was originally written as a helper for Axes.scatter().

`matplotlib.cbook.`**`file_requires_unicode`**(*x*)

Return whether the given writable file-like object requires Unicode to be written to it.

`matplotlib.cbook.`**`flatten`**(*seq*, *scalarp=<function is_scalar_or_string at 0x7f543929d1f0>*)

Return a generator of flattened nested containers.

For example:

```
>>> from matplotlib.cbook import flatten
>>> l = (('John', ['Hunter']), (1, 23), [[([42, (5, 23)], )]])
>>> print(list(flatten(l)))
['John', 'Hunter', 1, 23, 42, 5, 23]
```

By: Composite of Holger Krekel and Luther Blissett From: https://code.activestate.com/recipes/121294/ and Recipe 1.12 in cookbook

matplotlib.cbook.**get_realpath_and_stat**(*path*)

[*Deprecated*]

Notes

Deprecated since version 3.3:

matplotlib.cbook.**get_sample_data**(*fname*, *asfileobj=True*, ***, *np_load=False*)

Return a sample data file. *fname* is a path relative to the `mpl-data/sample_data` directory. If *asfileobj* is `True` return a file object, otherwise just a file path.

Sample data files are stored in the 'mpl-data/sample_data' directory within the Matplotlib package.

If the filename ends in .gz, the file is implicitly ungzipped. If the filename ends with .npy or .npz, *asfileobj* is True, and *np_load* is True, the file is loaded with `numpy.load`. *np_load* currently defaults to False but will default to True in a future release.

matplotlib.cbook.**index_of**(*y*)

A helper function to create reasonable x values for the given *y*.

This is used for plotting (x, y) if x values are not explicitly given.

First try `y.index` (assuming *y* is a `pandas.Series`), if that fails, use `range(len(y))`.

This will be extended in the future to deal with more types of labeled data.

Parameters

y

[float or array-like]

Returns

x, y

[ndarray] The x and y values to plot.

matplotlib.cbook.**is_math_text**(*s*)

Return whether the string *s* contains math expressions.

This is done by checking whether *s* contains an even number of non-escaped dollar signs.

matplotlib.cbook.**is_scalar_or_string**(*val*)
Return whether the given object is a scalar or string like.

matplotlib.cbook.**is_writable_file_like**(*obj*)
Return whether *obj* looks like a file object with a *write* method.

matplotlib.cbook.**local_over_kwdict**(*local_var*, *kwargs*, **keys*)
[*Deprecated*] Enforces the priority of a local variable over potentially conflicting argument(s) from a kwargs dict. The following possible output values are considered in order of priority:

```
local_var > kwargs[keys[0]] > ... > kwargs[keys[-1]]
```

The first of these whose value is not None will be returned. If all are None then None will be returned. Each key in keys will be removed from the kwargs dict in place.

Parameters

local_var

[any object] The local variable (highest priority).

kwargs

[dict] Dictionary of keyword arguments; modified in place.

keys

[str(s)] Name(s) of keyword arguments to process, in descending order of priority.

Returns

any object

Either local_var or one of kwargs[key] for key in keys.

Raises

IgnoredKeywordWarning

For each key in keys that is removed from kwargs but not used as the output value.

Notes

Deprecated since version 3.3.

class matplotlib.cbook.**maxdict**(*maxsize*)

Bases: dict

A dictionary with a maximum size.

Notes

This doesn't override all the relevant methods to constrain the size, just `__setitem__`, so use with caution.

matplotlib.cbook.**normalize_kwargs**(*kw*, *alias_mapping=None*, *required=<deprecated parameter>*, *forbidden=<deprecated parameter>*, *allowed=<deprecated parameter>*)

Helper function to normalize kwarg inputs.

The order they are resolved are:

1. aliasing
2. required
3. forbidden
4. allowed

This order means that only the canonical names need appear in *allowed*, *forbidden*, *required*.

Parameters

kw

[dict] A dict of keyword arguments.

alias_mapping

[dict or Artist subclass or Artist instance, optional] A mapping between a canonical name to a list of aliases, in order of precedence from lowest to highest.

If the canonical value is not in the list it is assumed to have the highest priority.

If an Artist subclass or instance is passed, use its properties alias mapping.

required

[list of str, optional] A list of keys that must be in *kws*. This parameter is deprecated.

forbidden

[list of str, optional] A list of keys which may not be in *kw*. This parameter is deprecated.

allowed

[list of str, optional] A list of allowed fields. If this not None, then raise if *kw* contains any keys not in the union of *required* and *allowed*. To allow only the required fields pass in an empty tuple `allowed=()`. This parameter is deprecated.

Raises

TypeError

To match what python raises if invalid args/kwargs are passed to a callable.

`matplotlib.cbook.`**open_file_cm**(*path_or_file*, *mode='r'*, *encoding=None*)

Pass through file objects and context-manage path-likes.

`matplotlib.cbook.`**print_cycles**(*objects*, *outstream=<_io.TextIOWrapper name='<stdout>' mode='w' encoding='utf-8'>*, *show_progress=False*)

Print loops of cyclic references in the given *objects*.

It is often useful to pass in `gc.garbage` to find the cycles that are preventing some objects from being garbage collected.

Parameters

objects

A list of objects to find cycles in.

outstream

The stream for output.

show_progress

[bool] If True, print the number of objects reached as they are found.

`matplotlib.cbook.`**pts_to_midstep**(*x*, **args*)

Convert continuous line to mid-steps.

Given a set of `N` points convert to `2N` points which when connected linearly give a step function which changes values at the middle of the intervals.

Parameters

x

[array] The x location of the steps. May be empty.

y1, ..., yp

[array] y arrays to be turned into steps; all must be the same length as `x`.

Returns

array

The x and y values converted to steps in the same order as the input; can be unpacked as `x_out, y1_out, ..., yp_out`. If the input is length `N`, each of these arrays will be length `2N`.

Examples

```
>>> x_s, y1_s, y2_s = pts_to_midstep(x, y1, y2)
```

matplotlib.cbook.**pts_to_poststep**(*x*, **args*)

Convert continuous line to post-steps.

Given a set of `N` points convert to `2N + 1` points, which when connected linearly give a step function which changes values at the end of the intervals.

Parameters

x

[array] The x location of the steps. May be empty.

y1, ..., yp

[array] y arrays to be turned into steps; all must be the same length as `x`.

Returns

array

The x and y values converted to steps in the same order as the input; can be unpacked as `x_out, y1_out, ..., yp_out`. If the input is length `N`, each of these arrays will be length `2N + 1`. For `N=0`, the length will be 0.

Examples

```
>>> x_s, y1_s, y2_s = pts_to_poststep(x, y1, y2)
```

matplotlib.cbook.**pts_to_prestep**(*x*, **args*)

Convert continuous line to pre-steps.

Given a set of `N` points, convert to `2N - 1` points, which when connected linearly give a step function which changes values at the beginning of the intervals.

Parameters

x

[array] The x location of the steps. May be empty.

y1, ..., yp

[array] y arrays to be turned into steps; all must be the same length as `x`.

Returns

array

The x and y values converted to steps in the same order as the input; can be unpacked as `x_out, y1_out, ..., yp_out`. If the input is length `N`, each of these arrays will be length `2N + 1`. For `N=0`, the length will be 0.

Examples

```
>>> x_s, y1_s, y2_s = pts_to_prestep(x, y1, y2)
```

matplotlib.cbook.**report_memory**(*i=0*)

Return the memory consumed by the process.

matplotlib.cbook.**safe_first_element**(*obj*)

Return the first element in *obj*.

This is an type-independent way of obtaining the first element, supporting both index access and the iterator protocol.

matplotlib.cbook.**safe_masked_invalid**(*x*, *copy=False*)

matplotlib.cbook.**sanitize_sequence**(*data*)

Convert dictview objects to list. Other inputs are returned unchanged.

class matplotlib.cbook.**silent_list**(*type*, *seq=None*)

Bases: `list`

A list with a short `repr()`.

This is meant to be used for a homogeneous list of artists, so that they don't cause long, meaningless output.

Instead of

```
[<matplotlib.lines.Line2D object at 0x7f5749fed3c8>,
 <matplotlib.lines.Line2D object at 0x7f5749fed4e0>,
 <matplotlib.lines.Line2D object at 0x7f5758016550>]
```

one will get

```
<a list of 3 Line2D objects>
```

matplotlib.cbook.**simple_linear_interpolation**(*a*, *steps*)

Resample an array with `steps - 1` points between original point pairs.

Along each column of *a*, `(steps - 1)` points are introduced between each original values; the values are linearly interpolated.

Parameters

a

[array, shape (n, ...)]

steps

[int]

Returns

array

shape `((n - 1) * steps + 1, ...)`

matplotlib.cbook.**strip_math**(*s*)

Remove latex formatting from mathtext.

Only handles fully math and fully non-math strings.

matplotlib.cbook.**to_filehandle**(*fname*, *flag='r'*, *return_opened=False*, *encoding=None*)

Convert a path to an open file handle or pass-through a file-like object.

Consider using *open_file_cm* instead, as it allows one to properly close newly created file objects more easily.

Parameters

fname

[str or path-like or file-like] If `str` or `os.PathLike`, the file is opened using the flags specified by *flag* and *encoding*. If a file-like object, it is passed through.

flag

[str, default 'r'] Passed as the *mode* argument to `open` when *fname* is `str` or `os.PathLike`; ignored if *fname* is file-like.

return_opened

[bool, default False] If True, return both the file object and a boolean indicating whether this was a new file (that the caller needs to close). If False, return only the new file.

encoding

[str or None, default None] Passed as the *mode* argument to `open` when *fname* is `str` or `os.PathLike`; ignored if *fname* is file-like.

Returns

fh

[file-like]

opened

[bool] *opened* is only returned if *return_opened* is True.

`matplotlib.cbook.violin_stats`(*X*, *method*, *points=100*, *quantiles=None*)

Return a list of dictionaries of data which can be used to draw a series of violin plots.

See the `Returns` section below to view the required keys of the dictionary.

Users can skip this function and pass a user-defined set of dictionaries with the same keys to *violinplot* instead of using Matplotlib to do the calculations. See the *Returns* section below for the keys that must be present in the dictionaries.

Parameters

X

[array-like] Sample data that will be used to produce the gaussian kernel density estimates. Must have 2 or fewer dimensions.

method

[callable] The method used to calculate the kernel density estimate for each column of data. When called via `method(v, coords)`, it should return a vector of the values of the KDE evaluated at the values specified in coords.

points

[int, default: 100] Defines the number of points to evaluate each of the gaussian kernel density estimates at.

quantiles

[array-like, default: None] Defines (if not None) a list of floats in interval [0, 1] for each column of data, which represents the quantiles that will be rendered for that column of data. Must have 2 or fewer dimensions. 1D array will be treated as a singleton list containing them.

Returns

list of dict

A list of dictionaries containing the results for each column of data. The dictionaries contain at least the following:

- coords: A list of scalars containing the coordinates this particular kernel density estimate was evaluated at.
- vals: A list of scalars containing the values of the kernel density estimate at each of the coordinates given in *coords*.
- mean: The mean value for this column of data.
- median: The median value for this column of data.
- min: The minimum value for this column of data.
- max: The maximum value for this column of data.
- quantiles: The quantile values for this column of data.

exception matplotlib.cbook.deprecation.**MatplotlibDeprecationWarning**

Bases: UserWarning

A class for issuing deprecation warnings for Matplotlib users.

In light of the fact that Python builtin DeprecationWarnings are ignored by default as of Python 2.7 (see link below), this class was put in to allow for the signaling of deprecation, but via UserWarnings which are not ignored by default.

https://docs.python.org/dev/whatsnew/2.7.html#the-future-for-python-2-x

matplotlib.cbook.deprecation.**deprecated**(*since*, *, *message=''*, *name=''*, *alternative=''*, *pending=False*, *obj_type=None*, *addendum=''*, *removal=''*)

Decorator to mark a function, a class, or a property as deprecated.

When deprecating a classmethod, a staticmethod, or a property, the `@deprecated` decorator should go *under* `@classmethod` and `@staticmethod` (i.e., *deprecated* should directly decorate the underlying callable), but *over* `@property`.

Parameters

since

[str] The release at which this API became deprecated.

message

[str, optional] Override the default deprecation message. The `%(since)s`, `%(name)s`, `%(alternative)s`, `%(obj_type)s`, `%(addendum)s`, and `%(removal)s` format specifiers will be replaced by the values of the respective arguments passed to this function.

name

[str, optional] The name used in the deprecation message; if not provided, the name is automatically determined from the deprecated object.

alternative

[str, optional] An alternative API that the user may use in place of the deprecated API. The deprecation warning will tell the user about this alternative if provided.

pending

[bool, optional] If True, uses a PendingDeprecationWarning instead of a DeprecationWarning. Cannot be used together with *removal*.

obj_type

[str, optional] The object type being deprecated; by default, 'class' if decorating a class, 'attribute' if decorating a property, 'function' otherwise.

addendum

[str, optional] Additional text appended directly to the final message.

removal

[str, optional] The expected removal version. With the default (an empty string), a removal version is automatically computed from *since*. Set to other Falsy values to not schedule a removal date. Cannot be used together with *pending*.

Examples

Basic example:

```
@deprecated('1.4.0')
def the_function_to_deprecate():
    pass
```

matplotlib.cbook.deprecation.**mplDeprecation**

alias of *matplotlib.cbook.deprecation.MatplotlibDeprecationWarning*

matplotlib.cbook.deprecation.**warn_deprecated**(*since*, ***, *message=''*, *name=''*, *alternative=''*, *pending=False*, *obj_type=''*, *addendum=''*, *removal=''*)

Display a standardized deprecation.

Parameters

since

[str] The release at which this API became deprecated.

message

[str, optional] Override the default deprecation message. The `%(since)s`, `%(name)s`, `%(alternative)s`, `%(obj_type)s`, `%(addendum)s`, and `%(removal)s` format specifiers will be replaced by the values of the respective arguments passed to this function.

name

[str, optional] The name of the deprecated object.

alternative

[str, optional] An alternative API that the user may use in place of the deprecated API. The deprecation warning will tell the user about this alternative if provided.

pending

[bool, optional] If True, uses a PendingDeprecationWarning instead of a DeprecationWarning. Cannot be used together with *removal*.

obj_type

[str, optional] The object type being deprecated.

addendum

[str, optional] Additional text appended directly to the final message.

removal

[str, optional] The expected removal version. With the default (an empty string), a removal version is automatically computed from *since*. Set to other Falsy values to not schedule a removal date. Cannot be used together with *pending*.

Examples

Basic example:

```
# To warn of the deprecation of "matplotlib.name_of_module"
warn_deprecated('1.4.0', name='matplotlib.name_of_module',
                obj_type='module')
```

18.15 matplotlib.cm

Builtin colormaps, colormap handling utilities, and the *ScalarMappable* mixin.

See also:

/gallery/color/colormap_reference for a list of builtin colormaps.

Creating Colormaps in Matplotlib for examples of how to make colormaps.

Choosing Colormaps in Matplotlib an in-depth discussion of choosing colormaps.

Colormap Normalization for more details about data normalization.

class matplotlib.cm.**ScalarMappable**(*norm=None*, *cmap=None*)

Bases: object

A mixin class to map scalar data to RGBA.

The ScalarMappable applies data normalization before returning RGBA colors from the given colormap.

Parameters

norm

[*matplotlib.colors.Normalize* (or subclass thereof)] The normalizing object which scales data, typically into the interval `[0, 1]`. If *None*, *norm* defaults to a *colors.Normalize* object which initializes its scaling based on the first data processed.

cmap

[str or *Colormap*] The colormap used to map normalized data values to RGBA colors.

`add_checker`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`autoscale`(*self*)
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`(*self*)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`changed`(*self*)
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`colorbar`
The last colorbar associated with this ScalarMappable. May be None.

`get_alpha`(*self*)

Returns

float

Always returns 1.

`get_array`(*self*)
Return the data array.

`get_clim`(*self*)
Return the values (min, max) that are mapped to the colormap limits.

`get_cmap`(*self*)
Return the *Colormap* instance.

`set_array`(*self*, *A*)
Set the image array from numpy array *A*.

Parameters

A

[ndarray]

`set_clim`(*self*, *vmin=None*, *vmax=None*)
Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_cmap`(*self*, *cmap*)
Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

`set_norm`(*self*, *norm*)
Set the normalization instance.

Parameters

norm

[*Normalize* or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`to_rgba`(*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)
Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a

ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

property update_dict

matplotlib.cm.**get_cmap**(*name=None*, *lut=None*)

Get a colormap instance, defaulting to rc values if *name* is None.

Colormaps added with *register_cmap()* take precedence over built-in colormaps.

Parameters

name

[*matplotlib.colors.Colormap* or str or None, default: None] If a *Colormap* instance, it will be returned. Otherwise, the name of a colormap known to Matplotlib, which will be resampled by *lut*. The default, None, means `rcParams["image.cmap"]` (default: `'viridis'`).

lut

[int or None, default: None] If *name* is not already a Colormap instance and *lut* is not None, the colormap will be resampled to have *lut* entries in the lookup table.

Notes

Currently, this returns the global colormap object, which is deprecated. In Matplotlib 3.5, you will no longer be able to modify the global colormaps in-place.

matplotlib.cm.**register_cmap**(*name=None*, *cmap=None*, *data=None*, *lut=None*)

Add a colormap to the set recognized by *get_cmap()*.

It can be used in two ways:

```
register_cmap(name='swirly', cmap=swirly_cmap)

register_cmap(name='choppy', data=choppydata, lut=128)
```

In the first case, *cmap* must be a *matplotlib.colors.Colormap* instance. The *name* is optional; if absent, the name will be the `name` attribute of the *cmap*.

The second case is deprecated. Here, the three arguments are passed to the *LinearSegmentedColormap* initializer, and the resulting colormap is registered. Instead of this implicit colormap creation, create a *LinearSegmentedColormap* and use the first case: `register_cmap(cmap=LinearSegmentedColormap(name, data, lut))`.

Notes

Registering a colormap stores a reference to the colormap object which can currently be modified and inadvertantly change the global colormap state. This behavior is deprecated and in Matplotlib 3.5 the registered colormap will be immutable.

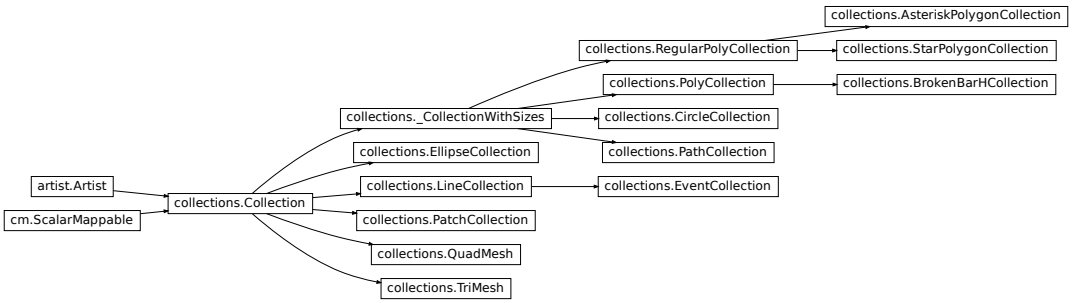
`matplotlib.cm.`**`revcmap`**(*data*)

[*Deprecated*] Can only handle specification *data* in dictionary format.

Notes

Deprecated since version 3.2.

18.16 matplotlib.collections



Classes for the efficient drawing of large collections of objects that share most properties, e.g., a large number of line segments or polygons.

The classes are not meant to be as flexible as their single element counterparts (e.g., you may not be able to select all line styles) but they are meant to be fast for common use cases (e.g., a large set of solid line segments).

class matplotlib.collections.**AsteriskPolygonCollection**(*numsides*, *rotation=0*, *sizes=1*, ***kwargs*)

Bases: *matplotlib.collections.RegularPolyCollection*

Draw a collection of regular asterisks with *numsides* points.

Parameters

numsides

[int] The number of sides of the polygon.

rotation

[float] The rotation of the polygon in radians.

sizes

[tuple of float] The area of the circle circumscribing the polygon in points^2.

****kwargs**

Forwarded to *Collection*.

Examples

See /gallery/event_handling/lasso_demo for a complete example:

```
offsets = np.random.rand(20, 2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]

collection = RegularPolyCollection(
    numsides=5, # a pentagon
    rotation=0, sizes=(50,),
    facecolors=facecolors,
    edgecolors=("black",),
    linewidths=(1,),
    offsets=offsets,
    transOffset=ax.transData,
    )
```

`add_callback`(*self, func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

`add_checker`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`autoscale`(*self*)
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`(*self*)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`property axes`
The *Axes* instance the artist resides in, or *None*.

`changed`(*self*)
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`contains`(*self*, *mouseevent*)
Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

`convert_xunits`(*self*, *x*)
Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

`convert_yunits`(*self*, *y*)
Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`findobj`(*self*, *match=None*, *include_self=True*)
Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

`format_cursor_data`(*self*, *data*)
Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

`get_agg_filter`(*self*)
Return filter function to be used for agg filter.

`get_alpha`(*self*)
Return the alpha value used for blending - not supported on all backends.

`get_animated`(*self*)
Return whether the artist is animated.

`get_array`(*self*)
Return the data array.

`get_capstyle`(*self*)

`get_children`(*self*)
Return a list of the child *Artist*s of this *Artist*.

`get_clim`(*self*)
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box`(*self*)
Return the clipbox.

`get_clip_on`(*self*)
Return whether the artist uses clipping.

`get_clip_path`(*self*)
Return the clip path.

`get_cmap`(*self*)
Return the *Colormap* instance.

`get_contains`(*self*)
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

See also:

set_contains

Notes

Deprecated since version 3.3.

get_cursor_data(*self*, *event*)
Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*matplotlib.backend_bases.MouseEvent*]

See also:

format_cursor_data

get_dashes(*self*)
Alias for *get_linestyle*.

get_datalim(*self*, *transData*)

get_ec(*self*)
Alias for *get_edgecolor*.

get_edgecolor(*self*)

get_edgecolors(*self*)
Alias for *get_edgecolor*.

get_facecolor(*self*)

get_facecolors(*self*)
Alias for *get_facecolor*.

get_fc(*self*)
Alias for *get_facecolor*.

get_figure(*self*)
Return the *Figure* instance the artist belongs to.

`get_fill`(*self*)
Return whether fill is set.

`get_gid`(*self*)
Return the group id.

`get_hatch`(*self*)
Return the current hatching pattern.

`get_in_layout`(*self*)
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle`(*self*)

`get_label`(*self*)
Return the label used for this artist in the legend.

`get_linestyle`(*self*)

`get_linestyles`(*self*)
Alias for *get_linestyle*.

`get_linewidth`(*self*)

`get_linewidths`(*self*)
Alias for *get_linewidth*.

`get_ls`(*self*)
Alias for *get_linestyle*.

`get_lw`(*self*)
Alias for *get_linewidth*.

`get_numsides`(*self*)

`get_offset_position`(*self*)
[*Deprecated*] Return how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

`get_offset_transform`(*self*)

`get_offsets`(*self*)
Return the offsets for the collection.

`get_path_effects`(*self*)

get_paths(*self*)

get_picker(*self*)
Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, *pickable*, *pick*

get_pickradius(*self*)

get_rasterized(*self*)
Return whether the artist is to be rasterized.

get_rotation(*self*)

get_sizes(*self*)
Return the sizes ('areas') of the elements in the collection.

Returns

array

The 'area' of each element.

get_sketch_params(*self*)
Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap(*self*)
Return the snap setting.

See *set_snap* for details.

get_tightbbox(*self*, *renderer*)
Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

`get_transform`(*self*)
Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine`(*self*)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms`(*self*)

`get_url`(*self*)
Return the url.

`get_urls`(*self*)
Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

`get_visible`(*self*)
Return the visibility.

`get_window_extent`(*self*, *renderer*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder`(*self*)
Return the artist's zorder.

`have_units`(*self*)
Return *True* if units are set on any axis.

`is_transform_set`(*self*)
Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

property mouseover
: If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

  See also *get_cursor_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

pchanged(*self*)
: Call all of the registered callbacks.

  This function is triggered internally when a property is changed.

  See also:

  add_callback

  remove_callback

pick(*self, mouseevent*)
: Process a pick event.

  Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

  See also:

  set_picker, *get_picker*, *pickable*

pickable(*self*)
: Return whether the artist is pickable.

  See also:

  set_picker, *get_picker*, *pick*

properties(*self*)
: Return a dictionary of all the properties of the artist.

remove(*self*)
: Remove the artist from the figure if possible.

  The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

  Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

  Note: there is no support for removing the artist's legend entry.

remove_callback(*self, oid*)
: Remove a callback based on its observer id.

  See also:

add_callback

set(*self*, ***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

set_aa(*self*, *aa*)
Alias for *set_antialiased*.

set_agg_filter(*self*, *filter_func*)
Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

set_alpha(*self*, *alpha*)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[float or None]

set_animated(*self*, *b*)
Set the artist's animation state.

Parameters

b

[bool]

set_antialiased(*self*, *aa*)
Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*self*, *aa*)
Alias for *set_antialiased*.

set_array(*self*, *A*)
Set the image array from numpy array *A*.

Parameters

A

[ndarray]

set_capstyle(*self*, *cs*)
Set the capstyle for the collection (for all its elements).

Parameters

cs

[{'butt', 'round', 'projecting'}] The capstyle.

set_clim(*self*, *vmin=None*, *vmax=None*)
Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_clip_box(*self*, *clipbox*)
Set the artist's clip *Bbox*.

Parameters

clipbox

[*Bbox*]

set_clip_on(*self*, *b*)
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*self*, *path*, *transform=None*)
Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap`(*self*, *cmap*)
Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

`set_color`(*self*, *c*)
Set both the edgecolor and the facecolor.

Parameters

c

[color or list of rgba tuples]

See also:

Collection.set_facecolor, *Collection.set_edgecolor*

For setting the edge or face color individually.

`set_contains`(*self*, *picker*)
[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

Parameters

picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

`set_dashes`(*self*, *ls*)
Alias for *set_linestyle*.

`set_ec`(*self*, *c*)
Alias for *set_edgecolor*.

`set_edgecolor`(*self*, *c*)
Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors`(*self*, *c*)
Alias for *set_edgecolor*.

`set_facecolor`(*self*, *c*)
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

`set_facecolors`(*self*, *c*)
Alias for *set_facecolor*.

set_fc(*self*, *c*)
Alias for *set_facecolor*.

set_figure(*self*, *fig*)
Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gid(*self*, *gid*)
Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*self*, *hatch*)
Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*self*, *in_layout*)
Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

`set_joinstyle`(*self*, *js*)
Set the joinstyle for the collection (for all its elements).

Parameters

js

[{'miter', 'round', 'bevel'}] The joinstyle.

`set_label`(*self*, *s*)
Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

`set_linestyle`(*self*, *ls*)
Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

`set_linestyles`(*self*, *ls*)
Alias for *set_linestyle*.

`set_linewidth`(*self*, *lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

`set_linewidths`(*self*, *lw*)
Alias for *set_linewidth*.

`set_ls`(*self*, *ls*)
Alias for *set_linestyle*.

`set_lw`(*self*, *lw*)
Alias for *set_linewidth*.

`set_norm`(*self*, *norm*)
Set the normalization instance.

Parameters

norm

[*Normalize* or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position`(*self*, *offset_position*)
[*Deprecated*] Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Parameters

offset_position

[{'screen', 'data'}]

Notes

Deprecated since version 3.3.

`set_offsets`(*self*, *offsets*)
Set the offsets for the collection.

Parameters

offsets

[array-like (N, 2) or (2,)]

`set_path_effects`(*self*, *path_effects*)
Set the path effects.

Parameters

path_effects

[*AbstractPathEffect*]

`set_paths`(*self*)

`set_picker`(*self*, *picker*)
Define the picking behavior of the artist.

Parameters

picker

[None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set_pickradius* instead.

`set_pickradius`(*self*, *pr*)
Set the pick radius used for containment tests.

Parameters

d

[float] Pick radius, in points.

`set_rasterized`(*self*, *rasterized*)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

Parameters

rasterized

[bool or None]

`set_sizes`(*self*, *sizes*, *dpi=72.0*)
Set the sizes of each member of the collection.

Parameters

sizes

[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi

[float, default: 72] The dpi of the canvas.

`set_sketch_params`(*self*, *scale=None*, *length=None*, *randomness=None*)
Sets the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

set_snap(*self*, *snap*)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transform(*self*, *t*)
Set the artist transform.

Parameters

t

[*Transform*]

set_url(*self*, *url*)
Set the url for the artist.

Parameters

url

[str]

set_urls(*self*, *urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_visible`(*self*, *b*)
Set the artist's visibility.

Parameters

b

[bool]

`set_zorder`(*self*, *level*)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

`property stale`
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`property sticky_edges`
`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba`(*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)
Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update`(*self*, *props*)
Update this artist's properties from the dict *props*.

Parameters

props

[dict]

`property update_dict`

`update_from`(*self*, *other*)
Copy properties from other to self.

`update_scalarmappable`(*self*)
Update colors from the scalar mappable array, if it is not None.

`zorder = 0`

`class matplotlib.collections.BrokenBarHCollection`(*xranges*, *yrange*, ***kwargs*)
Bases: *matplotlib.collections.PolyCollection*

A collection of horizontal bars spanning *yrange* with a sequence of *xranges*.

Parameters

xranges

[list of (float, float)] The sequence of (left-edge-position, width) pairs for each bar.

yrange

[(float, float)] The (lower-edge, height) common to all bars.

****kwargs**

Forwarded to *Collection*.

`add_callback`(*self*, *func*)
Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

`add_checker`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`autoscale`(*self*)
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`(*self*)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`property axes`
The *Axes* instance the artist resides in, or *None*.

`changed`(*self*)
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`contains`(*self*, *mouseevent*)
Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

`convert_xunits`(*self*, *x*)
Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

`convert_yunits`(*self*, *y*)
Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`findobj`(*self*, *match=None*, *include_self=True*)
Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.

- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

`format_cursor_data`(*self*, *data*)
Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

`get_agg_filter`(*self*)
Return filter function to be used for agg filter.

`get_alpha`(*self*)
Return the alpha value used for blending - not supported on all backends.

`get_animated`(*self*)
Return whether the artist is animated.

`get_array`(*self*)
Return the data array.

`get_capstyle`(*self*)

`get_children`(*self*)
Return a list of the child *Artist*s of this *Artist*.

`get_clim`(*self*)
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box`(*self*)
Return the clipbox.

`get_clip_on`(*self*)
Return whether the artist uses clipping.

`get_clip_path`(*self*)
Return the clip path.

get_cmap(*self*)
Return the *Colormap* instance.

get_contains(*self*)
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

See also:

set_contains

Notes

Deprecated since version 3.3.

get_cursor_data(*self*, *event*)
Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*matplotlib.backend_bases.MouseEvent*]

See also:

format_cursor_data

get_dashes(*self*)
Alias for *get_linestyle*.

get_datalim(*self*, *transData*)

get_ec(*self*)
Alias for *get_edgecolor*.

get_edgecolor(*self*)

get_edgecolors(*self*)
Alias for *get_edgecolor*.

get_facecolor(*self*)

get_facecolors(*self*)
Alias for *get_facecolor*.

get_fc(*self*)
Alias for *get_facecolor*.

get_figure(*self*)
Return the *Figure* instance the artist belongs to.

get_fill(*self*)
Return whether fill is set.

get_gid(*self*)
Return the group id.

get_hatch(*self*)
Return the current hatching pattern.

get_in_layout(*self*)
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle(*self*)

get_label(*self*)
Return the label used for this artist in the legend.

get_linestyle(*self*)

get_linestyles(*self*)
Alias for *get_linestyle*.

get_linewidth(*self*)

get_linewidths(*self*)
Alias for *get_linewidth*.

get_ls(*self*)
Alias for *get_linestyle*.

get_lw(*self*)
Alias for *get_linewidth*.

get_offset_position(*self*)
[*Deprecated*] Return how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

`get_offset_transform`(*self*)

`get_offsets`(*self*)
Return the offsets for the collection.

`get_path_effects`(*self*)

`get_paths`(*self*)

`get_picker`(*self*)
Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, *pickable*, *pick*

`get_pickradius`(*self*)

`get_rasterized`(*self*)
Return whether the artist is to be rasterized.

`get_sizes`(*self*)
Return the sizes ('areas') of the elements in the collection.

Returns

array

The 'area' of each element.

`get_sketch_params`(*self*)
Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap(*self*)
Return the snap setting.

See *set_snap* for details.

get_tightbbox(*self*, *renderer*)
Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

get_transform(*self*)
Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine(*self*)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms(*self*)

get_url(*self*)
Return the url.

get_urls(*self*)
Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

get_visible(*self*)
Return the visibility.

get_window_extent(*self*, *renderer*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to

unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder`(*self*)
Return the artist's zorder.

`have_units`(*self*)
Return *True* if units are set on any axis.

`is_transform_set`(*self*)
Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

`property mouseover`
If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also *get_cursor_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

`pchanged`(*self*)
Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback

remove_callback

`pick`(*self*, *mouseevent*)
Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

`pickable`(*self*)
Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

`properties`(*self*)
Return a dictionary of all the properties of the artist.

`remove`(*self*)
Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

`remove_callback`(*self*, *oid*)
Remove a callback based on its observer id.

See also:

add_callback

`set`(*self*, ***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

`set_aa`(*self*, *aa*)
Alias for *set_antialiased*.

`set_agg_filter`(*self*, *filter_func*)
Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha`(*self*, *alpha*)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[float or None]

`set_animated`(*self*, *b*)
Set the artist's animation state.

Parameters

b

[bool]

`set_antialiased`(*self*, *aa*)
Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

`set_antialiaseds`(*self*, *aa*)
Alias for *set_antialiased*.

`set_array`(*self*, *A*)
Set the image array from numpy array *A*.

Parameters

A

[ndarray]

`set_capstyle`(*self*, *cs*)
Set the capstyle for the collection (for all its elements).

Parameters

cs

[{'butt', 'round', 'projecting'}] The capstyle.

`set_clim`(*self*, *vmin=None*, *vmax=None*)
Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box`(*self*, *clipbox*)
Set the artist's clip *Bbox*.

Parameters

clipbox

[*Bbox*]

`set_clip_on`(*self*, *b*)
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

Parameters

b

[bool]

`set_clip_path`(*self*, *path*, *transform=None*)
Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap`(*self*, *cmap*)
Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

`set_color`(*self*, *c*)
Set both the edgecolor and the facecolor.

Parameters

c

[color or list of rgba tuples]

See also:

Collection.set_facecolor, *Collection.set_edgecolor*

For setting the edge or face color individually.

set_contains(*self*, *picker*)
[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

Parameters

picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

set_dashes(*self*, *ls*)
Alias for *set_linestyle*.

set_ec(*self*, *c*)
Alias for *set_edgecolor*.

set_edgecolor(*self*, *c*)
Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*self*, *c*)
Alias for *set_edgecolor*.

set_facecolor(*self*, *c*)
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

`set_facecolors`(*self*, *c*)
Alias for *set_facecolor*.

`set_fc`(*self*, *c*)
Alias for *set_facecolor*.

`set_figure`(*self*, *fig*)
Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

`set_gid`(*self*, *gid*)
Set the (group) id for the artist.

Parameters

gid

[str]

`set_hatch`(*self*, *hatch*)
Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

`set_in_layout`(*self*, *in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

`set_joinstyle`(*self*, *js*)

Set the joinstyle for the collection (for all its elements).

Parameters

js

[{'miter', 'round', 'bevel'}] The joinstyle.

`set_label`(*self*, *s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

`set_linestyle`(*self*, *ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

`set_linestyles`(*self*, *ls*)
Alias for *set_linestyle*.

`set_linewidth`(*self*, *lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

`set_linewidths`(*self*, *lw*)
Alias for *set_linewidth*.

`set_ls`(*self*, *ls*)
Alias for *set_linestyle*.

`set_lw`(*self*, *lw*)
Alias for *set_linewidth*.

`set_norm`(*self*, *norm*)
Set the normalization instance.

Parameters

norm

[*Normalize* or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position`(*self*, *offset_position*)
[*Deprecated*] Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Parameters

offset_position

[{'screen', 'data'}]

Notes

Deprecated since version 3.3.

`set_offsets`(*self*, *offsets*)
Set the offsets for the collection.

Parameters

offsets

[array-like (N, 2) or (2,)]

`set_path_effects`(*self*, *path_effects*)
Set the path effects.

Parameters

path_effects

[*AbstractPathEffect*]

`set_paths`(*self*, *verts*, *closed=True*)
Set the vertices of the polygons.

Parameters

verts

[list of array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts_i* defines the vertices of polygon *i* as a 2D array-like of shape (M, 2).

closed

[bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

`set_picker`(*self*, *picker*)
Define the picking behavior of the artist.

Parameters

picker

[None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).

- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set_pickradius* instead.

`set_pickradius`(*self*, *pr*)

Set the pick radius used for containment tests.

Parameters

d

[float] Pick radius, in points.

`set_rasterized`(*self*, *rasterized*)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

Parameters

rasterized

[bool or None]

`set_sizes`(*self*, *sizes*, *dpi=72.0*)

Set the sizes of each member of the collection.

Parameters

sizes

[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi

[float, default: 72] The dpi of the canvas.

`set_sketch_params`(*self*, *scale=None*, *length=None*, *randomness=None*)
Sets the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*self*, *snap*)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform`(*self*, *t*)
Set the artist transform.

Parameters

t

[*Transform*]

`set_url`(*self*, *url*)
Set the url for the artist.

Parameters

url

[str]

`set_urls`(*self*, *urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_verts`(*self*, *verts*, *closed=True*)
Set the vertices of the polygons.

Parameters

verts

[list of array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts_i* defines the vertices of polygon *i* as a 2D array-like of shape (M, 2).

closed

[bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

`set_verts_and_codes`(*self*, *verts*, *codes*)
Initialize vertices with path codes.

`set_visible`(*self*, *b*)
Set the artist's visibility.

Parameters

b

[bool]

`set_zorder`(*self*, *level*)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

classmethod **span_where**(*x*, *ymin*, *ymax*, *where*, ***kwargs*)

Return a *BrokenBarHCollection* that plots horizontal bars from over the regions in *x* where *where* is True. The bars range on the y-axis from *ymin* to *ymax*

kwargs are passed on to the collection.

property **stale**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property **sticky_edges**

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update`(*self*, *props*)
Update this artist's properties from the dict *props*.

Parameters

props

[dict]

`property update_dict`

`update_from`(*self*, *other*)
Copy properties from other to self.

`update_scalarmappable`(*self*)
Update colors from the scalar mappable array, if it is not None.

`zorder = 0`

`class matplotlib.collections.CircleCollection`(*sizes*, ***kwargs*)
Bases: `matplotlib.collections._CollectionWithSizes`

A collection of circles, drawn using splines.

Parameters

sizes

[float or array-like] The area of each circle in points^2.

****kwargs**

Forwarded to *Collection*.

`add_callback`(*self*, *func*)
Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

`add_checker`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`autoscale`(*self*)
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`(*self*)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`property axes`
The *Axes* instance the artist resides in, or *None*.

`changed`(*self*)
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`contains`(*self*, *mouseevent*)
Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

`convert_xunits`(*self*, *x*)
Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

`convert_yunits`(*self*, *y*)
Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`findobj`(*self*, *match=None*, *include_self=True*)
Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

`format_cursor_data`(*self*, *data*)
Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

`get_agg_filter`(*self*)
Return filter function to be used for agg filter.

`get_alpha`(*self*)
Return the alpha value used for blending - not supported on all backends.

`get_animated`(*self*)
Return whether the artist is animated.

`get_array`(*self*)
Return the data array.

`get_capstyle`(*self*)

`get_children`(*self*)
Return a list of the child *Artist*s of this *Artist*.

`get_clim`(*self*)
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box`(*self*)
Return the clipbox.

`get_clip_on`(*self*)
Return whether the artist uses clipping.

`get_clip_path`(*self*)
Return the clip path.

`get_cmap`(*self*)
Return the *Colormap* instance.

`get_contains`(*self*)
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

See also:

set_contains

Notes

Deprecated since version 3.3.

get_cursor_data(*self*, *event*)
Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*matplotlib.backend_bases.MouseEvent*]

See also:

format_cursor_data

get_dashes(*self*)
Alias for *get_linestyle*.

get_datalim(*self*, *transData*)

get_ec(*self*)
Alias for *get_edgecolor*.

get_edgecolor(*self*)

get_edgecolors(*self*)
Alias for *get_edgecolor*.

get_facecolor(*self*)

get_facecolors(*self*)
Alias for *get_facecolor*.

get_fc(*self*)
Alias for *get_facecolor*.

get_figure(*self*)
Return the *Figure* instance the artist belongs to.

`get_fill`(*self*)
Return whether fill is set.

`get_gid`(*self*)
Return the group id.

`get_hatch`(*self*)
Return the current hatching pattern.

`get_in_layout`(*self*)
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle`(*self*)

`get_label`(*self*)
Return the label used for this artist in the legend.

`get_linestyle`(*self*)

`get_linestyles`(*self*)
Alias for *get_linestyle*.

`get_linewidth`(*self*)

`get_linewidths`(*self*)
Alias for *get_linewidth*.

`get_ls`(*self*)
Alias for *get_linestyle*.

`get_lw`(*self*)
Alias for *get_linewidth*.

`get_offset_position`(*self*)
[*Deprecated*] Return how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

`get_offset_transform`(*self*)

`get_offsets`(*self*)
Return the offsets for the collection.

`get_path_effects`(*self*)

`get_paths`(*self*)

get_picker(*self*)
Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, *pickable*, *pick*

get_pickradius(*self*)

get_rasterized(*self*)
Return whether the artist is to be rasterized.

get_sizes(*self*)
Return the sizes ('areas') of the elements in the collection.

Returns

array

The 'area' of each element.

get_sketch_params(*self*)
Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap(*self*)
Return the snap setting.

See *set_snap* for details.

get_tightbbox(*self*, *renderer*)
Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

`get_transform`(*self*)
Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine`(*self*)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms`(*self*)

`get_url`(*self*)
Return the url.

`get_urls`(*self*)
Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

`get_visible`(*self*)
Return the visibility.

`get_window_extent`(*self*, *renderer*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder`(*self*)
Return the artist's zorder.

`have_units`(*self*)
Return *True* if units are set on any axis.

`is_transform_set`(*self*)
Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

`property mouseover`
If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also *get_cursor_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

`pchanged`(*self*)
Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback

remove_callback

`pick`(*self, mouseevent*)
Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

`pickable`(*self*)
Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

`properties`(*self*)
Return a dictionary of all the properties of the artist.

`remove`(*self*)
Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

`remove_callback`(*self, oid*)
Remove a callback based on its observer id.

See also:

add_callback

`set`(*self, **kwargs*)
A property batch setter. Pass *kwargs* to set properties.

set_aa(*self*, *aa*)
Alias for *set_antialiased*.

set_agg_filter(*self*, *filter_func*)
Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

set_alpha(*self*, *alpha*)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[float or None]

set_animated(*self*, *b*)
Set the artist's animation state.

Parameters

b

[bool]

set_antialiased(*self*, *aa*)
Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*self*, *aa*)
Alias for *set_antialiased*.

set_array(*self*, *A*)
Set the image array from numpy array *A*.

Parameters

A

[ndarray]

set_capstyle(*self*, *cs*)
Set the capstyle for the collection (for all its elements).

Parameters

cs

[{'butt', 'round', 'projecting'}] The capstyle.

`set_clim`(*self*, *vmin=None*, *vmax=None*)
Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box`(*self*, *clipbox*)
Set the artist's clip *Bbox*.

Parameters

clipbox

[*Bbox*]

`set_clip_on`(*self*, *b*)
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

Parameters

b

[bool]

`set_clip_path`(*self*, *path*, *transform=None*)
Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap`(*self*, *cmap*)
Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

`set_color`(*self*, *c*)
Set both the edgecolor and the facecolor.

Parameters

c

[color or list of rgba tuples]

See also:

Collection.set_facecolor, *Collection.set_edgecolor*

For setting the edge or face color individually.

`set_contains`(*self*, *picker*)
[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

Parameters

picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

`set_dashes`(*self*, *ls*)
Alias for *set_linestyle*.

`set_ec`(*self*, *c*)
Alias for *set_edgecolor*.

`set_edgecolor`(*self*, *c*)
Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors`(*self*, *c*)
Alias for *set_edgecolor*.

`set_facecolor`(*self*, *c*)
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

`set_facecolors`(*self*, *c*)
Alias for *set_facecolor*.

`set_fc`(*self*, *c*)
Alias for *set_facecolor*.

`set_figure`(*self*, *fig*)
Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

`set_gid`(*self*, *gid*)
Set the (group) id for the artist.

Parameters

gid

[str]

`set_hatch`(*self*, *hatch*)
Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

`set_in_layout`(*self*, *in_layout*)
Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

`set_joinstyle`(*self*, *js*)
Set the joinstyle for the collection (for all its elements).

Parameters

js

[{'miter', 'round', 'bevel'}] The joinstyle.

`set_label`(*self*, *s*)
Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

`set_linestyle`(*self*, *ls*)
Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

`set_linestyles`(*self*, *ls*)
Alias for *set_linestyle*.

`set_linewidth`(*self*, *lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

`set_linewidths`(*self*, *lw*)
Alias for *set_linewidth*.

`set_ls`(*self*, *ls*)
Alias for *set_linestyle*.

`set_lw`(*self*, *lw*)
Alias for *set_linewidth*.

`set_norm`(*self*, *norm*)
Set the normalization instance.

Parameters

norm

[*Normalize* or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position`(*self*, *offset_position*)
[*Deprecated*] Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Parameters

offset_position

[{'screen', 'data'}]

Notes

Deprecated since version 3.3.

`set_offsets`(*self*, *offsets*)
Set the offsets for the collection.

Parameters

offsets

[array-like (N, 2) or (2,)]

`set_path_effects`(*self*, *path_effects*)
Set the path effects.

Parameters

path_effects

[*AbstractPathEffect*]

`set_paths`(*self*)

`set_picker`(*self*, *picker*)
Define the picking behavior of the artist.

Parameters

picker

[None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set_pickradius* instead.

`set_pickradius`(*self*, *pr*)
Set the pick radius used for containment tests.

Parameters

d

[float] Pick radius, in points.

set_rasterized(*self*, *rasterized*)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

Parameters

rasterized

[bool or None]

set_sizes(*self*, *sizes*, *dpi=72.0*)
Set the sizes of each member of the collection.

Parameters

sizes

[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi

[float, default: 72] The dpi of the canvas.

set_sketch_params(*self*, *scale=None*, *length=None*, *randomness=None*)
Sets the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

set_snap(*self*, *snap*)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest

integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform`(*self*, *t*)

Set the artist transform.

Parameters

t

[*Transform*]

`set_url`(*self*, *url*)

Set the url for the artist.

Parameters

url

[str]

`set_urls`(*self*, *urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_visible`(*self*, *b*)

Set the artist's visibility.

Parameters

b

[bool]

`set_zorder`(*self*, *level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

`property stale`

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`property sticky_edges`

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba`(*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update`(*self*, *props*)
Update this artist's properties from the dict *props*.

Parameters

props

[dict]

`property update_dict`

`update_from`(*self*, *other*)
Copy properties from other to self.

`update_scalarmappable`(*self*)
Update colors from the scalar mappable array, if it is not None.

`zorder = 0`

`class matplotlib.collections.Collection`(*edgecolors=None*, *facecolors=None*, *linewidths=None*, *linestyles='solid'*, *capstyle=None*, *joinstyle=None*, *antialiaseds=None*, *offsets=None*, *transOffset=None*, *norm=None*, *cmap=None*, *pickradius=5.0*, *hatch=None*, *urls=None*, *offset_position=<deprecated parameter>*, *zorder=1*, ***kwargs*)
Bases: *matplotlib.artist.Artist*, *matplotlib.cm.ScalarMappable*

Base class for Collections. Must be subclassed to be usable.

A Collection represents a sequence of *Patch*es that can be drawn more efficiently together than individually. For example, when a single path is being drawn repeatedly at different offsets, the renderer can typically execute a `draw_marker()` call much more efficiently than a series of repeated calls to `draw_path()` with the offsets put in one-by-one.

Most properties of a collection can be configured per-element. Therefore, Collections have "plural" versions of many of the properties of a *Patch* (e.g. *Collection.get_paths* instead of *Patch.get_path*). Exceptions are the *zorder*, *hatch*, *pickradius*, *capstyle* and *joinstyle* properties, which can only be set globally for the whole collection.

Besides these exceptions, all properties can be specified as single values (applying to all elements) or sequences of values. The property of the `i`th element of the collection is:

```
prop[i % len(prop)]
```

Each Collection can optionally be used as its own *ScalarMappable* by passing the *norm* and *cmap* parameters to its constructor. If the Collection's *ScalarMappable* matrix `_A` has been set (via a call to *Collection.set_array*), then at draw time this internal scalar mappable will be used to set the `facecolors` and `edgecolors`, ignoring those that were manually passed in.

Parameters

edgecolors

[color or list of colors, default: `rcParams["patch.edgecolor"]` (default: `'black'`)] Edge color for each patch making up the collection. The special value 'face' can be passed to make the edgecolor match the facecolor.

facecolors

[color or list of colors, default: `rcParams["patch.facecolor"]` (default: `'C0'`)] Face color for each patch making up the collection.

linewidths

[float or list of floats, default: `rcParams["patch.linewidth"]` (default: `1.0`)] Line width for each patch making up the collection.

linestyles

[str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

```
(offset, onoffseq),
```

where *onoffseq* is an even length tuple of on and off ink lengths in points. For examples, see /gallery/lines_bars_and_markers/linestyles.

capstyle

[str, default: `rcParams["patch.capstyle"]`] Style to use for capping lines for all paths in the collection. See /gallery/lines_bars_and_markers/joinstyle for a demonstration of each of the allowed values.

joinstyle

[str, default: `rcParams["patch.joinstyle"]`] Style to use for joining lines for all paths in the collection. See /gallery/lines_bars_and_markers/joinstyle for a demonstration of each of the allowed values.

antialiaseds

[bool or list of bool, default: `rcParams["patch.antialiased"]` (default: `True`)] Whether each pach in the collection should be drawn with antialiasing.

offsets

[(float, float) or list thereof, default: (0, 0)] A vector by which to translate each patch after rendering (default is no translation). The translation is performed in screen (pixel) coordinates (i.e. after the Artist's transform is applied).

transOffset

[*Transform*, default: *IdentityTransform*] A single transform which will be applied to each *offsets* vector before it is used.

offset_position

[{'screen' (default), 'data' (deprecated)}] If set to 'data' (deprecated), *offsets* will be treated as if it is in data coordinates instead of in screen coordinates.

norm

[*Normalize*, optional] Forwarded to *ScalarMappable*. The default of `None` means that the first draw call will set `vmin` and `vmax` using the minimum and maximum values of the data.

cmap

[*Colormap*, optional] Forwarded to *ScalarMappable*. The default of `None` will result in `rcParams["image.cmap"]` (default: `'viridis'`) being used.

hatch

[str, optional] Hatching pattern to use in filled paths, if any. Valid strings are ['/', '', '|', '-', '+', 'x', 'o', 'O', '.', '*']. See /gallery/shapes_and_collections/hatch_demo for the meaning of each hatch type.

pickradius

[float, default: 5.0] If `pickradius <= 0`, then *Collection.contains* will return `True` whenever the test point is inside of one of the polygons formed by the control points of a Path in the Collection. On the other hand, if it is greater than 0, then we instead check if the test point is contained in a stroke of width `2*pickradius` following any of the Paths in the Collection.

urls

[list of str, default: None] A URL for each patch to link to once drawn. Currently only works for the SVG backend. See

/gallery/misc/hyperlinks_sgskip for examples.

zorder

[float, default: 1] The drawing order, shared by all Patches in the Collection. See /gallery/misc/zorder_demo for all defaults and examples.

`add_callback`(*self*, *func*)
Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

`add_checker`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`autoscale`(*self*)
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`(*self*)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`property axes`
The *Axes* instance the artist resides in, or *None*.

`changed`(*self*)
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`contains`(*self*, *mouseevent*)
Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

`convert_xunits`(*self*, *x*)
Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

`convert_yunits`(*self*, *y*)
Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`findobj`(*self*, *match=None*, *include_self=True*)
Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

`format_cursor_data`(*self*, *data*)
Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

`get_agg_filter`(*self*)
Return filter function to be used for agg filter.

`get_alpha`(*self*)
Return the alpha value used for blending - not supported on all backends.

`get_animated`(*self*)
Return whether the artist is animated.

`get_array`(*self*)
Return the data array.

`get_capstyle`(*self*)

`get_children`(*self*)
Return a list of the child *Artist*s of this *Artist*.

`get_clim`(*self*)
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box`(*self*)
Return the clipbox.

`get_clip_on`(*self*)
Return whether the artist uses clipping.

`get_clip_path`(*self*)
Return the clip path.

`get_cmap`(*self*)
Return the *Colormap* instance.

`get_contains`(*self*)
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

See also:

set_contains

Notes

Deprecated since version 3.3.

`get_cursor_data`(*self*, *event*)
Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*matplotlib.backend_bases.MouseEvent*]

See also:

format_cursor_data

get_dashes(*self*)
Alias for *get_linestyle*.

get_datalim(*self*, *transData*)

get_ec(*self*)
Alias for *get_edgecolor*.

get_edgecolor(*self*)

get_edgecolors(*self*)
Alias for *get_edgecolor*.

get_facecolor(*self*)

get_facecolors(*self*)
Alias for *get_facecolor*.

get_fc(*self*)
Alias for *get_facecolor*.

get_figure(*self*)
Return the *Figure* instance the artist belongs to.

get_fill(*self*)
Return whether fill is set.

get_gid(*self*)
Return the group id.

get_hatch(*self*)
Return the current hatching pattern.

get_in_layout(*self*)
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle(*self*)

get_label(*self*)
Return the label used for this artist in the legend.

get_linestyle(*self*)

get_linestyles(*self*)
Alias for *get_linestyle*.

get_linewidth(*self*)

get_linewidths(*self*)
Alias for *get_linewidth*.

get_ls(*self*)
Alias for *get_linestyle*.

get_lw(*self*)
Alias for *get_linewidth*.

get_offset_position(*self*)
[*Deprecated*] Return how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

get_offset_transform(*self*)

get_offsets(*self*)
Return the offsets for the collection.

get_path_effects(*self*)

get_paths(*self*)

get_picker(*self*)
Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, *pickable*, *pick*

get_pickradius(*self*)

get_rasterized(*self*)
Return whether the artist is to be rasterized.

get_sketch_params(*self*)
Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

`get_snap`(*self*)
Return the snap setting.

See *set_snap* for details.

`get_tightbbox`(*self*, *renderer*)
Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

`get_transform`(*self*)
Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine`(*self*)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms`(*self*)

`get_url`(*self*)
Return the url.

`get_urls`(*self*)
Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

`get_visible`(*self*)
Return the visibility.

`get_window_extent`(*self*, *renderer*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to

unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder`(*self*)
Return the artist's zorder.

`have_units`(*self*)
Return *True* if units are set on any axis.

`is_transform_set`(*self*)
Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

`property mouseover`
If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also *get_cursor_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

`pchanged`(*self*)
Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback

remove_callback

`pick`(*self*, *mouseevent*)
Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

`pickable`(*self*)
Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

`properties`(*self*)
Return a dictionary of all the properties of the artist.

`remove`(*self*)
Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

`remove_callback`(*self*, *oid*)
Remove a callback based on its observer id.

See also:

add_callback

`set`(*self*, ***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

`set_aa`(*self*, *aa*)
Alias for *set_antialiased*.

`set_agg_filter`(*self*, *filter_func*)
Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha`(*self*, *alpha*)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[float or None]

`set_animated`(*self*, *b*)
Set the artist's animation state.

Parameters

b

[bool]

`set_antialiased`(*self*, *aa*)
Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

`set_antialiaseds`(*self*, *aa*)
Alias for *set_antialiased*.

`set_array`(*self*, *A*)
Set the image array from numpy array *A*.

Parameters

A

[ndarray]

`set_capstyle`(*self*, *cs*)
Set the capstyle for the collection (for all its elements).

Parameters

cs

[{'butt', 'round', 'projecting'}] The capstyle.

`set_clim`(*self*, *vmin=None*, *vmax=None*)
Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box`(*self*, *clipbox*)
Set the artist's clip *Bbox*.

Parameters

clipbox

[*Bbox*]

`set_clip_on`(*self*, *b*)
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*self*, *path*, *transform=None*)
Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_cmap(*self*, *cmap*)
Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

set_color(*self*, *c*)
Set both the edgecolor and the facecolor.

Parameters

c

[color or list of rgba tuples]

See also:

Collection.set_facecolor, *Collection.set_edgecolor*

For setting the edge or face color individually.

set_contains(*self*, *picker*)
[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

Parameters

picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

set_dashes(*self*, *ls*)
Alias for *set_linestyle*.

set_ec(*self*, *c*)
Alias for *set_edgecolor*.

set_edgecolor(*self*, *c*)
Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*self*, *c*)
Alias for *set_edgecolor*.

set_facecolor(*self*, *c*)
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

`set_facecolors`(*self*, *c*)
Alias for *set_facecolor*.

`set_fc`(*self*, *c*)
Alias for *set_facecolor*.

`set_figure`(*self*, *fig*)
Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

`set_gid`(*self*, *gid*)
Set the (group) id for the artist.

Parameters

gid

[str]

`set_hatch`(*self*, *hatch*)
Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

`set_in_layout`(*self*, *in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

`set_joinstyle`(*self*, *js*)

Set the joinstyle for the collection (for all its elements).

Parameters

js

[{'miter', 'round', 'bevel'}] The joinstyle.

`set_label`(*self*, *s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

`set_linestyle`(*self*, *ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

`set_linestyles`(*self*, *ls*)
Alias for *set_linestyle*.

`set_linewidth`(*self*, *lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

`set_linewidths`(*self*, *lw*)
Alias for *set_linewidth*.

`set_ls`(*self*, *ls*)
Alias for *set_linestyle*.

`set_lw`(*self*, *lw*)
Alias for *set_linewidth*.

`set_norm`(*self*, *norm*)
Set the normalization instance.

Parameters

norm

[*Normalize* or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position`(*self*, *offset_position*)
[*Deprecated*] Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Parameters

offset_position

[{'screen', 'data'}]

Notes

Deprecated since version 3.3.

`set_offsets`(*self*, *offsets*)
Set the offsets for the collection.

Parameters

offsets

[array-like (N, 2) or (2,)]

`set_path_effects`(*self*, *path_effects*)
Set the path effects.

Parameters

path_effects

[*AbstractPathEffect*]

`set_paths`(*self*)

`set_picker`(*self*, *picker*)
Define the picking behavior of the artist.

Parameters

picker

[None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set_pickradius* instead.

`set_pickradius`(*self*, *pr*)
Set the pick radius used for containment tests.

Parameters

d

[float] Pick radius, in points.

`set_rasterized`(*self*, *rasterized*)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

Parameters

rasterized

[bool or None]

`set_sketch_params`(*self*, *scale=None*, *length=None*, *randomness=None*)
Sets the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*self*, *snap*)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest

integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform`(*self*, *t*)

Set the artist transform.

Parameters

t

[*Transform*]

`set_url`(*self*, *url*)

Set the url for the artist.

Parameters

url

[str]

`set_urls`(*self*, *urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_visible`(*self*, *b*)

Set the artist's visibility.

Parameters

b

[bool]

`set_zorder`(*self*, *level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

`property stale`

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`property sticky_edges`

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba`(*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update`(*self*, *props*)
Update this artist's properties from the dict *props*.

Parameters

props

[dict]

`property update_dict`

`update_from`(*self*, *other*)
Copy properties from other to self.

`update_scalarmappable`(*self*)
Update colors from the scalar mappable array, if it is not None.

`zorder = 0`

`class matplotlib.collections.EllipseCollection`(*widths*, *heights*, *angles*, *units='points'*, ***kwargs*)
Bases: *matplotlib.collections.Collection*

A collection of ellipses, drawn using splines.

Parameters

widths

[array-like] The lengths of the first axes (e.g., major axis lengths).

heights

[array-like] The lengths of second axes.

angles

[array-like] The angles of the first axes, degrees CCW from the x-axis.

units

[{'points', 'inches', 'dots', 'width', 'height', 'x', 'y', 'xy'}] The units in which majors and minors are given; 'width' and 'height' refer to the dimensions of the axes, while 'x' and 'y' refer to the *offsets* data units. 'xy' differs from all others in that the angle as plotted varies with the aspect ratio, and equals the specified angle only when the aspect ratio is unity. Hence it behaves the same as the *Ellipse* with `axes.transData` as its transform.

****kwargs**

Forwarded to *Collection*.

add_callback(*self*, *func*)
Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

add_checker(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

autoscale(*self*)
Autoscale the scalar limits on the norm instance using the current array

autoscale_None(*self*)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes
The *Axes* instance the artist resides in, or *None*.

changed(*self*)
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`contains`(*self*, *mouseevent*)
Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

`convert_xunits`(*self*, *x*)
Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

`convert_yunits`(*self*, *y*)
Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`findobj`(*self*, *match=None*, *include_self=True*)
Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.

- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

`format_cursor_data`(*self*, *data*)
Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

`get_agg_filter`(*self*)
Return filter function to be used for agg filter.

`get_alpha`(*self*)
Return the alpha value used for blending - not supported on all backends.

`get_animated`(*self*)
Return whether the artist is animated.

`get_array`(*self*)
Return the data array.

`get_capstyle`(*self*)

`get_children`(*self*)
Return a list of the child *Artist*s of this *Artist*.

`get_clim`(*self*)
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box`(*self*)
Return the clipbox.

`get_clip_on`(*self*)
Return whether the artist uses clipping.

get_clip_path(*self*)
Return the clip path.

get_cmap(*self*)
Return the *Colormap* instance.

get_contains(*self*)
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

See also:

set_contains

Notes

Deprecated since version 3.3.

get_cursor_data(*self*, *event*)
Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*matplotlib.backend_bases.MouseEvent*]

See also:

format_cursor_data

get_dashes(*self*)
Alias for *get_linestyle*.

get_datalim(*self*, *transData*)

get_ec(*self*)
Alias for *get_edgecolor*.

get_edgecolor(*self*)

get_edgecolors(*self*)
Alias for *get_edgecolor*.

get_facecolor(*self*)

get_facecolors(*self*)
Alias for *get_facecolor*.

get_fc(*self*)
Alias for *get_facecolor*.

get_figure(*self*)
Return the *Figure* instance the artist belongs to.

get_fill(*self*)
Return whether fill is set.

get_gid(*self*)
Return the group id.

get_hatch(*self*)
Return the current hatching pattern.

get_in_layout(*self*)
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle(*self*)

get_label(*self*)
Return the label used for this artist in the legend.

get_linestyle(*self*)

get_linestyles(*self*)
Alias for *get_linestyle*.

get_linewidth(*self*)

get_linewidths(*self*)
Alias for *get_linewidth*.

get_ls(*self*)
Alias for *get_linestyle*.

get_lw(*self*)
Alias for *get_linewidth*.

get_offset_position(*self*)
[*Deprecated*] Return how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position

is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

`get_offset_transform`(*self*)

`get_offsets`(*self*)
Return the offsets for the collection.

`get_path_effects`(*self*)

`get_paths`(*self*)

`get_picker`(*self*)
Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, *pickable*, *pick*

`get_pickradius`(*self*)

`get_rasterized`(*self*)
Return whether the artist is to be rasterized.

`get_sketch_params`(*self*)
Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

`get_snap`(*self*)
Return the snap setting.

See *set_snap* for details.

`get_tightbbox`(*self*, *renderer*)
Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

`get_transform`(*self*)
Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine`(*self*)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms`(*self*)

`get_url`(*self*)
Return the url.

`get_urls`(*self*)
Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

`get_visible`(*self*)
Return the visibility.

`get_window_extent`(*self*, *renderer*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder`(*self*)
Return the artist's zorder.

`have_units`(*self*)
Return *True* if units are set on any axis.

`is_transform_set`(*self*)
Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

`property mouseover`
If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also *get_cursor_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

`pchanged`(*self*)
Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback

remove_callback

`pick`(*self, mouseevent*)
Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

`pickable`(*self*)
Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

`properties`(*self*)
Return a dictionary of all the properties of the artist.

`remove`(*self*)
Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

`remove_callback`(*self*, *oid*)
Remove a callback based on its observer id.

See also:

add_callback

`set`(*self*, ***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

`set_aa`(*self*, *aa*)
Alias for *set_antialiased*.

`set_agg_filter`(*self*, *filter_func*)
Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha`(*self*, *alpha*)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[float or None]

`set_animated`(*self*, *b*)
Set the artist's animation state.

Parameters

b

[bool]

`set_antialiased`(*self*, *aa*)
Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

`set_antialiaseds`(*self*, *aa*)
Alias for *set_antialiased*.

`set_array`(*self*, *A*)
Set the image array from numpy array *A*.

Parameters

A

[ndarray]

`set_capstyle`(*self*, *cs*)
Set the capstyle for the collection (for all its elements).

Parameters

cs

[{'butt', 'round', 'projecting'}] The capstyle.

`set_clim`(*self*, *vmin=None*, *vmax=None*)
Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box`(*self*, *clipbox*)
Set the artist's clip *Bbox*.

Parameters

clipbox

[*Bbox*]

`set_clip_on`(*self*, *b*)
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

Parameters

b

[bool]

`set_clip_path`(*self*, *path*, *transform=None*)
Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap`(*self*, *cmap*)
Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

`set_color`(*self*, *c*)
Set both the edgecolor and the facecolor.

Parameters

c

[color or list of rgba tuples]

See also:

Collection.set_facecolor, *Collection.set_edgecolor*

For setting the edge or face color individually.

`set_contains`(*self*, *picker*)
[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

Parameters

picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

`set_dashes`(*self*, *ls*)
Alias for *set_linestyle*.

`set_ec`(*self*, *c*)
Alias for *set_edgecolor*.

`set_edgecolor`(*self*, *c*)
Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors`(*self*, *c*)
Alias for *set_edgecolor*.

`set_facecolor`(*self*, *c*)
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

set_facecolors(*self*, *c*)
Alias for *set_facecolor*.

set_fc(*self*, *c*)
Alias for *set_facecolor*.

set_figure(*self*, *fig*)
Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gid(*self*, *gid*)
Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*self*, *hatch*)
Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

`set_in_layout`(*self*, *in_layout*)
Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

`set_joinstyle`(*self*, *js*)
Set the joinstyle for the collection (for all its elements).

Parameters

js

[{'miter', 'round', 'bevel'}] The joinstyle.

`set_label`(*self*, *s*)
Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

`set_linestyle`(*self*, *ls*)
Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *`Line2D.set_linestyle`* for a complete description.

`set_linestyles`(*self*, *ls*)
Alias for *set_linestyle*.

`set_linewidth`(*self*, *lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

`set_linewidths`(*self*, *lw*)
Alias for *set_linewidth*.

`set_ls`(*self*, *ls*)
Alias for *set_linestyle*.

`set_lw`(*self*, *lw*)
Alias for *set_linewidth*.

`set_norm`(*self*, *norm*)
Set the normalization instance.

Parameters

norm

[*Normalize* or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position`(*self*, *offset_position*)
[*Deprecated*] Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Parameters

offset_position

[{'screen', 'data'}]

Notes

Deprecated since version 3.3.

`set_offsets`(*self*, *offsets*)
Set the offsets for the collection.

Parameters

offsets

[array-like (N, 2) or (2,)]

`set_path_effects`(*self*, *path_effects*)
Set the path effects.

Parameters

path_effects

[*AbstractPathEffect*]

`set_paths`(*self*)

`set_picker`(*self*, *picker*)
Define the picking behavior of the artist.

Parameters

picker

[None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set_pickradius* instead.

set_pickradius(*self*, *pr*)
Set the pick radius used for containment tests.

Parameters

d

[float] Pick radius, in points.

set_rasterized(*self*, *rasterized*)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

Parameters

rasterized

[bool or None]

set_sketch_params(*self*, *scale=None*, *length=None*, *randomness=None*)
Sets the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

set_snap(*self*, *snap*)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform`(*self*, *t*)
Set the artist transform.

Parameters

t

[*Transform*]

`set_url`(*self*, *url*)
Set the url for the artist.

Parameters

url

[str]

`set_urls`(*self*, *urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_visible`(*self*, *b*)
Set the artist's visibility.

Parameters

b

[bool]

`set_zorder`(*self*, *level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

`property stale`

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`property sticky_edges`

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba`(*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update`(*self*, *props*)
Update this artist's properties from the dict *props*.

Parameters

props

[dict]

`property update_dict`

`update_from`(*self*, *other*)
Copy properties from other to self.

`update_scalarmappable`(*self*)
Update colors from the scalar mappable array, if it is not None.

`zorder = 0`

`class matplotlib.collections.EventCollection`(*positions*, *orientation='horizontal'*, *lineoffset=0*, *linelength=1*, *linewidth=None*, *color=None*, *linestyle='solid'*, *antialiased=None*, ***kwargs*)
Bases: *matplotlib.collections.LineCollection*

A collection of locations along a single axis at which an "event" occured.

The events are given by a 1-dimensional array. They do not have an amplitude and are displayed as parallel lines.

Parameters

positions

[1D array-like] Each value is an event.

orientation

[{'horizontal', 'vertical'}, default: 'horizontal'] The sequence of events is plotted along this direction. The marker lines of the single events are along the orthogonal direction.

lineoffset

[float, default: 0] The offset of the center of the markers from the origin, in the direction orthogonal to *orientation*.

linelength

[float, default: 1] The total height of the marker (i.e. the marker stretches from `lineoffset - linelength/2` to `lineoffset + linelength/2`).

linewidth

[float or list thereof, default: `rcParams["lines.linewidth"]` (default: `1.5`)] The line width of the event lines, in points.

color

[color or list of colors, default: `rcParams["lines.color"]` (default: `'C0'`)] The color of the event lines.

linestyle

[str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

```
(offset, onoffseq),
```

where *onoffseq* is an even length tuple of on and off ink in points.

antialiased

[bool or list thereof, default: `rcParams["lines.antialiased"]` (default: `True`)] Whether to use antialiasing for drawing the lines.

****kwargs**

Forwarded to *LineCollection*.

Examples

`add_callback`(*self*, *func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

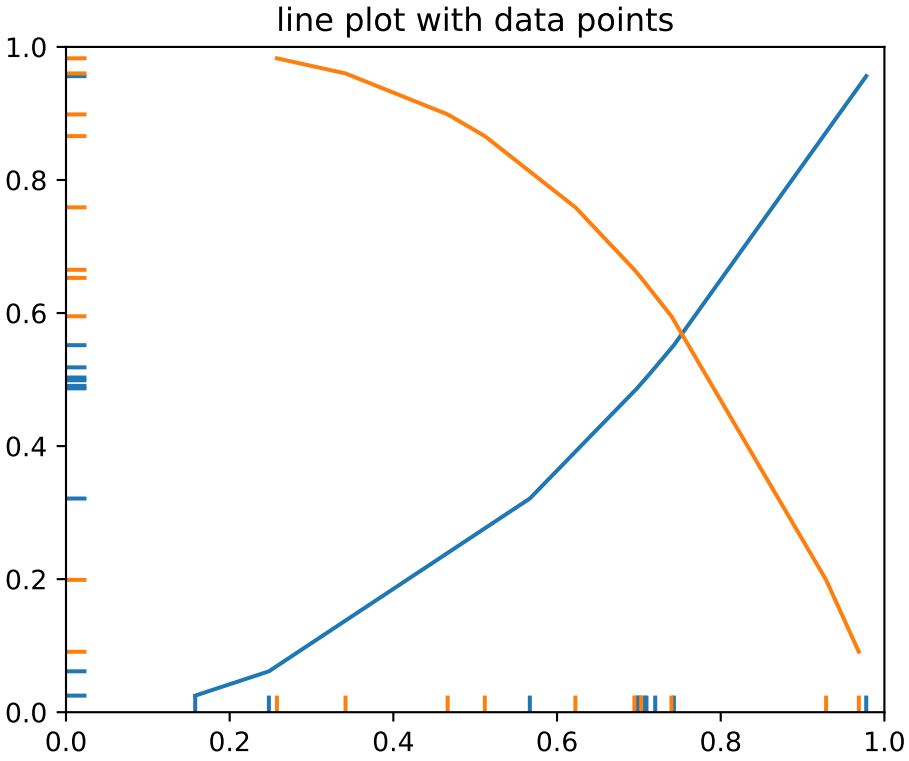
```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.



See also:

remove_callback

`add_checker`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`add_positions`(*self*, *position*)
Add one or more events at the specified positions.

`append_positions`(*self*, *position*)
Add one or more events at the specified positions.

`autoscale`(*self*)
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`(*self*)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`property axes`
The *Axes* instance the artist resides in, or *None*.

`changed`(*self*)
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`contains`(*self*, *mouseevent*)
Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

`convert_xunits`(*self*, *x*)
Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

`convert_yunits`(*self*, *y*)
Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`extend_positions`(*self*, *position*)
Add one or more events at the specified positions.

`findobj`(*self*, *match=None*, *include_self=True*)
Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

`format_cursor_data`(*self*, *data*)
Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

`get_agg_filter`(*self*)
Return filter function to be used for agg filter.

`get_alpha`(*self*)
Return the alpha value used for blending - not supported on all backends.

`get_animated`(*self*)
Return whether the artist is animated.

`get_array`(*self*)
Return the data array.

`get_capstyle`(*self*)

`get_children`(*self*)
Return a list of the child *Artist*s of this *Artist*.

`get_clim`(*self*)
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box`(*self*)
Return the clipbox.

`get_clip_on`(*self*)
Return whether the artist uses clipping.

`get_clip_path`(*self*)
Return the clip path.

`get_cmap`(*self*)
Return the *Colormap* instance.

`get_color`(*self*)
Return the color of the lines used to mark each event.

`get_colors`(*self*)

`get_contains`(*self*)
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

See also:

set_contains

Notes

Deprecated since version 3.3.

`get_cursor_data`(*self*, *event*)
Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*matplotlib.backend_bases.MouseEvent*]

See also:

format_cursor_data

`get_dashes`(*self*)
Alias for *get_linestyle*.

`get_datalim`(*self*, *transData*)

`get_ec`(*self*)
Alias for *get_edgecolor*.

`get_edgecolor`(*self*)

`get_edgecolors`(*self*)
Alias for *get_edgecolor*.

`get_facecolor`(*self*)

`get_facecolors`(*self*)
Alias for *get_facecolor*.

`get_fc`(*self*)
Alias for *get_facecolor*.

`get_figure`(*self*)
Return the *Figure* instance the artist belongs to.

`get_fill`(*self*)
Return whether fill is set.

`get_gid`(*self*)
Return the group id.

`get_hatch`(*self*)
Return the current hatching pattern.

`get_in_layout`(*self*)
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle`(*self*)

`get_label`(*self*)
Return the label used for this artist in the legend.

`get_linelength`(*self*)
Return the length of the lines used to mark each event.

`get_lineoffset`(*self*)
Return the offset of the lines used to mark each event.

`get_linestyle`(*self*)

`get_linestyles`(*self*)
Alias for *get_linestyle*.

`get_linewidth`(*self*)
Get the width of the lines used to mark each event.

`get_linewidths`(*self*)
Alias for *get_linewidth*.

`get_ls`(*self*)
Alias for *get_linestyle*.

`get_lw`(*self*)
Alias for *get_linewidth*.

`get_offset_position`(*self*)
[*Deprecated*] Return how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

`get_offset_transform`(*self*)

`get_offsets`(*self*)
Return the offsets for the collection.

`get_orientation`(*self*)
Return the orientation of the event line ('horizontal' or 'vertical').

`get_path_effects`(*self*)

`get_paths`(*self*)

get_picker(*self*)
Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, *pickable*, *pick*

get_pickradius(*self*)

get_positions(*self*)
Return an array containing the floating-point values of the positions.

get_rasterized(*self*)
Return whether the artist is to be rasterized.

get_segments(*self*)

Returns

list

List of segments in the LineCollection. Each list item contains an array of vertices.

get_sketch_params(*self*)
Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap(*self*)
Return the snap setting.

See *set_snap* for details.

get_tightbbox(*self*, *renderer*)
Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

`get_transform`(*self*)
Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine`(*self*)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms`(*self*)

`get_url`(*self*)
Return the url.

`get_urls`(*self*)
Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

`get_visible`(*self*)
Return the visibility.

`get_window_extent`(*self*, *renderer*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder`(*self*)
Return the artist's zorder.

`have_units`(*self*)
Return *True* if units are set on any axis.

`is_horizontal`(*self*)
True if the eventcollection is horizontal, False if vertical.

`is_transform_set`(*self*)
Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

`property mouseover`
If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also *get_cursor_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

`pchanged`(*self*)
Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback

remove_callback

`pick`(*self*, *mouseevent*)
Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

`pickable`(*self*)
Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

`properties`(*self*)
Return a dictionary of all the properties of the artist.

`remove`(*self*)
Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

`remove_callback`(*self*, *oid*)
Remove a callback based on its observer id.

See also:

add_callback

`set`(*self*, ***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

`set_aa`(*self*, *aa*)
Alias for *set_antialiased*.

`set_agg_filter`(*self*, *filter_func*)
Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha`(*self*, *alpha*)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[float or None]

`set_animated`(*self*, *b*)
Set the artist's animation state.

Parameters

b

[bool]

`set_antialiased`(*self*, *aa*)
Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

`set_antialiaseds`(*self*, *aa*)
Alias for *set_antialiased*.

`set_array`(*self*, *A*)
Set the image array from numpy array *A*.

Parameters

A

[ndarray]

`set_capstyle`(*self*, *cs*)
Set the capstyle for the collection (for all its elements).

Parameters

cs

[{'butt', 'round', 'projecting'}] The capstyle.

`set_clim`(*self*, *vmin=None*, *vmax=None*)
Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box`(*self*, *clipbox*)
Set the artist's clip *Bbox*.

Parameters

clipbox

[*Bbox*]

`set_clip_on`(*self*, *b*)
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

Parameters

b

[bool]

`set_clip_path`(*self*, *path*, *transform=None*)
Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap`(*self*, *cmap*)
Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

`set_color`(*self*, *c*)
Set the color(s) of the LineCollection.

Parameters

c

[color or list of colors] Single color (all patches have same color), or a sequence of rgba tuples; if it is a sequence the patches will cycle through the sequence.

`set_contains`(*self*, *picker*)
[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

Parameters

picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

`set_dashes`(*self*, *ls*)
Alias for *set_linestyle*.

`set_ec`(*self*, *c*)
Alias for *set_edgecolor*.

`set_edgecolor`(*self*, *c*)
Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors`(*self*, *c*)
Alias for *set_edgecolor*.

`set_facecolor`(*self*, *c*)
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

`set_facecolors`(*self*, *c*)
Alias for *set_facecolor*.

set_fc(*self*, *c*)
Alias for *set_facecolor*.

set_figure(*self*, *fig*)
Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gid(*self*, *gid*)
Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*self*, *hatch*)
Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*self*, *in_layout*)
Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

`set_joinstyle`(*self*, *js*)
Set the joinstyle for the collection (for all its elements).

Parameters

js

[{'miter', 'round', 'bevel'}] The joinstyle.

`set_label`(*self*, *s*)
Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

`set_linelength`(*self*, *linelength*)
Set the length of the lines used to mark each event.

`set_lineoffset`(*self*, *lineoffset*)
Set the offset of the lines used to mark each event.

`set_linestyle`(*self*, *ls*)
Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

`set_linestyles`(*self*, *ls*)
Alias for *set_linestyle*.

`set_linewidth`(*self*, *lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

`set_linewidths`(*self*, *lw*)
Alias for *set_linewidth*.

`set_ls`(*self*, *ls*)
Alias for *set_linestyle*.

`set_lw`(*self*, *lw*)
Alias for *set_linewidth*.

`set_norm`(*self*, *norm*)
Set the normalization instance.

Parameters

norm

[*Normalize* or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position`(*self*, *offset_position*)
[*Deprecated*] Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Parameters

offset_position

[{'screen', 'data'}]

Notes

Deprecated since version 3.3.

`set_offsets`(*self*, *offsets*)
Set the offsets for the collection.

Parameters

offsets

[array-like (N, 2) or (2,)]

`set_orientation`(*self*, *orientation=None*)
Set the orientation of the event line.

Parameters

orientation

[{'horizontal', 'vertical'}]

`set_path_effects`(*self*, *path_effects*)
Set the path effects.

Parameters

path_effects

[*AbstractPathEffect*]

`set_paths`(*self*, *segments*)

`set_picker`(*self*, *picker*)
Define the picking behavior of the artist.

Parameters

picker

[None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set_pickradius* instead.

`set_pickradius`(*self*, *pr*)
Set the pick radius used for containment tests.

Parameters

d

[float] Pick radius, in points.

`set_positions`(*self*, *positions*)
Set the positions of the events.

`set_rasterized`(*self*, *rasterized*)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

Parameters

rasterized

[bool or None]

`set_segments`(*self*, *segments*)

`set_sketch_params`(*self*, *scale=None*, *length=None*, *randomness=None*)
Sets the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

set_snap(*self*, *snap*)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transform(*self*, *t*)
Set the artist transform.

Parameters

t

[*Transform*]

set_url(*self*, *url*)
Set the url for the artist.

Parameters

url

[str]

set_urls(*self*, *urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_verts`(*self*, *segments*)

`set_visible`(*self*, *b*)
Set the artist's visibility.

Parameters

b

[bool]

`set_zorder`(*self*, *level*)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

`property stale`
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`property sticky_edges`
`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`switch_orientation`(*self*)
Switch the orientation of the event line, either from vertical to horizontal or vice versus.

to_rgba(*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(*self*, *props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

property update_dict

update_from(*self*, *other*)

Copy properties from other to self.

update_scalarmappable(*self*)

Update colors from the scalar mappable array, if it is not None.

zorder = 0

class matplotlib.collections.LineCollection(*segments*, *linewidths=None*, *colors=None*, *antialiaseds=None*, *linestyles='solid'*, *offsets=None*, *transOffset=None*, *norm=None*, *cmap=None*, *pickradius=5*, *zorder=2*, *facecolors='none'*, ***kwargs*)

Bases: *matplotlib.collections.Collection*

Represents a sequence of *Line2D*s that should be drawn together.

This class extends *Collection* to represent a sequence of *Line2D*s instead of just a sequence of *Patch*s. Just as in *Collection*, each property of a *LineCollection* may be either a single value or a list of values. This list is then used cyclically for each element of the LineCollection, so the property of the `i`th element of the collection is:

```
prop[i % len(prop)]
```

The properties of each member of a *LineCollection* default to their values in `rcParams["lines.*"]` instead of `rcParams["patch.*"]`, and the property *colors* is added in place of *edgecolors*.

Parameters

segments: list of array-like

A sequence of (*line0*, *line1*, *line2*), where:

```
linen = (x0, y0), (x1, y1), ... (xm, ym)
```

or the equivalent numpy array with two columns. Each line can have a different number of segments.

linewidths

[float or list of float, default: `rcParams["lines.linewidth"]` (default: `1.5`)] The width of each line in points.

colors

[color or list of color, default: `rcParams["lines.color"]` (default: `'C0'`)] A sequence of RGBA tuples (e.g., arbitrary color strings, etc, not allowed).

antialiaseds

[bool or list of bool, default: `rcParams["lines.antialiased"]` (default: `True`)] Whether to use antialiasing for each line.

zorder

[int, default: 2] zorder of the lines once drawn.

facecolors

[color or list of color, default: 'none'] The facecolors of the LineCollection. Setting to a value other than 'none' will lead to each line being "filled in" as if there was an implicit line segment joining the last and first points of that line back around to each other. In order to manually specify what should count as the "interior" of each line, please use *PathCollection* instead, where the "interior" can be specified by appropriate usage of *CLOSEPOLY*.

****kwargs**

Forwareded to *Collection*.

`add_callback`(*self*, *func*)
Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

`add_checker`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`autoscale`(*self*)
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`(*self*)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`property axes`
The *Axes* instance the artist resides in, or *None*.

`changed`(*self*)
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`contains`(*self*, *mouseevent*)
Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

`convert_xunits`(*self*, *x*)
Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

`convert_yunits`(*self*, *y*)
Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`findobj`(*self*, *match=None*, *include_self=True*)
Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.

- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

`format_cursor_data`(*self*, *data*)
Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

`get_agg_filter`(*self*)
Return filter function to be used for agg filter.

`get_alpha`(*self*)
Return the alpha value used for blending - not supported on all backends.

`get_animated`(*self*)
Return whether the artist is animated.

`get_array`(*self*)
Return the data array.

`get_capstyle`(*self*)

`get_children`(*self*)
Return a list of the child *Artist*s of this *Artist*.

`get_clim`(*self*)
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box`(*self*)
Return the clipbox.

`get_clip_on`(*self*)
Return whether the artist uses clipping.

`get_clip_path`(*self*)
Return the clip path.

get_cmap(*self*)
Return the *Colormap* instance.

get_color(*self*)

get_colors(*self*)

get_contains(*self*)
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

See also:

set_contains

Notes

Deprecated since version 3.3.

get_cursor_data(*self*, *event*)
Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*matplotlib.backend_bases.MouseEvent*]

See also:

format_cursor_data

get_dashes(*self*)
Alias for *get_linestyle*.

get_datalim(*self*, *transData*)

get_ec(*self*)
Alias for *get_edgecolor*.

get_edgecolor(*self*)

get_edgecolors(*self*)
Alias for *get_edgecolor*.

get_facecolor(*self*)

get_facecolors(*self*)
Alias for *get_facecolor*.

get_fc(*self*)
Alias for *get_facecolor*.

get_figure(*self*)
Return the *Figure* instance the artist belongs to.

get_fill(*self*)
Return whether fill is set.

get_gid(*self*)
Return the group id.

get_hatch(*self*)
Return the current hatching pattern.

get_in_layout(*self*)
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle(*self*)

get_label(*self*)
Return the label used for this artist in the legend.

get_linestyle(*self*)

get_linestyles(*self*)
Alias for *get_linestyle*.

get_linewidth(*self*)

get_linewidths(*self*)
Alias for *get_linewidth*.

get_ls(*self*)
Alias for *get_linestyle*.

get_lw(*self*)
Alias for *get_linewidth*.

get_offset_position(*self*)
[*Deprecated*] Return how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has

been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

`get_offset_transform`(*self*)

`get_offsets`(*self*)
Return the offsets for the collection.

`get_path_effects`(*self*)

`get_paths`(*self*)

`get_picker`(*self*)
Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, *pickable*, *pick*

`get_pickradius`(*self*)

`get_rasterized`(*self*)
Return whether the artist is to be rasterized.

`get_segments`(*self*)

Returns

list

List of segments in the LineCollection. Each list item contains an array of vertices.

`get_sketch_params`(*self*)
Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.

- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

`get_snap`(*self*)
Return the snap setting.

See *set_snap* for details.

`get_tightbbox`(*self*, *renderer*)
Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

`get_transform`(*self*)
Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine`(*self*)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms`(*self*)

`get_url`(*self*)
Return the url.

`get_urls`(*self*)
Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

`get_visible`(*self*)
Return the visibility.

`get_window_extent`(*self*, *renderer*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder`(*self*)
Return the artist's zorder.

`have_units`(*self*)
Return *True* if units are set on any axis.

`is_transform_set`(*self*)
Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

`property mouseover`
If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also *get_cursor_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

`pchanged`(*self*)
Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback

remove_callback

`pick`(*self*, *mouseevent*)
Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

`pickable`(*self*)
Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

`properties`(*self*)
Return a dictionary of all the properties of the artist.

`remove`(*self*)
Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

`remove_callback`(*self*, *oid*)
Remove a callback based on its observer id.

See also:

add_callback

`set`(*self*, ***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

`set_aa`(*self*, *aa*)
Alias for *set_antialiased*.

`set_agg_filter`(*self*, *filter_func*)
Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha`(*self*, *alpha*)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[float or None]

`set_animated`(*self*, *b*)
Set the artist's animation state.

Parameters

b

[bool]

`set_antialiased`(*self*, *aa*)
Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*self*, *aa*)
Alias for *set_antialiased*.

set_array(*self*, *A*)
Set the image array from numpy array *A*.

Parameters

A

[ndarray]

set_capstyle(*self*, *cs*)
Set the capstyle for the collection (for all its elements).

Parameters

cs

[{'butt', 'round', 'projecting'}] The capstyle.

set_clim(*self*, *vmin=None*, *vmax=None*)
Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_clip_box(*self*, *clipbox*)
Set the artist's clip *Bbox*.

Parameters

clipbox

[*Bbox*]

set_clip_on(*self*, *b*)
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

Parameters

b

[bool]

`set_clip_path`(*self*, *path*, *transform=None*)
Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap`(*self*, *cmap*)
Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

`set_color`(*self*, *c*)
Set the color(s) of the LineCollection.

Parameters

c

[color or list of colors] Single color (all patches have same color), or a sequence of rgba tuples; if it is a sequence the patches will cycle through the sequence.

set_contains(*self*, *picker*)
[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

Parameters

picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

set_dashes(*self*, *ls*)
Alias for *set_linestyle*.

set_ec(*self*, *c*)
Alias for *set_edgecolor*.

set_edgecolor(*self*, *c*)
Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*self*, *c*)
Alias for *set_edgecolor*.

set_facecolor(*self*, *c*)
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

`set_facecolors`(*self*, *c*)
Alias for *set_facecolor*.

`set_fc`(*self*, *c*)
Alias for *set_facecolor*.

`set_figure`(*self*, *fig*)
Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

`set_gid`(*self*, *gid*)
Set the (group) id for the artist.

Parameters

gid

[str]

`set_hatch`(*self*, *hatch*)
Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

`set_in_layout`(*self*, *in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

`set_joinstyle`(*self*, *js*)

Set the joinstyle for the collection (for all its elements).

Parameters

js

[{'miter', 'round', 'bevel'}] The joinstyle.

`set_label`(*self*, *s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

`set_linestyle`(*self*, *ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

`set_linestyles`(*self*, *ls*)
Alias for *set_linestyle*.

`set_linewidth`(*self*, *lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

`set_linewidths`(*self*, *lw*)
Alias for *set_linewidth*.

`set_ls`(*self*, *ls*)
Alias for *set_linestyle*.

`set_lw`(*self*, *lw*)
Alias for *set_linewidth*.

`set_norm`(*self*, *norm*)
Set the normalization instance.

Parameters

norm

[*Normalize* or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position`(*self*, *offset_position*)
[*Deprecated*] Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Parameters

offset_position

[{'screen', 'data'}]

Notes

Deprecated since version 3.3.

`set_offsets`(*self*, *offsets*)
Set the offsets for the collection.

Parameters

offsets

[array-like (N, 2) or (2,)]

`set_path_effects`(*self*, *path_effects*)
Set the path effects.

Parameters

path_effects

[*AbstractPathEffect*]

`set_paths`(*self*, *segments*)

`set_picker`(*self*, *picker*)
Define the picking behavior of the artist.

Parameters

picker

[None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set_pickradius* instead.

`set_pickradius`(*self*, *pr*)
Set the pick radius used for containment tests.

Parameters

d

[float] Pick radius, in points.

`set_rasterized`(*self*, *rasterized*)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

Parameters

rasterized

[bool or None]

`set_segments`(*self*, *segments*)

`set_sketch_params`(*self*, *scale=None*, *length=None*, *randomness=None*)
Sets the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*self*, *snap*)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated

value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform`(*self*, *t*)

Set the artist transform.

Parameters

t

[*Transform*]

`set_url`(*self*, *url*)

Set the url for the artist.

Parameters

url

[str]

`set_urls`(*self*, *urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_verts`(*self*, *segments*)

`set_visible`(*self*, *b*)
Set the artist's visibility.

Parameters

b

[bool]

`set_zorder`(*self*, *level*)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

`property stale`
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`property sticky_edges`
`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba`(*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)
Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update`(*self*, *props*)
Update this artist's properties from the dict *props*.

Parameters

props

[dict]

`property update_dict`

`update_from`(*self*, *other*)
Copy properties from other to self.

`update_scalarmappable`(*self*)
Update colors from the scalar mappable array, if it is not None.

`zorder = 0`

`class matplotlib.collections.PatchCollection`(*patches*, *match_original=False*, ***kwargs*)
Bases: *matplotlib.collections.Collection*

A generic collection of patches.

This makes it easier to assign a color map to a heterogeneous collection of patches.

This also may improve plotting speed, since PatchCollection will draw faster than a large number of patches.

patches

a sequence of Patch objects. This list may include a heterogeneous assortment of different patch types.

match_original

If True, use the colors and linewidths of the original patches. If False, new colors may be assigned by providing the standard collection arguments, facecolor, edgecolor, linewidths, norm or cmap.

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their *rcParams* patch setting, in sequence form.

The use of *ScalarMappable* functionality is optional. If the *ScalarMappable* matrix `_A` has been set (via a call to *set_array*), at draw time a call to scalar mappable will be made to set the face colors.

`add_callback`(*self*, *func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

`add_checker`(*self*, *checker*)

[*Deprecated*]

Notes

Deprecated since version 3.3:

`autoscale`(*self*)

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`(*self*)

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes
The *Axes* instance the artist resides in, or *None*.

changed(*self*)
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

check_update(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

contains(*self*, *mouseevent*)
Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*self*, *x*)
Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*self*, *y*)
Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

draw(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`findobj`(*self*, *match=None*, *include_self=True*)
Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

`format_cursor_data`(*self*, *data*)
Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

`get_agg_filter`(*self*)
Return filter function to be used for agg filter.

`get_alpha`(*self*)
Return the alpha value used for blending - not supported on all backends.

`get_animated`(*self*)
Return whether the artist is animated.

`get_array`(*self*)
Return the data array.

`get_capstyle`(*self*)

`get_children`(*self*)
Return a list of the child *Artist*s of this *Artist*.

`get_clim`(*self*)
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box`(*self*)
Return the clipbox.

`get_clip_on`(*self*)
Return whether the artist uses clipping.

`get_clip_path`(*self*)
Return the clip path.

`get_cmap`(*self*)
Return the *Colormap* instance.

`get_contains`(*self*)
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

See also:

set_contains

Notes

Deprecated since version 3.3.

`get_cursor_data`(*self*, *event*)
Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*matplotlib.backend_bases.MouseEvent*]

See also:

format_cursor_data

`get_dashes`(*self*)
Alias for *get_linestyle*.

`get_datalim`(*self*, *transData*)

`get_ec`(*self*)
Alias for *get_edgecolor*.

`get_edgecolor`(*self*)

`get_edgecolors`(*self*)
Alias for *get_edgecolor*.

`get_facecolor`(*self*)

`get_facecolors`(*self*)
Alias for *get_facecolor*.

`get_fc`(*self*)
Alias for *get_facecolor*.

`get_figure`(*self*)
Return the *Figure* instance the artist belongs to.

`get_fill`(*self*)
Return whether fill is set.

`get_gid`(*self*)
Return the group id.

`get_hatch`(*self*)
Return the current hatching pattern.

`get_in_layout`(*self*)
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle`(*self*)

`get_label`(*self*)
Return the label used for this artist in the legend.

get_linestyle(*self*)

get_linestyles(*self*)
Alias for *get_linestyle*.

get_linewidth(*self*)

get_linewidths(*self*)
Alias for *get_linewidth*.

get_ls(*self*)
Alias for *get_linestyle*.

get_lw(*self*)
Alias for *get_linewidth*.

get_offset_position(*self*)
[*Deprecated*] Return how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

get_offset_transform(*self*)

get_offsets(*self*)
Return the offsets for the collection.

get_path_effects(*self*)

get_paths(*self*)

get_picker(*self*)
Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, *pickable*, *pick*

get_pickradius(*self*)

get_rasterized(*self*)
Return whether the artist is to be rasterized.

get_sketch_params(*self*)
Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

`get_snap`(*self*)
Return the snap setting.

See *set_snap* for details.

`get_tightbbox`(*self*, *renderer*)
Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

`get_transform`(*self*)
Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine`(*self*)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms`(*self*)

`get_url`(*self*)
Return the url.

`get_urls`(*self*)
Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

`get_visible`(*self*)
Return the visibility.

`get_window_extent`(*self*, *renderer*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder`(*self*)
Return the artist's zorder.

`have_units`(*self*)
Return *True* if units are set on any axis.

`is_transform_set`(*self*)
Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

`property mouseover`
If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also *get_cursor_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

`pchanged`(*self*)
Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback

remove_callback

`pick`(*self*, *mouseevent*)
Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

`pickable`(*self*)
Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

`properties`(*self*)
Return a dictionary of all the properties of the artist.

`remove`(*self*)
Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

`remove_callback`(*self*, *oid*)
Remove a callback based on its observer id.

See also:

add_callback

`set`(*self*, ***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

`set_aa`(*self*, *aa*)
Alias for *set_antialiased*.

`set_agg_filter`(*self*, *filter_func*)
Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha`(*self*, *alpha*)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[float or None]

`set_animated`(*self*, *b*)
Set the artist's animation state.

Parameters

b

[bool]

`set_antialiased`(*self*, *aa*)
Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

`set_antialiaseds`(*self*, *aa*)
Alias for *set_antialiased*.

`set_array`(*self*, *A*)
Set the image array from numpy array *A*.

Parameters

A

[ndarray]

`set_capstyle`(*self*, *cs*)
Set the capstyle for the collection (for all its elements).

Parameters

cs

[{'butt', 'round', 'projecting'}] The capstyle.

`set_clim`(*self*, *vmin=None*, *vmax=None*)
Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box`(*self*, *clipbox*)
Set the artist's clip *Bbox*.

Parameters

clipbox

[*Bbox*]

set_clip_on(*self*, *b*)
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*self*, *path*, *transform=None*)
Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_cmap(*self*, *cmap*)
Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

set_color(*self*, *c*)
Set both the edgecolor and the facecolor.

Parameters

c

[color or list of rgba tuples]

See also:

Collection.set_facecolor, *Collection.set_edgecolor*

For setting the edge or face color individually.

`set_contains`(*self*, *picker*)
[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

Parameters

picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

`set_dashes`(*self*, *ls*)
Alias for *set_linestyle*.

`set_ec`(*self*, *c*)
Alias for *set_edgecolor*.

`set_edgecolor`(*self*, *c*)
Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*self*, *c*)
Alias for *set_edgecolor*.

set_facecolor(*self*, *c*)
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

set_facecolors(*self*, *c*)
Alias for *set_facecolor*.

set_fc(*self*, *c*)
Alias for *set_facecolor*.

set_figure(*self*, *fig*)
Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gid(*self*, *gid*)
Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*self*, *hatch*)
Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
```

(continues on next page)

(continued from previous page)

```
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

`set_in_layout`(*self*, *in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

`set_joinstyle`(*self*, *js*)

Set the joinstyle for the collection (for all its elements).

Parameters

js

[{'miter', 'round', 'bevel'}] The joinstyle.

`set_label`(*self*, *s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

`set_linestyle`(*self*, *ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

`set_linestyles`(*self*, *ls*)
Alias for *set_linestyle*.

`set_linewidth`(*self*, *lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

`set_linewidths`(*self*, *lw*)
Alias for *set_linewidth*.

`set_ls`(*self*, *ls*)
Alias for *set_linestyle*.

`set_lw`(*self*, *lw*)
Alias for *set_linewidth*.

`set_norm`(*self*, *norm*)
Set the normalization instance.

Parameters

norm

[*Normalize* or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position`(*self*, *offset_position*)
[*Deprecated*] Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Parameters

offset_position

[{'screen', 'data'}]

Notes

Deprecated since version 3.3.

`set_offsets`(*self*, *offsets*)
Set the offsets for the collection.

Parameters

offsets

[array-like (N, 2) or (2,)]

`set_path_effects`(*self*, *path_effects*)
Set the path effects.

Parameters

path_effects

[*AbstractPathEffect*]

`set_paths`(*self*, *patches*)

`set_picker`(*self*, *picker*)
Define the picking behavior of the artist.

Parameters

picker

[None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set_pickradius* instead.

`set_pickradius`(*self*, *pr*)

Set the pick radius used for containment tests.

Parameters

d

[float] Pick radius, in points.

`set_rasterized`(*self*, *rasterized*)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

Parameters

rasterized

[bool or None]

`set_sketch_params`(*self*, *scale=None*, *length=None*, *randomness=None*)

Sets the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*self*, *snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform`(*self*, *t*)

Set the artist transform.

Parameters

t

[*Transform*]

`set_url`(*self*, *url*)

Set the url for the artist.

Parameters

url

[str]

`set_urls`(*self*, *urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_visible`(*self*, *b*)
Set the artist's visibility.

Parameters

b

[bool]

`set_zorder`(*self*, *level*)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

`property stale`
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`property sticky_edges`
`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba`(*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)
Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update`(*self*, *props*)
Update this artist's properties from the dict *props*.

Parameters

props

[dict]

`property update_dict`

`update_from`(*self*, *other*)
Copy properties from other to self.

`update_scalarmappable`(*self*)
Update colors from the scalar mappable array, if it is not None.

`zorder = 0`

`class matplotlib.collections.PathCollection`(*paths*, *sizes=None*, ***kwargs*)
Bases: `matplotlib.collections._CollectionWithSizes`

A collection of *Path*s, as created by e.g. *scatter*.

Parameters

paths

[list of *path.Path*] The paths that will make up the *Collection*.

sizes

[array-like] The factor by which to scale each drawn *Path*. One unit squared in the Path's data space is scaled to be `sizes**2` points when rendered.

****kwargs**

Forwarded to *Collection*.

`add_callback`(*self*, *func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

`add_checker`(*self*, *checker*)

[*Deprecated*]

Notes

Deprecated since version 3.3:

`autoscale`(*self*)
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`(*self*)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`property axes`
The *Axes* instance the artist resides in, or *None*.

`changed`(*self*)
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`contains`(*self*, *mouseevent*)
Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

`convert_xunits`(*self*, *x*)
Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

`convert_yunits`(*self*, *y*)
Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`findobj`(*self*, *match=None*, *include_self=True*)
Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

`format_cursor_data`(*self*, *data*)
Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

`get_agg_filter`(*self*)
Return filter function to be used for agg filter.

`get_alpha`(*self*)
Return the alpha value used for blending - not supported on all backends.

`get_animated`(*self*)
Return whether the artist is animated.

`get_array`(*self*)
Return the data array.

`get_capstyle`(*self*)

`get_children`(*self*)
Return a list of the child *Artist*s of this *Artist*.

`get_clim`(*self*)
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box`(*self*)
Return the clipbox.

`get_clip_on`(*self*)
Return whether the artist uses clipping.

`get_clip_path`(*self*)
Return the clip path.

`get_cmap`(*self*)
Return the *Colormap* instance.

`get_contains`(*self*)
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

See also:

set_contains

Notes

Deprecated since version 3.3.

`get_cursor_data`(*self*, *event*)
Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*matplotlib.backend_bases.MouseEvent*]

See also:

format_cursor_data

`get_dashes`(*self*)
Alias for *get_linestyle*.

`get_datalim`(*self*, *transData*)

`get_ec`(*self*)
Alias for *get_edgecolor*.

`get_edgecolor`(*self*)

`get_edgecolors`(*self*)
Alias for *get_edgecolor*.

`get_facecolor`(*self*)

`get_facecolors`(*self*)
Alias for *get_facecolor*.

`get_fc`(*self*)
Alias for *get_facecolor*.

`get_figure`(*self*)
Return the *Figure* instance the artist belongs to.

`get_fill`(*self*)
Return whether fill is set.

`get_gid`(*self*)
Return the group id.

`get_hatch`(*self*)
Return the current hatching pattern.

`get_in_layout`(*self*)
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle`(*self*)

`get_label`(*self*)
Return the label used for this artist in the legend.

`get_linestyle`(*self*)

`get_linestyles`(*self*)
Alias for *get_linestyle*.

`get_linewidth`(*self*)

`get_linewidths`(*self*)
Alias for *get_linewidth*.

`get_ls`(*self*)
Alias for *get_linestyle*.

`get_lw`(*self*)
Alias for *get_linewidth*.

`get_offset_position`(*self*)
[*Deprecated*] Return how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

`get_offset_transform`(*self*)

`get_offsets`(*self*)
Return the offsets for the collection.

`get_path_effects`(*self*)

`get_paths`(*self*)

`get_picker`(*self*)
Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, *pickable*, *pick*

`get_pickradius`(*self*)

`get_rasterized`(*self*)
Return whether the artist is to be rasterized.

`get_sizes`(*self*)
Return the sizes ('areas') of the elements in the collection.

Returns

array

The 'area' of each element.

`get_sketch_params`(*self*)
Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

`get_snap`(*self*)
Return the snap setting.

See *set_snap* for details.

`get_tightbbox`(*self*, *renderer*)
Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

`get_transform`(*self*)
Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine`(*self*)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms`(*self*)

`get_url`(*self*)
Return the url.

`get_urls`(*self*)
Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

`get_visible`(*self*)
Return the visibility.

`get_window_extent`(*self*, *renderer*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder`(*self*)
Return the artist's zorder.

`have_units`(*self*)
Return *True* if units are set on any axis.

`is_transform_set`(*self*)
Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

`legend_elements`(*self*, *prop='colors'*, *num='auto'*, *fmt=None*, *func=<function PathCollection.<lambda> at 0x7f5434b37af0>*, ***kwargs*)
Create legend handles and labels for a PathCollection.

Each legend handle is a *Line2D* representing the Path that was drawn, and each label is a string what each Path represents.

This is useful for obtaining a legend for a *scatter* plot; e.g.:

```
scatter = plt.scatter([1, 2, 3],  [4, 5, 6],  c=[7, 2, 3])
plt.legend(*scatter.legend_elements())
```

creates three legend elements, one for each color with the numerical values passed to *c* as the labels.

Also see the automatedlegendcreation example.

Parameters

prop

[{"colors", "sizes"}, default: "colors"] If "colors", the legend handles will show the different colors of the collection. If "sizes", the legend will show the different sizes. To set both, use *kwargs* to directly edit the *Line2D* properties.

num

[int, None, "auto" (default), array-like, or *Locator*,] Target number of elements to create. If None, use all unique elements of the mappable array. If an integer, target to use *num* elements in the normed range. If "*auto*", try to determine which option better suits the nature of the data. The number of created elements may slightly deviate from *num* due to a *Locator* being used to find useful locations. If a list or array, use exactly those elements for the legend. Finally, a *Locator* can be provided.

fmt

[str, *Formatter*, or None (default)] The format or formatter to use for the labels. If a string must be a valid input for a *StrMethodFormatter*. If None (the default), use a *ScalarFormatter*.

func

[function, default *lambda x: x*] Function to calculate the labels. Often the size (or color) argument to *scatter* will have been pre-processed by the user using a function `s = f(x)` to make the markers visible; e.g. `size = np.log10(x)`. Providing the inverse of this function here allows that pre-processing to be inverted, so that the legend labels have the correct values; e.g. `func = lambda x: 10**x`.

****kwargs**

Allowed keyword arguments are *color* and *size*. E.g. it may be useful to set the color of the markers if *prop*="*sizes*" is used; similarly to set the size of the markers if *prop*="*colors*" is used. Any further parameters are passed onto the *Line2D* instance. This may be useful to e.g. specify a different *markeredgecolor* or *alpha* for the legend handles.

Returns

handles

[list of *Line2D*] Visual representation of each element of the legend.

labels

[list of str] The string labels for elements of the legend.

`property mouseover`
: If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

  See also *get_cursor_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

`pchanged`(*self*)
: Call all of the registered callbacks.

  This function is triggered internally when a property is changed.

  See also:

  add_callback

  remove_callback

`pick`(*self*, *mouseevent*)
: Process a pick event.

  Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

  See also:

  set_picker, *get_picker*, *pickable*

`pickable`(*self*)
: Return whether the artist is pickable.

  See also:

  set_picker, *get_picker*, *pick*

`properties`(*self*)
: Return a dictionary of all the properties of the artist.

`remove`(*self*)
: Remove the artist from the figure if possible.

  The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

  Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

  Note: there is no support for removing the artist's legend entry.

`remove_callback`(*self*, *oid*)
: Remove a callback based on its observer id.

  See also:

  add_callback

`set`(*self*, ***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

`set_aa`(*self*, *aa*)
Alias for *set_antialiased*.

`set_agg_filter`(*self*, *filter_func*)
Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha`(*self*, *alpha*)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[float or None]

`set_animated`(*self*, *b*)
Set the artist's animation state.

Parameters

b

[bool]

`set_antialiased`(*self*, *aa*)
Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

`set_antialiaseds`(*self*, *aa*)
Alias for *set_antialiased*.

`set_array`(*self*, *A*)
Set the image array from numpy array *A*.

Parameters

A

[ndarray]

`set_capstyle`(*self*, *cs*)
Set the capstyle for the collection (for all its elements).

Parameters

cs

[{'butt', 'round', 'projecting'}] The capstyle.

`set_clim`(*self*, *vmin=None*, *vmax=None*)
Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box`(*self*, *clipbox*)
Set the artist's clip *Bbox*.

Parameters

clipbox

[*Bbox*]

`set_clip_on`(*self*, *b*)
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

Parameters

b

[bool]

`set_clip_path`(*self*, *path*, *transform=None*)
Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap`(*self*, *cmap*)
Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

`set_color`(*self*, *c*)
Set both the edgecolor and the facecolor.

Parameters

c

[color or list of rgba tuples]

See also:

Collection.set_facecolor, *Collection.set_edgecolor*

For setting the edge or face color individually.

`set_contains`(*self*, *picker*)
[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

Parameters

picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

`set_dashes`(*self*, *ls*)
Alias for *set_linestyle*.

`set_ec`(*self*, *c*)
Alias for *set_edgecolor*.

`set_edgecolor`(*self*, *c*)
Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors`(*self*, *c*)
Alias for *set_edgecolor*.

`set_facecolor`(*self*, *c*)
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

`set_facecolors`(*self*, *c*)
Alias for *set_facecolor*.

`set_fc`(*self*, *c*)
Alias for *set_facecolor*.

`set_figure`(*self*, *fig*)
Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

`set_gid`(*self*, *gid*)
Set the (group) id for the artist.

Parameters

gid

[str]

`set_hatch`(*self*, *hatch*)
Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

`set_in_layout`(*self*, *in_layout*)
Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_joinstyle(*self*, *js*)
Set the joinstyle for the collection (for all its elements).

Parameters

js

[{'miter', 'round', 'bevel'}] The joinstyle.

set_label(*self*, *s*)
Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linestyle(*self*, *ls*)
Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

set_linestyles(*self*, *ls*)
Alias for *set_linestyle*.

set_linewidth(*self*, *lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

`set_linewidths`(*self*, *lw*)
Alias for *set_linewidth*.

`set_ls`(*self*, *ls*)
Alias for *set_linestyle*.

`set_lw`(*self*, *lw*)
Alias for *set_linewidth*.

`set_norm`(*self*, *norm*)
Set the normalization instance.

Parameters

norm

[*Normalize* or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position`(*self*, *offset_position*)
[*Deprecated*] Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Parameters

offset_position

[{'screen', 'data'}]

Notes

Deprecated since version 3.3.

`set_offsets`(*self*, *offsets*)
Set the offsets for the collection.

Parameters

offsets

[array-like (N, 2) or (2,)]

`set_path_effects`(*self*, *path_effects*)
Set the path effects.

Parameters

path_effects

[*AbstractPathEffect*]

`set_paths`(*self*, *paths*)

`set_picker`(*self*, *picker*)
Define the picking behavior of the artist.

Parameters

picker

[None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set_pickradius* instead.

`set_pickradius`(*self*, *pr*)
Set the pick radius used for containment tests.

Parameters

d

[float] Pick radius, in points.

`set_rasterized`(*self*, *rasterized*)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

Parameters

rasterized

[bool or None]

`set_sizes`(*self*, *sizes*, *dpi=72.0*)
Set the sizes of each member of the collection.

Parameters

sizes

[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi

[float, default: 72] The dpi of the canvas.

`set_sketch_params`(*self*, *scale=None*, *length=None*, *randomness=None*)
Sets the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*self*, *snap*)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform`(*self*, *t*)
Set the artist transform.

Parameters

t

[*Transform*]

`set_url`(*self*, *url*)
Set the url for the artist.

Parameters

url

[str]

`set_urls`(*self*, *urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_visible`(*self*, *b*)
Set the artist's visibility.

Parameters

b

[bool]

`set_zorder`(*self*, *level*)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

`property stale`
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`property sticky_edges`
`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba`(*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)
Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update`(*self*, *props*)
Update this artist's properties from the dict *props*.

Parameters

props

[dict]

`property update_dict`

`update_from`(*self*, *other*)
Copy properties from other to self.

`update_scalarmappable`(*self*)
Update colors from the scalar mappable array, if it is not None.

`zorder = 0`

`class matplotlib.collections.PolyCollection`(*verts*, *sizes=None*, *closed=True*, ***kwargs*)
Bases: `matplotlib.collections._CollectionWithSizes`

Parameters

verts

[list of array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts_i* defines the vertices of polygon *i* as a 2D array-like of shape (M, 2).

sizes

[array-like, default: None] Squared scaling factors for the polygons. The coordinates of each polygon *verts_i* are multiplied by the square-root of the corresponding entry in *sizes* (i.e., *sizes*

specify the scaling of areas). The scaling is applied before the Artist master transform.

closed

[bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

****kwargs**

Forwarded to *Collection*.

`add_callback`(*self*, *func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

`add_checker`(*self*, *checker*)

[*Deprecated*]

Notes

Deprecated since version 3.3:

`autoscale`(*self*)

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`(*self*)

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes
: The *Axes* instance the artist resides in, or *None*.

changed(*self*)
: Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

check_update(*self*, *checker*)
: [*Deprecated*]

  Notes

  Deprecated since version 3.3:

contains(*self*, *mouseevent*)
: Test whether the mouse event occurred in the collection.

  Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*self*, *x*)
: Convert *x* using the unit type of the xaxis.

  If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*self*, *y*)
: Convert *y* using the unit type of the yaxis.

  If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

draw(*self*, *renderer*)
: Draw the Artist (and its children) using the given renderer.

  This has no effect if the artist is not visible (*Artist.get_visible* returns False).

  Parameters

  renderer

  [*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`findobj`(*self*, *match=None*, *include_self=True*)
Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

`format_cursor_data`(*self*, *data*)
Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

`get_agg_filter`(*self*)
Return filter function to be used for agg filter.

`get_alpha`(*self*)
Return the alpha value used for blending - not supported on all backends.

`get_animated`(*self*)
Return whether the artist is animated.

`get_array`(*self*)
Return the data array.

`get_capstyle`(*self*)

`get_children`(*self*)
Return a list of the child *Artist*s of this *Artist*.

`get_clim`(*self*)
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box`(*self*)
Return the clipbox.

`get_clip_on`(*self*)
Return whether the artist uses clipping.

`get_clip_path`(*self*)
Return the clip path.

`get_cmap`(*self*)
Return the *Colormap* instance.

`get_contains`(*self*)
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

See also:

set_contains

Notes

Deprecated since version 3.3.

`get_cursor_data`(*self*, *event*)
Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*matplotlib.backend_bases.MouseEvent*]

See also:

format_cursor_data

`get_dashes`(*self*)
Alias for *get_linestyle*.

`get_datalim`(*self*, *transData*)

`get_ec`(*self*)
Alias for *get_edgecolor*.

`get_edgecolor`(*self*)

`get_edgecolors`(*self*)
Alias for *get_edgecolor*.

`get_facecolor`(*self*)

`get_facecolors`(*self*)
Alias for *get_facecolor*.

`get_fc`(*self*)
Alias for *get_facecolor*.

`get_figure`(*self*)
Return the *Figure* instance the artist belongs to.

`get_fill`(*self*)
Return whether fill is set.

`get_gid`(*self*)
Return the group id.

`get_hatch`(*self*)
Return the current hatching pattern.

`get_in_layout`(*self*)
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle`(*self*)

`get_label`(*self*)
Return the label used for this artist in the legend.

`get_linestyle`(*self*)

`get_linestyles`(*self*)
Alias for *get_linestyle*.

`get_linewidth`(*self*)

`get_linewidths`(*self*)
Alias for *get_linewidth*.

`get_ls`(*self*)
Alias for *get_linestyle*.

`get_lw`(*self*)
Alias for *get_linewidth*.

`get_offset_position`(*self*)
[*Deprecated*] Return how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

`get_offset_transform`(*self*)

`get_offsets`(*self*)
Return the offsets for the collection.

`get_path_effects`(*self*)

`get_paths`(*self*)

`get_picker`(*self*)
Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, *pickable*, *pick*

`get_pickradius`(*self*)

`get_rasterized`(*self*)
Return whether the artist is to be rasterized.

`get_sizes`(*self*)
Return the sizes ('areas') of the elements in the collection.

Returns

array

The 'area' of each element.

`get_sketch_params`(*self*)
Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

`get_snap`(*self*)
Return the snap setting.

See *set_snap* for details.

`get_tightbbox`(*self*, *renderer*)
Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

`get_transform`(*self*)
Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine`(*self*)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms`(*self*)

`get_url`(*self*)
Return the url.

`get_urls`(*self*)
Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

`get_visible`(*self*)
Return the visibility.

`get_window_extent`(*self*, *renderer*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder`(*self*)
Return the artist's zorder.

`have_units`(*self*)
Return *True* if units are set on any axis.

`is_transform_set`(*self*)
Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

`property mouseover`
If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also *get_cursor_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

`pchanged`(*self*)
Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback

remove_callback

`pick`(*self*, *mouseevent*)
Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

`pickable`(*self*)
Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

`properties`(*self*)
Return a dictionary of all the properties of the artist.

`remove`(*self*)
Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

`remove_callback`(*self*, *oid*)
Remove a callback based on its observer id.

See also:

add_callback

`set`(*self*, ***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

`set_aa`(*self*, *aa*)
Alias for *set_antialiased*.

`set_agg_filter`(*self*, *filter_func*)
Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha`(*self*, *alpha*)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[float or None]

`set_animated`(*self*, *b*)
Set the artist's animation state.

Parameters

b

[bool]

`set_antialiased`(*self*, *aa*)
Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

`set_antialiaseds`(*self*, *aa*)
Alias for *set_antialiased*.

`set_array`(*self*, *A*)
Set the image array from numpy array *A*.

Parameters

A

[ndarray]

`set_capstyle`(*self*, *cs*)
Set the capstyle for the collection (for all its elements).

Parameters

cs

[{'butt', 'round', 'projecting'}] The capstyle.

`set_clim`(*self*, *vmin=None*, *vmax=None*)
Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box`(*self*, *clipbox*)
Set the artist's clip *Bbox*.

Parameters

clipbox

[*Bbox*]

`set_clip_on`(*self*, *b*)
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

Parameters

b

[bool]

`set_clip_path`(*self*, *path*, *transform=None*)
Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap`(*self*, *cmap*)
Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

set_color(*self*, *c*)
Set both the edgecolor and the facecolor.

Parameters

c

[color or list of rgba tuples]

See also:

Collection.set_facecolor, *Collection.set_edgecolor*

For setting the edge or face color individually.

set_contains(*self*, *picker*)
[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

Parameters

picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

set_dashes(*self*, *ls*)
Alias for *set_linestyle*.

set_ec(*self*, *c*)
Alias for *set_edgecolor*.

set_edgecolor(*self*, *c*)
Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*self*, *c*)
Alias for *set_edgecolor*.

set_facecolor(*self*, *c*)
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

set_facecolors(*self*, *c*)
Alias for *set_facecolor*.

set_fc(*self*, *c*)
Alias for *set_facecolor*.

set_figure(*self*, *fig*)
Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gid(*self*, *gid*)
Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*self*, *hatch*)
Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

`set_in_layout`(*self*, *in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

`set_joinstyle`(*self*, *js*)

Set the joinstyle for the collection (for all its elements).

Parameters

js

[{'miter', 'round', 'bevel'}] The joinstyle.

`set_label`(*self*, *s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linestyle(*self*, *ls*)
Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

set_linestyles(*self*, *ls*)
Alias for *set_linestyle*.

set_linewidth(*self*, *lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

set_linewidths(*self*, *lw*)
Alias for *set_linewidth*.

set_ls(*self*, *ls*)
Alias for *set_linestyle*.

set_lw(*self*, *lw*)
Alias for *set_linewidth*.

set_norm(*self*, *norm*)
Set the normalization instance.

Parameters

norm

[*Normalize* or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position`(*self*, *offset_position*)
[*Deprecated*] Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Parameters

offset_position

[{'screen', 'data'}]

Notes

Deprecated since version 3.3.

`set_offsets`(*self*, *offsets*)
Set the offsets for the collection.

Parameters

offsets

[array-like (N, 2) or (2,)]

`set_path_effects`(*self*, *path_effects*)
Set the path effects.

Parameters

path_effects

[*AbstractPathEffect*]

`set_paths`(*self*, *verts*, *closed=True*)
Set the vertices of the polygons.

Parameters

verts

[list of array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts_i* defines the vertices of polygon *i* as a 2D array-like of shape (M, 2).

closed

[bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

`set_picker`(*self*, *picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set_pickradius* instead.

`set_pickradius`(*self*, *pr*)

Set the pick radius used for containment tests.

Parameters

d

[float] Pick radius, in points.

`set_rasterized`(*self*, *rasterized*)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

Parameters

rasterized

[bool or None]

`set_sizes`(*self*, *sizes*, *dpi=72.0*)

Set the sizes of each member of the collection.

Parameters

sizes

[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi

[float, default: 72] The dpi of the canvas.

`set_sketch_params`(*self*, *scale=None*, *length=None*, *randomness=None*)

Sets the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*self*, *snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform`(*self*, *t*)
Set the artist transform.

Parameters

t

[*Transform*]

`set_url`(*self*, *url*)
Set the url for the artist.

Parameters

url

[str]

`set_urls`(*self*, *urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_verts`(*self*, *verts*, *closed=True*)
Set the vertices of the polygons.

Parameters

verts

[list of array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts_i* defines the vertices of polygon *i* as a 2D array-like of shape (M, 2).

closed

[bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

`set_verts_and_codes`(*self*, *verts*, *codes*)
Initialize vertices with path codes.

`set_visible`(*self*, *b*)
Set the artist's visibility.

Parameters

b

[bool]

`set_zorder`(*self*, *level*)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

`property stale`
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`property sticky_edges`
`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba`(*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)
Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update`(*self*, *props*)
Update this artist's properties from the dict *props*.

Parameters

props

[dict]

`property update_dict`

`update_from`(*self*, *other*)
Copy properties from other to self.

`update_scalarmappable`(*self*)
Update colors from the scalar mappable array, if it is not None.

`zorder = 0`

`class matplotlib.collections.QuadMesh`(*meshWidth*, *meshHeight*, *coordinates*, *antialiased=True*, *shading='flat'*, ***kwargs*)
Bases: *matplotlib.collections.Collection*

Class for the efficient drawing of a quadrilateral mesh.

A quadrilateral mesh consists of a grid of vertices. The dimensions of this array are (*meshWidth* + 1, *meshHeight* + 1). Each vertex in the mesh has a different set of "mesh coordinates" representing its position in the topology of the mesh. For any values (*m*, *n*) such that 0 <= *m* <= *meshWidth* and 0 <= *n* <= *meshHeight*, the vertices at mesh coordinates (*m*, *n*), (*m*, *n* + 1), (*m* + 1, *n* + 1), and (*m* + 1, *n*) form one of the quadrilaterals in the mesh. There are thus (*meshWidth* *

meshHeight) quadrilaterals in the mesh. The mesh need not be regular and the polygons need not be convex.

A quadrilateral mesh is represented by a (2 x ((*meshWidth* + 1) * (*meshHeight* + 1))) numpy array *coordinates*, where each row is the *x* and *y* coordinates of one of the vertices. To define the function that maps from a data point to its corresponding color, use the *set_cmap()* method. Each of these arrays is indexed in row-major order by the mesh coordinates of the vertex (or the mesh coordinates of the lower left vertex, in the case of the colors).

For example, the first entry in *coordinates* is the coordinates of the vertex at mesh coordinates (0, 0), then the one at (0, 1), then at (0, 2) .. (0, meshWidth), (1, 0), (1, 1), and so on.

shading may be 'flat', or 'gouraud'

Parameters

edgecolors

[color or list of colors, default: `rcParams["patch.edgecolor"]` (default: `'black'`)] Edge color for each patch making up the collection. The special value 'face' can be passed to make the edgecolor match the facecolor.

facecolors

[color or list of colors, default: `rcParams["patch.facecolor"]` (default: `'C0'`)] Face color for each patch making up the collection.

linewidths

[float or list of floats, default: `rcParams["patch.linewidth"]` (default: `1.0`)] Line width for each patch making up the collection.

linestyles

[str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

```
(offset, onoffseq),
```

where *onoffseq* is an even length tuple of on and off ink lengths in points. For examples, see /gallery/lines_bars_and_markers/linestyles.

capstyle

[str, default: `rcParams["patch.capstyle"]`] Style to use for capping lines for all paths in the collection. See /gallery/lines_bars_and_markers/joinstyle for a demonstration of each of the allowed values.

joinstyle

[str, default: `rcParams["patch.joinstyle"]`] Style to use for joining lines for all paths in the collection. See /gallery/lines_bars_and_markers/joinstyle for a demonstration of each of the allowed values.

antialiaseds

[bool or list of bool, default: `rcParams["patch.antialiased"]` (default: `True`)] Whether each pach in the collection should be drawn with antialiasing.

offsets

[(float, float) or list thereof, default: (0, 0)] A vector by which to translate each patch after rendering (default is no translation). The translation is performed in screen (pixel) coordinates (i.e. after the Artist's transform is applied).

transOffset

[*Transform*, default: *IdentityTransform*] A single transform which will be applied to each *offsets* vector before it is used.

offset_position

[{'screen' (default), 'data' (deprecated)}] If set to 'data' (deprecated), *offsets* will be treated as if it is in data coordinates instead of in screen coordinates.

norm

[*Normalize*, optional] Forwarded to *ScalarMappable*. The default of `None` means that the first draw call will set `vmin` and `vmax` using the minimum and maximum values of the data.

cmap

[*Colormap*, optional] Forwarded to *ScalarMappable*. The default of `None` will result in `rcParams["image.cmap"]` (default: `'viridis'`) being used.

hatch

[str, optional] Hatching pattern to use in filled paths, if any. Valid strings are ['/', '', '|', '-', '+', 'x', 'o', 'O', '.', '*']. See /gallery/shapes_and_collections/hatch_demo for the meaning of each hatch type.

pickradius

[float, default: 5.0] If `pickradius <= 0`, then *Collection.contains* will return `True` whenever the test point is inside of one of the polygons formed by the control points of a Path in the Collection. On the other hand, if it is greater than 0, then we instead check

if the test point is contained in a stroke of width `2*pickradius` following any of the Paths in the Collection.

urls

[list of str, default: None] A URL for each patch to link to once drawn. Currently only works for the SVG backend. See /gallery/misc/hyperlinks_sgskip for examples.

zorder

[float, default: 1] The drawing order, shared by all Patches in the Collection. See /gallery/misc/zorder_demo for all defaults and examples.

`add_callback`(*self*, *func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

`add_checker`(*self*, *checker*)

[*Deprecated*]

Notes

Deprecated since version 3.3:

`autoscale`(*self*)
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`(*self*)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`property axes`
The *Axes* instance the artist resides in, or *None*.

`changed`(*self*)
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`contains`(*self*, *mouseevent*)
Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

`static convert_mesh_to_paths`(*meshWidth*, *meshHeight*, *coordinates*)
Convert a given mesh into a sequence of *Path* objects.

This function is primarily of use to implementers of backends that do not directly support quadmeshes.

`convert_mesh_to_triangles`(*self*, *meshWidth*, *meshHeight*, *coordinates*)
Convert a given mesh into a sequence of triangles, each point with its own color. This is useful for experiments using *draw_gouraud_triangle*.

`convert_xunits`(*self*, *x*)
Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

`convert_yunits`(*self*, *y*)
Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`findobj`(*self*, *match=None*, *include_self=True*)
Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

`format_cursor_data`(*self*, *data*)
Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

get_agg_filter(*self*)
Return filter function to be used for agg filter.

get_alpha(*self*)
Return the alpha value used for blending - not supported on all backends.

get_animated(*self*)
Return whether the artist is animated.

get_array(*self*)
Return the data array.

get_capstyle(*self*)

get_children(*self*)
Return a list of the child *Artist*s of this *Artist*.

get_clim(*self*)
Return the values (min, max) that are mapped to the colormap limits.

get_clip_box(*self*)
Return the clipbox.

get_clip_on(*self*)
Return whether the artist uses clipping.

get_clip_path(*self*)
Return the clip path.

get_cmap(*self*)
Return the *Colormap* instance.

get_contains(*self*)
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

See also:

set_contains

Notes

Deprecated since version 3.3.

get_cursor_data(*self*, *event*)
Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*matplotlib.backend_bases.MouseEvent*]

See also:

format_cursor_data

`get_dashes`(*self*)
Alias for *get_linestyle*.

`get_datalim`(*self*, *transData*)

`get_ec`(*self*)
Alias for *get_edgecolor*.

`get_edgecolor`(*self*)

`get_edgecolors`(*self*)
Alias for *get_edgecolor*.

`get_facecolor`(*self*)

`get_facecolors`(*self*)
Alias for *get_facecolor*.

`get_fc`(*self*)
Alias for *get_facecolor*.

`get_figure`(*self*)
Return the *Figure* instance the artist belongs to.

`get_fill`(*self*)
Return whether fill is set.

`get_gid`(*self*)
Return the group id.

get_hatch(*self*)
Return the current hatching pattern.

get_in_layout(*self*)
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle(*self*)

get_label(*self*)
Return the label used for this artist in the legend.

get_linestyle(*self*)

get_linestyles(*self*)
Alias for *get_linestyle*.

get_linewidth(*self*)

get_linewidths(*self*)
Alias for *get_linewidth*.

get_ls(*self*)
Alias for *get_linestyle*.

get_lw(*self*)
Alias for *get_linewidth*.

get_offset_position(*self*)
[*Deprecated*] Return how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

get_offset_transform(*self*)

get_offsets(*self*)
Return the offsets for the collection.

get_path_effects(*self*)

get_paths(*self*)

get_picker(*self*)
Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, *pickable*, *pick*

get_pickradius(*self*)

get_rasterized(*self*)
Return whether the artist is to be rasterized.

get_sketch_params(*self*)
Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap(*self*)
Return the snap setting.

See *set_snap* for details.

get_tightbbox(*self*, *renderer*)
Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

get_transform(*self*)
Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine(*self*)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms(*self*)

`get_url`(*self*)
Return the url.

`get_urls`(*self*)
Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

`get_visible`(*self*)
Return the visibility.

`get_window_extent`(*self*, *renderer*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder`(*self*)
Return the artist's zorder.

`have_units`(*self*)
Return *True* if units are set on any axis.

`is_transform_set`(*self*)
Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

`property mouseover`
If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also *get_cursor_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

`pchanged`(*self*)
Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback

remove_callback

pick(*self*, *mouseevent*)
Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

pickable(*self*)
Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

properties(*self*)
Return a dictionary of all the properties of the artist.

remove(*self*)
Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*self*, *oid*)
Remove a callback based on its observer id.

See also:

add_callback

set(*self*, ***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

set_aa(*self*, *aa*)
Alias for *set_antialiased*.

set_agg_filter(*self*, *filter_func*)
Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha`(*self*, *alpha*)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[float or None]

`set_animated`(*self*, *b*)
Set the artist's animation state.

Parameters

b

[bool]

`set_antialiased`(*self*, *aa*)
Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

`set_antialiaseds`(*self*, *aa*)
Alias for *set_antialiased*.

`set_array`(*self*, *A*)
Set the image array from numpy array *A*.

Parameters

A

[ndarray]

`set_capstyle`(*self*, *cs*)
Set the capstyle for the collection (for all its elements).

Parameters

cs

[{'butt', 'round', 'projecting'}] The capstyle.

`set_clim`(*self*, *vmin=None*, *vmax=None*)
Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box`(*self*, *clipbox*)
Set the artist's clip *Bbox*.

Parameters

clipbox

[*Bbox*]

`set_clip_on`(*self*, *b*)
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

Parameters

b

[bool]

`set_clip_path`(*self*, *path*, *transform=None*)
Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap`(*self*, *cmap*)
Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

`set_color`(*self*, *c*)
Set both the edgecolor and the facecolor.

Parameters

c

[color or list of rgba tuples]

See also:

Collection.set_facecolor, *Collection.set_edgecolor*

For setting the edge or face color individually.

`set_contains`(*self*, *picker*)
[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

Parameters

picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

`set_dashes`(*self*, *ls*)
Alias for *set_linestyle*.

`set_ec`(*self*, *c*)
Alias for *set_edgecolor*.

`set_edgecolor`(*self*, *c*)
Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors`(*self*, *c*)
Alias for *set_edgecolor*.

`set_facecolor`(*self*, *c*)
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

`set_facecolors`(*self*, *c*)
Alias for *set_facecolor*.

`set_fc`(*self*, *c*)
Alias for *set_facecolor*.

`set_figure`(*self*, *fig*)
Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

`set_gid`(*self*, *gid*)
Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*self*, *hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*self*, *in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_joinstyle(*self*, *js*)

Set the joinstyle for the collection (for all its elements).

Parameters

js

[{'miter', 'round', 'bevel'}] The joinstyle.

`set_label`(*self*, *s*)
Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

`set_linestyle`(*self*, *ls*)
Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

`set_linestyles`(*self*, *ls*)
Alias for *set_linestyle*.

`set_linewidth`(*self*, *lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

`set_linewidths`(*self*, *lw*)
Alias for *set_linewidth*.

`set_ls`(*self*, *ls*)
Alias for *set_linestyle*.

`set_lw`(*self*, *lw*)
Alias for *set_linewidth*.

`set_norm`(*self*, *norm*)
Set the normalization instance.

Parameters

norm

[*Normalize* or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position`(*self*, *offset_position*)
[*Deprecated*] Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Parameters

offset_position

[{'screen', 'data'}]

Notes

Deprecated since version 3.3.

`set_offsets`(*self*, *offsets*)
Set the offsets for the collection.

Parameters

offsets

[array-like (N, 2) or (2,)]

`set_path_effects`(*self*, *path_effects*)
Set the path effects.

Parameters

path_effects

[*AbstractPathEffect*]

`set_paths`(*self*)

`set_picker`(*self*, *picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set_pickradius* instead.

`set_pickradius`(*self*, *pr*)

Set the pick radius used for containment tests.

Parameters

d

[float] Pick radius, in points.

`set_rasterized`(*self*, *rasterized*)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

Parameters

rasterized

[bool or None]

`set_sketch_params`(*self*, *scale=None*, *length=None*, *randomness=None*)
Sets the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*self*, *snap*)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform`(*self*, *t*)
Set the artist transform.

Parameters

t

[*Transform*]

set_url(*self*, *url*)
Set the url for the artist.

Parameters

url

[str]

set_urls(*self*, *urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_visible(*self*, *b*)
Set the artist's visibility.

Parameters

b

[bool]

set_zorder(*self*, *level*)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

property stale
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges
`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba`(*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)
Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update`(*self*, *props*)
Update this artist's properties from the dict *props*.

Parameters

props

[dict]

`property update_dict`

`update_from`(*self*, *other*)
Copy properties from other to self.

`update_scalarmappable`(*self*)
Update colors from the scalar mappable array, if it is not None.

`zorder = 0`

class matplotlib.collections.**RegularPolyCollection**(*numsides*, *rotation=0*, *sizes=1*, ***kwargs*)

Bases: matplotlib.collections._CollectionWithSizes

A collection of n-sided regular polygons.

Parameters

numsides

[int] The number of sides of the polygon.

rotation

[float] The rotation of the polygon in radians.

sizes

[tuple of float] The area of the circle circumscribing the polygon in points^2.

****kwargs**

Forwarded to *Collection*.

Examples

See /gallery/event_handling/lasso_demo for a complete example:

```
offsets = np.random.rand(20, 2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]

collection = RegularPolyCollection(
    numsides=5, # a pentagon
    rotation=0, sizes=(50,),
    facecolors=facecolors,
    edgecolors=("black",),
    linewidths=(1,),
    offsets=offsets,
    transOffset=ax.transData,
    )
```

add_callback(*self*, *func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

`add_checker`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`autoscale`(*self*)
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`(*self*)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`property axes`
The *Axes* instance the artist resides in, or *None*.

`changed`(*self*)
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`contains`(*self*, *mouseevent*)
Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

`convert_xunits`(*self*, *x*)
Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

`convert_yunits`(*self*, *y*)
Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`findobj`(*self*, *match=None*, *include_self=True*)
Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

format_cursor_data(*self*, *data*)
Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

get_agg_filter(*self*)
Return filter function to be used for agg filter.

get_alpha(*self*)
Return the alpha value used for blending - not supported on all backends.

get_animated(*self*)
Return whether the artist is animated.

get_array(*self*)
Return the data array.

get_capstyle(*self*)

get_children(*self*)
Return a list of the child *Artist*s of this *Artist*.

get_clim(*self*)
Return the values (min, max) that are mapped to the colormap limits.

get_clip_box(*self*)
Return the clipbox.

get_clip_on(*self*)
Return whether the artist uses clipping.

get_clip_path(*self*)
Return the clip path.

get_cmap(*self*)
Return the *Colormap* instance.

get_contains(*self*)
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

See also:

set_contains

Notes

Deprecated since version 3.3.

get_cursor_data(*self*, *event*)
Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*matplotlib.backend_bases.MouseEvent*]

See also:

format_cursor_data

get_dashes(*self*)
Alias for *get_linestyle*.

get_datalim(*self*, *transData*)

get_ec(*self*)
Alias for *get_edgecolor*.

get_edgecolor(*self*)

get_edgecolors(*self*)
Alias for *get_edgecolor*.

get_facecolor(*self*)

get_facecolors(*self*)
Alias for *get_facecolor*.

get_fc(*self*)
Alias for *get_facecolor*.

get_figure(*self*)
Return the *Figure* instance the artist belongs to.

`get_fill`(*self*)
Return whether fill is set.

`get_gid`(*self*)
Return the group id.

`get_hatch`(*self*)
Return the current hatching pattern.

`get_in_layout`(*self*)
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle`(*self*)

`get_label`(*self*)
Return the label used for this artist in the legend.

`get_linestyle`(*self*)

`get_linestyles`(*self*)
Alias for *get_linestyle*.

`get_linewidth`(*self*)

`get_linewidths`(*self*)
Alias for *get_linewidth*.

`get_ls`(*self*)
Alias for *get_linestyle*.

`get_lw`(*self*)
Alias for *get_linewidth*.

`get_numsides`(*self*)

`get_offset_position`(*self*)
[*Deprecated*] Return how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

`get_offset_transform`(*self*)

`get_offsets`(*self*)
Return the offsets for the collection.

`get_path_effects`(*self*)

get_paths(*self*)

get_picker(*self*)
Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, *pickable*, *pick*

get_pickradius(*self*)

get_rasterized(*self*)
Return whether the artist is to be rasterized.

get_rotation(*self*)

get_sizes(*self*)
Return the sizes ('areas') of the elements in the collection.

Returns

array

The 'area' of each element.

get_sketch_params(*self*)
Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap(*self*)
Return the snap setting.

See *set_snap* for details.

get_tightbbox(*self*, *renderer*)
Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

`get_transform`(*self*)
Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine`(*self*)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms`(*self*)

`get_url`(*self*)
Return the url.

`get_urls`(*self*)
Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

`get_visible`(*self*)
Return the visibility.

`get_window_extent`(*self*, *renderer*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder`(*self*)
Return the artist's zorder.

`have_units`(*self*)
Return *True* if units are set on any axis.

`is_transform_set`(*self*)
Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

property mouseover
: If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

  See also *get_cursor_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

pchanged(*self*)
: Call all of the registered callbacks.

  This function is triggered internally when a property is changed.

  See also:

  add_callback

  remove_callback

pick(*self, mouseevent*)
: Process a pick event.

  Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

  See also:

  set_picker, *get_picker*, *pickable*

pickable(*self*)
: Return whether the artist is pickable.

  See also:

  set_picker, *get_picker*, *pick*

properties(*self*)
: Return a dictionary of all the properties of the artist.

remove(*self*)
: Remove the artist from the figure if possible.

  The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

  Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

  Note: there is no support for removing the artist's legend entry.

remove_callback(*self, oid*)
: Remove a callback based on its observer id.

  See also:

add_callback

set(*self*, ***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

set_aa(*self*, *aa*)
Alias for *set_antialiased*.

set_agg_filter(*self*, *filter_func*)
Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

set_alpha(*self*, *alpha*)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[float or None]

set_animated(*self*, *b*)
Set the artist's animation state.

Parameters

b

[bool]

set_antialiased(*self*, *aa*)
Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*self*, *aa*)
Alias for *set_antialiased*.

set_array(*self*, *A*)
Set the image array from numpy array *A*.

Parameters

A

[ndarray]

set_capstyle(*self*, *cs*)
Set the capstyle for the collection (for all its elements).

Parameters

cs

[{'butt', 'round', 'projecting'}] The capstyle.

set_clim(*self*, *vmin=None*, *vmax=None*)
Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_clip_box(*self*, *clipbox*)
Set the artist's clip *Bbox*.

Parameters

clipbox

[*Bbox*]

set_clip_on(*self*, *b*)
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*self*, *path*, *transform=None*)
Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap`(*self*, *cmap*)
Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

`set_color`(*self*, *c*)
Set both the edgecolor and the facecolor.

Parameters

c

[color or list of rgba tuples]

See also:

Collection.set_facecolor, *Collection.set_edgecolor*

For setting the edge or face color individually.

`set_contains`(*self*, *picker*)
[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

Parameters

picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

`set_dashes`(*self*, *ls*)
Alias for *set_linestyle*.

`set_ec`(*self*, *c*)
Alias for *set_edgecolor*.

`set_edgecolor`(*self*, *c*)
Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors`(*self*, *c*)
Alias for *set_edgecolor*.

`set_facecolor`(*self*, *c*)
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

`set_facecolors`(*self*, *c*)
Alias for *set_facecolor*.

set_fc(*self*, *c*)
Alias for *set_facecolor*.

set_figure(*self*, *fig*)
Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gid(*self*, *gid*)
Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*self*, *hatch*)
Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*self*, *in_layout*)
Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

`set_joinstyle`(*self*, *js*)
Set the joinstyle for the collection (for all its elements).

Parameters

js

[{'miter', 'round', 'bevel'}] The joinstyle.

`set_label`(*self*, *s*)
Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

`set_linestyle`(*self*, *ls*)
Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

`set_linestyles`(*self*, *ls*)
Alias for *set_linestyle*.

`set_linewidth`(*self*, *lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

`set_linewidths`(*self*, *lw*)
Alias for *set_linewidth*.

`set_ls`(*self*, *ls*)
Alias for *set_linestyle*.

`set_lw`(*self*, *lw*)
Alias for *set_linewidth*.

`set_norm`(*self*, *norm*)
Set the normalization instance.

Parameters

norm

[*Normalize* or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position`(*self*, *offset_position*)
[*Deprecated*] Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Parameters

offset_position

[{'screen', 'data'}]

Notes

Deprecated since version 3.3.

`set_offsets`(*self*, *offsets*)
Set the offsets for the collection.

Parameters

offsets

[array-like (N, 2) or (2,)]

`set_path_effects`(*self*, *path_effects*)
Set the path effects.

Parameters

path_effects

[*AbstractPathEffect*]

`set_paths`(*self*)

`set_picker`(*self*, *picker*)
Define the picking behavior of the artist.

Parameters

picker

[None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set_pickradius* instead.

`set_pickradius`(*self*, *pr*)
Set the pick radius used for containment tests.

Parameters

d

[float] Pick radius, in points.

`set_rasterized`(*self*, *rasterized*)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

Parameters

rasterized

[bool or None]

`set_sizes`(*self*, *sizes*, *dpi=72.0*)
Set the sizes of each member of the collection.

Parameters

sizes

[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi

[float, default: 72] The dpi of the canvas.

`set_sketch_params`(*self*, *scale=None*, *length=None*, *randomness=None*)
Sets the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*self*, *snap*)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform`(*self*, *t*)
Set the artist transform.

Parameters

t

[*Transform*]

`set_url`(*self*, *url*)
Set the url for the artist.

Parameters

url

[str]

`set_urls`(*self*, *urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_visible`(*self*, *b*)
Set the artist's visibility.

Parameters

b

[bool]

`set_zorder`(*self*, *level*)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

`property stale`
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`property sticky_edges`
`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba`(*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)
Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update`(*self*, *props*)
Update this artist's properties from the dict *props*.

Parameters

props

[dict]

`property update_dict`

`update_from`(*self*, *other*)
Copy properties from other to self.

`update_scalarmappable`(*self*)
Update colors from the scalar mappable array, if it is not None.

`zorder = 0`

`class matplotlib.collections.StarPolygonCollection`(*numsides*, *rotation=0*, *sizes=1*, ***kwargs*)
Bases: *matplotlib.collections.RegularPolyCollection*

Draw a collection of regular stars with *numsides* points.

Parameters

numsides

[int] The number of sides of the polygon.

rotation

[float] The rotation of the polygon in radians.

sizes

[tuple of float] The area of the circle circumscribing the polygon in points^2.

****kwargs**

Forwarded to *Collection*.

Examples

See /gallery/event_handling/lasso_demo for a complete example:

```
offsets = np.random.rand(20, 2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]

collection = RegularPolyCollection(
    numsides=5, # a pentagon
    rotation=0, sizes=(50,),
    facecolors=facecolors,
    edgecolors=("black",),
    linewidths=(1,),
    offsets=offsets,
    transOffset=ax.transData,
    )
```

`add_callback`(*self*, *func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

`add_checker`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`autoscale`(*self*)
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`(*self*)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`property axes`
The *Axes* instance the artist resides in, or *None*.

`changed`(*self*)
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`contains`(*self*, *mouseevent*)
Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

`convert_xunits`(*self*, *x*)
Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

`convert_yunits`(*self*, *y*)
Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`findobj`(*self*, *match=None*, *include_self=True*)
Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

`format_cursor_data`(*self*, *data*)
Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

`get_agg_filter`(*self*)
Return filter function to be used for agg filter.

`get_alpha`(*self*)
Return the alpha value used for blending - not supported on all backends.

`get_animated`(*self*)
Return whether the artist is animated.

`get_array`(*self*)
Return the data array.

`get_capstyle`(*self*)

`get_children`(*self*)
Return a list of the child *Artist*s of this *Artist*.

`get_clim`(*self*)
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box`(*self*)
Return the clipbox.

`get_clip_on`(*self*)
Return whether the artist uses clipping.

`get_clip_path`(*self*)
Return the clip path.

`get_cmap`(*self*)
Return the *Colormap* instance.

`get_contains`(*self*)
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

See also:

set_contains

Notes

Deprecated since version 3.3.

`get_cursor_data`(*self*, *event*)
Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*matplotlib.backend_bases.MouseEvent*]

See also:

format_cursor_data

`get_dashes`(*self*)
Alias for *get_linestyle*.

`get_datalim`(*self*, *transData*)

`get_ec`(*self*)
Alias for *get_edgecolor*.

`get_edgecolor`(*self*)

`get_edgecolors`(*self*)
Alias for *get_edgecolor*.

`get_facecolor`(*self*)

`get_facecolors`(*self*)
Alias for *get_facecolor*.

`get_fc`(*self*)
Alias for *get_facecolor*.

`get_figure`(*self*)
Return the *Figure* instance the artist belongs to.

`get_fill`(*self*)
Return whether fill is set.

`get_gid`(*self*)
Return the group id.

`get_hatch`(*self*)
Return the current hatching pattern.

`get_in_layout`(*self*)
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle(*self*)

get_label(*self*)
Return the label used for this artist in the legend.

get_linestyle(*self*)

get_linestyles(*self*)
Alias for *get_linestyle*.

get_linewidth(*self*)

get_linewidths(*self*)
Alias for *get_linewidth*.

get_ls(*self*)
Alias for *get_linestyle*.

get_lw(*self*)
Alias for *get_linewidth*.

get_numsides(*self*)

get_offset_position(*self*)
[*Deprecated*] Return how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

get_offset_transform(*self*)

get_offsets(*self*)
Return the offsets for the collection.

get_path_effects(*self*)

get_paths(*self*)

get_picker(*self*)
Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, *pickable*, *pick*

get_pickradius(*self*)

get_rasterized(*self*)
Return whether the artist is to be rasterized.

get_rotation(*self*)

get_sizes(*self*)
Return the sizes ('areas') of the elements in the collection.

Returns

array

The 'area' of each element.

get_sketch_params(*self*)
Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap(*self*)
Return the snap setting.

See *set_snap* for details.

get_tightbbox(*self*, *renderer*)
Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

`get_transform`(*self*)
Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine`(*self*)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms`(*self*)

`get_url`(*self*)
Return the url.

`get_urls`(*self*)
Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

`get_visible`(*self*)
Return the visibility.

`get_window_extent`(*self*, *renderer*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder`(*self*)
Return the artist's zorder.

`have_units`(*self*)
Return *True* if units are set on any axis.

`is_transform_set`(*self*)
Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

`property mouseover`
If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also *get_cursor_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

`pchanged`(*self*)
Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback

remove_callback

pick(*self*, *mouseevent*)
Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

pickable(*self*)
Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

properties(*self*)
Return a dictionary of all the properties of the artist.

remove(*self*)
Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*self*, *oid*)
Remove a callback based on its observer id.

See also:

add_callback

set(*self*, ***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

set_aa(*self*, *aa*)
Alias for *set_antialiased*.

set_agg_filter(*self*, *filter_func*)
Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha`(*self*, *alpha*)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[float or None]

`set_animated`(*self*, *b*)
Set the artist's animation state.

Parameters

b

[bool]

`set_antialiased`(*self*, *aa*)
Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

`set_antialiaseds`(*self*, *aa*)
Alias for *set_antialiased*.

`set_array`(*self*, *A*)
Set the image array from numpy array *A*.

Parameters

A

[ndarray]

`set_capstyle`(*self*, *cs*)
Set the capstyle for the collection (for all its elements).

Parameters

cs

[{'butt', 'round', 'projecting'}] The capstyle.

`set_clim`(*self*, *vmin=None*, *vmax=None*)
Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box`(*self*, *clipbox*)
Set the artist's clip *Bbox*.

Parameters

clipbox

[*Bbox*]

`set_clip_on`(*self*, *b*)
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

Parameters

b

[bool]

`set_clip_path`(*self*, *path*, *transform=None*)
Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap`(*self*, *cmap*)
Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

`set_color`(*self*, *c*)
Set both the edgecolor and the facecolor.

Parameters

c

[color or list of rgba tuples]

See also:

Collection.set_facecolor, *Collection.set_edgecolor*

For setting the edge or face color individually.

`set_contains`(*self*, *picker*)
[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

Parameters

picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

`set_dashes`(*self*, *ls*)
Alias for *set_linestyle*.

`set_ec`(*self*, *c*)
Alias for *set_edgecolor*.

`set_edgecolor`(*self*, *c*)
Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors`(*self*, *c*)
Alias for *set_edgecolor*.

`set_facecolor`(*self*, *c*)
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

`set_facecolors`(*self*, *c*)
Alias for *set_facecolor*.

`set_fc`(*self*, *c*)
Alias for *set_facecolor*.

`set_figure`(*self*, *fig*)
Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

`set_gid`(*self*, *gid*)
Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*self*, *hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*self*, *in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_joinstyle(*self*, *js*)

Set the joinstyle for the collection (for all its elements).

Parameters

js

[{'miter', 'round', 'bevel'}] The joinstyle.

`set_label`(*self*, *s*)
Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

`set_linestyle`(*self*, *ls*)
Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

`set_linestyles`(*self*, *ls*)
Alias for *set_linestyle*.

`set_linewidth`(*self*, *lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

`set_linewidths`(*self*, *lw*)
Alias for *set_linewidth*.

`set_ls`(*self*, *ls*)
Alias for *set_linestyle*.

set_lw(*self*, *lw*)
Alias for *set_linewidth*.

set_norm(*self*, *norm*)
Set the normalization instance.

Parameters

norm

[*Normalize* or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_position(*self*, *offset_position*)
[*Deprecated*] Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Parameters

offset_position

[{'screen', 'data'}]

Notes

Deprecated since version 3.3.

set_offsets(*self*, *offsets*)
Set the offsets for the collection.

Parameters

offsets

[array-like (N, 2) or (2,)]

set_path_effects(*self*, *path_effects*)
Set the path effects.

Parameters

path_effects

[*AbstractPathEffect*]

`set_paths`(*self*)

`set_picker`(*self*, *picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set_pickradius* instead.

`set_pickradius`(*self*, *pr*)

Set the pick radius used for containment tests.

Parameters

d

[float] Pick radius, in points.

`set_rasterized`(*self*, *rasterized*)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

Parameters

rasterized

[bool or None]

set_sizes(*self*, *sizes*, *dpi=72.0*)

Set the sizes of each member of the collection.

Parameters

sizes

[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi

[float, default: 72] The dpi of the canvas.

set_sketch_params(*self*, *scale=None*, *length=None*, *randomness=None*)

Sets the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

set_snap(*self*, *snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.

- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform`(*self*, *t*)
Set the artist transform.

Parameters

t

[*Transform*]

`set_url`(*self*, *url*)
Set the url for the artist.

Parameters

url

[str]

`set_urls`(*self*, *urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_visible`(*self*, *b*)
Set the artist's visibility.

Parameters

b

[bool]

`set_zorder`(*self*, *level*)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

property stale
: Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges
: `x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)
: Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(*self*, *props*)
: Update this artist's properties from the dict *props*.

Parameters

props

[dict]

property update_dict

update_from(*self*, *other*)
Copy properties from other to self.

update_scalarmappable(*self*)
Update colors from the scalar mappable array, if it is not None.

zorder = 0

class matplotlib.collections.TriMesh(*triangulation*, ***kwargs*)
Bases: *matplotlib.collections.Collection*

Class for the efficient drawing of a triangular mesh using Gouraud shading.

A triangular mesh is a *Triangulation* object.

Parameters

edgecolors

[color or list of colors, default: rcParams["patch.edgecolor"] (default: 'black')] Edge color for each patch making up the collection. The special value 'face' can be passed to make the edgecolor match the facecolor.

facecolors

[color or list of colors, default: rcParams["patch.facecolor"] (default: 'C0')] Face color for each patch making up the collection.

linewidths

[float or list of floats, default: rcParams["patch.linewidth"] (default: 1.0)] Line width for each patch making up the collection.

linestyles

[str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

```
(offset, onoffseq),
```

where *onoffseq* is an even length tuple of on and off ink lengths in points. For examples, see /gallery/lines_bars_and_markers/linestyles.

capstyle

[str, default: rcParams["patch.capstyle"]] Style to use for capping lines for all paths in the collection. See /gallery/lines_bars_and_markers/joinstyle for a demonstration of each of the allowed values.

joinstyle

[str, default: rcParams["patch.joinstyle"]] Style to use for joining lines for all paths in the collection. See /gallery/lines_bars_and_markers/joinstyle for a demonstration of each of the allowed values.

antialiaseds

[bool or list of bool, default: rcParams["patch.antialiased"] (default: True)] Whether each pach in the collection should be drawn with antialiasing.

offsets

[(float, float) or list thereof, default: (0, 0)] A vector by which to translate each patch after rendering (default is no translation). The translation is performed in screen (pixel) coordinates (i.e. after the Artist's transform is applied).

transOffset

[*Transform*, default: *IdentityTransform*] A single transform which will be applied to each *offsets* vector before it is used.

offset_position

[{'screen' (default), 'data' (deprecated)}] If set to 'data' (deprecated), *offsets* will be treated as if it is in data coordinates instead of in screen coordinates.

norm

[*Normalize*, optional] Forwarded to *ScalarMappable*. The default of None means that the first draw call will set vmin and vmax using the minimum and maximum values of the data.

cmap

[*Colormap*, optional] Forwarded to *ScalarMappable*. The default of None will result in rcParams["image.cmap"] (default: 'viridis') being used.

hatch

[str, optional] Hatching pattern to use in filled paths, if any. Valid strings are ['/', '', '|', '-', '+', 'x', 'o', 'O', '.', '*']. See /gallery/shapes_and_collections/hatch_demo for the meaning of each hatch type.

pickradius

[float, default: 5.0] If `pickradius <= 0`, then *Collection.contains* will return `True` whenever the test point is inside of one of the polygons formed by the control points of a Path in the Collection. On the other hand, if it is greater than 0, then we instead check if the test point is contained in a stroke of width `2*pickradius` following any of the Paths in the Collection.

urls

[list of str, default: None] A URL for each patch to link to once drawn. Currently only works for the SVG backend. See /gallery/misc/hyperlinks_sgskip for examples.

zorder

[float, default: 1] The drawing order, shared by all Patches in the Collection. See /gallery/misc/zorder_demo for all defaults and examples.

`add_callback`(*self*, *func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

`add_checker`(*self*, *checker*)

[*Deprecated*]

Notes

Deprecated since version 3.3:

`autoscale`(*self*)
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`(*self*)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`property axes`
The *Axes* instance the artist resides in, or *None*.

`changed`(*self*)
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update`(*self*, *checker*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`contains`(*self*, *mouseevent*)
Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

`static convert_mesh_to_paths`(*tri*)
Convert a given mesh into a sequence of *Path* objects.

This function is primarily of use to implementers of backends that do not directly support meshes.

`convert_xunits`(*self*, *x*)
Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

`convert_yunits`(*self*, *y*)
Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`findobj`(*self*, *match=None*, *include_self=True*)
Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

`format_cursor_data`(*self*, *data*)
Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

`get_agg_filter`(*self*)
Return filter function to be used for agg filter.

`get_alpha`(*self*)
Return the alpha value used for blending - not supported on all backends.

`get_animated`(*self*)
Return whether the artist is animated.

`get_array`(*self*)
Return the data array.

`get_capstyle`(*self*)

`get_children`(*self*)
Return a list of the child *Artist*s of this *Artist*.

`get_clim`(*self*)
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box`(*self*)
Return the clipbox.

`get_clip_on`(*self*)
Return whether the artist uses clipping.

`get_clip_path`(*self*)
Return the clip path.

`get_cmap`(*self*)
Return the *Colormap* instance.

`get_contains`(*self*)
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

See also:

set_contains

Notes

Deprecated since version 3.3.

`get_cursor_data`(*self*, *event*)
Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*matplotlib.backend_bases.MouseEvent*]

See also:

format_cursor_data

`get_dashes`(*self*)
Alias for *get_linestyle*.

`get_datalim`(*self*, *transData*)

`get_ec`(*self*)
Alias for *get_edgecolor*.

`get_edgecolor`(*self*)

`get_edgecolors`(*self*)
Alias for *get_edgecolor*.

`get_facecolor`(*self*)

`get_facecolors`(*self*)
Alias for *get_facecolor*.

`get_fc`(*self*)
Alias for *get_facecolor*.

`get_figure`(*self*)
Return the *Figure* instance the artist belongs to.

`get_fill`(*self*)
Return whether fill is set.

`get_gid`(*self*)
Return the group id.

`get_hatch`(*self*)
Return the current hatching pattern.

`get_in_layout`(*self*)
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle`(*self*)

`get_label`(*self*)
Return the label used for this artist in the legend.

`get_linestyle`(*self*)

`get_linestyles`(*self*)
Alias for *get_linestyle*.

`get_linewidth`(*self*)

`get_linewidths`(*self*)
Alias for *get_linewidth*.

`get_ls`(*self*)
Alias for *get_linestyle*.

`get_lw`(*self*)
Alias for *get_linewidth*.

`get_offset_position`(*self*)
[*Deprecated*] Return how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

`get_offset_transform`(*self*)

`get_offsets`(*self*)
Return the offsets for the collection.

`get_path_effects`(*self*)

`get_paths`(*self*)

`get_picker`(*self*)
Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, *pickable*, *pick*

`get_pickradius`(*self*)

`get_rasterized`(*self*)
Return whether the artist is to be rasterized.

get_sketch_params(*self*)
Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap(*self*)
Return the snap setting.

See *set_snap* for details.

get_tightbbox(*self*, *renderer*)
Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

get_transform(*self*)
Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine(*self*)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms(*self*)

get_url(*self*)
Return the url.

get_urls(*self*)
Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

`get_visible`(*self*)
Return the visibility.

`get_window_extent`(*self*, *renderer*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder`(*self*)
Return the artist's zorder.

`have_units`(*self*)
Return *True* if units are set on any axis.

`is_transform_set`(*self*)
Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

`property mouseover`
If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also *get_cursor_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

`pchanged`(*self*)
Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback

remove_callback

`pick`(*self*, *mouseevent*)
Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

pickable(*self*)
Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

properties(*self*)
Return a dictionary of all the properties of the artist.

remove(*self*)
Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*self*, *oid*)
Remove a callback based on its observer id.

See also:

add_callback

set(*self*, ***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

set_aa(*self*, *aa*)
Alias for *set_antialiased*.

set_agg_filter(*self*, *filter_func*)
Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

set_alpha(*self*, *alpha*)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[float or None]

set_animated(*self*, *b*)
Set the artist's animation state.

Parameters

b

[bool]

set_antialiased(*self*, *aa*)
Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*self*, *aa*)
Alias for *set_antialiased*.

set_array(*self*, *A*)
Set the image array from numpy array *A*.

Parameters

A

[ndarray]

set_capstyle(*self*, *cs*)
Set the capstyle for the collection (for all its elements).

Parameters

cs

[{'butt', 'round', 'projecting'}] The capstyle.

set_clim(*self*, *vmin=None*, *vmax=None*)
Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_clip_box(*self*, *clipbox*)
Set the artist's clip *Bbox*.

Parameters

clipbox

[*Bbox*]

set_clip_on(*self*, *b*)
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*self*, *path*, *transform=None*)
Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_cmap(*self*, *cmap*)
Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

set_color(*self*, *c*)
Set both the edgecolor and the facecolor.

Parameters

c

[color or list of rgba tuples]

See also:

Collection.set_facecolor, *Collection.set_edgecolor*

For setting the edge or face color individually.

set_contains(*self*, *picker*)
[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

Parameters

picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

set_dashes(*self*, *ls*)
Alias for *set_linestyle*.

set_ec(*self*, *c*)
Alias for *set_edgecolor*.

set_edgecolor(*self*, *c*)
Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors`(*self*, *c*)
Alias for *set_edgecolor*.

`set_facecolor`(*self*, *c*)
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

`set_facecolors`(*self*, *c*)
Alias for *set_facecolor*.

`set_fc`(*self*, *c*)
Alias for *set_facecolor*.

`set_figure`(*self*, *fig*)
Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

`set_gid`(*self*, *gid*)
Set the (group) id for the artist.

Parameters

gid

[str]

`set_hatch`(*self*, *hatch*)
Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

`set_in_layout`(*self*, *in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

`set_joinstyle`(*self*, *js*)

Set the joinstyle for the collection (for all its elements).

Parameters

js

[{'miter', 'round', 'bevel'}] The joinstyle.

`set_label`(*self*, *s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linestyle(*self*, *ls*)
Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

set_linestyles(*self*, *ls*)
Alias for *set_linestyle*.

set_linewidth(*self*, *lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

set_linewidths(*self*, *lw*)
Alias for *set_linewidth*.

set_ls(*self*, *ls*)
Alias for *set_linestyle*.

set_lw(*self*, *lw*)
Alias for *set_linewidth*.

set_norm(*self*, *norm*)
Set the normalization instance.

Parameters

norm

[*Normalize* or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position`(*self*, *offset_position*)
[*Deprecated*] Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Parameters

offset_position

[{'screen', 'data'}]

Notes

Deprecated since version 3.3.

`set_offsets`(*self*, *offsets*)
Set the offsets for the collection.

Parameters

offsets

[array-like (N, 2) or (2,)]

`set_path_effects`(*self*, *path_effects*)
Set the path effects.

Parameters

path_effects

[*AbstractPathEffect*]

`set_paths`(*self*)

`set_picker`(*self*, *picker*)
Define the picking behavior of the artist.

Parameters

picker

[None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set_pickradius* instead.

`set_pickradius`(*self*, *pr*)

Set the pick radius used for containment tests.

Parameters

d

[float] Pick radius, in points.

`set_rasterized`(*self*, *rasterized*)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

Parameters

rasterized

[bool or None]

`set_sketch_params`(*self*, *scale=None*, *length=None*, *randomness=None*)

Sets the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*self*, *snap*)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform`(*self*, *t*)
Set the artist transform.

Parameters

t

[*Transform*]

`set_url`(*self*, *url*)
Set the url for the artist.

Parameters

url

[str]

`set_urls`(*self*, *urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_visible`(*self*, *b*)
Set the artist's visibility.

Parameters

b

[bool]

`set_zorder`(*self*, *level*)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

`property stale`
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`property sticky_edges`
`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*self*, *x*, *alpha=None*, *bytes=False*, *norm=True*)
Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(*self*, *props*)
Update this artist's properties from the dict *props*.

Parameters

props

[dict]

property update_dict

update_from(*self*, *other*)
Copy properties from other to self.

update_scalarmappable(*self*)
Update colors from the scalar mappable array, if it is not None.

zorder = 0

18.17 matplotlib.colorbar

Colorbars are a visualization of the mapping from scalar values to colors. In Matplotlib they are drawn into a dedicated *Axes*.

Note: Colorbars are typically created through *Figure.colorbar* or its pyplot wrapper *pyplot.colorbar*, which use *make_axes* and *Colorbar* internally.

As an end-user, you most likely won't have to call the methods or instantiate the classes in this module explicitly.

ColorbarBase

The base class with full colorbar drawing functionality. It can be used as-is to make a colorbar for a given colormap; a mappable object (e.g., image) is not needed.

Colorbar

On top of *ColorbarBase* this connects the colorbar with a *ScalarMappable* such as an image or contour plot.

ColorbarPatch

A specialized *Colorbar* to support hatched contour plots.

make_axes()

Create an *Axes* suitable for a colorbar. This functions can be used with figures containing a single axes or with freely placed axes.

make_axes_gridspec()

Create a *SubplotBase* suitable for a colorbar. This function should be used for adding a colorbar to a *GridSpec*.

class matplotlib.colorbar.**Colorbar**(*ax*, *mappable*, ***kwargs*)

Bases: *matplotlib.colorbar.ColorbarBase*

This class connects a *ColorbarBase* to a *ScalarMappable* such as an *AxesImage* generated via *imshow*.

Note: This class is not intended to be instantiated directly; instead, use *Figure.colorbar* or *pyplot.colorbar* to create a colorbar.

---

add_lines(*self*, *CS*, *erase=True*)

Add the lines from a non-filled *ContourSet* to the colorbar.

Parameters

CS

[*ContourSet*] The line positions are taken from the ContourSet levels. The ContourSet must not be filled.

erase

[bool, default: True] Whether to remove any previously added lines.

`on_mappable_changed`(*self*, *mappable*)

[*Deprecated*] Update this colorbar to match the mappable's properties.

Typically this is automatically registered as an event handler by *colorbar_factory()* and should not be called manually.

Notes

Deprecated since version 3.3.

`remove`(*self*)

Remove this colorbar from the figure.

If the colorbar was created with `use_gridspec=True` the previous gridspec is restored.

`update_bruteforce`(*self*, *mappable*)

[*Deprecated*] Destroy and rebuild the colorbar. This is intended to become obsolete, and will probably be deprecated and then removed. It is not called when the pyplot.colorbar function or the Figure.colorbar method are used to create the colorbar.

Notes

Deprecated since version 3.3.

`update_normal`(*self*, *mappable*)

Update solid patches, lines, etc.

This is meant to be called when the norm of the image or contour plot to which this colorbar belongs changes.

If the norm on the mappable is different than before, this resets the locator and formatter for the axis, so if these have been customized, they will need to be customized again. However, if the norm only changes values of *vmin*, *vmax* or *cmap* then the old formatter and locator will be preserved.

class matplotlib.colorbar.**ColorbarBase**(*ax*, ***, *cmap=None*, *norm=None*, *alpha=None*, *values=None*, *boundaries=None*, *orientation='vertical'*, *ticklocation='auto'*, *extend=None*, *spacing='uniform'*, *ticks=None*, *format=None*, *drawedges=False*, *filled=True*, *extendfrac=None*, *extendrect=False*, *label=''*)

Bases: `object`

Draw a colorbar in an existing axes.

There are only some rare cases in which you would work directly with a *ColorbarBase* as an end-user. Typically, colorbars are used with *ScalarMappable*s such as an *AxesImage* generated via *imshow*. For these cases you will use *Colorbar* and likely create it via *pyplot.colorbar* or *Figure.colorbar*.

The main application of using a *ColorbarBase* explicitly is drawing colorbars that are not associated with other elements in the figure, e.g. when showing a colormap by itself.

If the *cmap* kwarg is given but *boundaries* and *values* are left as None, then the colormap will be displayed on a 0-1 scale. To show the under- and over-value colors, specify the *norm* as:

```
norm=colors.Normalize(clip=False)
```

To show the colors versus index instead of on the 0-1 scale, use:

```
norm=colors.NoNorm()
```

Useful public methods are *set_label()* and *add_lines()*.

Parameters

ax

[*Axes*] The *Axes* instance in which the colorbar is drawn.

cmap

[*Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] The colormap to use.

norm

[*Normalize*]

alpha

[float] The colorbar transparency between 0 (transparent) and 1 (opaque).

values

boundaries

orientation

[{'vertical', 'horizontal'}]

ticklocation

[{'auto', 'left', 'right', 'top', 'bottom'}]

extend

[{'neither', 'both', 'min', 'max'}]

spacing

[{'uniform', 'proportional'}]

ticks

[*Locator* or array-like of float]

format

[str or *Formatter*]

drawedges

[bool]

filled

[bool]

extendfrac

extendrec

label

[str]

Attributes

ax

[*Axes*] The *Axes* instance in which the colorbar is drawn.

lines

[list] A list of *LineCollection* if lines were drawn, otherwise an empty list.

dividers

[*LineCollection*] A LineCollection if *drawedges* is `True`, otherwise `None`.

`add_lines`(*self*, *levels*, *colors*, *linewidths*, *erase=True*)

Draw lines on the colorbar.

The lines are appended to the list `lines`.

Parameters

levels

[array-like] The positions of the lines.

colors

[color or list of colors] Either a single color applying to all lines or one color value for each line.

linewidths

[float or array-like] Either a single linewidth applying to all lines or one linewidth for each line.

erase

[bool, default: True] Whether to remove any previously added lines.

`config_axis`(*self*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`draw_all`(*self*)
Calculate any free parameters based on the current cmap and norm, and do all the drawing.

`get_ticks`(*self*, *minor=False*)
Return the x ticks as a list of locations.

`minorticks_off`(*self*)
Turn the minor ticks of the colorbar off.

`minorticks_on`(*self*)
Turn the minor ticks of the colorbar on without extruding into the "extend regions".

`n_rasterize = 50`

`remove`(*self*)
Remove this colorbar from the figure.

`set_alpha`(*self*, *alpha*)
Set the transparency between 0 (transparent) and 1 (opaque).

`set_label`(*self*, *label*, *, *loc=None*, ***kwargs*)
Add a label to the long axis of the colorbar.

set_ticklabels(*self*, *ticklabels*, *update_ticks=True*)
Set tick labels.

Tick labels are updated immediately unless *update_ticks* is *False*, in which case one should call *update_ticks* explicitly.

set_ticks(*self*, *ticks*, *update_ticks=True*)
Set tick locations.

Parameters

ticks

[array-like or *Locator* or None] The tick positions can be hard-coded by an array of values; or they can be defined by a *Locator*. Setting to *None* reverts to using a default locator.

update_ticks

[bool, default: True] If True, tick locations are updated immediately. If False, the user has to call *update_ticks* later to update the ticks.

update_ticks(*self*)
Force the update of the ticks and ticklabels. This must be called whenever the tick locator and/or tick formatter changes.

class matplotlib.colorbar.ColorbarPatch(*ax*, *mappable*, ***kw*)
Bases: *matplotlib.colorbar.Colorbar*

A Colorbar that uses a list of *Patch* instances rather than the default *PatchCollection* created by *pcolor*, because the latter does not allow the hatch pattern to vary among the members of the collection.

matplotlib.colorbar.colorbar_factory(*cax*, *mappable*, ***kwargs*)
Create a colorbar on the given axes for the given mappable.

Note: This is a low-level function to turn an existing axes into a colorbar axes. Typically, you'll want to use *colorbar* instead, which automatically handles creation and placement of a suitable axes as well.

Parameters

cax

[*Axes*] The *Axes* to turn into a colorbar.

mappable

[*ScalarMappable*] The mappable to be described by the colorbar.

****kwargs**

Keyword arguments are passed to the respective colorbar class.

Returns

Colorbar **or** *ColorbarPatch*

The created colorbar instance. *ColorbarPatch* is only used if *mappable* is a *ContourSet* with hatches.

matplotlib.colorbar.**make_axes**(*parents*, *location=None*, *orientation=None*, *fraction=0.15*, *shrink=1.0*, *aspect=20*, ***kw*)

Create an *Axes* suitable for a colorbar.

The axes is placed in the figure of the *parents* axes, by resizing and repositioning *parents*.

Parameters

parents

[*Axes* or list of *Axes*] The Axes to use as parents for placing the colorbar.

location

[None or {'left', 'right', 'top', 'bottom'}] The position, relative to *parents*, where the colorbar axes should be created. If None, the value will either come from the given `orientation`, else it will default to 'right'.

orientation

[None or {'vertical', 'horizontal'}] The orientation of the colorbar. Typically, this keyword shouldn't be used, as it can be derived from the `location` keyword.

fraction

[float, default: 0.15] Fraction of original axes to use for colorbar.

shrink

[float, default: 1.0] Fraction by which to multiply the size of the colorbar.

aspect

[float, default: 20] Ratio of long to short dimensions.

Returns

cax

[*Axes*] The child axes.

kw

[dict] The reduced keyword dictionary to be passed when creating the colorbar instance.

Other Parameters

pad

[float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

anchor

[(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

panchor

[(float, float), or *False*, optional] The anchor point of the colorbar parent axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

matplotlib.colorbar.**make_axes_gridspec**(*parent*, ***, *fraction=0.15*, *shrink=1.0*, *aspect=20*, ***kw*)

Create a *SubplotBase* suitable for a colorbar.

The axes is placed in the figure of the *parent* axes, by resizing and repositioning *parent*.

This function is similar to *make_axes*. Primary differences are

- *make_axes_gridspec* only handles the *orientation* keyword and cannot handle the *location* keyword.
- *make_axes_gridspec* should only be used with a *SubplotBase* parent.
- *make_axes* creates an *Axes*; *make_axes_gridspec* creates a *SubplotBase*.
- *make_axes* updates the position of the parent. *make_axes_gridspec* replaces the `grid_spec` attribute of the parent with a new one.

While this function is meant to be compatible with *make_axes*, there could be some minor differences.

Parameters

parent

[*Axes*] The Axes to use as parent for placing the colorbar.

fraction

[float, default: 0.15] Fraction of original axes to use for colorbar.

shrink

[float, default: 1.0] Fraction by which to multiply the size of the colorbar.

aspect

[float, default: 20] Ratio of long to short dimensions.

Returns

cax

[*SubplotBase*] The child axes.

kw

[dict] The reduced keyword dictionary to be passed when creating the colorbar instance.

Other Parameters

orientation

[{'vertical', 'horizontal'}, default: 'vertical'] The orientation of the colorbar.

pad

[float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

anchor

[(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

panchor

[(float, float), or *False*, optional] The anchor point of the colorbar parent axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

18.18 matplotlib.colors

The Color *tutorials* and examples demonstrate how to set colors and colormaps.

A module for converting numbers or color arguments to *RGB* or *RGBA*.

RGB and *RGBA* are sequences of, respectively, 3 or 4 floats in the range 0-1.

This module includes functions and classes for color specification conversions, and for mapping numbers to colors in a 1-D array of colors called a colormap.

Mapping data onto colors using a colormap typically involves two steps: a data array is first mapped onto the range 0-1 using a subclass of *Normalize*, then this number is mapped to a color using a subclass of *Colormap*. Two sublasses of *Colormap* provided here: *LinearSegmentedColormap*, which uses piecewise-linear interpolation to define colormaps, and *ListedColormap*, which makes a colormap from a list of colors.

See also:

Creating Colormaps in Matplotlib for examples of how to make colormaps and

Choosing Colormaps in Matplotlib for a list of built-in colormaps.

Colormap Normalization for more details about data normalization

More colormaps are available at palettable.

The module also provides functions for checking whether an object can be interpreted as a color (*is_color_like*), for converting such an object to an RGBA tuple (*to_rgba*) or to an HTML-like hex string in the "#rrggbb" format (*to_hex*), and a sequence of colors to an (n, 4) RGBA array (*to_rgba_array*). Caching is used for efficiency.

Matplotlib recognizes the following formats to specify a color:

- an RGB or RGBA (red, green, blue, alpha) tuple of float values in closed interval `[0, 1]` (e.g., `(0.1, 0.2, 0.5)` or `(0.1, 0.2, 0.5, 0.3)`);
- a hex RGB or RGBA string (e.g., `'#0f0f0f'` or `'#0f0f0f80'`; case-insensitive);
- a shorthand hex RGB or RGBA string, equivalent to the hex RGB or RGBA string obtained by duplicating each character, (e.g., `'#abc'`, equivalent to `'#aabbcc'`, or `'#abcd'`, equivalent to `'#aabbccdd'`; case-insensitive);
- a string representation of a float value in `[0, 1]` inclusive for gray level (e.g., `'0.5'`);
- one of the characters `{'b', 'g', 'r', 'c', 'm', 'y', 'k', 'w'}`, which are shorthand notations for shades of blue, green, red, cyan, magenta, yellow, black, and white. Note that the colors `'g', 'c', 'm', 'y'` do not coincide with the X11/CSS4 colors. Their particular shades were chosen for better visibility of colored lines against typical backgrounds.
- a X11/CSS4 color name (case-insensitive);
- a name from the xkcd color survey, prefixed with `'xkcd:'` (e.g., `'xkcd:sky blue'`; case insensitive);
- one of the Tableau Colors from the 'T10' categorical palette (the default color cycle): `{'tab:blue', 'tab:orange', 'tab:green', 'tab:red', 'tab:purple', 'tab:brown', 'tab:pink', 'tab:gray', 'tab:olive', 'tab:cyan'}` (case-insensitive);
- a "CN" color spec, i.e. 'C' followed by a number, which is an index into the default property cycle (`rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd',`

`'#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf']))`); the indexing is intended to occur at rendering time, and defaults to black if the cycle does not include color.

18.18.1 Classes

BoundaryNorm(boundaries, ncolors[, clip, extend])	Generate a colormap index based on discrete intervals.
Colormap(name[, N])	Baseclass for all scalar to RGBA mappings.
DivergingNorm(**kwargs)	[*Deprecated*]
LightSource([azdeg, altdeg, hsv_min_val, ...])	Create a light source coming from the specified azimuth and elevation.
LinearSegmentedColormap(name, segmentdata[, ...])	Colormap objects based on lookup tables using linear segments.
ListedColormap(colors[, name, N])	Colormap object generated from a list of colors.
LogNorm([vmin, vmax, clip])	Normalize a given value to the 0-1 range on a log scale.
NoNorm([vmin, vmax, clip])	Dummy replacement for *Normalize*, for the case where we want to use indices directly in a *ScalarMappable*.
Normalize([vmin, vmax, clip])	A class which, when called, linearly normalizes data into the `[0.0, 1.0]` interval.
PowerNorm(gamma[, vmin, vmax, clip])	Linearly map a given value to the 0-1 range and then apply a power-law normalization over that range.
SymLogNorm(linthresh[, linscale, vmin, ...])	The symmetrical logarithmic scale is logarithmic in both the positive and negative directions from the origin.
TwoSlopeNorm(vcenter[, vmin, vmax])	Normalize data with a set center.

matplotlib.colors.BoundaryNorm

class matplotlib.colors.**BoundaryNorm**(*boundaries*, *ncolors*, *clip=False*, ***, *extend='neither'*)

Bases: *matplotlib.colors.Normalize*

Generate a colormap index based on discrete intervals.

Unlike *Normalize* or *LogNorm*, *BoundaryNorm* maps values to integers instead of to the interval 0-1.

Mapping to the 0-1 interval could have been done via piece-wise linear interpolation, but using integers seems simpler, and reduces the number of conversions back and forth between integer and floating point.

Parameters

boundaries

[array-like] Monotonically increasing sequence of boundaries

ncolors

[int] Number of colors in the colormap to be used

clip

[bool, optional] If clip is `True`, out of range values are mapped to 0 if they are below `boundaries[0]` or mapped to `ncolors - 1` if they are above `boundaries[-1]`.

If clip is `False`, out of range values are mapped to -1 if they are below `boundaries[0]` or mapped to *ncolors* if they are above `boundaries[-1]`. These are then converted to valid indices by *Colormap.__call__*.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Extend the number of bins to include one or both of the regions beyond the boundaries. For example, if `extend` is 'min', then the color to which the region between the first pair of boundaries is mapped will be distinct from the first color in the colormap, and by default a *Colorbar* will be drawn with the triangle extension on the left or lower end.

Returns

int16 scalar or array

Notes

boundaries defines the edges of bins, and data falling within a bin is mapped to the color with the same index.

If the number of bins, including any extensions, is less than *ncolors*, the color index is chosen by linear interpolation, mapping the `[0, nbins - 1]` range onto the `[0, ncolors - 1]` range.

`__call__`(*self*, *value*, *clip=None*)

Normalize *value* data in the `[vmin, vmax]` interval into the `[0.0, 1.0]` interval and return it.

Parameters

value

Data to normalize.

clip

[bool] If `None`, defaults to `self.clip` (which defaults to `False`).

Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

`__init__`(*self*, *boundaries*, *ncolors*, *clip=False*, *, *extend='neither'*)

Parameters

boundaries

[array-like] Monotonically increasing sequence of boundaries

ncolors

[int] Number of colors in the colormap to be used

clip

[bool, optional] If clip is `True`, out of range values are mapped to 0 if they are below `boundaries[0]` or mapped to `ncolors - 1` if they are above `boundaries[-1]`.

If clip is `False`, out of range values are mapped to -1 if they are below `boundaries[0]` or mapped to *ncolors* if they are above `boundaries[-1]`. These are then converted to valid indices by *Colormap.__call__*.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Extend the number of bins to include one or both of the regions beyond the boundaries. For example, if `extend` is 'min', then the color to which the region between the first pair of boundaries is mapped will be distinct from the first color in the colormap, and by default a *Colorbar* will be drawn with the triangle extension on the left or lower end.

Returns

int16 scalar or array

Notes

boundaries defines the edges of bins, and data falling within a bin is mapped to the color with the same index.

If the number of bins, including any extensions, is less than *ncolors*, the color index is chosen by linear interpolation, mapping the `[0, nbins - 1]` range onto the `[0, ncolors - 1]` range.

`__module__ = 'matplotlib.colors'`

`__slotnames__ = []`

`inverse`(*self*, *value*)

Raises

ValueError

BoundaryNorm is not invertible, so calling this method will always raise an error

Examples using `matplotlib.colors.BoundaryNorm`

- sphx_glr_gallery_lines_bars_and_markers_multicolored_line.py
- sphx_glr_gallery_images_contours_and_fields_image_annotated_heatmap.py
- sphx_glr_gallery_images_contours_and_fields_image_masked.py

- sphx_glr_gallery_userdemo_colormap_normalizations.py
- *Customized Colorbars Tutorial*
- *Colormap Normalization*

matplotlib.colors.Colormap

`class matplotlib.colors.Colormap`(*name*, *N=256*)

Bases: `object`

Baseclass for all scalar to RGBA mappings.

Typically, Colormap instances are used to convert data values (floats) from the interval `[0, 1]` to the RGBA color that the respective Colormap represents. For scaling of data into the `[0, 1]` interval see *matplotlib.colors.Normalize*. Subclasses of *matplotlib.cm.ScalarMappable* make heavy use of this `data -> normalize -> map-to-color` processing chain.

Parameters

name

[str] The name of the colormap.

N

[int] The number of rgb quantization levels.

`__call__`(*self*, *X*, *alpha=None*, *bytes=False*)

Parameters

X

[float or int, ndarray or scalar] The data value(s) to convert to RGBA. For floats, X should be in the interval `[0.0, 1.0]` to return the RGBA values `X*100` percent along the Colormap line. For integers, X should be in the interval `[0, Colormap.N)` to return RGBA values *indexed* from the Colormap with index `X`.

alpha

[float, None] Alpha must be a scalar between 0 and 1, or None.

bytes

[bool] If False (default), the returned RGBA values will be floats in the interval `[0, 1]` otherwise they will be uint8s in the interval `[0, 255]`.

Returns

Tuple of RGBA values if X is scalar, otherwise an array of RGBA values with a shape of `X.shape + (4, )`.

`__copy__`(*self*)

`__dict__ = mappingproxy({'__module__': 'matplotlib.colors', '__doc__': '\n Baseclass for`

`__init__`(*self*, *name*, *N=256*)

Parameters

name

[str] The name of the colormap.

N

[int] The number of rgb quantization levels.

`__module__ = 'matplotlib.colors'`

`__weakref__`
list of weak references to the object (if defined)

`colorbar_extend`
When this colormap exists on a scalar mappable and colorbar_extend is not False, colorbar creation will pick up `colorbar_extend` as the default value for the `extend` keyword in the *matplotlib.colorbar.Colorbar* constructor.

`is_gray`(*self*)

`reversed`(*self*, *name=None*)
Return a reversed instance of the Colormap.

Note: This function is not implemented for base class.

Parameters

name

[str, optional] The name for the reversed colormap. If it's None the name will be the name of the parent colormap + "_r".

See also:

LinearSegmentedColormap.reversed

ListedColormap.reversed

`set_bad`(*self*, *color='k'*, *alpha=None*)
Set the color for masked values.

`set_over`(*self*, *color='k'*, *alpha=None*)
Set the color for high out-of-range values when `norm.clip = False`.

`set_under`(*self*, *color='k'*, *alpha=None*)
Set the color for low out-of-range values when `norm.clip = False`.

Examples using `matplotlib.colors.Colormap`

- sphx_glr_gallery_lines_bars_and_markers_multicolored_line.py
- sphx_glr_gallery_images_contours_and_fields_contourf_demo.py
- sphx_glr_gallery_color_custom_cmap.py

- *Customized Colorbars Tutorial*
- *Creating Colormaps in Matplotlib*

matplotlib.colors.DivergingNorm

class matplotlib.colors.DivergingNorm(**kwargs)

Bases: *matplotlib.colors.TwoSlopeNorm*

[*Deprecated*]

Notes

Deprecated since version 3.2:

Normalize data with a set center.

Useful when mapping data with an unequal rates of change around a conceptual center, e.g., data that range from -2 to 4, with 0 as the midpoint.

Parameters

vcenter

[float] The data value that defines `0.5` in the normalization.

vmin

[float, optional] The data value that defines `0.0` in the normalization. Defaults to the min value of the dataset.

vmax

[float, optional] The data value that defines `1.0` in the normalization. Defaults to the the max value of the dataset.

Examples

This maps data value -4000 to 0., 0 to 0.5, and +10000 to 1.0; data between is linearly interpolated:

```
>>> import matplotlib.colors as mcolors
>>> offset = mcolors.TwoSlopeNorm(vmin=-4000.,
                                  vcenter=0., vmax=10000)
>>> data = [-4000., -2000., 0., 2500., 5000., 7500., 10000.]
>>> offset(data)
array([0., 0.25, 0.5, 0.625, 0.75, 0.875, 1.0])
```

__init__(*self*, *vcenter*, *vmin=None*, *vmax=None*)

Normalize data with a set center.

Useful when mapping data with an unequal rates of change around a conceptual center, e.g., data that range from -2 to 4, with 0 as the midpoint.

Parameters

vcenter

[float] The data value that defines `0.5` in the normalization.

vmin

[float, optional] The data value that defines `0.0` in the normalization. Defaults to the min value of the dataset.

vmax

[float, optional] The data value that defines `1.0` in the normalization. Defaults to the the max value of the dataset.

Examples

This maps data value -4000 to 0., 0 to 0.5, and +10000 to 1.0; data between is linearly interpolated:

```
>>> import matplotlib.colors as mcolors
>>> offset = mcolors.TwoSlopeNorm(vmin=-4000.,
                                  vcenter=0., vmax=10000)
>>> data = [-4000., -2000., 0., 2500., 5000., 7500., 10000.]
>>> offset(data)
array([0., 0.25, 0.5, 0.625, 0.75, 0.875, 1.0])
```

__module__ = 'matplotlib.colors'

Examples using `matplotlib.colors.DivergingNorm`

matplotlib.colors.LightSource

class matplotlib.colors.**LightSource**(*azdeg=315*, *altdeg=45*, *hsv_min_val=0*, *hsv_max_val=1*, *hsv_min_sat=1*, *hsv_max_sat=0*)

Bases: `object`

Create a light source coming from the specified azimuth and elevation. Angles are in degrees, with the azimuth measured clockwise from north and elevation up from the zero plane of the surface.

shade is used to produce "shaded" rgb values for a data array. *shade_rgb* can be used to combine an rgb image with an elevation map. *hillshade* produces an illumination map of a surface.

Specify the azimuth (measured clockwise from south) and altitude (measured up from the plane of the surface) of the light source in degrees.

Parameters

azdeg

[float, default: 315 degrees (from the northwest)] The azimuth (0-360, degrees clockwise from North) of the light source.

altdeg

[float, default: 45 degrees] The altitude (0-90, degrees up from horizontal) of the light source.

Notes

For backwards compatibility, the parameters *hsv_min_val*, *hsv_max_val*, *hsv_min_sat*, and *hsv_max_sat* may be supplied at initialization as well. However, these parameters will only be used if "blend_mode='hsv'" is passed into *shade* or *shade_rgb*. See the documentation for *blend_hsv* for more details.

`__dict__ = mappingproxy({'__module__': 'matplotlib.colors', '__doc__': '\n Create a light`

`__init__`(*self*, *azdeg=315*, *altdeg=45*, *hsv_min_val=0*, *hsv_max_val=1*, *hsv_min_sat=1*, *hsv_max_sat=0*)

Specify the azimuth (measured clockwise from south) and altitude (measured up from the plane of the surface) of the light source in degrees.

Parameters

azdeg

[float, default: 315 degrees (from the northwest)] The azimuth (0-360, degrees clockwise from North) of the light source.

altdeg

[float, default: 45 degrees] The altitude (0-90, degrees up from horizontal) of the light source.

Notes

For backwards compatibility, the parameters *hsv_min_val*, *hsv_max_val*, *hsv_min_sat*, and *hsv_max_sat* may be supplied at initialization as well. However, these parameters will only be used if "blend_mode='hsv'" is passed into *shade* or *shade_rgb*. See the documentation for *blend_hsv* for more details.

`__module__ = 'matplotlib.colors'`

`__weakref__`

list of weak references to the object (if defined)

`blend_hsv`(*self*, *rgb*, *intensity*, *hsv_max_sat=None*, *hsv_max_val=None*, *hsv_min_val=None*, *hsv_min_sat=None*)

Take the input data array, convert to HSV values in the given colormap, then adjust those color values to give the impression of a shaded relief map with

a specified light source. RGBA values are returned, which can then be used to plot the shaded image with imshow.

The color of the resulting image will be darkened by moving the (s, v) values (in hsv colorspace) toward (hsv_min_sat, hsv_min_val) in the shaded regions, or lightened by sliding (s, v) toward (hsv_max_sat, hsv_max_val) in regions that are illuminated. The default extremes are chose so that completely shaded points are nearly black (s = 1, v = 0) and completely illuminated points are nearly white (s = 0, v = 1).

Parameters

rgb

[ndarray] An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

intensity

[ndarray] An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

hsv_max_sat

[number, default: 1] The maximum saturation value that the *intensity* map can shift the output image to.

hsv_min_sat

[number, optional] The minimum saturation value that the *intensity* map can shift the output image to. Defaults to 0.

hsv_max_val

[number, optional] The maximum value ("v" in "hsv") that the *intensity* map can shift the output image to. Defaults to 1.

hsv_min_val

[number, optional] The minimum value ("v" in "hsv") that the *intensity* map can shift the output image to. Defaults to 0.

Returns

ndarray

An MxNx3 RGB array representing the combined images.

`blend_overlay`(*self*, *rgb*, *intensity*)

Combines an rgb image with an intensity map using "overlay" blending.

Parameters

rgb

[ndarray] An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

intensity

[ndarray] An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

Returns

ndarray

An MxNx3 RGB array representing the combined images.

`blend_soft_light`(*self*, *rgb*, *intensity*)

Combine an rgb image with an intensity map using "soft light" blending, using the "pegtop" formula.

Parameters

rgb

[ndarray] An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

intensity

[ndarray] An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

Returns

ndarray

An MxNx3 RGB array representing the combined images.

`property direction`

The unit vector direction towards the light source.

`hillshade`(*self*, *elevation*, *vert_exag=1*, *dx=1*, *dy=1*, *fraction=1.0*)

Calculate the illumination intensity for a surface using the defined azimuth and elevation for the light source.

This computes the normal vectors for the surface, and then passes them on to *shade_normals*

Parameters

elevation

[array-like] A 2d array (or equivalent) of the height values used to generate an illumination map

vert_exag

[number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs. meters) or to exaggerate or de-emphasize topographic effects.

dx

[number, optional] The x-spacing (columns) of the input *elevation* grid.

dy

[number, optional] The y-spacing (rows) of the input *elevation* grid.

fraction

[number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

Returns

ndarray

A 2d array of illumination values between 0-1, where 0 is completely in shadow and 1 is completely illuminated.

`shade`(*self*, *data*, *cmap*, *norm=None*, *blend_mode='overlay'*, *vmin=None*, *vmax=None*, *vert_exag=1*, *dx=1*, *dy=1*, *fraction=1*, ***kwargs*)

Combine colormapped data values with an illumination intensity map (a.k.a. "hillshade") of the values.

Parameters

data

[array-like] A 2d array (or equivalent) of the height values used to generate a shaded map.

cmap

[*Colormap*] The colormap used to color the *data* array. Note that this must be a *Colormap* instance. For example, rather than passing in `cmap='gist_earth'`, use `cmap=plt.get_cmap('gist_earth')` instead.

norm

[*Normalize* instance, optional] The normalization used to scale values before colormapping. If None, the input will be linearly scaled between its min and max.

blend_mode

[{'hsv', 'overlay', 'soft'} or callable, optional] The type of blending used to combine the colormapped data values with the illumination intensity. Default is "overlay". Note that for most topographic surfaces, "overlay" or "soft" appear more visually realistic. If a user-defined function is supplied, it is expected to combine an MxNx3 RGB array of floats (ranging 0 to 1) with an MxNx1 hillshade array (also 0 to 1). (Call signature `func(rgb, illum, **kwargs)`) Additional kwargs supplied to this function will be passed on to the *blend_mode* function.

vmin

[float or None, optional] The minimum value used in colormapping *data*. If *None* the minimum value in *data* is used. If *norm* is specified, then this argument will be ignored.

vmax

[float or None, optional] The maximum value used in colormapping *data*. If *None* the maximum value in *data* is used. If *norm* is specified, then this argument will be ignored.

vert_exag

[number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs. meters) or to exaggerate or de-emphasize topography.

dx

[number, optional] The x-spacing (columns) of the input *elevation* grid.

dy

[number, optional] The y-spacing (rows) of the input *elevation* grid.

fraction

[number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

Additional kwargs are passed on to the *blend_mode* function.

Returns

ndarray

An MxNx4 array of floats ranging between 0-1.

`shade_normals`(*self*, *normals*, *fraction=1.0*)

Calculate the illumination intensity for the normal vectors of a surface using the defined azimuth and elevation for the light source.

Imagine an artificial sun placed at infinity in some azimuth and elevation position illuminating our surface. The parts of the surface that slope toward the sun should brighten while those sides facing away should become darker.

Parameters

fraction

[number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

Returns

ndarray

A 2d array of illumination values between 0-1, where 0 is completely in shadow and 1 is completely illuminated.

`shade_rgb`(*self*, *rgb*, *elevation*, *fraction=1.0*, *blend_mode='hsv'*, *vert_exag=1*, *dx=1*, *dy=1*, ***kwargs*)

Use this light source to adjust the colors of the *rgb* input array to give the impression of a shaded relief map with the given *elevation*.

Parameters

rgb

[array-like] An (M, N, 3) RGB array, assumed to be in the range of 0 to 1.

elevation

[array-like] An (M, N) array of the height values used to generate a shaded map.

fraction

[number] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

blend_mode

[{'hsv', 'overlay', 'soft'} or callable, optional] The type of blending used to combine the colormapped data values with the illumination intensity. For backwards compatibility, this defaults to "hsv". Note that for most topographic surfaces, "overlay" or "soft" appear more visually realistic. If a user-defined function is supplied, it is expected to combine an MxNx3 RGB array of floats (ranging 0 to 1) with an MxNx1 hillshade array (also 0 to 1). (Call signature `func(rgb, illum, **kwargs)`) Additional kwargs supplied to this function will be passed on to the *blend_mode* function.

vert_exag

[number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs. meters) or to exaggerate or de-emphasize topography.

dx

[number, optional] The x-spacing (columns) of the input *elevation* grid.

dy

[number, optional] The y-spacing (rows) of the input *elevation* grid.

Additional kwargs are passed on to the *blend_mode* function.

Returns

ndarray

An (m, n, 3) array of floats ranging between 0-1.

matplotlib.colors.LinearSegmentedColormap

class matplotlib.colors.**LinearSegmentedColormap**(*name*, *segmentdata*, *N=256*, *gamma=1.0*)

Bases: *matplotlib.colors.Colormap*

Colormap objects based on lookup tables using linear segments.

The lookup table is generated using linear interpolation for each primary color, with the 0-1 domain divided into any number of segments.

Create color map from linear mapping segments

segmentdata argument is a dictionary with a red, green and blue entries. Each entry should be a list of *x*, *y0*, *y1* tuples, forming rows in a table. Entries for alpha are optional.

Example: suppose you want red to increase from 0 to 1 over the bottom half, green to do the same over the middle half, and blue over the top half. Then you would use:

```
cdict = {'red':   [(0.0,  0.0, 0.0),
                   (0.5,  1.0, 1.0),
                   (1.0,  1.0, 1.0)],

         'green': [(0.0,  0.0, 0.0),
                   (0.25, 0.0, 0.0),
                   (0.75, 1.0, 1.0),
                   (1.0,  1.0, 1.0)],

         'blue':  [(0.0,  0.0, 0.0),
                   (0.5,  0.0, 0.0),
                   (1.0,  1.0, 1.0)]}
```

Each row in the table for a given color is a sequence of *x*, *y0*, *y1* tuples. In each sequence, *x* must increase monotonically from 0 to 1. For any input value *z* falling between *x[i]* and *x[i+1]*, the output value of a given color will be linearly interpolated between *y1[i]* and *y0[i+1]*:

```
row i:   x  y0  y1
               /
              /
row i+1: x  y0  y1
```

Hence y0 in the first row and y1 in the last row are never used.

See also:

LinearSegmentedColormap.from_list

Static method; factory function for generating a smoothly-varying LinearSegmentedColormap.

makeMappingArray

For information about making a mapping array.

`__init__`(*self*, *name*, *segmentdata*, *N=256*, *gamma=1.0*)
Create color map from linear mapping segments

segmentdata argument is a dictionary with a red, green and blue entries. Each entry should be a list of *x*, *y0*, *y1* tuples, forming rows in a table. Entries for alpha are optional.

Example: suppose you want red to increase from 0 to 1 over the bottom half, green to do the same over the middle half, and blue over the top half. Then you would use:

```
cdict = {'red':   [(0.0,  0.0, 0.0),
                   (0.5,  1.0, 1.0),
                   (1.0,  1.0, 1.0)],

         'green': [(0.0,  0.0, 0.0),
                   (0.25, 0.0, 0.0),
                   (0.75, 1.0, 1.0),
                   (1.0,  1.0, 1.0)],

         'blue':  [(0.0,  0.0, 0.0),
                   (0.5,  0.0, 0.0),
                   (1.0,  1.0, 1.0)]}
```

Each row in the table for a given color is a sequence of *x*, *y0*, *y1* tuples. In each sequence, *x* must increase monotonically from 0 to 1. For any input value *z* falling between *x[i]* and *x[i+1]*, the output value of a given color will be linearly interpolated between *y1[i]* and *y0[i+1]*:

```
row i:   x  y0  y1
               /
              /
row i+1: x  y0  y1
```

Hence y0 in the first row and y1 in the last row are never used.

See also:

LinearSegmentedColormap.from_list

Static method; factory function for generating a smoothly-varying LinearSegmentedColormap.

makeMappingArray

For information about making a mapping array.

```
__module__ = 'matplotlib.colors'
```

`static from_list`(*name*, *colors*, *N=256*, *gamma=1.0*)

Create a *LinearSegmentedColormap* from a list of colors.

Parameters

name

[str] The name of the colormap.

colors

[array-like of colors or array-like of (value, color)] If only colors are given, they are equidistantly mapped from the range $[0, 1]$; i.e. 0 maps to `colors[0]` and 1 maps to `colors[-1]`. If (value, color) pairs are given, the mapping is from *value* to *color*. This can be used to divide the range unevenly.

N

[int] The number of rgb quantization levels.

gamma

[float]

`reversed`(*self*, *name=None*)

Return a reversed instance of the Colormap.

Parameters

name

[str, optional] The name for the reversed colormap. If it's None the name will be the name of the parent colormap + "_r".

Returns

LinearSegmentedColormap

The reversed colormap.

`set_gamma`(*self*, *gamma*)
Set a new gamma value and regenerate color map.

matplotlib.colors.ListedColormap

class matplotlib.colors.**ListedColormap**(*colors*, *name='from_list'*, *N=None*)

Bases: *matplotlib.colors.Colormap*

Colormap object generated from a list of colors.

This may be most useful when indexing directly into a colormap, but it can also be used to generate special colormaps for ordinary mapping.

Parameters

colors

[list, array] List of Matplotlib color specifications, or an equivalent Nx3 or Nx4 floating point array (*N* rgb or rgba values).

name

[str, optional] String to identify the colormap.

N

[int, optional] Number of entries in the map. The default is *None*, in which case there is one colormap entry for each element in the list of colors. If

```
N < len(colors)
```

the list will be truncated at *N*. If

```
N > len(colors)
```

the list will be extended by repetition.

Parameters

name

[str] The name of the colormap.

N

[int] The number of rgb quantization levels.

`__init__`(*self*, *colors*, *name='from_list'*, *N=None*)

Parameters

name

[str] The name of the colormap.

N

[int] The number of rgb quantization levels.

`__module__ = 'matplotlib.colors'`

`reversed`(*self*, *name=None*)

Return a reversed instance of the Colormap.

Parameters

name

[str, optional] The name for the reversed colormap. If it's None the name will be the name of the parent colormap + "_r".

Returns

ListedColormap

A reversed instance of the colormap.

Examples using `matplotlib.colors.ListedColormap`

- sphx_glr_gallery_lines_bars_and_markers_multicolored_line.py

matplotlib.colors.LogNorm

`class matplotlib.colors.LogNorm(vmin=None, vmax=None, clip=False)`

Bases: *matplotlib.colors.Normalize*

Normalize a given value to the 0-1 range on a log scale.

Parameters

vmin, vmax

[float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

clip

[bool, default: False] If `True` values falling outside the range `[vmin, vmax]`, are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If `False` masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is `clip=False`.

Notes

Returns 0 if `vmin == vmax`.

`__call__`(*self*, *value*, *clip=None*)
Normalize *value* data in the `[vmin, vmax]` interval into the `[0.0, 1.0]` interval and return it.

Parameters

value

Data to normalize.

clip

[bool] If `None`, defaults to `self.clip` (which defaults to `False`).

Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

`__module__ = 'matplotlib.colors'`

`__slotnames__ = []`

`autoscale`(*self*, *A*)
Set *vmin*, *vmax* to min, max of *A*.

`autoscale_None`(*self*, *A*)
If vmin or vmax are not set, use the min/max of *A* to set them.

`inverse`(*self*, *value*)

Examples using `matplotlib.colors.LogNorm`

- sphx_glr_gallery_images_contours_and_fields_pcolor_demo.py
- sphx_glr_gallery_statistics_hist.py
- sphx_glr_gallery_userdemo_colormap_normalizations.py
- *Colormap Normalization*

matplotlib.colors.NoNorm

class matplotlib.colors.**NoNorm**(*vmin=None*, *vmax=None*, *clip=False*)

Bases: *matplotlib.colors.Normalize*

Dummy replacement for *Normalize*, for the case where we want to use indices directly in a *ScalarMappable*.

Parameters

vmin, vmax

[float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

clip

[bool, default: False] If `True` values falling outside the range `[vmin, vmax]`, are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If `False` masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is `clip=False`.

Notes

Returns 0 if `vmin == vmax`.

`__call__`(*self*, *value*, *clip=None*)

Normalize *value* data in the `[vmin, vmax]` interval into the `[0.0, 1.0]` interval and return it.

Parameters

value

Data to normalize.

clip

[bool] If `None`, defaults to `self.clip` (which defaults to `False`).

Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

`__module__ = 'matplotlib.colors'`

`__slotnames__ = []`

`inverse`(*self*, *value*)

Examples using `matplotlib.colors.NoNorm`

matplotlib.colors.Normalize

`class matplotlib.colors.Normalize`(*vmin=None*, *vmax=None*, *clip=False*)

Bases: `object`

A class which, when called, linearly normalizes data into the `[0.0, 1.0]` interval.

Parameters

vmin, vmax

[float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

clip

[bool, default: False] If `True` values falling outside the range `[vmin, vmax]`, are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If `False` masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is `clip=False`.

Notes

Returns 0 if `vmin == vmax`.

`__call__`(*self*, *value*, *clip=None*)

Normalize *value* data in the `[vmin, vmax]` interval into the `[0.0, 1.0]` interval and return it.

Parameters

value

Data to normalize.

clip

[bool] If `None`, defaults to `self.clip` (which defaults to `False`).

Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

`__dict__ = mappingproxy({'__module__': 'matplotlib.colors', '__doc__': '\n A class which,`

`__init__`(*self*, *vmin=None*, *vmax=None*, *clip=False*)

Parameters

vmin, vmax

[float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

clip

[bool, default: False] If `True` values falling outside the range `[vmin, vmax]`, are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If `False` masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is `clip=False`.

Notes

Returns 0 if `vmin == vmax`.

`__module__ = 'matplotlib.colors'`

`__slotnames__ = []`

`__weakref__`
list of weak references to the object (if defined)

`autoscale`(*self*, *A*)
Set *vmin*, *vmax* to min, max of *A*.

`autoscale_None`(*self*, *A*)
If vmin or vmax are not set, use the min/max of *A* to set them.

`inverse`(*self*, *value*)

`static process_value`(*value*)

Homogenize the input *value* for easy and efficient normalization.

value can be a scalar or sequence.

Returns

result

[masked array] Masked array with the same shape as *value*.

is_scalar

[bool] Whether *value* is a scalar.

Notes

Float dtypes are preserved; integer types with two bytes or smaller are converted to np.float32, and larger types are converted to np.float64. Preserving float32 when possible, and using in-place operations, greatly improves speed for large arrays.

`scaled`(*self*)

Return whether vmin and vmax are set.

matplotlib.colors.PowerNorm

class matplotlib.colors.**PowerNorm**(*gamma*, *vmin=None*, *vmax=None*, *clip=False*)

Bases: *matplotlib.colors.Normalize*

Linearly map a given value to the 0-1 range and then apply a power-law normalization over that range.

Parameters

vmin, vmax

[float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

clip

[bool, default: False] If `True` values falling outside the range `[vmin, vmax]`, are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If `False` masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is `clip=False`.

Notes

Returns 0 if `vmin == vmax`.

`__call__`(*self*, *value*, *clip=None*)

Normalize *value* data in the `[vmin, vmax]` interval into the `[0.0, 1.0]` interval and return it.

Parameters

value

Data to normalize.

clip

[bool] If `None`, defaults to `self.clip` (which defaults to `False`).

Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

`__init__`(*self*, *gamma*, *vmin=None*, *vmax=None*, *clip=False*)

Parameters

vmin, vmax

[float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

clip

[bool, default: False] If `True` values falling outside the range `[vmin, vmax]`, are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If `False` masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is `clip=False`.

Notes

Returns 0 if `vmin == vmax`.

`__module__ = 'matplotlib.colors'`

`__slotnames__ = []`

`inverse`(*self*, *value*)

Examples using `matplotlib.colors.PowerNorm`

- sphx_glr_gallery_showcase_mandelbrot.py
- sphx_glr_gallery_scales_power_norm.py
- sphx_glr_gallery_userdemo_colormap_normalizations.py
- *Colormap Normalization*

matplotlib.colors.SymLogNorm

class matplotlib.colors.**SymLogNorm**(*linthresh*, *linscale=1.0*, *vmin=None*, *vmax=None*, *clip=False*, *, *base=None*)

Bases: *matplotlib.colors.Normalize*

The symmetrical logarithmic scale is logarithmic in both the positive and negative directions from the origin.

Since the values close to zero tend toward infinity, there is a need to have a range around zero that is linear. The parameter *linthresh* allows the user to specify the size of this range (*-linthresh*, *linthresh*).

Parameters

linthresh

[float] The range within which the plot is linear (to avoid having the plot go to infinity around zero).

linscale

[float, default: 1] This allows the linear range (*-linthresh* to *linthresh*) to be stretched relative to the logarithmic range. Its value is the number of powers of *base* to use for each half of the linear range.

For example, when *linscale* == 1.0 (the default) and `base=10`, then space used for the positive and negative halves of the linear range will be equal to a decade in the logarithmic.

base

[float, default: None] If not given, defaults to `np.e` (consistent with prior behavior) and warns.

In v3.3 the default value will change to 10 to be consistent with *SymLogNorm*.

To suppress the warning pass *base* as a keyword argument.

`__call__`(*self*, *value*, *clip=None*)

Normalize *value* data in the `[vmin, vmax]` interval into the `[0.0, 1.0]` interval and return it.

Parameters

value

Data to normalize.

clip

[bool] If `None`, defaults to `self.clip` (which defaults to `False`).

Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

`__init__`(*self*, *linthresh*, *linscale=1.0*, *vmin=None*, *vmax=None*, *clip=False*, **, base=None*)

Parameters

linthresh

[float] The range within which the plot is linear (to avoid having the plot go to infinity around zero).

linscale

[float, default: 1] This allows the linear range (*-linthresh* to *linthresh*) to be stretched relative to the logarithmic range. Its value is the number of powers of *base* to use for each half of the linear range.

For example, when *linscale* == 1.0 (the default) and `base=10`, then space used for the positive and negative halves of the linear range will be equal to a decade in the logarithmic.

base

[float, default: None] If not given, defaults to `np.e` (consistent with prior behavior) and warns.

In v3.3 the default value will change to 10 to be consistent with *SymLogNorm*.

To suppress the warning pass *base* as a keyword argument.

`__module__ = 'matplotlib.colors'`

`__slotnames__ = []`

`autoscale`(*self*, *A*)
Set *vmin*, *vmax* to min, max of *A*.

`autoscale_None`(*self*, *A*)
If vmin or vmax are not set, use the min/max of *A* to set them.

`inverse`(*self*, *value*)

Examples using `matplotlib.colors.SymLogNorm`

- sphx_glr_gallery_userdemo_colormap_normalizations.py
- sphx_glr_gallery_userdemo_colormap_normalizations_symlognorm.py
- *Colormap Normalization*

matplotlib.colors.TwoSlopeNorm

`class matplotlib.colors.TwoSlopeNorm`(*vcenter*, *vmin=None*, *vmax=None*)
Bases: *matplotlib.colors.Normalize*

Normalize data with a set center.

Useful when mapping data with an unequal rates of change around a conceptual center, e.g., data that range from -2 to 4, with 0 as the midpoint.

Parameters

vcenter

[float] The data value that defines `0.5` in the normalization.

vmin

[float, optional] The data value that defines `0.0` in the normalization. Defaults to the min value of the dataset.

vmax

[float, optional] The data value that defines `1.0` in the normalization. Defaults to the the max value of the dataset.

Examples

This maps data value -4000 to 0., 0 to 0.5, and +10000 to 1.0; data between is linearly interpolated:

```
>>> import matplotlib.colors as mcolors
>>> offset = mcolors.TwoSlopeNorm(vmin=-4000.,
                                  vcenter=0., vmax=10000)
>>> data = [-4000., -2000., 0., 2500., 5000., 7500., 10000.]
>>> offset(data)
array([0., 0.25, 0.5, 0.625, 0.75, 0.875, 1.0])
```

__call__(*self*, *value*, *clip=None*)
Map value to the interval [0, 1]. The clip argument is unused.

__init__(*self*, *vcenter*, *vmin=None*, *vmax=None*)
Normalize data with a set center.

Useful when mapping data with an unequal rates of change around a conceptual center, e.g., data that range from -2 to 4, with 0 as the midpoint.

Parameters

vcenter

[float] The data value that defines `0.5` in the normalization.

vmin

[float, optional] The data value that defines `0.0` in the normalization. Defaults to the min value of the dataset.

vmax

[float, optional] The data value that defines `1.0` in the normalization. Defaults to the the max value of the dataset.

Examples

This maps data value -4000 to 0., 0 to 0.5, and +10000 to 1.0; data between is linearly interpolated:

```
>>> import matplotlib.colors as mcolors
>>> offset = mcolors.TwoSlopeNorm(vmin=-4000.,
                                  vcenter=0., vmax=10000)
>>> data = [-4000., -2000., 0., 2500., 5000., 7500., 10000.]
>>> offset(data)
array([0., 0.25, 0.5, 0.625, 0.75, 0.875, 1.0])
```

__module__ = 'matplotlib.colors'

__slotnames__ = []

autoscale_None(*self*, *A*)
Get vmin and vmax, and then clip at vcenter

Examples using `matplotlib.colors.TwoSlopeNorm`

- *Colormap Normalization*

18.18.2 Functions

from_levels_and_colors(levels, colors[, extend])	A helper routine to generate a cmap and a norm instance which behave similar to contourf's levels and colors arguments.
hsv_to_rgb(hsv)	Convert hsv values to rgb.
rgb_to_hsv(arr)	Convert float rgb values (in the range [0, 1]), in a numpy array to hsv values.
to_hex(c[, keep_alpha])	Convert *c* to a hex color.
to_rgb(c)	Convert *c* to an RGB color, silently dropping the alpha channel.
to_rgba(c[, alpha])	Convert *c* to an RGBA color.
to_rgba_array(c[, alpha])	Convert *c* to a (n, 4) array of RGBA colors.
is_color_like(c)	Return whether *c* can be interpreted as an RGB(A) color.
same_color(c1, c2)	Return whether the colors *c1* and *c2* are the same.
makeMappingArray(N, data[, gamma])	[*Deprecated*] Create an *N* -element 1-d lookup table.
get_named_colors_mapping()	Return the global mapping of names to named colors.

matplotlib.colors.from_levels_and_colors

`matplotlib.colors.`**`from_levels_and_colors`**(*levels*, *colors*, *extend='neither'*)

A helper routine to generate a cmap and a norm instance which behave similar to contourf's levels and colors arguments.

Parameters

levels

[sequence of numbers] The quantization levels used to construct the *BoundaryNorm*. Value `v` is quantized to level `i` if `lev[i] <= v < lev[i+1]`.

colors

[sequence of colors] The fill color to use for each level. If *extend* is "neither" there must be `n_level - 1` colors. For an *extend* of

"min" or "max" add one extra color, and for an *extend* of "both" add two colors.

extend

[{'neither', 'min', 'max', 'both'}, optional] The behaviour when a value falls out of range of the given levels. See *contourf* for details.

Returns

cmap

[*Normalize*]

norm

[*Colormap*]

Examples using `matplotlib.colors.from_levels_and_colors`

matplotlib.colors.hsv_to_rgb

`matplotlib.colors.hsv_to_rgb(hsv)`

Convert hsv values to rgb.

Parameters

hsv

[(..., 3) array-like] All values assumed to be in range [0, 1]

Returns

(..., 3) ndarray

Colors converted to RGB values in range [0, 1]

Examples using `matplotlib.colors.hsv_to_rgb`

- sphx_glr_gallery_mplot3d_voxels_torus.py

matplotlib.colors.rgb_to_hsv

matplotlib.colors.**rgb_to_hsv**(*arr*)

Convert float rgb values (in the range [0, 1]), in a numpy array to hsv values.

Parameters

arr

[(..., 3) array-like] All values must be in the range [0, 1]

Returns

(..., 3) ndarray

Colors converted to hsv values in range [0, 1]

Examples using `matplotlib.colors.rgb_to_hsv`

- sphx_glr_gallery_color_named_colors.py

matplotlib.colors.to_hex

matplotlib.colors.**to_hex**(*c*, *keep_alpha=False*)

Convert *c* to a hex color.

Uses the `#rrggbb` format if *keep_alpha* is False (the default), `#rrggbbaa` otherwise.

Examples using `matplotlib.colors.to_hex`

matplotlib.colors.to_rgb

matplotlib.colors.**to_rgb**(*c*)

Convert *c* to an RGB color, silently dropping the alpha channel.

Examples using `matplotlib.colors.to_rgb`

- sphx_glr_gallery_color_named_colors.py

matplotlib.colors.to_rgba

matplotlib.colors.to_rgba(*c*, *alpha=None*)

Convert *c* to an RGBA color.

Parameters

c

[Matplotlib color or `np.ma.masked`]

alpha

[float, optional] If *alpha* is not `None`, it forces the alpha value, except if *c* is `"none"` (case-insensitive), which always maps to `(0, 0, 0, 0)`.

Returns

tuple

Tuple of `(r, g, b, a)` scalars.

Examples using `matplotlib.colors.to_rgba`

- sphx_glr_gallery_color_named_colors.py
- sphx_glr_gallery_shapes_and_collections_collections.py
- sphx_glr_gallery_shapes_and_collections_line_collection.py
- sphx_glr_gallery_event_handling_lasso_demo.py
- sphx_glr_gallery_misc_demo_ribbon_box.py
- sphx_glr_gallery_widgets_menu.py

matplotlib.colors.to_rgba_array

matplotlib.colors.to_rgba_array(*c*, *alpha=None*)

Convert *c* to a (n, 4) array of RGBA colors.

If *alpha* is not `None`, it forces the alpha value. If *c* is `"none"` (case-insensitive) or an empty list, an empty array is returned. If *c* is a masked array, an ndarray is returned with a (0, 0, 0, 0) row for each masked value or row in *c*.

Examples using `matplotlib.colors.to_rgba_array`

matplotlib.colors.is_color_like

`matplotlib.colors.is_color_like(c)`
Return whether *c* can be interpreted as an RGB(A) color.

Examples using `matplotlib.colors.is_color_like`

matplotlib.colors.same_color

`matplotlib.colors.same_color(c1, c2)`
Return whether the colors *c1* and *c2* are the same.

c1, *c2* can be single colors or lists/arrays of colors.

Examples using `matplotlib.colors.same_color`

matplotlib.colors.makeMappingArray

`matplotlib.colors.makeMappingArray(N, data, gamma=1.0)`
[*Deprecated*] Create an *N* -element 1-d lookup table.

This assumes a mapping $f : [0, 1] \to [0, 1]$. The returned data is an array of N values $y = f(x)$ where x is sampled from [0, 1].

By default (*gamma* = 1) x is equidistantly sampled from [0, 1]. The *gamma* correction factor γ distorts this equidistant sampling by $x \to x^\gamma$.

Parameters

N

[int] The number of elements of the created lookup table; at least 1.

data

[Mx3 array-like or callable] Defines the mapping f.

If a Mx3 array-like, the rows define values (x, y0, y1). The x values must start with x=0, end with x=1, and all x values be in increasing order.

A value between x_i and x_{i+1} is mapped to the range $y^1_{i-1} \ldots y^0_i$ by linear interpolation.

For the simple case of a y-continuous mapping, y0 and y1 are identical.

The two values of y are to allow for discontinuous mapping functions. E.g. a sawtooth with a period of 0.2 and an amplitude of 1 would be:

```
[(0, 1, 0), (0.2, 1, 0), (0.4, 1, 0), ..., [(1, 1, 0)]
```

In the special case of `N == 1`, by convention the returned value is y0 for x == 1.

If *data* is a callable, it must accept and return numpy arrays:

```
data(x : ndarray) -> ndarray
```

and map values between 0 - 1 to 0 - 1.

gamma

[float] Gamma correction factor for input distribution x of the mapping.

See also https://en.wikipedia.org/wiki/Gamma_correction.

Returns

array

The lookup table where `lut[x * (N-1)]` gives the closest value for values of x between 0 and 1.

Notes

This function is internally used for *LinearSegmentedColormap*.

Deprecated since version 3.2.

Examples using `matplotlib.colors.makeMappingArray`

matplotlib.colors.get_named_colors_mapping

matplotlib.colors.**get_named_colors_mapping**()

Return the global mapping of names to named colors.

Examples using `matplotlib.colors.get_named_colors_mapping`

18.19 matplotlib.container

class matplotlib.container.**BarContainer**(**args*, ***kwargs*)

Bases: *matplotlib.container.Container*

Container for the artists of bar plots (e.g. created by *Axes.bar*).

The container can be treated as a tuple of the *patches* themselves. Additionally, you can access these and further parameters by the attributes.

Attributes

patches

[list of *Rectangle*] The artists of the bars.

errorbar

[None or *ErrorbarContainer*] A container for the error bar artists if error bars are present. *None* otherwise.

class matplotlib.container.**Container**(**args*, ***kwargs*)

Bases: `tuple`

Base class for containers.

Containers are classes that collect semantically related Artists such as the bars of a bar plot.

add_callback(*self*, *func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

get_children(*self*)

get_label(*self*)
Return the label used for this artist in the legend.

pchanged(*self*)
Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback

remove_callback

remove(*self*)

remove_callback(*self*, *oid*)
Remove a callback based on its observer id.

See also:

add_callback

set_label(*self*, *s*)
Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

class matplotlib.container.**ErrorbarContainer**(**args*, ***kwargs*)
Bases: *matplotlib.container.Container*

Container for the artists of error bars (e.g. created by *Axes.errorbar*).

The container can be treated as the *lines* tuple itself. Additionally, you can access these and further parameters by the attributes.

Attributes

lines

[tuple] Tuple of `(data_line, caplines, barlinecols)`.

- data_line : *Line2D* instance of x, y plot markers and/or line.
- caplines : tuple of *Line2D* instances of the error bar caps.

- barlinecols : list of *LineCollection* with the horizontal and vertical error ranges.

has_xerr, has_yerr

[bool] `True` if the errorbar has x/y errors.

class matplotlib.container.**StemContainer**(**args*, ***kwargs*)

Bases: *matplotlib.container.Container*

Container for the artists created in a *Axes.stem()* plot.

The container can be treated like a namedtuple `(markerline, stemlines, baseline)`.

Attributes

markerline

[*Line2D*] The artist of the markers at the stem heads.

stemlines

[list of *Line2D*] The artists of the vertical lines for all stems.

baseline

[*Line2D*] The artist of the horizontal baseline.

Parameters

markerline_stemlines_baseline

[tuple] Tuple of `(markerline, stemlines, baseline)`. `markerline` contains the *LineCollection* of the markers, `stemlines` is a *LineCollection* of the main lines, `baseline` is the *Line2D* of the baseline.

18.20 matplotlib.contour

Classes to support contour plotting and labelling for the Axes class.

class matplotlib.contour.**ClabelText**(*x=0*, *y=0*, *text=''*, *color=None*, *verticalalignment='baseline'*, *horizontalalignment='left'*, *multialignment=None*, *fontproperties=None*, *rotation=None*, *linespacing=None*, *rotation_mode=None*, *usetex=None*, *wrap=False*, ***kwargs*)

Bases: *matplotlib.text.Text*

Unlike the ordinary text, the get_rotation returns an updated angle in the pixel coordinate assuming that the input rotation is an angle in data coordinate (or whatever transform set).

Create a *Text* instance at *x*, *y* with string *text*.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array an
alpha	float or None
animated	bool
backgroundcolor	color
bbox	dict with properties for *patches.FancyBboxPatch*
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
figure	*Figure*
fontfamily or family	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', '
fontproperties or font or font_properties	*font_manager.FontProperties* or `str` or `pathlib.Path`
fontsize or size	float or {'xx-small', 'x-small', 'small', 'medium', 'large',
fontstretch or stretch	{a numeric value in range 0-1000, 'ultra-condensed',
fontstyle or style	{'normal', 'italic', 'oblique'}
fontvariant or variant	{'normal', 'small-caps'}
fontweight or weight	{a numeric value in range 0-1000, 'ultralight', 'light',
gid	str
horizontalalignment or ha	{'center', 'right', 'left'}
in_layout	bool
label	object
linespacing	float (multiple of font size)
multialignment or ma	{'left', 'right', 'center'}
path_effects	*AbstractPathEffect*
picker	None or bool or callable
position	(float, float)
rasterized	bool or None
rotation	float or {'vertical', 'horizontal'}
rotation_mode	{None, 'default', 'anchor'}
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
text	object
transform	*Transform*
url	str
usetex	bool or None
verticalalignment or va	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}

Tabl

Property	Description
visible	bool
wrap	bool
x	float
y	float
zorder	float

get_rotation(*self*)
Return the text angle in degrees between 0 and 360.

class matplotlib.contour.ContourLabeler
Bases: object

Mixin to provide labelling capability to *ContourSet*.

add_label(*self*, *x*, *y*, *rotation*, *lev*, *cvalue*)
Add contour label using *Text* class.

add_label_clabeltext(*self*, *x*, *y*, *rotation*, *lev*, *cvalue*)
Add contour label using *ClabelText* class.

add_label_near(*self*, *x*, *y*, *inline=True*, *inline_spacing=5*, *transform=None*)
Add a label near the point (x, y). If transform is None (default), (x, y) is in data coordinates; if transform is False, (x, y) is in display coordinates; otherwise, the specified transform will be used to translate (x, y) into display coordinates.

Parameters

x, y

[float] The approximate location of the label.

inline

[bool, default: True] If *True* remove the segment of the contour beneath the label.

inline_spacing

[int, default: 5] Space in pixels to leave on each side of label when placing inline. This spacing will be exact for labels at locations where the contour is straight, less so for labels on curved contours.

calc_label_rot_and_inline(*self*, *slc*, *ind*, *lw*, *lc=None*, *spacing=5*)
Calculate the appropriate label rotation given the linecontour coordinates in screen units, the index of the label location and the label width.

If *lc* is not None or empty, also break contours and compute inlining.

spacing is the empty space to leave around the label, in pixels.

Both tasks are done together to avoid calculating path lengths multiple times, which is relatively costly.

The method used here involves computing the path length along the contour in pixel coordinates and then looking approximately (label width / 2) away from central point to determine rotation and then to break contour if desired.

`clabel`(*self*, *levels=None*, ***, *fontsize=None*, *inline=True*, *inline_spacing=5*, *fmt='%1.3f'*, *colors=None*, *use_clabeltext=False*, *manual=False*, *rightside_up=True*, *zorder=None*)

Label a contour plot.

Adds labels to line contours in this *ContourSet* (which inherits from this mixin class).

Parameters

levels

[array-like, optional] A list of level values, that should be labeled. The list must be a subset of `cs.levels`. If not given, all levels are labeled.

fontsize

[str or float, default: `rcParams["font.size"]` (default: `10.0`)] Size in points or relative size e.g., 'smaller', 'x-large'. See *Text.set_size* for accepted string values.

colors

[color or colors or None, default: None] The label colors:

- If *None*, the color of each label matches the color of the corresponding contour.
- If one string color, e.g., *colors* = 'r' or *colors* = 'red', all labels will be plotted in this color.
- If a tuple of colors (string, float, rgb, etc), different labels will be plotted in different colors in the order specified.

inline

[bool, default: True] If `True` the underlying contour is removed where the label is placed.

inline_spacing

[float, default: 5] Space in pixels to leave on each side of label when placing inline.

This spacing will be exact for labels at locations where the contour is straight, less so for labels on curved contours.

fmt

[str or dict, default: '%1.3f'] A format string for the label.

Alternatively, this can be a dictionary matching contour levels with arbitrary strings to use for each contour level (i.e., fmt[level]=string), or it can be any callable, such as a *Formatter* instance, that returns a string when called with a numeric contour level.

manual

[bool or iterable, default: False] If `True`, contour labels will be placed manually using mouse clicks. Click the first button near a contour to add a label, click the second button (or potentially both mouse buttons at once) to finish adding labels. The third button can be used to remove the last label added, but only if labels are not inline. Alternatively, the keyboard can be used to select label locations (enter to end label placement, delete or backspace act like the third mouse button, and any other key will select a label location).

manual can also be an iterable object of (x, y) tuples. Contour labels will be created as if mouse is clicked at each (x, y) position.

rightside_up

[bool, default: True] If `True`, label rotations will always be plus or minus 90 degrees from level.

use_clabeltext

[bool, default: False] If `True`, *ClabelText* class (instead of *Text*) is used to create labels. *ClabelText* recalculates rotation angles of texts during the drawing time, therefore this can be used if aspect of the axes changes.

zorder

[float or None, default: `(2 + contour.get_zorder())`] zorder of the contour labels.

Returns

labels

A list of *Text* instances for the labels.

`get_label_coords`(*self*, *distances*, *XX*, *YY*, *ysize*, *lw*)

Return x, y, and the index of a label location.

Labels are plotted at a location with the smallest deviation of the contour from a straight line unless there is another label nearby, in which case the

next best place on the contour is picked up. If all such candidates are rejected, the beginning of the contour is chosen.

`get_label_width`(*self*, *lev*, *fmt*, *fsize*)
Return the width of the label in points.

`get_text`(*self*, *lev*, *fmt*)
Get the text of the label.

`labels`(*self*, *inline*, *inline_spacing*)

`locate_label`(*self*, *linecontour*, *labelwidth*)
Find good place to draw a label (relatively flat part of the contour).

`pop_label`(*self*, *index=- 1*)
Defaults to removing last label, but any index can be supplied

`print_label`(*self*, *linecontour*, *labelwidth*)
Return whether a contour is long enough to hold a label.

`set_label_props`(*self*, *label*, *text*, *color*)
Set the label properties - color, fontsize, text.

`too_close`(*self*, *x*, *y*, *lw*)
Return *True* if a label is already near this location.

class matplotlib.contour.**ContourSet**(*ax*, **args*, *levels=None*, *filled=False*, *linewidths=None*, *linestyles=None*, *hatches=None*, *alpha=None*, *origin=None*, *extent=None*, *cmap=None*, *colors=None*, *norm=None*, *vmin=None*, *vmax=None*, *extend='neither'*, *antialiased=None*, *nchunk=0*, *locator=None*, *transform=None*, ***kwargs*)

Bases: *matplotlib.cm.ScalarMappable*, *matplotlib.contour.ContourLabeler*

Store a set of contour lines or filled regions.

User-callable method: *clabel*

Parameters

ax

[*Axes*]

levels

[[level0, level1, ..., leveln]] A list of floating point numbers indicating the contour levels.

allsegs

[[level0segs, level1segs, ...]] List of all the polygon segments for all the *levels*. For contour lines `len(allsegs) == len(levels)`, and

for filled contour regions `len(allsegs) = len(levels)-1`. The lists should look like

```
level0segs = [polygon0, polygon1, ...]
polygon0 = [[x0, y0], [x1, y1], ...]
```

allkinds

[`None` or [level0kinds, level1kinds, ...]] Optional list of all the polygon vertex kinds (code types), as described and used in Path. This is used to allow multiply- connected paths such as holes within filled polygons. If not `None`, `len(allkinds) == len(allsegs)`. The lists should look like

```
level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
```

If *allkinds* is not `None`, usually all polygons for a particular contour level are grouped together so that `level0segs = [polygon0]` and `level0kinds = [polygon0kinds]`.

****kwargs**

Keyword arguments are as described in the docstring of *contour*.

Attributes

ax

The axes object in which the contours are drawn.

collections

A silent_list of LineCollections or PolyCollections.

levels

Contour levels.

layers

Same as levels for line contours; half-way between levels for filled contours. See `_process_colors()`.

Draw contour lines or filled regions, depending on whether keyword arg *filled* is `False` (default) or `True`.

Call signature:

```
ContourSet(ax, levels, allsegs, [allkinds], **kwargs)
```

Parameters

ax

[*Axes*] The *Axes* object to draw on.

levels

[[level0, level1, ..., leveln]] A list of floating point numbers indicating the contour levels.

allsegs

[[level0segs, level1segs, ...]] List of all the polygon segments for all the *levels*. For contour lines `len(allsegs) == len(levels)`, and for filled contour regions `len(allsegs) = len(levels)-1`. The lists should look like

```
level0segs = [polygon0, polygon1, ...]
polygon0 = [[x0, y0], [x1, y1], ...]
```

allkinds

[[level0kinds, level1kinds, ...], optional] Optional list of all the polygon vertex kinds (code types), as described and used in Path. This is used to allow multiply- connected paths such as holes within filled polygons. If not `None`, `len(allkinds) == len(allsegs)`. The lists should look like

```
level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
```

If *allkinds* is not `None`, usually all polygons for a particular contour level are grouped together so that `level0segs = [polygon0]` and `level0kinds = [polygon0kinds]`.

****kwargs**

Keyword arguments are as described in the docstring of *contour*.

`property ax`

`changed`(*self*)
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`find_nearest_contour`(*self*, *x*, *y*, *indices=None*, *pixel=True*)
Find the point in the contour plot that is closest to `(x, y)`.

Parameters

x, y: float

The reference point.

indices

[list of int or None, default: None] Indices of contour levels to consider. If None (the default), all levels are considered.

pixel

[bool, default: True] If *True*, measure distance in pixel (screen) space, which is useful for manual contour labeling; else, measure distance in axes space.

Returns

contour

[*Collection*] The contour that is closest to `(x, y)`.

segment

[int] The index of the *Path* in *contour* that is closest to `(x, y)`.

index

[int] The index of the path segment in *segment* that is closest to `(x, y)`.

xmin, ymin

[float] The point in the contour plot that is closest to `(x, y)`.

d

[float] The distance from `(xmin, ymin)` to `(x, y)`.

`get_alpha`(*self*)
Return alpha to be applied to all ContourSet artists.

`get_transform`(*self*)
Return the *Transform* instance used by this ContourSet.

`legend_elements`(*self*, *variable_name='x'*, *str_format=<class 'str'>*)
Return a list of artists and labels suitable for passing through to *legend* which represent this ContourSet.

The labels have the form "0 < x <= 1" stating the data ranges which the artists represent.

Parameters

variable_name

[str] The string used inside the inequality used on the labels.

str_format

[function: float -> str] Function used to format the numbers in the labels.

Returns

artists

[List[*Artist*]] A list of the artists.

labels

[List[str]] A list of the labels.

`set_alpha`(*self*, *alpha*)

Set the alpha blending value for all ContourSet artists. *alpha* must be between 0 (transparent) and 1 (opaque).

`class matplotlib.contour.`**`QuadContourSet`**(*ax*, **args*, *levels=None*, *filled=False*, *linewidths=None*, *linestyles=None*, *hatches=None*, *alpha=None*, *origin=None*, *extent=None*, *cmap=None*, *colors=None*, *norm=None*, *vmin=None*, *vmax=None*, *extend='neither'*, *antialiased=None*, *nchunk=0*, *locator=None*, *transform=None*, ***kwargs*)

Bases: *matplotlib.contour.ContourSet*

Create and store a set of contour lines or filled regions.

User-callable method: *clabel*

Attributes

ax

The axes object in which the contours are drawn.

collections

A silent_list of LineCollections or PolyCollections.

levels

Contour levels.

layers

Same as levels for line contours; half-way between levels for filled contours. See `_process_colors()` method.

Draw contour lines or filled regions, depending on whether keyword arg *filled* is `False` (default) or `True`.

Call signature:

```
ContourSet(ax, levels, allsegs, [allkinds], **kwargs)
```

Parameters

ax

[*Axes*] The *Axes* object to draw on.

levels

[[level0, level1, ..., leveln]] A list of floating point numbers indicating the contour levels.

allsegs

[[level0segs, level1segs, ...]] List of all the polygon segments for all the *levels*. For contour lines `len(allsegs) == len(levels)`, and for filled contour regions `len(allsegs) = len(levels)-1`. The lists should look like

```
level0segs = [polygon0, polygon1, ...]
polygon0 = [[x0, y0], [x1, y1], ...]
```

allkinds

[[level0kinds, level1kinds, ...], optional] Optional list of all the polygon vertex kinds (code types), as described and used in Path. This is used to allow multiply- connected paths such as holes within filled polygons. If not `None`, `len(allkinds) == len(allsegs)`. The lists should look like

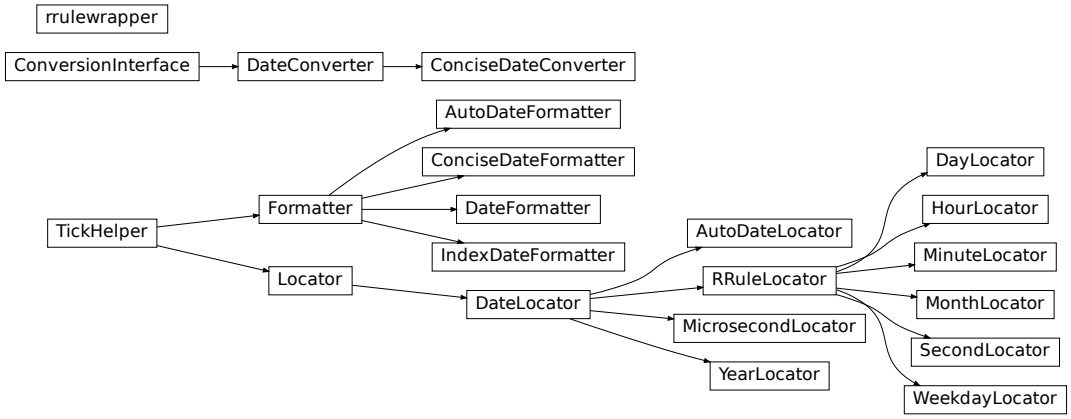
```
level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
```

If *allkinds* is not `None`, usually all polygons for a particular contour level are grouped together so that `level0segs = [polygon0]` and `level0kinds = [polygon0kinds]`.

****kwargs**

Keyword arguments are as described in the docstring of *contour*.

18.21 matplotlib.dates



Matplotlib provides sophisticated date plotting capabilities, standing on the shoulders of python `datetime` and the add-on module `dateutil`.

18.21.1 Matplotlib date format

Matplotlib represents dates using floating point numbers specifying the number of days since a default epoch of 1970-01-01 UTC; for example, 1970-01-01, 06:00 is the floating point number 0.25. The formatters and locators require the use of `datetime.datetime` objects, so only dates between year 0001 and 9999 can be represented. Microsecond precision is achievable for (approximately) 70 years on either side of the epoch, and 20 microseconds for the rest of the allowable range of dates (year 0001 to 9999). The epoch can be changed at import time via *`dates.set_epoch`* or `rcParams["dates.epoch"]` to other dates if necessary; see /gallery/ticks_and_spines/date_precision_and_epochs for a discussion.

Note: Before Matplotlib 3.3, the epoch was 0000-12-31 which lost modern microsecond precision and also made the default axis limit of 0 an invalid datetime. In 3.3 the epoch was changed as above. To convert old ordinal floats to the new epoch, users can do:

```
new_ordinal = old_ordinal + mdates.date2num(np.datetime64('0000-12-31'))
```

There are a number of helper functions to convert between `datetime` objects and Matplotlib dates:

datestr2num	Convert a date string to a datenum using `dateutil.parser.parse`.
date2num	Convert datetime objects to Matplotlib dates.
num2date	Convert Matplotlib dates to `datetime` objects.
num2timedelta	Convert number of days to a `timedelta` object.
drange	Return a sequence of equally spaced Matplotlib dates.
set_epoch	Set the epoch (origin for dates) for datetime calculations.
get_epoch	Get the epoch used by *dates*.

Note: Like Python's `datetime.datetime`, Matplotlib uses the Gregorian calendar for all conversions between dates and floating point numbers. This practice is not universal, and calendar differences can cause confusing differences between what Python and Matplotlib give as the number of days since 0001-01-01 and what other software and databases yield. For example, the US Naval Observatory uses a calendar that switches from Julian to Gregorian in October, 1582. Hence, using their calculator, the number of days between 0001-01-01 and 2006-04-01 is 732403, whereas using the Gregorian calendar via the datetime module we find:

```
In [1]: date(2006, 4, 1).toordinal() - date(1, 1, 1).toordinal()
Out[1]: 732401
```

All the Matplotlib date converters, tickers and formatters are timezone aware. If no explicit timezone is provided, `rcParams["timezone"]` (default: `'UTC'`) is assumed. If you want to use a custom time zone, pass a `datetime.tzinfo` instance with the tz keyword argument to *num2date*, *plot_date*, and any custom date tickers or locators you create.

A wide range of specific and general purpose date tick locators and formatters are provided in this module. See *matplotlib.ticker* for general information on tick locators and formatters. These are described below.

The dateutil module provides additional code to handle date ticking, making it easy to place ticks on any kinds of dates. See examples below.

18.21.2 Date tickers

Most of the date tickers can locate single or multiple values. For example:

```
# import constants for the days of the week
from matplotlib.dates import MO, TU, WE, TH, FR, SA, SU

# tick on mondays every week
loc = WeekdayLocator(byweekday=MO, tz=tz)

# tick on mondays and saturdays
loc = WeekdayLocator(byweekday=(MO, SA))
```

In addition, most of the constructors take an interval argument:

```
# tick on mondays every second week
loc = WeekdayLocator(byweekday=MO, interval=2)
```

The rrule locator allows completely general date ticking:

```
# tick every 5th easter
rule = rrulewrapper(YEARLY, byeaster=1, interval=5)
loc = RRuleLocator(rule)
```

The available date tickers are:

- *MicrosecondLocator*: Locate microseconds.
- *SecondLocator*: Locate seconds.
- *MinuteLocator*: Locate minutes.
- *HourLocator*: Locate hours.
- *DayLocator*: Locate specified days of the month.
- *WeekdayLocator*: Locate days of the week, e.g., MO, TU.
- *MonthLocator*: Locate months, e.g., 7 for July.
- *YearLocator*: Locate years that are multiples of base.
- *RRuleLocator*: Locate using a `matplotlib.dates.rrulewrapper`. `rrulewrapper` is a simple wrapper around dateutil's `dateutil.rrule` which allow almost arbitrary date tick specifications. See rrule example.
- *AutoDateLocator*: On autoscale, this class picks the best *DateLocator* (e.g., *RRuleLocator*) to set the view limits and the tick locations. If called with `interval_multiples=True` it will make ticks line up with sensible multiples of the tick intervals. E.g. if the interval is 4 hours, it will pick hours 0, 4, 8, etc as ticks. This behaviour is not guaranteed by default.

18.21.3 Date formatters

The available date formatters are:

- *AutoDateFormatter*: attempts to figure out the best format to use. This is most useful when used with the *AutoDateLocator*.
- *ConciseDateFormatter*: also attempts to figure out the best format to use, and to make the format as compact as possible while still having complete date information. This is most useful when used with the *AutoDateLocator*.
- *DateFormatter*: use `strftime` format strings.
- *IndexDateFormatter*: date plots with implicit *x* indexing.

class matplotlib.dates.**AutoDateFormatter**(*locator*, *tz=None*, *defaultfmt='%Y-%m-%d'*)

Bases: *matplotlib.ticker.Formatter*

A *Formatter* which attempts to figure out the best format to use. This is most useful when used with the *AutoDateLocator*.

The AutoDateFormatter has a scale dictionary that maps the scale of the tick (the distance in days between one major tick) and a format string. The default looks like this:

```
self.scaled = {
    DAYS_PER_YEAR: rcParams['date.autoformat.year'],
    DAYS_PER_MONTH: rcParams['date.autoformat.month'],
    1.0: rcParams['date.autoformat.day'],
    1. / HOURS_PER_DAY: rcParams['date.autoformat.hour'],
    1. / (MINUTES_PER_DAY): rcParams['date.autoformat.minute'],
    1. / (SEC_PER_DAY): rcParams['date.autoformat.second'],
    1. / (MUSECONDS_PER_DAY): rcParams['date.autoformat.microsecond'],
}
```

The algorithm picks the key in the dictionary that is >= the current scale and uses that format string. You can customize this dictionary by doing:

```
>>> locator = AutoDateLocator()
>>> formatter = AutoDateFormatter(locator)
>>> formatter.scaled[1/(24.*60.)] = '%M:%S' # only show min and sec
```

A custom *FuncFormatter* can also be used. The following example shows how to use a custom format function to strip trailing zeros from decimal seconds and adds the date to the first ticklabel:

```
>>> def my_format_function(x, pos=None):
...     x = matplotlib.dates.num2date(x)
...     if pos == 0:
...         fmt = '%D %H:%M:%S.%f'
...     else:
...         fmt = '%H:%M:%S.%f'
```

(continues on next page)

(continued from previous page)

```
...     label = x.strftime(fmt)
...     label = label.rstrip("0")
...     label = label.rstrip(".")
...     return label
>>> from matplotlib.ticker import FuncFormatter
>>> formatter.scaled[1/(24.*60.)] = FuncFormatter(my_format_function)
```

Autoformat the date labels. The default format is the one to use if none of the values in `self.scaled` are greater than the unit returned by `locator._get_unit()`.

class matplotlib.dates.**AutoDateLocator**(*tz=None*, *minticks=5*, *maxticks=None*, *interval_multiples=True*)

Bases: *matplotlib.dates.DateLocator*

On autoscale, this class picks the best *DateLocator* to set the view limits and the tick locations.

Attributes

intervald

[dict] Mapping of tick frequencies to multiples allowed for that ticking. The default is

```
self.intervald = {
    YEARLY  : [1, 2, 4, 5, 10, 20, 40, 50, 100, 200, 400, 500,
               1000, 2000, 4000, 5000, 10000],
    MONTHLY : [1, 2, 3, 4, 6],
    DAILY   : [1, 2, 3, 7, 14, 21],
    HOURLY  : [1, 2, 3, 4, 6, 12],
    MINUTELY: [1, 5, 10, 15, 30],
    SECONDLY: [1, 5, 10, 15, 30],
    MICROSECONDLY: [1, 2, 5, 10, 20, 50, 100, 200, 500,
                    1000, 2000, 5000, 10000, 20000, 50000,
                    100000, 200000, 500000, 1000000],
}
```

where the keys are defined in `dateutil.rrule`.

The interval is used to specify multiples that are appropriate for the frequency of ticking. For instance, every 7 days is sensible for daily ticks, but for minutes/seconds, 15 or 30 make sense.

When customizing, you should only modify the values for the existing keys. You should not add or delete entries.

Example for forcing ticks every 3 hours:

```
locator = AutoDateLocator()
locator.intervald[HOURLY] = [3]  # only show every 3 hours
```

Parameters

tz

[datetime.tzinfo] Ticks timezone.

minticks

[int] The minimum number of ticks desired; controls whether ticks occur yearly, monthly, etc.

maxticks

[int] The maximum number of ticks desired; controls the interval between ticks (ticking every other, every 3, etc.). For fine-grained control, this can be a dictionary mapping individual rrule frequency constants (YEARLY, MONTHLY, etc.) to their own maximum number of ticks. This can be used to keep the number of ticks appropriate to the format chosen in *AutoDateFormatter*. Any frequency not specified in this dictionary is given a default value.

interval_multiples

[bool, default: True] Whether ticks should be chosen to be multiple of the interval, locking them to 'nicer' locations. For example, this will force the ticks to be at hours 0, 6, 12, 18 when hourly ticking is done at 6 hour intervals.

`autoscale`(*self*)
[*Deprecated*] Try to choose the view limits intelligently.

Notes

Deprecated since version 3.2.

`get_locator`(*self*, *dmin*, *dmax*)
Pick the best locator based on a distance.

`nonsingular`(*self*, *vmin*, *vmax*)
Given the proposed upper and lower extent, adjust the range if it is too close to being singular (i.e. a range of ~0).

`tick_values`(*self*, *vmin*, *vmax*)
Return the values of the located ticks given **vmin** and **vmax**.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

class matplotlib.dates.**ConciseDateConverter**(*formats=None*, *zero_formats=None*, *offset_formats=None*, *show_offset=True*)

Bases: *matplotlib.dates.DateConverter*

axisinfo(*self*, *unit*, *axis*)

Return the *AxisInfo* for *unit*.

unit is a tzinfo instance or None. The *axis* argument is required but not used.

class matplotlib.dates.**ConciseDateFormatter**(*locator*, *tz=None*, *formats=None*, *offset_formats=None*, *zero_formats=None*, *show_offset=True*)

Bases: *matplotlib.ticker.Formatter*

A *Formatter* which attempts to figure out the best format to use for the date, and to make it as compact as possible, but still be complete. This is most useful when used with the *AutoDateLocator*:

```
>>> locator = AutoDateLocator()
>>> formatter = ConciseDateFormatter(locator)
```

Parameters

locator

[*ticker.Locator*] Locator that this axis is using.

tz

[str, optional] Passed to *dates.date2num*.

formats

[list of 6 strings, optional] Format strings for 6 levels of tick labelling: mostly years, months, days, hours, minutes, and seconds. Strings use the same format codes as `strftime`. Default is `['%Y', '%b', '%d', '%H:%M', '%H:%M', '%S.%f']`

zero_formats

[list of 6 strings, optional] Format strings for tick labels that are "zeros" for a given tick level. For instance, if most ticks are months, ticks around 1 Jan 2005 will be labeled "Dec", "2005", "Feb". The default is `['', '%Y', '%b', '%b-%d', '%H:%M', '%H:%M']`

offset_formats

[list of 6 strings, optional] Format strings for the 6 levels that is applied to the "offset" string found on the right side of an x-axis, or top of a y-axis. Combined with the tick labels this should completely specify the date. The default is:

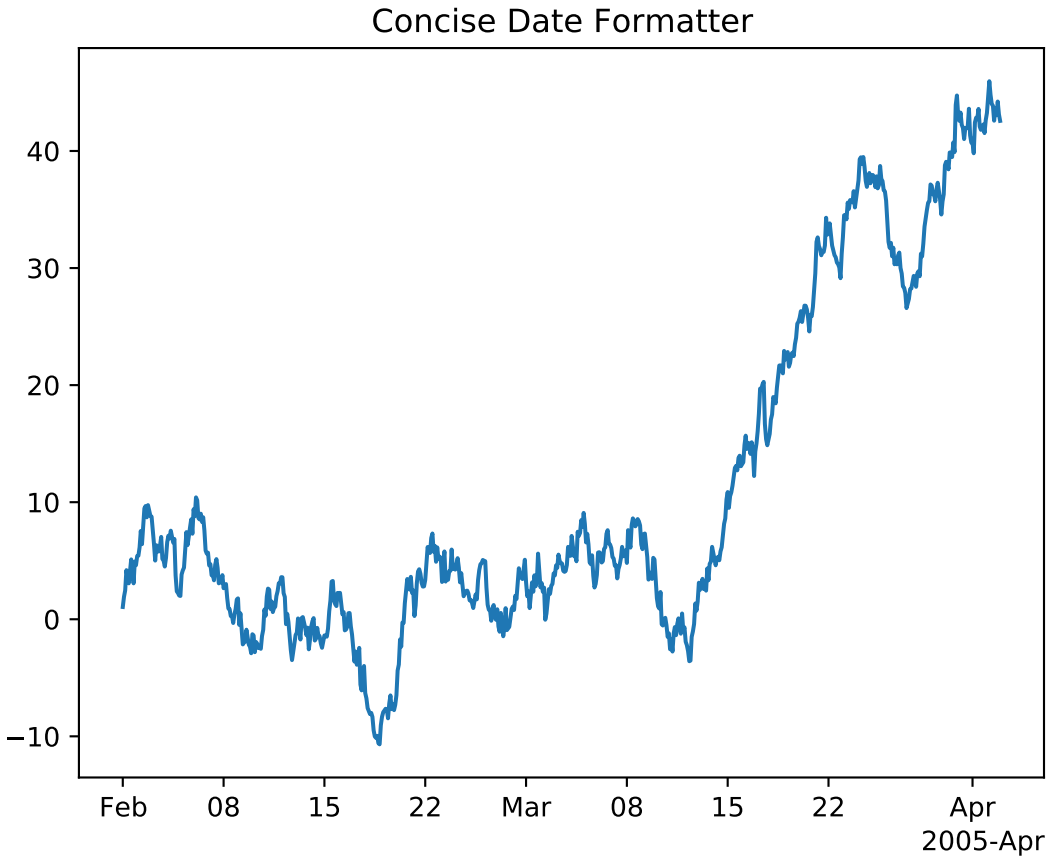
```
['', '%Y', '%Y-%b', '%Y-%b-%d', '%Y-%b-%d', '%Y-%b-%d %H:%M']
```

show_offset

[bool, default: True] Whether to show the offset or not.

Examples

See /gallery/ticks_and_spines/date_concise_formatter



Autoformat the date labels. The default format is used to form an initial string, and then redundant elements are removed.

`format_data_short`(*self*, *value*)
: Return a short string version of the tick value.

  Defaults to the position-independent long value.

`format_ticks`(*self*, *values*)
: Return the tick labels for all the ticks at once.

get_offset(*self*)

class matplotlib.dates.DateConverter

Bases: *matplotlib.units.ConversionInterface*

Converter for `datetime.date` and `datetime.datetime` data, or for date/time data represented as it would be converted by *date2num*.

The 'unit' tag for such data is None or a tzinfo instance.

static axisinfo(*unit*, *axis*)

Return the *AxisInfo* for *unit*.

unit is a tzinfo instance or None. The *axis* argument is required but not used.

static convert(*value*, *unit*, *axis*)

If *value* is not already a number or sequence of numbers, convert it with *date2num*.

The *unit* and *axis* arguments are not used.

static default_units(*x*, *axis*)

Return the tzinfo instance of *x* or of its first element, or None

class matplotlib.dates.DateFormatter(*fmt*, *tz=None*)

Bases: *matplotlib.ticker.Formatter*

Format a tick (in days since the epoch) with a `strftime` format string.

Parameters

fmt

[str] `strftime` format string

tz

[`datetime.tzinfo`, default: `rcParams["timezone"]` (default: `'UTC'`)] Ticks timezone.

property illegal_s

set_tzinfo(*self*, *tz*)

class matplotlib.dates.DateLocator(*tz=None*)

Bases: *matplotlib.ticker.Locator*

Determines the tick locations when plotting dates.

This class is subclassed by other Locators and is not meant to be used on its own.

Parameters

tz

[`datetime.tzinfo`]

`datalim_to_dt`(*self*)
Convert axis data interval to datetime objects.

`hms0d = {'byhour': 0, 'byminute': 0, 'bysecond': 0}`

`nonsingular`(*self*, *vmin*, *vmax*)
Given the proposed upper and lower extent, adjust the range if it is too close to being singular (i.e. a range of ~0).

`set_tzinfo`(*self*, *tz*)
Set time zone info.

`viewlim_to_dt`(*self*)
Convert the view interval to datetime objects.

`class matplotlib.dates.DayLocator`(*bymonthday=None*, *interval=1*, *tz=None*)
Bases: *matplotlib.dates.RRuleLocator*

Make ticks on occurrences of each day of the month. For example, 1, 15, 30.

Mark every day in *bymonthday*; *bymonthday* can be an int or sequence.

Default is to tick every day of the month: `bymonthday=range(1, 32)`.

`class matplotlib.dates.HourLocator`(*byhour=None*, *interval=1*, *tz=None*)
Bases: *matplotlib.dates.RRuleLocator*

Make ticks on occurrences of each hour.

Mark every hour in *byhour*; *byhour* can be an int or sequence. Default is to tick every hour: `byhour=range(24)`

interval is the interval between each iteration. For example, if `interval=2`, mark every second occurrence.

`class matplotlib.dates.IndexDateFormatter`(***kwargs*)
Bases: *matplotlib.ticker.Formatter*

[*Deprecated*] Use with *IndexLocator* to cycle format strings by index.

Notes

Deprecated since version 3.3.

Parameters

t

[list of float] A sequence of dates (floating point days).

fmt

[str] A `strftime` format string.

class matplotlib.dates.MicrosecondLocator(*interval=1*, *tz=None*)

Bases: *matplotlib.dates.DateLocator*

Make ticks on regular intervals of one or more microsecond(s).

Note: By default, Matplotlib uses a floating point representation of time in days since the epoch, so plotting data with microsecond time resolution does not work well for dates that are far (about 70 years) from the epoch (check with *get_epoch*).

If you want sub-microsecond resolution time plots, it is strongly recommended to use floating point seconds, not datetime-like time representation.

If you really must use datetime.datetime() or similar and still need microsecond precision, change the time origin via *dates.set_epoch* to something closer to the dates being plotted. See /gallery/ticks_and_spines/date_precision_and_epochs.

---

interval is the interval between each iteration. For example, if `interval=2`, mark every second microsecond.

set_axis(*self*, *axis*)

set_data_interval(*self*, *vmin*, *vmax*)

set_view_interval(*self*, *vmin*, *vmax*)

tick_values(*self*, *vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

class matplotlib.dates.MinuteLocator(*byminute=None*, *interval=1*, *tz=None*)

Bases: *matplotlib.dates.RRuleLocator*

Make ticks on occurrences of each minute.

Mark every minute in *byminute*; *byminute* can be an int or sequence. Default is to tick every minute: `byminute=range(60)`

interval is the interval between each iteration. For example, if `interval=2`, mark every second occurrence.

class matplotlib.dates.MonthLocator(*bymonth=None*, *bymonthday=1*, *interval=1*, *tz=None*)

Bases: *matplotlib.dates.RRuleLocator*

Make ticks on occurrences of each month, e.g., 1, 3, 12.

Mark every month in *bymonth*; *bymonth* can be an int or sequence. Default is `range(1, 13)`, i.e. every month.

interval is the interval between each iteration. For example, if `interval=2`, mark every second occurrence.

`class matplotlib.dates.RRuleLocator(o, tz=None)`

Bases: *matplotlib.dates.DateLocator*

Parameters

tz

[datetime.tzinfo]

`autoscale(self)`

[*Deprecated*] Set the view limits to include the data range.

Notes

Deprecated since version 3.2.

`static get_unit_generic(freq)`

`tick_values(self, vmin, vmax)`

Return the values of the located ticks given **vmin** and **vmax**.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

`class matplotlib.dates.SecondLocator(bysecond=None, interval=1, tz=None)`

Bases: *matplotlib.dates.RRuleLocator*

Make ticks on occurrences of each second.

Mark every second in *bysecond*; *bysecond* can be an int or sequence. Default is to tick every second: `bysecond = range(60)`

interval is the interval between each iteration. For example, if `interval=2`, mark every second occurrence.

`class matplotlib.dates.WeekdayLocator(byweekday=1, interval=1, tz=None)`

Bases: *matplotlib.dates.RRuleLocator*

Make ticks on occurrences of each weekday.

Mark every weekday in *byweekday*; *byweekday* can be a number or sequence.

Elements of *byweekday* must be one of MO, TU, WE, TH, FR, SA, SU, the constants from `dateutil.rrule`, which have been imported into the *matplotlib.dates* namespace.

interval specifies the number of weeks to skip. For example, `interval=2` plots every second week.

`class matplotlib.dates.YearLocator(`*base=1*, *month=1*, *day=1*, *tz=None*`)`

Bases: *matplotlib.dates.DateLocator*

Make ticks on a given day of each year that is a multiple of base.

Examples:

```
# Tick every year on Jan 1st
locator = YearLocator()

# Tick every 5 years on July 4th
locator = YearLocator(5, month=7, day=4)
```

Mark years that are multiple of base on a given month and day (default jan 1).

`autoscale(`*self*`)`

[*Deprecated*] Set the view limits to include the data range.

Notes

Deprecated since version 3.2.

`tick_values(`*self*, *vmin*, *vmax*`)`

Return the values of the located ticks given **vmin** and **vmax**.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

`matplotlib.dates.date2num(`*d*`)`

Convert datetime objects to Matplotlib dates.

Parameters

d

[`datetime.datetime` or `numpy.datetime64` or sequences of these]

Returns

float or sequence of floats

Number of days since the epoch. See *get_epoch* for the epoch, which can be changed by rcParams["date.epoch"] (default: '1970-01-01T00:00:00') or *set_epoch*. If the epoch is "1970-01-01T00:00:00" (default) then noon Jan 1 1970 ("1970-01-01T12:00:00") returns 0.5.

Notes

The Gregorian calendar is assumed; this is not universal practice. For details see the module docstring.

matplotlib.dates.**datestr2num**(*d*, *default=None*)

Convert a date string to a datenum using dateutil.parser.parse.

Parameters

d

[str or sequence of str] The dates to convert.

default

[datetime.datetime, optional] The default date to use when fields are missing in *d*.

matplotlib.dates.**drange**(*dstart*, *dend*, *delta*)

Return a sequence of equally spaced Matplotlib dates.

The dates start at *dstart* and reach up to, but not including *dend*. They are spaced by *delta*.

Parameters

dstart, dend

[datetime] The date limits.

delta

[datetime.timedelta] Spacing of the dates.

Returns

numpy.array

A list floats representing Matplotlib dates.

matplotlib.dates.**epoch2num**(*e*)

Convert UNIX time to days since Matplotlib epoch.

Parameters

e

[list of floats] Time in seconds since 1970-01-01.

Returns

`numpy.array`

Time in days since Matplotlib epoch (see *get_epoch()*).

`matplotlib.dates.get_epoch()`
Get the epoch used by *dates*.

Returns

epoch: str

String for the epoch (parsable by `numpy.datetime64`).

`matplotlib.dates.mx2num(mxdates)`
[*Deprecated*] Convert mx `datetime` instance (or sequence of mx instances) to the new date format.

Notes

Deprecated since version 3.2.

`matplotlib.dates.num2date(x, tz=None)`
Convert Matplotlib dates to `datetime` objects.

Parameters

x

[float or sequence of floats] Number of days (fraction part represents hours, minutes, seconds) since the epoch. See *get_epoch* for the epoch, which can be changed by `rcParams["date.epoch"]` (default: `'1970-01-01T00:00:00'`) or *set_epoch*.

tz

[str, optional] Timezone of *x* (defaults to `rcParams["timezone"]` (default: `'UTC'`)).

Returns

`datetime` **or sequence of** `datetime`

Dates are returned in timezone *tz*.

If *x* is a sequence, a sequence of `datetime` objects will be returned.

Notes

The addition of one here is a historical artifact. Also, note that the Gregorian calendar is assumed; this is not universal practice. For details, see the module docstring.

`matplotlib.dates.`**num2epoch**(*d*)

Convert days since Matplotlib epoch to UNIX time.

Parameters

d

[list of floats] Time in days since Matplotlib epoch (see *get_epoch()*).

Returns

`numpy.array`

Time in seconds since 1970-01-01.

`matplotlib.dates.`**num2timedelta**(*x*)

Convert number of days to a `timedelta` object.

If *x* is a sequence, a sequence of `timedelta` objects will be returned.

Parameters

x

[float, sequence of floats] Number of days. The fraction part represents hours, minutes, seconds.

Returns

`datetime.timedelta` **or list[**`datetime.timedelta`**]**

`class matplotlib.dates.`**relativedelta**(*dt1=None*, *dt2=None*, *years=0*, *months=0*, *days=0*, *leapdays=0*, *weeks=0*, *hours=0*, *minutes=0*, *seconds=0*, *microseconds=0*, *year=None*, *month=None*, *day=None*, *weekday=None*, *yearday=None*, *nlyearday=None*, *hour=None*, *minute=None*, *second=None*, *microsecond=None*)

Bases: `object`

The relativedelta type is designed to be applied to an existing datetime and can replace specific components of that datetime, or represents an interval of time.

It is based on the specification of the excellent work done by M.-A. Lemburg in his mx.DateTime extension. However, notice that this type does *NOT* implement the same algorithm as his work. Do *NOT* expect it to behave like mx.DateTime's counterpart.

There are two different ways to build a relativedelta instance. The first one is passing it two date/datetime classes:

```
relativedelta(datetime1, datetime2)
```

The second one is passing it any number of the following keyword arguments:

```
relativedelta(arg1=x,arg2=y,arg3=z...)

year, month, day, hour, minute, second, microsecond:
    Absolute information (argument is singular); adding or subtracting a
    relativedelta with absolute information does not perform an arithmetic
    operation, but rather REPLACES the corresponding value in the
    original datetime with the value(s) in relativedelta.

years, months, weeks, days, hours, minutes, seconds, microseconds:
    Relative information, may be negative (argument is plural); adding
    or subtracting a relativedelta with relative information performs
    the corresponding arithmetic operation on the original datetime value
    with the information in the relativedelta.

weekday:
    One of the weekday instances (MO, TU, etc) available in the
    relativedelta module. These instances may receive a parameter N,
    specifying the Nth weekday, which could be positive or negative
    (like MO(+1) or MO(-2)). Not specifying it is the same as specifying
    +1. You can also use an integer, where 0=MO. This argument is always
    relative e.g. if the calculated date is already Monday, using MO(1)
    or MO(-1) won't change the day. To effectively make it absolute, use
    it in combination with the day argument (e.g. day=1, MO(1) for first
    Monday of the month).

leapdays:
    Will add given days to the date found, if year is a leap
    year, and the date found is post 28 of february.

yearday, nlyearday:
    Set the yearday or the non-leap year day (jump leap days).
    These are converted to day/month/leapdays information.
```

There are relative and absolute forms of the keyword arguments. The plural is relative, and the singular is absolute. For each argument in the order below, the absolute form is applied first (by setting each attribute to that value) and then the relative form (by adding the value to the attribute).

The order of attributes considered when this relativedelta is added to a datetime is:

1. Year
2. Month
3. Day
4. Hours
5. Minutes
6. Seconds
7. Microseconds

Finally, weekday is applied, using the rule described above.

For example

```
>>> from datetime import datetime
>>> from dateutil.relativedelta import relativedelta, MO
>>> dt = datetime(2018, 4, 9, 13, 37, 0)
>>> delta = relativedelta(hours=25, day=1, weekday=MO(1))
>>> dt + delta
datetime.datetime(2018, 4, 2, 14, 37)
```

First, the day is set to 1 (the first of the month), then 25 hours are added, to get to the 2nd day and 14th hour, finally the weekday is applied, but since the 2nd is already a Monday there is no effect.

normalized(*self*)

Return a version of this object represented entirely using integer values for the relative attributes.

```
>>> relativedelta(days=1.5, hours=2).normalized()
relativedelta(days=+1, hours=+14)
```

Returns

Returns a `dateutil.relativedelta.relativedelta` object.

property weeks

class matplotlib.dates.**rrule**(*freq*, *dtstart=None*, *interval=1*, *wkst=None*, *count=None*, *until=None*, *bysetpos=None*, *bymonth=None*, *bymonthday=None*, *byyearday=None*, *byeaster=None*, *byweekno=None*, *byweekday=None*, *byhour=None*, *byminute=None*, *bysecond=None*, *cache=False*)

Bases: `dateutil.rrule.rrulebase`

That's the base of the rrule operation. It accepts all the keywords defined in the RFC as its constructor parameters (except byday, which was renamed to

byweekday) and more. The constructor prototype is:

```
rrule(freq)
```

Where freq must be one of YEARLY, MONTHLY, WEEKLY, DAILY, HOURLY, MINUTELY, or SECONDLY.

Note: Per RFC section 3.3.10, recurrence instances falling on invalid dates and times are ignored rather than coerced:

> Recurrence rules may generate recurrence instances with an invalid date (e.g., February 30) or nonexistent local time (e.g., 1:30 AM on a day where the local time is moved forward by an hour at 1:00 AM). Such recurrence instances MUST be ignored and MUST NOT be counted as part of the recurrence set.

This can lead to possibly surprising behavior when, for example, the start date occurs at the end of the month:

```
>>> from dateutil.rrule import rrule, MONTHLY
>>> from datetime import datetime
>>> start_date = datetime(2014, 12, 31)
>>> list(rrule(freq=MONTHLY, count=4, dtstart=start_date))
...
[datetime.datetime(2014, 12, 31, 0, 0),
 datetime.datetime(2015, 1, 31, 0, 0),
 datetime.datetime(2015, 3, 31, 0, 0),
 datetime.datetime(2015, 5, 31, 0, 0)]
```

Additionally, it supports the following keyword arguments:

Parameters

- `dtstart` -- The recurrence start. Besides being the base for the recurrence, missing parameters in the final recurrence instances will also be extracted from this date. If not given, datetime.now() will be used instead.
- `interval` -- The interval between each freq iteration. For example, when using YEARLY, an interval of 2 means once every two years, but with HOURLY, it means once every two hours. The default interval is 1.
- `wkst` -- The week start day. Must be one of the MO, TU, WE constants, or an integer, specifying the first day of the week. This will affect recurrences based on weekly periods. The default week start is got from calendar.firstweekday(), and may be modified by calendar.setfirstweekday().
- `count` -- If given, this determines how many occurrences will be generated.

Note: As of version 2.5.0, the use of the keyword `until` in conjunction with `count` is deprecated, to make sure `dateutil` is fully compliant with RFC-5545 Sec. 3.3.10. Therefore, `until` and `count` **must not** occur in the same call to `rrule`.

- `until` -- If given, this must be a datetime instance specifying the upper-bound limit of the recurrence. The last recurrence in the rule is the greatest datetime that is less than or equal to the value specified in the `until` parameter.

Note: As of version 2.5.0, the use of the keyword `until` in conjunction with `count` is deprecated, to make sure `dateutil` is fully compliant with RFC-5545 Sec. 3.3.10. Therefore, `until` and `count` **must not** occur in the same call to `rrule`.

- `bysetpos` -- If given, it must be either an integer, or a sequence of integers, positive or negative. Each given integer will specify an occurrence number, corresponding to the nth occurrence of the rule inside the frequency period. For example, a bysetpos of -1 if combined with a MONTHLY frequency, and a byweekday of (MO, TU, WE, TH, FR), will result in the last work day of every month.
- `bymonth` -- If given, it must be either an integer, or a sequence of integers, meaning the months to apply the recurrence to.
- `bymonthday` -- If given, it must be either an integer, or a sequence of integers, meaning the month days to apply the recurrence to.
- `byyearday` -- If given, it must be either an integer, or a sequence of integers, meaning the year days to apply the recurrence to.
- `byeaster` -- If given, it must be either an integer, or a sequence of integers, positive or negative. Each integer will define an offset from the Easter Sunday. Passing the offset 0 to byeaster will yield the Easter Sunday itself. This is an extension to the RFC specification.
- `byweekno` -- If given, it must be either an integer, or a sequence of integers, meaning the week numbers to apply the recurrence to. Week numbers have the meaning described in ISO8601, that is, the first week of the year is that containing at least four days of the new year.
- `byweekday` -- If given, it must be either an integer (0 == MO), a sequence of integers, one of the weekday constants (MO, TU, etc), or a sequence of these constants. When given, these variables will define the weekdays where the recurrence will be ap-

plied. It's also possible to use an argument n for the weekday instances, which will mean the nth occurrence of this weekday in the period. For example, with MONTHLY, or with YEARLY and BYMONTH, using FR(+1) in byweekday will specify the first friday of the month where the recurrence happens. Notice that in the RFC documentation, this is specified as BYDAY, but was renamed to avoid the ambiguity of that keyword.

- `byhour` -- If given, it must be either an integer, or a sequence of integers, meaning the hours to apply the recurrence to.
- `byminute` -- If given, it must be either an integer, or a sequence of integers, meaning the minutes to apply the recurrence to.
- `bysecond` -- If given, it must be either an integer, or a sequence of integers, meaning the seconds to apply the recurrence to.
- `cache` -- If given, it must be a boolean value specifying to enable or disable caching of results. If you will use the same rrule instance multiple times, enabling caching will improve the performance considerably.

`replace`(*self*, ***kwargs*)

Return new rrule with same attributes except for those attributes given new values by whichever keyword arguments are specified.

`matplotlib.dates.set_epoch`(*epoch*)

Set the epoch (origin for dates) for datetime calculations.

The default epoch is `rcParams["dates.epoch"]` (by default 1970-01-01T00:00).

If microsecond accuracy is desired, the date being plotted needs to be within approximately 70 years of the epoch. Matplotlib internally represents dates as days since the epoch, so floating point dynamic range needs to be within a factor fo 2^52.

set_epoch must be called before any dates are converted (i.e. near the import section) or a RuntimeError will be raised.

See also /gallery/ticks_and_spines/date_precision_and_epochs.

Parameters

epoch

[str] valid UTC date parsable by `numpy.datetime64` (do not include timezone).

18.22 matplotlib.dviread

A module for reading dvi files output by TeX. Several limitations make this not (currently) useful as a general-purpose dvi preprocessor, but it is currently used by the pdf backend for processing usetex text.

Interface:

```
with Dvi(filename, 72) as dvi:
    # iterate over pages:
    for page in dvi:
        w, h, d = page.width, page.height, page.descent
        for x, y, font, glyph, width in page.text:
            fontname = font.texname
            pointsize = font.size
            ...
        for x, y, height, width in page.boxes:
            ...
```

class matplotlib.dviread.Dvi(*filename*, *dpi*)

Bases: object

A reader for a dvi ("device-independent") file, as produced by TeX. The current implementation can only iterate through pages in order, and does not even attempt to verify the postamble.

This class can be used as a context manager to close the underlying file upon exit. Pages can be read via iteration. Here is an overly simple way to extract text without trying to detect whitespace:

```
>>> with matplotlib.dviread.Dvi('input.dvi', 72) as dvi:
...     for page in dvi:
...         print(''.join(chr(t.glyph) for t in page.text))
```

Read the data from the file named *filename* and convert TeX's internal units to units of *dpi* per inch. *dpi* only sets the units and does not limit the resolution. Use None to return TeX's internal units.

close(*self*)

Close the underlying file if it is open.

class matplotlib.dviread.DviFont(*scale*, *tfm*, *texname*, *vf*)

Bases: object

Encapsulation of a font that a DVI file can refer to.

This class holds a font's texname and size, supports comparison, and knows the widths of glyphs in the same units as the AFM file. There are also internal attributes (for use by dviread.py) that are *not* used for comparison.

The size is in Adobe points (converted from TeX points).

Parameters

scale

[float] Factor by which the font is scaled from its natural size.

tfm

[Tfm] TeX font metrics for this font

texname

[bytes] Name of the font as used internally by TeX and friends, as an ASCII bytestring. This is usually very different from any external font names, and `dviread.PsfontsMap` can be used to find the external name of the font.

vf

[Vf] A TeX "virtual font" file, or None if this font is not virtual.

Attributes

texname

[bytes]

size

[float] Size of the font in Adobe points, converted from the slightly smaller TeX points.

widths

[list] Widths of glyphs in glyph-space units, typically 1/1000ths of the point size.

size

texname

widths

class matplotlib.dviread.**Encoding**(***kwargs*)

Bases: `object`

[*Deprecated*] Parse a *.enc file referenced from a psfonts.map style file.

The format this class understands is a very limited subset of PostScript.

Usage (subject to change):

```
for name in Encoding(filename):
    whatever(name)
```

Parameters

filename

[str or path-like]

Notes

Deprecated since version 3.3.

Attributes

encoding

[list] List of character names

`encoding`

`class matplotlib.dviread.PsFont(`*texname*, *psname*, *effects*, *encoding*, *filename*`)`

Bases: `tuple`

Create new instance of PsFont(texname, psname, effects, encoding, filename)

`effects`
Alias for field number 2

`encoding`
Alias for field number 3

`filename`
Alias for field number 4

`psname`
Alias for field number 1

`texname`
Alias for field number 0

`class matplotlib.dviread.PsfontsMap(`*filename*`)`

Bases: `object`

A psfonts.map formatted file, mapping TeX fonts to PS fonts.

Parameters

filename

[str or path-like]

Notes

For historical reasons, TeX knows many Type-1 fonts by different names than the outside world. (For one thing, the names have to fit in eight characters.) Also, TeX's native fonts are not Type-1 but Metafont, which is nontrivial to convert to PostScript except as a bitmap. While high-quality conversions to Type-1 format exist and are shipped with modern TeX distributions, we need to know which Type-1 fonts are the counterparts of which native fonts. For these reasons a mapping is needed from internal font names to font file names.

A texmf tree typically includes mapping files called e.g. `psfonts.map`, `pdftex.map`, or `dvipdfm.map`. The file `psfonts.map` is used by **`dvips`**, `pdftex.map` by **`pdfTeX`**, and `dvipdfm.map` by **`dvipdfm`**. `psfonts.map` might avoid embedding the 35 PostScript fonts (i.e., have no filename for them, as in the Times-Bold example above), while the pdf-related files perhaps only avoid the "Base 14" pdf fonts. But the user may have configured these files differently.

Examples

```
>>> map = PsfontsMap(find_tex_file('pdftex.map'))
>>> entry = map[b'ptmbo8r']
>>> entry.texname
b'ptmbo8r'
>>> entry.psname
b'Times-Bold'
>>> entry.encoding
'/usr/local/texlive/2008/texmf-dist/fonts/enc/dvips/base/8r.enc'
>>> entry.effects
{'slant': 0.16700000000000001}
>>> entry.filename
```

class matplotlib.dviread.**Tfm**(*filename*)

Bases: `object`

A TeX Font Metric file.

This implementation covers only the bare minimum needed by the Dvi class.

Parameters

filename

[str or path-like]

Attributes

checksum

[int] Used for verifying against the dvi file.

design_size

[int] Design size of the font (unknown units)

width, height, depth

[dict] Dimensions of each character, need to be scaled by the factor specified in the dvi file. These are dicts because indexing may not start from 0.

checksum

depth

design_size

height

width

class matplotlib.dviread.**Vf**(*filename*)

Bases: *matplotlib.dviread.Dvi*

A virtual font (*.vf file) containing subroutines for dvi files.

Parameters

filename

[str or path-like]

Notes

The virtual font format is a derivative of dvi: http://mirrors.ctan.org/info/knuth/virtual-fonts This class reuses some of the machinery of *Dvi* but replaces the `_read` loop and dispatch mechanism.

Examples

```
vf = Vf(filename)
glyph = vf[code]
glyph.text, glyph.boxes, glyph.width
```

Read the data from the file named *filename* and convert TeX's internal units to units of *dpi* per inch. *dpi* only sets the units and does not limit the resolution. Use None to return TeX's internal units.

matplotlib.dviread.**find_tex_file**(*filename*, *format=None*)

Find a file in the texmf tree.

Calls `kpsewhich` which is an interface to the kpathsea library [1]. Most existing TeX distributions on Unix-like systems use kpathsea. It is also available as part of MikTeX, a popular distribution on Windows.

If the file is not found, an empty string is returned.

Parameters

filename

[str or path-like]

format

[str or bytes] Used as the value of the `--format` option to `kpsewhich`. Could be e.g. 'tfm' or 'vf' to limit the search to that type of files.

References

[1]

18.23 matplotlib.figure

matplotlib.figure implements the following classes:

Figure

Top level *Artist*, which holds all plot elements.

SubplotParams

Control the default spacing between subplots.

18.23.1 Classes

AxesStack	[*Deprecated*]
Figure	The top level container for all the plot elements.
SubplotParams	A class to hold the parameters for a subplot.

matplotlib.figure.AxesStack

class matplotlib.figure.**AxesStack**(***kwargs*)

Bases: matplotlib.figure._AxesStack

[*Deprecated*]

Notes

Deprecated since version 3.2:

__init__(*self*)

Initialize self. See help(type(self)) for accurate signature.

__module__ = 'matplotlib.figure'

Examples using matplotlib.figure.AxesStack

matplotlib.figure.Figure

class matplotlib.figure.**Figure**(*figsize=None*, *dpi=None*, *facecolor=None*, *edgecolor=None*, *linewidth=0.0*, *frameon=None*, *subplotpars=None*, *tight_layout=None*, *constrained_layout=None*)

Bases: *matplotlib.artist.Artist*

The top level container for all the plot elements.

The Figure instance supports callbacks through a *callbacks* attribute which is a *CallbackRegistry* instance. The events you can connect to are 'dpi_changed', and the callback will be called with `func(fig)` where fig is the *Figure* instance.

Attributes

patch

The *Rectangle* instance representing the figure background patch.

suppressComposite

For multiple figure images, the figure will make composite images depending on the renderer option_image_nocomposite function. If *suppressComposite* is a boolean, this will override the renderer.

Parameters

figsize

[2-tuple of floats, default: `rcParams["figure.figsize"]` (default: `[6.4, 4.8]`)] Figure dimension `(width, height)` in inches.

dpi

[float, default: `rcParams["figure.dpi"]` (default: `100.0`)] Dots per inch.

facecolor

[default: `rcParams["figure.facecolor"]` (default: `'white'`)] The figure patch facecolor.

edgecolor

[default: `rcParams["figure.edgecolor"]` (default: `'white'`)] The figure patch edge color.

linewidth

[float] The linewidth of the frame (i.e. the edge linewidth of the figure patch).

frameon

[bool, default: `rcParams["figure.frameon"]` (default: `True`)] If `False`, suppress drawing the figure background patch.

subplotpars

[*SubplotParams*] Subplot parameters. If not given, the default subplot parameters `rcParams["figure.subplot.*"]` are used.

tight_layout

[bool or dict, default: `rcParams["figure.autolayout"]` (default: `False`)] If `False` use *subplotpars*. If `True` adjust subplot parameters using *tight_layout* with default padding. When providing a dict containing the keys `pad`, `w_pad`, `h_pad`, and `rect`, the default *tight_layout* paddings will be overridden.

constrained_layout

[bool, default: `rcParams["figure.constrained_layout.use"]` (default: `False`)] If `True` use constrained layout to adjust positioning of plot elements. Like `tight_layout`, but designed to be more flexible. See *Constrained Layout Guide* for examples. (Note: does not work with *add_subplot* or *subplot2grid*.)

`__getstate__`(*self*)

`__init__`(*self*, *figsize=None*, *dpi=None*, *facecolor=None*, *edgecolor=None*, *linewidth=0.0*, *frameon=None*, *subplotpars=None*, *tight_layout=None*, *constrained_layout=None*)

Parameters

figsize

[2-tuple of floats, default: `rcParams["figure.figsize"]` (default: `[6.4, 4.8]`)] Figure dimension `(width, height)` in inches.

dpi

[float, default: `rcParams["figure.dpi"]` (default: `100.0`)] Dots per inch.

facecolor

[default: `rcParams["figure.facecolor"]` (default: `'white'`)] The figure patch facecolor.

edgecolor

[default: `rcParams["figure.edgecolor"]` (default: `'white'`)] The figure patch edge color.

linewidth

[float] The linewidth of the frame (i.e. the edge linewidth of the figure patch).

frameon

[bool, default: `rcParams["figure.frameon"]` (default: `True`)] If `False`, suppress drawing the figure background patch.

subplotpars

[*SubplotParams*] Subplot parameters. If not given, the default subplot parameters `rcParams["figure.subplot.*"]` are used.

tight_layout

[bool or dict, default: `rcParams["figure.autolayout"]` (default: `False`)] If `False` use *subplotpars*. If `True` adjust subplot parameters using *tight_layout* with default padding. When providing a dict containing the keys `pad`, `w_pad`, `h_pad`, and `rect`, the default *tight_layout* paddings will be overridden.

constrained_layout

[bool, default: `rcParams["figure.constrained_layout.use"]` (default: `False`)] If `True` use constrained layout to adjust positioning of plot elements. Like `tight_layout`, but designed to be more flexible. See *Constrained Layout Guide* for examples. (Note: does not work with *add_subplot* or *subplot2grid*.)

`__module__ = 'matplotlib.figure'`

`__repr__`(*self*)
Return repr(self).

`__setstate__`(*self*, *state*)

`__str__`(*self*)
Return str(self).

`add_artist`(*self*, *artist*, *clip=False*)
Add an *Artist* to the figure.

Usually artists are added to axes objects using *Axes.add_artist*; this method can be used in the rare cases where one needs to add artists directly to the figure instead.

Parameters

artist

[*Artist*] The artist to add to the figure. If the added artist has no transform previously set, its transform will be set to `figure.transFigure`.

clip

[bool, default: False] Whether the added artist should be clipped by the figure patch.

Returns

Artist

The added artist.

`add_axes`(*self*, **args*, ***kwargs*)
Add an axes to the figure.

Call signatures:

```
add_axes(rect, projection=None, polar=False, **kwargs)
add_axes(ax)
```

Parameters

rect

[sequence of float] The dimensions [left, bottom, width, height] of the new axes. All quantities are in fractions of figure width and height.

projection

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the *Axes*. *str* is the name of a custom projection, see *projections*. The default None results in a 'rectilinear' projection.

polar

[bool, default: False] If True, equivalent to projection='polar'.

sharex, sharey

[*Axes*, optional] Share the x or y *axis* with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

label

[str] A label for the returned axes.

Returns

Axes*, or a subclass of *Axes

The returned axes class depends on the projection used. It is *Axes* if rectilinear projection is used and *projections.polar.PolarAxes* if polar projection is used.

Other Parameters

****kwargs**

This method also takes the keyword arguments for the returned axes class. The keyword arguments for the rectilinear axes class *Axes* can be found in the following table but there might also be other keyword arguments if another projection is used, see the actual axes class.

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and r
alpha	float or None
anchor	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
animated	bool
aspect	{'auto'} or num
autoscale_on	bool
autoscalex_on	bool
autoscaley_on	bool
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	None, or a number
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None

Figure.add_subplot

pyplot.subplot

pyplot.axes

Figure.subplots

pyplot.subplots

Notes

If the figure already has an axes with key (*args*, *kwargs*) then it will simply make that axes current and return it. This behavior is deprecated. Meanwhile, if you do not want this behavior (i.e., you want to force the creation of a new axes), you must use a unique set of args and kwargs. The axes *label* attribute has been exposed for this purpose: if you want two axes that are otherwise identical to be added to the figure, make sure you give them unique labels.

In rare circumstances, *add_axes* may be called with a single argument, a axes instance already created in the present figure but not in the figure's list of axes.

Examples

Some simple examples:

```
rect = l, b, w, h
fig = plt.figure()
fig.add_axes(rect, label=label1)
fig.add_axes(rect, label=label2)
fig.add_axes(rect, frameon=False, facecolor='g')
fig.add_axes(rect, polar=True)
ax = fig.add_axes(rect, projection='polar')
fig.delaxes(ax)
fig.add_axes(ax)
```

`add_axobserver`(*self*, *func*)
Whenever the axes state change, `func(self)` will be called.

`add_gridspec`(*self*, *nrows=1*, *ncols=1*, ***kwargs*)
Return a *GridSpec* that has this figure as a parent. This allows complex layout of axes in the figure.

Parameters

nrows

[int, default: 1] Number of rows in grid.

ncols

[int, default: 1] Number or columns in grid.

Returns

GridSpec

Other Parameters

****kwargs**

Keyword arguments are passed to *GridSpec*.

See also:

matplotlib.pyplot.subplots

Examples

Adding a subplot that spans two rows:

```
fig = plt.figure()
gs = fig.add_gridspec(2, 2)
ax1 = fig.add_subplot(gs[0, 0])
ax2 = fig.add_subplot(gs[1, 0])
# spans two rows:
ax3 = fig.add_subplot(gs[:, 1])
```

`add_subplot`(*self*, **args*, ***kwargs*)

Add an *Axes* to the figure as part of a subplot arrangement.

Call signatures:

```
add_subplot(nrows, ncols, index, **kwargs)
add_subplot(pos, **kwargs)
add_subplot(ax)
add_subplot()
```

Parameters

***args**

[int, (int, int, *index*), or *SubplotSpec*, default: (1, 1, 1)] The position of the subplot described by one of

- Three integers (*nrows*, *ncols*, *index*). The subplot will take the *index* position on a grid with *nrows* rows and *ncols* columns. *index* starts at 1 in the upper left corner and increases to the right. *index* can also be a two-tuple specifying the (*first*, *last*) indices (1-based, and including *last*) of the subplot, e.g., `fig.add_subplot(3, 1, (1, 2))` makes a subplot that spans the upper 2/3 of the figure.
- A 3-digit integer. The digits are interpreted as if given separately as three single-digit integers, i.e. `fig.add_subplot(235)` is the same as `fig.add_subplot(2, 3, 5)`. Note that this can only be used if there are no more than 9 subplots.

- A *SubplotSpec*.

In rare circumstances, *add_subplot* may be called with a single argument, a subplot axes instance already created in the present figure but not in the figure's list of axes.

projection

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the subplot (*Axes*). *str* is the name of a custom projection, see *projections*. The default None results in a 'rectilinear' projection.

polar

[bool, default: False] If True, equivalent to projection='polar'.

sharex, sharey

[*Axes*, optional] Share the x or y *axis* with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

label

[str] A label for the returned axes.

Returns

axes.SubplotBase, **or another subclass of** *Axes*

The axes of the subplot. The returned axes base class depends on the projection used. It is *Axes* if rectilinear projection is used and *projections.polar.PolarAxes* if polar projection is used. The returned axes is then a subplot subclass of the base class.

Other Parameters

****kwargs**

This method also takes the keyword arguments for the returned axes base class; except for the *figure* argument. The keyword arguments for the rectilinear base class *Axes* can be found in the following table but there might also be other keyword arguments if another projection is used.

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and r
alpha	float or None
anchor	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
animated	bool

Table 135 – continued from previous page

Property	Description
aspect	{'auto'} or num
autoscale_on	bool
autoscalex_on	bool
autoscaley_on	bool
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	None, or a number
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
contains	unknown
facecolor or fc	color
figure	*Figure*
frame_on	bool
gid	str
in_layout	bool
label	object
navigate	bool
navigate_mode	unknown
path_effects	*AbstractPathEffect*
picker	None or bool or callable
position	[left, bottom, width, height] or *Bbox*
prop_cycle	unknown
rasterization_zorder	float or None
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
title	str
transform	*Transform*

Figure.add_axes

pyplot.subplot

pyplot.axes

Figure.subplots

pyplot.subplots

Notes

If the figure already has a subplot with key (*args*, *kwargs*) then it will simply make that subplot current and return it. This behavior is deprecated. Meanwhile, if you do not want this behavior (i.e., you want to force the creation of a new subplot), you must use a unique set of args and kwargs. The axes *label* attribute has been exposed for this purpose: if you want two subplots that are otherwise identical to be added to the figure, make sure you give them unique labels.

Examples

```
fig = plt.figure()

fig.add_subplot(231)
ax1 = fig.add_subplot(2, 3, 1)  # equivalent but more general

fig.add_subplot(232, frameon=False)  # subplot with no frame
fig.add_subplot(233, projection='polar')  # polar subplot
fig.add_subplot(234, sharex=ax1)  # subplot sharing x-axis with ax1
fig.add_subplot(235, facecolor="red")  # red subplot

ax1.remove()  # delete ax1 from the figure
fig.add_subplot(ax1)  # add ax1 back to the figure
```

`align_labels`(*self*, *axs=None*)

Align the xlabels and ylabels of subplots with the same subplots row or column (respectively) if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

Parameters

axs

[list of *Axes*] Optional list (or ndarray) of *Axes* to align the labels. Default is to align all axes on the figure.

See also:

matplotlib.figure.Figure.align_xlabels

matplotlib.figure.Figure.align_ylabels

`align_xlabels`(*self*, *axs=None*)

Align the xlabels of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the bottom, it is aligned with labels on axes that also have their label on the bottom and that have the same bottom-most subplot row. If the label is on the top, it is aligned with labels on axes with the same top-most row.

Parameters

axs

[list of *Axes*] Optional list of (or ndarray) *Axes* to align the xlabels. Default is to align all axes on the figure.

See also:

matplotlib.figure.Figure.align_ylabels

matplotlib.figure.Figure.align_labels

Notes

This assumes that `axs` are from the same *GridSpec*, so that their *SubplotSpec* positions correspond to figure positions.

Examples

Example with rotated xtick labels:

```
fig, axs = plt.subplots(1, 2)
for tick in axs[0].get_xticklabels():
    tick.set_rotation(55)
axs[0].set_xlabel('XLabel 0')
axs[1].set_xlabel('XLabel 1')
fig.align_xlabels()
```

`align_ylabels`(*self*, *axs=None*)

Align the ylabels of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the left, it is aligned with labels on axes that also have their label on the left and that have the same left-most subplot column. If the label is on the right, it is aligned with labels on axes with the same right-most column.

Parameters

axs

[list of *Axes*] Optional list (or ndarray) of *Axes* to align the ylabels. Default is to align all axes on the figure.

See also:

matplotlib.figure.Figure.align_xlabels

matplotlib.figure.Figure.align_labels

Notes

This assumes that `axs` are from the same *GridSpec*, so that their *SubplotSpec* positions correspond to figure positions.

Examples

Example with large yticks labels:

```
fig, axs = plt.subplots(2, 1)
axs[0].plot(np.arange(0, 1000, 50))
axs[0].set_ylabel('YLabel 0')
axs[1].set_ylabel('YLabel 1')
fig.align_ylabels()
```

`autofmt_xdate`(*self*, *bottom=0.2*, *rotation=30*, *ha='right'*, *which='major'*)

Date ticklabels often overlap, so it is useful to rotate them and right align them. Also, a common use case is a number of subplots with shared xaxes where the x-axis is date data. The ticklabels are often long, and it helps to rotate them on the bottom subplot and turn them off on other subplots, as well as turn off xlabels.

Parameters

bottom

[float, default: 0.2] The bottom of the subplots for *subplots_adjust*.

rotation

[float, default: 30 degrees] The rotation angle of the xtick labels in degrees.

ha

[{'left', 'center', 'right'}, default: 'right'] The horizontal alignment of the xticklabels.

which

[{'major', 'minor', 'both'}, default: 'major'] Selects which ticklabels to rotate.

`property axes`

List of axes in the Figure. You can access and modify the axes in the Figure through this list.

Do not modify the list itself. Instead, use "*add_axes*, *add_subplot* or *delaxes* to add or remove an axes.

`clear`(*self*, *keep_observers=False*)

Clear the figure -- synonym for *clf*.

`clf`(*self*, *keep_observers=False*)

Clear the figure.

Set *keep_observers* to True if, for example, a gui widget is tracking the axes in the figure.

`colorbar`(*self*, *mappable*, *cax=None*, *ax=None*, *use_gridspec=True*, ***kw*)

Create a colorbar for a ScalarMappable instance, *mappable*.

Documentation for the pyplot thin wrapper:

Add a colorbar to a plot.

Function signatures for the *pyplot* interface; all but the first are also method signatures for the *colorbar* method:

```
colorbar(**kwargs)
colorbar(mappable, **kwargs)
colorbar(mappable, cax=cax, **kwargs)
colorbar(mappable, ax=ax, **kwargs)
```

Parameters

mappable

The *matplotlib.cm.ScalarMappable* (i.e., *AxesImage*, *ContourSet*, etc.) described by this colorbar. This argument is mandatory for the *Figure.colorbar* method but optional for the *pyplot.colorbar* function, which sets the default to the current image.

Note that one can create a *ScalarMappable* "on-the-fly" to generate colorbars not attached to a previously drawn artist, e.g.

```
fig.colorbar(cm.ScalarMappable(norm=norm, cmap=cmap), ax=ax)
```

cax

[*Axes*, optional] Axes into which the colorbar will be drawn.

ax

[*Axes*, list of Axes, optional] Parent axes from which space for a new colorbar axes will be stolen. If a list of axes is given they will all be resized to make room for the colorbar axes.

use_gridspec

[bool, optional] If *cax* is `None`, a new *cax* is created as an instance of Axes. If *ax* is an instance of Subplot and *use_gridspec* is `True`, *cax* is created as an instance of Subplot using the *gridspec* module.

Returns

colorbar

[*Colorbar*] See also its base class, *ColorbarBase*.

Notes

Additional keyword arguments are of two kinds:

axes properties:

fraction

[float, default: 0.15] Fraction of original axes to use for colorbar.

shrink

[float, default: 1.0] Fraction by which to multiply the size of the colorbar.

aspect

[float, default: 20] Ratio of long to short dimensions.

pad

[float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

anchor

[(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

panchor

[(float, float), or *False*, optional] The anchor point of the colorbar parent axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

colorbar properties:

Property	Description
extend	{'neither', 'both', 'min', 'max'} If not 'neither', make pointed end(s) for out-of- range values. These are set for a given colormap using the colormap set_under and set_over methods.
extendfrac	{*None*, 'auto', length, lengths} If set to *None*, both the minimum and maximum triangular colorbar extensions with have a length of 5% of the interior colorbar length (this is the default setting). If set to 'auto', makes the triangular colorbar extensions the same lengths as the interior boxes (when *spacing* is set to 'uniform') or the same lengths as the respective adjacent interior boxes (when *spacing* is set to 'proportional'). If a scalar, indicates the length of both the minimum and maximum triangular colorbar extensions as a fraction of the interior colorbar length. A two-element sequence of fractions may also be given, indicating the lengths of the minimum and maximum colorbar extensions respectively as a fraction of the interior colorbar length.
extendrect	bool If *False* the minimum and maximum colorbar extensions will be triangular (the default). If *True* the extensions will be rectangular.
spacing	{'uniform', 'proportional'} Uniform spacing gives each discrete color the same space; proportional makes the space proportional to the data interval.
ticks	*None* or list of ticks or Locator If None, ticks are determined automatically from the input.
format	None or str or Formatter If None, *ScalarFormatter* is used. If a format string is given, e.g., '%.3f', that is used. An alternative *Formatter* may be given instead.
drawedges	bool Whether to draw lines at color boundaries.
label	str The label on the colorbar's long axis.

The following will probably be useful only in the context of indexed colors (that is, when the mappable has norm=NoNorm()), or other unusual circumstances.

Property	Description
boundaries	None or a sequence
values	None or a sequence which must be of length 1 less than the sequence of *boundaries*. For each region delimited by adjacent entries in *boundaries*, the color mapped to the corresponding value in values will be used.

If *mappable* is a *ContourSet*, its *extend* kwarg is included automatically.

The *shrink* kwarg provides a simple way to scale the colorbar with respect to the axes. Note that if *cax* is specified, it determines the size of the colorbar and *shrink* and *aspect* kwargs are ignored.

For more precise control, you can manually specify the positions of the axes objects in which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewers (svg and pdf) renders white gaps between segments of the colorbar. This is due to bugs in the viewers, not Matplotlib. As a workaround, the colorbar can be rendered with overlapping segments:

```
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However this has negative consequences in other circumstances, e.g. with semi-transparent images (alpha < 1) and colorbar extensions; therefore, this workaround is not used by default (see issue #1188).

`contains`(*self*, *mouseevent*)
Test whether the mouse event occurred on the figure.

Returns

bool, {}

`delaxes`(*self*, *ax*)
Remove the *Axes* *ax* from the figure; update the current axes.

`property dpi`
The resolution in dots per inch.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`draw_artist`(*self*, *a*)
Draw *Artist* instance *a* only.

This can only be called after the figure has been drawn.

`execute_constrained_layout`(*self*, *renderer=None*)
Use `layoutbox` to determine pos positions within axes.

See also *set_constrained_layout_pads*.

`figimage`(*self*, *X*, *xo=0*, *yo=0*, *alpha=None*, *norm=None*, *cmap=None*, *vmin=None*, *vmax=None*, *origin=None*, *resize=False*, ***kwargs*)
Add a non-resampled image to the figure.

The image is attached to the lower or upper left corner depending on *origin*.

Parameters

X

The image data. This is an array of one of the following shapes:

- MxN: luminance (grayscale) values
- MxNx3: RGB values
- MxNx4: RGBA values

xo, yo

[int] The *x*/*y* image offset in pixels.

alpha

[None or float] The alpha blending value.

norm

[*matplotlib.colors.Normalize*] A *Normalize* instance to map the luminance to the interval [0, 1].

cmap

[str or *matplotlib.colors.Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] The colormap to use.

vmin, vmax

[float] If *norm* is not given, these values set the data limits for the colormap.

origin

[{'upper', 'lower'}, default: `rcParams["image.origin"]` (default: `'upper'`)] Indicates where the [0, 0] index of the array is in the upper left or lower left corner of the axes.

resize

[bool] If *True*, resize the figure to match the given image size.

Returns

matplotlib.image.FigureImage

Other Parameters

****kwargs**

Additional kwargs are *Artist* kwargs passed on to *FigureImage*.

Notes

figimage complements the axes image (*imshow*) which will be resampled to fit the current axes. If you want a resampled image to fill the entire figure, you can define an *Axes* with extent [0, 0, 1, 1].

Examples

```
f = plt.figure()
nx = int(f.get_figwidth() * f.dpi)
ny = int(f.get_figheight() * f.dpi)
data = np.random.random((ny, nx))
f.figimage(data)
plt.show()
```

`property frameon`
Return the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.get_visible()`.

`gca`(*self*, ***kwargs*)
Get the current axes, creating one if necessary.

The following kwargs are supported for ensuring the returned axes adheres to the given projection etc., and for axes creation if the active axes does not exist:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and r
alpha	float or None
anchor	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
animated	bool
aspect	{'auto'} or num
autoscale_on	bool
autoscalex_on	bool
autoscaley_on	bool
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	None, or a number
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
contains	unknown
facecolor or fc	color
figure	*Figure*
frame_on	bool
gid	str
in_layout	bool
label	object
navigate	bool
navigate_mode	unknown
path_effects	*AbstractPathEffect*
picker	None or bool or callable
position	[left, bottom, width, height] or *Bbox*
prop_cycle	unknown
rasterization_zorder	float or None
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
title	str
transform	*Transform*
url	str
visible	bool
xbound	unknown
xlabel	str
xlim	(bottom: float, top: float)
xmargin	float greater than -0.5
xscale	{"linear", "log", "symlog", "logit", ...}
xticklabels	unknown
xticks	unknown

Table 136 – continued from previous page

Property	Description
ybound	unknown
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	{"linear", "log", "symlog", "logit", ...}
yticklabels	unknown
yticks	unknown
zorder	float

`get_axes`(*self*)
Return a list of axes in the Figure. You can access and modify the axes in the Figure through this list.

Do not modify the list itself. Instead, use *add_axes*, *add_subplot* or *delaxes* to add or remove an axes.

Note: This is equivalent to the property *axes*.

`get_children`(*self*)
Get a list of artists contained in the figure.

`get_constrained_layout`(*self*)
Return whether constrained layout is being used.

See *Constrained Layout Guide*.

`get_constrained_layout_pads`(*self*, *relative=False*)
Get padding for `constrained_layout`.

Returns a list of `w_pad, h_pad` in inches and `wspace` and `hspace` as fractions of the subplot.

See *Constrained Layout Guide*.

Parameters

relative

[bool] If `True`, then convert from inches to figure relative.

`get_default_bbox_extra_artists`(*self*)

`get_dpi`(*self*)
Return the resolution in dots per inch as a float.

`get_edgecolor`(*self*)
Get the edge color of the Figure rectangle.

`get_facecolor`(*self*)
Get the face color of the Figure rectangle.

get_figheight(*self*)
Return the figure height in inches.

get_figwidth(*self*)
Return the figure width in inches.

get_frameon(*self*)
Return the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.get_visible()`.

get_size_inches(*self*)
Return the current size of the figure in inches.

Returns

ndarray

The size (width, height) of the figure in inches.

See also:

matplotlib.figure.Figure.set_size_inches

matplotlib.figure.Figure.get_figwidth

matplotlib.figure.Figure.get_figheight

Notes

The size in pixels can be obtained by multiplying with *Figure.dpi*.

get_tight_layout(*self*)
Return whether *tight_layout* is called when drawing.

get_tightbbox(*self*, *renderer*, *bbox_extra_artists=None*)
Return a (tight) bounding box of the figure in inches.

Artists that have `artist.set_in_layout(False)` are not included in the bbox.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

bbox_extra_artists

[list of *Artist* or `None`] List of artists to include in the tight bounding box. If `None` (default), then all artist children of each axes are included in the tight bounding box.

Returns

BboxBase

containing the bounding box (in figure inches).

`get_window_extent`(*self*, **args*, ***kwargs*)

Return the figure bounding box in display space. Arguments are ignored.

`ginput`(*self*, *n=1*, *timeout=30*, *show_clicks=True*, *mouse_add=<MouseButton.LEFT: 1>*, *mouse_pop=<MouseButton.RIGHT: 3>*, *mouse_stop=<MouseButton.MIDDLE: 2>*)

Blocking call to interact with a figure.

Wait until the user clicks *n* times on the figure, and return the coordinates of each click in a list.

There are three possible interactions:

- Add a point.
- Remove the most recently added point.
- Stop the interaction and return the points added so far.

The actions are assigned to mouse buttons via the arguments *mouse_add*, *mouse_pop* and *mouse_stop*.

Parameters

n

[int, default: 1] Number of mouse clicks to accumulate. If negative, accumulate clicks until the input is terminated manually.

timeout

[float, default: 30 seconds] Number of seconds to wait before timing out. If zero or negative will never timeout.

show_clicks

[bool, default: True] If True, show a red cross at the location of each click.

mouse_add

[*MouseButton* or None, default: *MouseButton.LEFT*] Mouse button used to add points.

mouse_pop

[*MouseButton* or None, default: *MouseButton.RIGHT*] Mouse button used to remove the most recently added point.

mouse_stop

[*MouseButton* or None, default: *MouseButton.MIDDLE*] Mouse button used to stop input.

Returns

list of tuples

A list of the clicked (x, y) coordinates.

Notes

The keyboard can also be used to select points in case your mouse does not have one or more of the buttons. The delete and backspace keys act like right clicking (i.e., remove last point), the enter key terminates input and any other key (not already used by the window manager) selects a point.

`init_layoutbox`(*self*)
Initialize the layoutbox for use in constrained_layout.

`legend`(*self*, **args*, ***kwargs*)
Place a legend on the figure.

To make a legend from existing artists on every axes:

```
legend()
```

To make a legend for a list of lines and labels:

```
legend(
    (line1, line2, line3),
    ('label1', 'label2', 'label3'),
    loc='upper right')
```

These can also be specified by keyword:

```
legend(
    handles=(line1, line2, line3),
    labels=('label1', 'label2', 'label3'),
    loc='upper right')
```

Parameters

handles

[list of *Artist*, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with *labels*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

labels

[list of str, optional] A list of labels to show next to the artists. Use this together with *handles*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

Returns

Legend

Other Parameters

loc

[str or pair of floats, default: `rcParams["legend.loc"]` (default: `'best'`) ('best' for axes, 'upper right' for figures)] The location of the legend.

The strings `'upper left'`, `'upper right'`, `'lower left'`, `'lower right'` place the legend at the corresponding corner of the axes/figure.

The strings `'upper center'`, `'lower center'`, `'center left'`, `'center right'` place the legend at the center of the corresponding edge of the axes/figure.

The string `'center'` places the legend at the center of the axes/figure.

The string `'best'` places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case *bbox_to_anchor* will be ignored).

For back-compatibility, `'center right'` (but no other location) can also be spelled `'right'`, and each "string" locations can also be given as a numeric value:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*. Defaults to `axes.bbox` (if called as a method to *Axes.legend*) or `figure.bbox` (if *Figure.legend*). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by *bbox_transform*, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox `(x, y, width, height)` that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple `(x, y)` places the corner of the legend specified by *loc* at x, y. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

ncol

[int, default: 1] The number of columns that the legend has.

prop

[None or *matplotlib.font_manager.FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

labelcolor

[str or list] Sets the color of the text in the legend. Can be a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

numpoints

[int, default: `rcParams["legend.numpoints"]` (default: `1`)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).

scatterpoints

[int, default: `rcParams["legend.scatterpoints"]` (default: `1`)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).

scatteryoffsets

[iterable of floats, default: `[0.375, 0.5, 0.3125]`] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to `[0.5]`.

markerscale

[float, default: `rcParams["legend.markerscale"]` (default: `1.0`)] The relative size of legend markers compared with the originally drawn ones.

markerfirst

[bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

frameon

[bool, default: `rcParams["legend.frameon"]` (default: `True`)] Whether the legend should be drawn on a patch (frame).

fancybox

[bool, default: `rcParams["legend.fancybox"]` (default: `True`)] Whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend's background.

shadow

[bool, default: rcParams["legend.shadow"] (default: False)] Whether to draw a shadow behind the legend.

framealpha

[float, default: rcParams["legend.framealpha"] (default: 0.8)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is None, the default value is ignored.

facecolor

["inherit" or color, default: rcParams["legend.facecolor"] (default: 'inherit')] The legend's background color. If "inherit", use rcParams["axes.facecolor"] (default: 'white').

edgecolor

["inherit" or color, default: rcParams["legend.edgecolor"] (default: '0.8')] The legend's background patch edge color. If "inherit", use take rcParams["axes.edgecolor"] (default: 'black').

mode

[{"expand", None}] If *mode* is set to "expand" the legend will be horizontally expanded to fill the axes area (or *bbox_to_anchor* if defines the legend's size).

bbox_transform

[None or *matplotlib.transforms.Transform*] The transform for the bounding box (*bbox_to_anchor*). For a value of None (default) the Axes' transAxes transform will be used.

title

[str or None] The legend's title. Default is no title (None).

title_fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: rcParams["legend.title_fontsize"] (default: None)] The font size of the legend's title.

borderpad

[float, default: rcParams["legend.borderpad"] (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

labelspacing

[float, default: rcParams["legend.labelspacing"] (default: 0.5)] The vertical space between the legend entries, in font-size units.

handlelength

[float, default: `rcParams["legend.handlelength"]` (default: `2.0`)] The length of the legend handles, in font-size units.

handletextpad

[float, default: `rcParams["legend.handletextpad"]` (default: `0.8`)] The pad between the legend handle and text, in font-size units.

borderaxespad

[float, default: `rcParams["legend.borderaxespad"]` (default: `0.5`)] The pad between the axes and legend border, in font-size units.

columnspacing

[float, default: `rcParams["legend.columnspacing"]` (default: `2.0`)] The spacing between columns, in font-size units.

handler_map

[dict or None] The custom dictionary mapping instances or types to a legend handler. This *handler_map* updates the default handler map found at *matplotlib.legend.Legend.get_legend_handler_map*.

Notes

Some artists are not supported by this function. See *Legend guide* for details.

`savefig`(*self*, *fname*, *, *transparent=None*, **kwargs*)

Save the current figure.

Call signature:

```
savefig(fname, dpi=None, facecolor='w', edgecolor='w',
        orientation='portrait', papertype=None, format=None,
        transparent=False, bbox_inches=None, pad_inches=0.1,
        frameon=None, metadata=None)
```

The available output formats depend on the backend being used.

Parameters

fname

[str or path-like or file-like] A path, or a Python file-like object, or possibly some backend-dependent object such as *matplotlib.backends.backend_pdf.PdfPages*.

If *format* is set, it determines the output format, and the file is saved as *fname*. Note that *fname* is used verbatim, and there

is no attempt to make the extension, if any, of *fname* match *format*, and no extension is appended.

If *format* is not set, then the format is inferred from the extension of *fname*, if there is one. If *format* is not set and *fname* has no extension, then the file is saved with `rcParams["savefig.format"]` (default: `'png'`) and the appropriate extension is appended to *fname*.

Other Parameters

dpi

[float or 'figure', default: `rcParams["savefig.dpi"]` (default: `'figure'`)] The resolution in dots per inch. If 'figure', use the figure's dpi value.

quality

[int, default: `rcParams["savefig.jpeg_quality"]` (default: `95`)] Applicable only if *format* is 'jpg' or 'jpeg', ignored otherwise.

The image quality, on a scale from 1 (worst) to 95 (best). Values above 95 should be avoided; 100 disables portions of the JPEG compression algorithm, and results in large files with hardly any gain in image quality.

This parameter is deprecated.

optimize

[bool, default: False] Applicable only if *format* is 'jpg' or 'jpeg', ignored otherwise.

Whether the encoder should make an extra pass over the image in order to select optimal encoder settings.

This parameter is deprecated.

progressive

[bool, default: False] Applicable only if *format* is 'jpg' or 'jpeg', ignored otherwise.

Whether the image should be stored as a progressive JPEG file.

This parameter is deprecated.

facecolor

[color or 'auto', default: `rcParams["savefig.facecolor"]` (default: `'auto'`)] The facecolor of the figure. If 'auto', use the current figure facecolor.

edgecolor

[color or 'auto', default: `rcParams["savefig.edgecolor"]` (default: `'auto'`)] The edgecolor of the figure. If 'auto', use the current figure edgecolor.

orientation

[{'landscape', 'portrait'}] Currently only supported by the postscript backend.

papertype

[str] One of 'letter', 'legal', 'executive', 'ledger', 'a0' through 'a10', 'b0' through 'b10'. Only supported for postscript output.

format

[str] The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under *fname*.

transparent

[bool] If *True*, the axes patches will all be transparent; the figure patch will also be transparent unless facecolor and/or edgecolor are specified via kwargs. This is useful, for example, for displaying a plot on top of a colored background on a web page. The transparency of these patches will be restored to their original values upon exit of this function.

bbox_inches

[str or *Bbox*, default: `rcParams["savefig.bbox"]` (default: `None`)] Bounding box in inches: only the given portion of the figure is saved. If 'tight', try to figure out the tight bbox of the figure.

pad_inches

[float, default: `rcParams["savefig.pad_inches"]` (default: `0.1`)] Amount of padding around the figure when bbox_inches is 'tight'.

bbox_extra_artists

[list of *Artist*, optional] A list of extra artists that will be considered when the tight bbox is calculated.

backend

[str, optional] Use a non-default backend to render the file, e.g. to render a png file with the "cairo" backend rather than the default "agg", or a pdf file with the "pgf" backend rather than the default "pdf". Note that the default backend is normally sufficient. See *The builtin backends* for a list of valid backends for each file format. Custom backends can be referenced as "module://...".

metadata

[dict, optional] Key/value pairs to store in the image metadata. The supported keys and defaults depend on the image format and backend:

- 'png' with Agg backend: See the parameter `metadata` of *print_png*.
- 'pdf' with pdf backend: See the parameter `metadata` of *PdfPages*.
- 'svg' with svg backend: See the parameter `metadata` of *print_svg*.
- 'eps' and 'ps' with PS backend: Only 'Creator' is supported.

pil_kwargs

[dict, optional] Additional keyword arguments that are passed to `PIL.Image.Image.save` when saving the figure.

`sca`(*self*, *a*)
Set the current axes to be *a* and return *a*.

`set_canvas`(*self*, *canvas*)
Set the canvas that contains the figure

Parameters

canvas

[FigureCanvas]

`set_constrained_layout`(*self*, *constrained*)
Set whether `constrained_layout` is used upon drawing. If None, `rcParams["figure.constrained_layout.use"]` (default: `False`) value will be used.

When providing a dict containing the keys `w_pad`, `h_pad` the default `constrained_layout` paddings will be overridden. These pads are in inches and default to 3.0/72.0. `w_pad` is the width padding and `h_pad` is the height padding.

See *Constrained Layout Guide*.

Parameters

constrained

[bool or dict or None]

`set_constrained_layout_pads`(*self*, ***kwargs*)
Set padding for `constrained_layout`. Note the kwargs can be passed as a dictionary `fig.set_constrained_layout(**paddict)`.

See *Constrained Layout Guide*.

Parameters

w_pad

[float] Width padding in inches. This is the pad around axes and is meant to make sure there is enough room for fonts to look good. Defaults to 3 pts = 0.04167 inches

h_pad

[float] Height padding in inches. Defaults to 3 pts.

wspace

[float] Width padding between subplots, expressed as a fraction of the subplot width. The total padding ends up being w_pad + wspace.

hspace

[float] Height padding between subplots, expressed as a fraction of the subplot width. The total padding ends up being h_pad + hspace.

`set_dpi`(*self*, *val*)
Set the resolution of the figure in dots-per-inch.

Parameters

val

[float]

`set_edgecolor`(*self*, *color*)
Set the edge color of the Figure rectangle.

Parameters

color

[color]

`set_facecolor`(*self*, *color*)
Set the face color of the Figure rectangle.

Parameters

color

[color]

`set_figheight`(*self*, *val*, *forward=True*)
Set the height of the figure in inches.

Parameters

val

[float]

forward

[bool] See *set_size_inches*.

See also:

matplotlib.figure.Figure.set_figwidth

matplotlib.figure.Figure.set_size_inches

set_figwidth(*self*, *val*, *forward=True*)

Set the width of the figure in inches.

Parameters

val

[float]

forward

[bool] See *set_size_inches*.

See also:

matplotlib.figure.Figure.set_figheight

matplotlib.figure.Figure.set_size_inches

set_frameon(*self*, *b*)

Set the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.set_visible()`.

Parameters

b

[bool]

set_size_inches(*self*, *w*, *h=None*, *forward=True*)

Set the figure size in inches.

Call signatures:

```
fig.set_size_inches(w, h)  # OR
fig.set_size_inches((w, h))
```

Parameters

w

[(float, float) or float] Width and height in inches (if height not specified as a separate argument) or width.

h

[float] Height in inches.

forward

[bool, default: True] If `True`, the canvas size is automatically updated, e.g., you can resize the figure window from the shell.

See also:

matplotlib.figure.Figure.get_size_inches

matplotlib.figure.Figure.set_figwidth

matplotlib.figure.Figure.set_figheight

Notes

To transform from pixels to inches divide by *Figure.dpi*.

`set_tight_layout`(*self*, *tight*)

Set whether and how *tight_layout* is called when drawing.

Parameters

tight

[bool or dict with keys "pad", "w_pad", "h_pad", "rect" or None] If a bool, sets whether to call *tight_layout* upon drawing. If `None`, use the `figure.autolayout` rcparam instead. If a dict, pass it as kwargs to *tight_layout*, overriding the default paddings.

`show`(*self*, *warn=True*)

If using a GUI backend with pyplot, display the figure window.

If the figure was not created using *figure*, it will lack a *FigureManagerBase*, and this method will raise an AttributeError.

Warning: This does not manage an GUI event loop. Consequently, the figure may only be shown briefly or not shown at all if you or your environment are not managing an event loop.

Proper use cases for *Figure.show* include running this from a GUI application or an IPython shell.

If you're running a pure python shell or executing a non-GUI python script, you should use *matplotlib.pyplot.show* instead, which takes care of managing the event loop for you.

Parameters

warn

[bool, default: True] If `True` and we are not running headless (i.e. on Linux with an unset DISPLAY), issue warning when called on a non-GUI backend.

`subplot_mosaic`(*self*, *layout*, *, *subplot_kw=None*, *gridspec_kw=None*, *empty_sentinel='.'*)

Build a layout of Axes based on ASCII art or nested lists.

This is a helper function to build complex GridSpec layouts visually.

Note: This API is provisional and may be revised in the future based on early user feedback.

Parameters

layout

[list of list of {hashable or nested} or str] A visual layout of how you want your Axes to be arranged labeled as strings. For example

```
x = [['A panel', 'A panel', 'edge'],
     ['C panel', '.',       'edge']]
```

Produces 4 axes:

- 'A panel' which is 1 row high and spans the first two columns
- 'edge' which is 2 rows high and is on the right edge
- 'C panel' which in 1 row and 1 column wide in the bottom left
- a blank space 1 row and 1 column wide in the bottom center

Any of the entries in the layout can be a list of lists of the same form to create nested layouts.

If input is a str, then it must be of the form

```
'''
AAE
C.E
'''
```

where each character is a column and each line is a row. This only allows only single character Axes labels and does not allow nesting but is very terse.

subplot_kw

[dict, optional] Dictionary with keywords passed to the *Figure.add_subplot* call used to create each subplot.

gridspec_kw

[dict, optional] Dictionary with keywords passed to the *GridSpec* constructor used to create the grid the subplots are placed on.

empty_sentinel

[object, optional] Entry in the layout to mean "leave this space empty". Defaults to `'.'`. Note, if *layout* is a string, it is processed via `inspect.cleandoc` to remove leading white space, which may interfere with using white-space as the empty sentinel.

Returns

dict[label, Axes]

A dictionary mapping the labels to the Axes objects.

`subplots`(*self*, *nrows=1*, *ncols=1*, ***, *sharex=False*, *sharey=False*, *squeeze=True*, *subplot_kw=None*, *gridspec_kw=None*)

Add a set of subplots to this figure.

This utility wrapper makes it convenient to create common layouts of subplots in a single call.

Parameters

nrows, ncols

[int, default: 1] Number of rows/columns of the subplot grid.

sharex, sharey

[bool or {'none', 'all', 'row', 'col'}, default: False] Controls sharing of properties among x (*sharex*) or y (*sharey*) axes:

- True or 'all': x- or y-axis will be shared among all subplots.
- False or 'none': each subplot x- or y-axis will be independent.

- 'row': each subplot row will share an x- or y-axis.
- 'col': each subplot column will share an x- or y-axis.

When subplots have a shared x-axis along a column, only the x tick labels of the bottom subplot are created. Similarly, when subplots have a shared y-axis along a row, only the y tick labels of the first column subplot are created. To later turn other subplots' ticklabels on, use *tick_params*.

squeeze

[bool, default: True]

- If True, extra dimensions are squeezed out from the returned array of Axes:
  - if only one subplot is constructed (nrows=ncols=1), the resulting single Axes object is returned as a scalar.
  - for Nx1 or 1xM subplots, the returned object is a 1D numpy object array of Axes objects.
  - for NxM, subplots with N>1 and M>1 are returned as a 2D array.
- If False, no squeezing at all is done: the returned Axes object is always a 2D array containing Axes instances, even if it ends up being 1x1.

subplot_kw

[dict, optional] Dict with keywords passed to the *Figure.add_subplot* call used to create each subplot.

gridspec_kw

[dict, optional] Dict with keywords passed to the *GridSpec* constructor used to create the grid the subplots are placed on.

Returns

Axes **or array of Axes**

Either a single *Axes* object or an array of Axes objects if more than one subplot was created. The dimensions of the resulting array can be controlled with the *squeeze* keyword, see above.

See also:

pyplot.subplots

Figure.add_subplot

pyplot.subplot

Examples

```
# First create some toy data:
x = np.linspace(0, 2*np.pi, 400)
y = np.sin(x**2)

# Create a figure
plt.figure()

# Create a subplot
ax = fig.subplots()
ax.plot(x, y)
ax.set_title('Simple plot')

# Create two subplots and unpack the output array immediately
ax1, ax2 = fig.subplots(1, 2, sharey=True)
ax1.plot(x, y)
ax1.set_title('Sharing Y axis')
ax2.scatter(x, y)

# Create four polar axes and access them through the returned array
axes = fig.subplots(2, 2, subplot_kw=dict(polar=True))
axes[0, 0].plot(x, y)
axes[1, 1].scatter(x, y)

# Share a X axis with each column of subplots
fig.subplots(2, 2, sharex='col')

# Share a Y axis with each row of subplots
fig.subplots(2, 2, sharey='row')

# Share both X and Y axes with all subplots
fig.subplots(2, 2, sharex='all', sharey='all')

# Note that this is the same as
fig.subplots(2, 2, sharex=True, sharey=True)
```

subplots_adjust(*self*, *left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*, *hspace=None*)

Adjust the subplot layout parameters.

Unset parameters are left unmodified; initial values are given by `rcParams["figure.subplot.[name]"]`.

Parameters

left

[float, optional] The position of the left edge of the subplots, as a fraction of the figure width.

right

[float, optional] The position of the right edge of the subplots,

as a fraction of the figure width.

bottom

[float, optional] The position of the bottom edge of the subplots, as a fraction of the figure height.

top

[float, optional] The position of the top edge of the subplots, as a fraction of the figure height.

wspace

[float, optional] The width of the padding between subplots, as a fraction of the average axes width.

hspace

[float, optional] The height of the padding between subplots, as a fraction of the average axes height.

`suptitle`(*self*, *t*, ***kwargs*)

Add a centered title to the figure.

Parameters

t

[str] The title text.

x

[float, default 0.5] The x location of the text in figure coordinates.

y

[float, default 0.98] The y location of the text in figure coordinates.

horizontalalignment, ha

[{'center', 'left', right'}, default: 'center'] The horizontal alignment of the text relative to (*x*, *y*).

verticalalignment, va

[{'top', 'center', 'bottom', 'baseline'}, default: 'top'] The vertical alignment of the text relative to (*x*, *y*).

fontsize, size

[default: `rcParams["figure.titlesize"]` (default: `'large'`)] The font size of the text. See *Text.set_size* for possible values.

fontweight, weight

[default: rcParams["figure.titleweight"] (default: 'normal')] The font weight of the text. See *Text.set_weight* for possible values.

Returns

text

The *Text* instance of the title.

Other Parameters

fontproperties

[None or dict, optional] A dict of font properties. If *fontproperties* is given the default values for font size and weight are taken from the *FontProperties* defaults. rcParams["figure.titlesize"] (default: 'large') and rcParams["figure.titleweight"] (default: 'normal') are ignored in this case.

****kwargs**

Additional kwargs are *matplotlib.text.Text* properties.

Examples

```
>>> fig.suptitle('This is the figure title', fontsize=12)
```

text(*self*, *x*, *y*, *s*, *fontdict=None*, ***kwargs*)

Add text to figure.

Parameters

x, y

[float] The position to place the text. By default, this is in figure coordinates, floats in [0, 1]. The coordinate system can be changed using the *transform* keyword.

s

[str] The text string.

fontdict

[dict, optional] A dictionary to override the default text properties. If not given, the defaults are determined by rcParams["font.*"]. Properties passed as *kwargs* override the corresponding ones given in *fontdict*.

Returns

Text

Other Parameters

**kwargs

[*Text* properties] Other miscellaneous text parameters.

Property	Description

See also:

Axes.text

pyplot.text

`tight_layout`(*self*, *renderer=<deprecated parameter>*, *pad=1.08*, *h_pad=None*, *w_pad=None*, *rect=None*)

Adjust the padding between and around subplots.

To exclude an artist on the axes from the bounding box calculation that determines the subplot parameters (i.e. legend, or annotation), set `a.set_in_layout(False)` for that artist.

Parameters

renderer

[subclass of *RendererBase*, optional] Defaults to the renderer for the figure. Deprecated.

pad

[float, default: 1.08] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

h_pad, w_pad

[float, default: *pad*] Padding (height/width) between edges of adjacent subplots, as a fraction of the font size.

rect

[tuple (left, bottom, right, top), default: (0, 0, 1, 1)] A rectangle in normalized figure coordinates into which the whole subplots area (including labels) will fit.

See also:

Figure.set_tight_layout

pyplot.tight_layout

waitforbuttonpress(*self*, *timeout=- 1*)

Blocking call to interact with the figure.

Wait for user input and return True if a key was pressed, False if a mouse button was pressed and None if no input was given within *timeout* seconds. Negative values deactivate *timeout*.

matplotlib.figure.SubplotParams

class matplotlib.figure.**SubplotParams**(*left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*, *hspace=None*)

Bases: object

A class to hold the parameters for a subplot.

Defaults are given by rcParams["figure.subplot.[name]"].

Parameters

left

[float] The position of the left edge of the subplots, as a fraction of the figure width.

right

[float] The position of the right edge of the subplots, as a fraction of the figure width.

bottom

[float] The position of the bottom edge of the subplots, as a fraction of the figure height.

top

[float] The position of the top edge of the subplots, as a fraction of the figure height.

wspace

[float] The width of the padding between subplots, as a fraction of the average axes width.

hspace

[float] The height of the padding between subplots, as a fraction of the average axes height.

`__dict__ = mappingproxy({'__module__': 'matplotlib.figure', '__doc__': '\n A class to hol`

`__init__`(*self*, *left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*, *hspace=None*)

Defaults are given by `rcParams["figure.subplot.[name]"]`.

Parameters

left

[float] The position of the left edge of the subplots, as a fraction of the figure width.

right

[float] The position of the right edge of the subplots, as a fraction of the figure width.

bottom

[float] The position of the bottom edge of the subplots, as a fraction of the figure height.

top

[float] The position of the top edge of the subplots, as a fraction of the figure height.

wspace

[float] The width of the padding between subplots, as a fraction of the average axes width.

hspace

[float] The height of the padding between subplots, as a fraction of the average axes height.

`__module__ = 'matplotlib.figure'`

`__slotnames__ = []`

`__weakref__`
list of weak references to the object (if defined)

`update`(*self*, *left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*, *hspace=None*)
Update the dimensions of the passed parameters. *None* means unchanged.

Examples using `matplotlib.figure.SubplotParams`

- sphx_glr_gallery_pyplots_auto_subplots_adjust.py

18.23.2 Functions

figaspect	Calculate the width and height for a figure with a specified aspect ratio.

matplotlib.figure.figaspect

`matplotlib.figure.figaspect`(*arg*)
Calculate the width and height for a figure with a specified aspect ratio.

While the height is taken from `rcParams["figure.figsize"]` (default: `[6.4, 4.8]`), the width is adjusted to match the desired aspect ratio. Additionally, it is ensured that the width is in the range [4., 16.] and the height is in the range [2., 16.]. If necessary, the default height is adjusted to ensure this.

Parameters

arg

[float or 2d array] If a float, this defines the aspect ratio (i.e. the ratio height / width). In case of an array the aspect ratio is number of rows / number of columns, so that the array could be fitted in the figure undistorted.

Returns

width, height

The figure size in inches.

Notes

If you want to create an axes within the figure, that still preserves the aspect ratio, be sure to create it with equal width and height. See examples below.

Thanks to Fernando Perez for this function.

Examples

Make a figure twice as tall as it is wide:

```
w, h = figaspect(2.)
fig = Figure(figsize=(w, h))
ax = fig.add_axes([0.1, 0.1, 0.8, 0.8])
ax.imshow(A, **kwargs)
```

Make a figure with the proper aspect for an array:

```
A = rand(5, 3)
w, h = figaspect(A)
fig = Figure(figsize=(w, h))
ax = fig.add_axes([0.1, 0.1, 0.8, 0.8])
ax.imshow(A, **kwargs)
```

Examples using `matplotlib.figure.figaspect`

18.24 matplotlib.font_manager

A module for finding, managing, and using fonts across platforms.

This module provides a single *FontManager* instance that can be shared across backends and platforms. The *findfont* function returns the best TrueType (TTF) font file in the local or system font path that matches the specified *FontProperties* instance. The *FontManager* also handles Adobe Font Metrics (AFM) font files for use by the PostScript backend.

The design is based on the W3C Cascading Style Sheet, Level 1 (CSS1) font specification. Future versions may implement the Level 2 or 2.1 specifications.

class matplotlib.font_manager.**FontEntry**(*fname*='', *name*='', *style*='normal', *variant*='normal', *weight*='normal', *stretch*='normal', *size*='medium')

Bases: `object`

A class for storing Font properties. It is used when populating the font lookup dictionary.

class matplotlib.font_manager.**FontManager**(*size=None*, *weight='normal'*)

Bases: object

On import, the *FontManager* singleton instance creates a list of ttf and afm fonts and caches their *FontProperties*. The *FontManager.findfont* method does a nearest neighbor search to find the font that most closely matches the specification. If no good enough match is found, the default font is returned.

addfont(*self*, *path*)

Cache the properties of the font at *path* to make it available to the *FontManager*. The type of font is inferred from the path suffix.

Parameters

path

[str or path-like]

property **defaultFont**

findfont(*self*, *prop*, *fontext='ttf'*, *directory=None*, *fallback_to_default=True*, *rebuild_if_missing=True*)

Find a font that most closely matches the given font properties.

Parameters

prop

[str or *FontProperties*] The font properties to search for. This can be either a *FontProperties* object or a string defining a fontconfig patterns.

fontext

[{'ttf', 'afm'}, default: 'ttf'] The extension of the font file:

- 'ttf': TrueType and OpenType fonts (.ttf, .ttc, .otf)
- 'afm': Adobe Font Metrics (.afm)

directory

[str, optional] If given, only search this directory and its subdirectories.

fallback_to_default

[bool] If True, will fallback to the default font family (usually "DejaVu Sans" or "Helvetica") if the first lookup hard-fails.

rebuild_if_missing

[bool] Whether to rebuild the font cache and search again if the first match appears to point to a nonexisting font (i.e., the font cache contains outdated entries).

Returns

str

The filename of the best matching font.

Notes

This performs a nearest neighbor search. Each font is given a similarity score to the target font properties. The first font with the highest score is returned. If no matches below a certain threshold are found, the default font (usually DejaVu Sans) is returned.

The result is cached, so subsequent lookups don't have to perform the O(n) nearest neighbor search.

See the W3C Cascading Style Sheet, Level 1 documentation for a description of the font finding algorithm.

`static get_default_size()`
Return the default font size.

`get_default_weight(self)`
Return the default font weight.

`score_family(self, families, family2)`
Return a match score between the list of font families in *families* and the font family name *family2*.

An exact match at the head of the list returns 0.0.

A match further down the list will return between 0 and 1.

No match will return 1.0.

`score_size(self, size1, size2)`
Return a match score between *size1* and *size2*.

If *size2* (the size specified in the font file) is 'scalable', this function always returns 0.0, since any font size can be generated.

Otherwise, the result is the absolute distance between *size1* and *size2*, normalized so that the usual range of font sizes (6pt - 72pt) will lie between 0.0 and 1.0.

`score_stretch(self, stretch1, stretch2)`
Return a match score between *stretch1* and *stretch2*.

The result is the absolute value of the difference between the CSS numeric values of *stretch1* and *stretch2*, normalized between 0.0 and 1.0.

`score_style(self, style1, style2)`
Return a match score between *style1* and *style2*.

An exact match returns 0.0.

A match between 'italic' and 'oblique' returns 0.1.

No match returns 1.0.

`score_variant`(*self*, *variant1*, *variant2*)
Return a match score between *variant1* and *variant2*.

An exact match returns 0.0, otherwise 1.0.

`score_weight`(*self*, *weight1*, *weight2*)
Return a match score between *weight1* and *weight2*.

The result is 0.0 if both weight1 and weight 2 are given as strings and have the same value.

Otherwise, the result is the absolute value of the difference between the CSS numeric values of *weight1* and *weight2*, normalized between 0.05 and 1.0.

`set_default_weight`(*self*, *weight*)
Set the default font weight. The initial value is 'normal'.

`class matplotlib.font_manager.FontProperties`(*family=None*, *style=None*, *variant=None*, *weight=None*, *stretch=None*, *size=None*, *fname=None*)

Bases: `object`

A class for storing and manipulating font properties.

The font properties are those described in the W3C Cascading Style Sheet, Level 1 font specification. The six properties are:

- family: A list of font names in decreasing order of priority. The items may include a generic font family name, either 'serif', 'sans-serif', 'cursive', 'fantasy', or 'monospace'. In that case, the actual font to be used will be looked up from the associated rcParam.
- style: Either 'normal', 'italic' or 'oblique'.
- variant: Either 'normal' or 'small-caps'.
- stretch: A numeric value in the range 0-1000 or one of 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded' or 'ultra-expanded'.
- weight: A numeric value in the range 0-1000 or one of 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'.
- size: Either an relative value of 'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large' or an absolute font size, e.g., 12.

The default font property for TrueType fonts (as specified in the default rcParams) is

```
sans-serif, normal, normal, normal, normal, scalable.
```

Alternatively, a font may be specified using the absolute path to a font file, by using the *fname* kwarg. However, in this case, it is typically simpler to just pass the path (as a `pathlib.Path`, not a `str`) to the *font* kwarg of the *`Text`* object.

The preferred usage of font sizes is to use the relative values, e.g., 'large', instead of absolute font sizes, e.g., 12. This approach allows all text sizes to be made larger or smaller based on the font manager's default font size.

This class will also accept a fontconfig pattern, if it is the only argument provided. This support does not depend on fontconfig; we are merely borrowing its pattern syntax for use here.

Note that Matplotlib's internal font manager and fontconfig use a different algorithm to lookup fonts, so the results of the same pattern may be different in Matplotlib than in other applications that use fontconfig.

`copy`(*self*)
: Return a copy of self.

`get_family`(*self*)
: Return a list of font names that comprise the font family.

`get_file`(*self*)
: Return the filename of the associated font.

`get_fontconfig_pattern`(*self*)
: Get a fontconfig pattern suitable for looking up the font as specified with fontconfig's `fc-match` utility.

  This support does not depend on fontconfig; we are merely borrowing its pattern syntax for use here.

`get_name`(*self*)
: Return the name of the font that best matches the font properties.

`get_size`(*self*)
: Return the font size.

`get_size_in_points`(*self*)

`get_slant`(*self*)
: Return the font style. Values are: 'normal', 'italic' or 'oblique'.

`get_stretch`(*self*)
: Return the font stretch or width. Options are: 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded', 'ultra-expanded'.

`get_style`(*self*)
: Return the font style. Values are: 'normal', 'italic' or 'oblique'.

`get_variant`(*self*)
: Return the font variant. Values are: 'normal' or 'small-caps'.

get_weight(*self*)
Set the font weight. Options are: A numeric value in the range 0-1000 or one of 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'

set_family(*self*, *family*)
Change the font family. May be either an alias (generic name is CSS parlance), such as: 'serif', 'sans-serif', 'cursive', 'fantasy', or 'monospace', a real font name or a list of real font names. Real font names are not supported when `rcParams["text.usetex"]` (default: `False`) is `True`.

set_file(*self*, *file*)
Set the filename of the fontfile to use. In this case, all other properties will be ignored.

set_fontconfig_pattern(*self*, *pattern*)
Set the properties by parsing a fontconfig *pattern*.

This support does not depend on fontconfig; we are merely borrowing its pattern syntax for use here.

set_name(*self*, *family*)
Change the font family. May be either an alias (generic name is CSS parlance), such as: 'serif', 'sans-serif', 'cursive', 'fantasy', or 'monospace', a real font name or a list of real font names. Real font names are not supported when `rcParams["text.usetex"]` (default: `False`) is `True`.

set_size(*self*, *size*)
Set the font size. Either an relative value of 'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large' or an absolute font size, e.g., 12.

set_slant(*self*, *style*)
Set the font style. Values are: 'normal', 'italic' or 'oblique'.

set_stretch(*self*, *stretch*)
Set the font stretch or width. Options are: 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded' or 'ultra-expanded', or a numeric value in the range 0-1000.

set_style(*self*, *style*)
Set the font style. Values are: 'normal', 'italic' or 'oblique'.

set_variant(*self*, *variant*)
Set the font variant. Values are: 'normal' or 'small-caps'.

set_weight(*self*, *weight*)
Set the font weight. May be either a numeric value in the range 0-1000 or one of 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'

class matplotlib.font_manager.JSONEncoder(**kwargs)
Bases: matplotlib.font_manager._JSONEncoder

[*Deprecated*]

Notes

Deprecated since version 3.2:

Constructor for JSONEncoder, with sensible defaults.

If skipkeys is false, then it is a TypeError to attempt encoding of keys that are not str, int, float or None. If skipkeys is True, such items are simply skipped.

If ensure_ascii is true, the output is guaranteed to be str objects with all incoming non-ASCII characters escaped. If ensure_ascii is false, the output can contain non-ASCII characters.

If check_circular is true, then lists, dicts, and custom encoded objects will be checked for circular references during encoding to prevent an infinite recursion (which would cause an OverflowError). Otherwise, no such check takes place.

If allow_nan is true, then NaN, Infinity, and -Infinity will be encoded as such. This behavior is not JSON specification compliant, but is consistent with most JavaScript based encoders and decoders. Otherwise, it will be a ValueError to encode such floats.

If sort_keys is true, then the output of dictionaries will be sorted by key; this is useful for regression tests to ensure that JSON serializations can be compared on a day-to-day basis.

If indent is a non-negative integer, then JSON array elements and object members will be pretty-printed with that indent level. An indent level of 0 will only insert newlines. None is the most compact representation.

If specified, separators should be an (item_separator, key_separator) tuple. The default is (', ', ': ') if *indent* is `None` and (',', ': ') otherwise. To get the most compact JSON representation, you should specify (',', ':') to eliminate whitespace.

If specified, default is a function that gets called for objects that can't otherwise be serialized. It should return a JSON encodable version of the object or raise a `TypeError`.

`matplotlib.font_manager.`**`afmFontProperty`**(*fontpath*, *font*)

Extract information from an AFM font file.

Parameters

font

[*AFM*] The AFM font file from which information will be extracted.

Returns

FontEntry

The extracted font properties.

matplotlib.font_manager.**createFontList**(*fontfiles*, *fontext='ttf'*)

[*Deprecated*] Create a font lookup list. The default is to create a list of TrueType fonts. An AFM font list can optionally be created.

Notes

Deprecated since version 3.2.

matplotlib.font_manager.**findSystemFonts**(*fontpaths=None*, *fontext='ttf'*)

Search for fonts in the specified font paths. If no paths are given, will use a standard set of system paths, as well as the list of fonts tracked by fontconfig if fontconfig is installed and available. A list of TrueType fonts are returned by default with AFM fonts as an option.

matplotlib.font_manager.**findfont**(*prop*, *fontext='ttf'*, *directory=None*, *fallback_to_default=True*, *rebuild_if_missing=True*)

Find a font that most closely matches the given font properties.

Parameters

prop

[str or *FontProperties*] The font properties to search for. This can be either a *FontProperties* object or a string defining a fontconfig patterns.

fontext

[{'ttf', 'afm'}, default: 'ttf'] The extension of the font file:

- 'ttf': TrueType and OpenType fonts (.ttf, .ttc, .otf)
- 'afm': Adobe Font Metrics (.afm)

directory

[str, optional] If given, only search this directory and its subdirectories.

fallback_to_default

[bool] If True, will fallback to the default font family (usually "DejaVu Sans" or "Helvetica") if the first lookup hard-fails.

rebuild_if_missing

[bool] Whether to rebuild the font cache and search again if the first match appears to point to a nonexisting font (i.e., the font cache contains outdated entries).

Returns

str

The filename of the best matching font.

Notes

This performs a nearest neighbor search. Each font is given a similarity score to the target font properties. The first font with the highest score is returned. If no matches below a certain threshold are found, the default font (usually DejaVu Sans) is returned.

The result is cached, so subsequent lookups don't have to perform the O(n) nearest neighbor search.

See the W3C Cascading Style Sheet, Level 1 documentation for a description of the font finding algorithm.

`matplotlib.font_manager.get_font(`*filename*, *hinting_factor=None*`)`

`matplotlib.font_manager.get_fontconfig_fonts(`*fontext='ttf'*`)`
List font filenames known to `fc-list` having the given extension.

`matplotlib.font_manager.get_fontext_synonyms(`*fontext*`)`
Return a list of file extensions extensions that are synonyms for the given file extension *fileext*.

`matplotlib.font_manager.is_opentype_cff_font(`*filename*`)`
Return whether the given font is a Postscript Compact Font Format Font embedded in an OpenType wrapper. Used by the PostScript and PDF backends that can not subset these fonts.

`matplotlib.font_manager.json_dump(`*data*, *filename*`)`
Dump *FontManager* *data* as JSON to the file named *filename*.

See also:

json_load

Notes

File paths that are children of the Matplotlib data path (typically, fonts shipped with Matplotlib) are stored relative to that data path (to remain valid across virtualenvs).

This function temporarily locks the output file to prevent multiple processes from overwriting one another's output.

`matplotlib.font_manager.json_load(`*filename*`)`
Load a *FontManager* from the JSON file named *filename*.

See also:

json_dump

matplotlib.font_manager.**list_fonts**(*directory*, *extensions*)
Return a list of all fonts matching any of the extensions, found recursively under the directory.

matplotlib.font_manager.**ttfFontProperty**(*font*)
Extract information from a TrueType font file.

Parameters

font

[FT2Font] The TrueType font file from which information will be extracted.

Returns

FontEntry

The extracted font properties.

matplotlib.font_manager.**win32FontDirectory**()
Return the user-specified font directory for Win32. This is looked up from the registry key

```
\\HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Explorer\Shell␣
↪Folders\Fonts
```

If the key is not found, %WINDIR%\Fonts will be returned.

matplotlib.font_manager.**win32InstalledFonts**(*directory=None*, *fontext='ttf'*)
Search for fonts in the specified font directory, or use the system directories if none given. Additionally, it is searched for user fonts installed. A list of TrueType font filenames are returned by default, or AFM fonts if *fontext* == 'afm'.

18.25 matplotlib.fontconfig_pattern

A module for parsing and generating fontconfig patterns.

class matplotlib.fontconfig_pattern.**FontconfigPatternParser**
Bases: object

A simple pyparsing-based parser for fontconfig patterns.

parse(*self*, *pattern*)
Parse the given fontconfig *pattern* and return a dictionary of key/value pairs useful for initializing a *font_manager.FontProperties* object.

matplotlib.fontconfig_pattern.**family_escape**(*repl*, *string*, *count=0*)
Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

matplotlib.fontconfig_pattern.**family_unescape**(*repl*, *string*, *count=0*)
Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

matplotlib.fontconfig_pattern.**generate_fontconfig_pattern**(*d*)
Given a dictionary of key/value pairs, generates a fontconfig pattern string.

matplotlib.fontconfig_pattern.**parse_fontconfig_pattern**(*pattern*)
Parse the given fontconfig *pattern* and return a dictionary of key/value pairs useful for initializing a *font_manager.FontProperties* object.

matplotlib.fontconfig_pattern.**value_escape**(*repl*, *string*, *count=0*)
Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

matplotlib.fontconfig_pattern.**value_unescape**(*repl*, *string*, *count=0*)
Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

18.26 matplotlib.gridspec

gridspec contains classes that help to layout multiple *Axes* in a grid-like pattern within a figure.

The *GridSpec* specifies the overall grid structure. Individual cells within the grid are referenced by *SubplotSpec*s.

See the tutorial *Customizing Figure Layouts Using GridSpec and Other Functions* for a comprehensive usage guide.

18.26.1 Classes

GridSpec(nrows, ncols[, figure, left, ...])	A grid layout to place subplots within a figure.
SubplotSpec(gridspec, num1[, num2])	Specifies the location of a subplot in a *GridSpec*.
GridSpecBase(nrows, ncols[, height_ratios, ...])	A base class of GridSpec that specifies the geometry of the grid that a subplot will be placed.
GridSpecFromSubplotSpec(nrows, ncols, ...[, ...])	GridSpec whose subplot layout parameters are inherited from the location specified by a given SubplotSpec.

matplotlib.gridspec.GridSpec

class matplotlib.gridspec.**GridSpec**(*nrows*, *ncols*, *figure=None*, *left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*, *hspace=None*, *width_ratios=None*, *height_ratios=None*)

Bases: *matplotlib.gridspec.GridSpecBase*

A grid layout to place subplots within a figure.

The location of the grid cells is determined in a similar way to *SubplotParams* using *left*, *right*, *top*, *bottom*, *wspace* and *hspace*.

Parameters

nrows, ncols

[int] The number of rows and columns of the grid.

figure

[*Figure*, optional] Only used for constrained layout to create a proper layoutbox.

left, right, top, bottom

[float, optional] Extent of the subplots as a fraction of figure width or height. Left cannot be larger than right, and bottom cannot be larger than top. If not given, the values will be inferred from a figure or rcParams at draw time. See also *GridSpec.get_subplot_params*.

wspace

[float, optional] The amount of width reserved for space between subplots, expressed as a fraction of the average axis width. If not given, the values will be inferred from a figure or rcParams when necessary. See also *GridSpec.get_subplot_params*.

hspace

[float, optional] The amount of height reserved for space between subplots, expressed as a fraction of the average axis height. If not given, the values will be inferred from a figure or rcParams when necessary. See also *GridSpec.get_subplot_params*.

width_ratios

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width.

height_ratios

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each column gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height.

`__getstate__`(*self*)

`__init__`(*self*, *nrows*, *ncols*, *figure=None*, *left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*, *hspace=None*, *width_ratios=None*, *height_ratios=None*)

Parameters

nrows, ncols

[int] The number of rows and columns of the grid.

figure

[*Figure*, optional] Only used for constrained layout to create a proper layoutbox.

left, right, top, bottom

[float, optional] Extent of the subplots as a fraction of figure width or height. Left cannot be larger than right, and bottom cannot be larger than top. If not given, the values will be inferred from a figure or rcParams at draw time. See also *GridSpec.get_subplot_params*.

wspace

[float, optional] The amount of width reserved for space between subplots, expressed as a fraction of the average axis width. If not given, the values will be inferred from a figure or rcParams when necessary. See also *GridSpec.get_subplot_params*.

hspace

[float, optional] The amount of height reserved for space between subplots, expressed as a fraction of the average axis height. If not given, the values will be inferred from a figure or rcParams when necessary. See also *GridSpec.get_subplot_params*.

width_ratios

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width.

height_ratios

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each column gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height.

`__module__ = 'matplotlib.gridspec'`

`get_subplot_params`(*self*, *figure=None*)
Return the *SubplotParams* for the GridSpec.

In order of precedence the values are taken from

- non-*None* attributes of the GridSpec
- the provided *figure*
- `rcParams["figure.subplot.*"]`

`locally_modified_subplot_params`(*self*)
Return a list of the names of the subplot parameters explicitly set in the GridSpec.

This is a subset of the attributes of *SubplotParams*.

`tight_layout`(*self*, *figure*, *renderer=None*, *pad=1.08*, *h_pad=None*, *w_pad=None*, *rect=None*)
Adjust subplot parameters to give specified padding.

Parameters

pad

[float] Padding between the figure edge and the edges of subplots, as a fraction of the font-size.

h_pad, w_pad

[float, optional] Padding (height/width) between edges of adjacent subplots. Defaults to *pad*.

rect

[tuple of 4 floats, default: (0, 0, 1, 1), i.e. the whole figure] (left, bottom, right, top) rectangle in normalized figure coordinates that the whole subplots area (including labels) will fit into.

`update`(*self*, ***kwargs*)
Update the subplot parameters of the grid.

Parameters that are not explicitly given are not changed. Setting a parameter to *None* resets it to `rcParams["figure.subplot.*"]`.

Parameters

left, right, top, bottom

[float or None, optional] Extent of the subplots as a fraction of figure width or height.

wspace, hspace

[float, optional] Spacing between the subplots as a fraction of the average subplot width / height.

matplotlib.gridspec.SubplotSpec

`class matplotlib.gridspec.SubplotSpec(`*gridspec*, *num1*, *num2=None*`)`

Bases: `object`

Specifies the location of a subplot in a *`GridSpec`*.

Note: Likely, you'll never instantiate a *`SubplotSpec`* yourself. Instead you will typically obtain one from a *`GridSpec`* using item-access.

Parameters

gridspec

[*GridSpec*] The GridSpec, which the subplot is referencing.

num1, num2

[int] The subplot will occupy the num1-th cell of the given gridspec. If num2 is provided, the subplot will span between num1-th cell and num2-th cell *inclusive*.

The index starts from 0.

`__dict__ = mappingproxy({'__module__': 'matplotlib.gridspec', '__doc__': "\n Specifies th`

`__eq__`(*self*, *other*)
Two SubplotSpecs are considered equal if they refer to the same position(s) in the same *GridSpec*.

`__getstate__`(*self*)

`__hash__`(*self*)
Return hash(self).

`__init__`(*self*, *gridspec*, *num1*, *num2=None*)
Initialize self. See help(type(self)) for accurate signature.

`__module__ = 'matplotlib.gridspec'`

`__repr__`(*self*)
Return repr(self).

`__weakref__`
list of weak references to the object (if defined)

`property colspan`
The columns spanned by this subplot, as a `range` object.

`get_geometry`(*self*)
Return the subplot geometry as tuple `(n_rows, n_cols, start, stop)`.

The indices *start* and *stop* define the range of the subplot within the *GridSpec*. *stop* is inclusive (i.e. for a single cell `start == stop`).

`get_gridspec`(*self*)

`get_position`(*self*, *figure*, *return_all=False*)
Update the subplot position from `figure.subplotpars`.

`get_rows_columns`(*self*)
[*Deprecated*] Return the subplot row and column numbers as a tuple `(n_rows, n_cols, row_start, row_stop, col_start, col_stop)`.

Notes

Deprecated since version 3.3.

`get_topmost_subplotspec`(*self*)
Return the topmost *SubplotSpec* instance associated with the subplot.

`property num2`

`property rowspan`
The rows spanned by this subplot, as a `range` object.

`subgridspec`(*self*, *nrows*, *ncols*, ***kwargs*)
Create a GridSpec within this subplot.

The created *GridSpecFromSubplotSpec* will have this *SubplotSpec* as a parent.

Parameters

nrows

[int] Number of rows in grid.

ncols

[int] Number or columns in grid.

Returns

GridSpecFromSubplotSpec

Other Parameters

****kwargs**

All other parameters are passed to *GridSpecFromSubplotSpec*.

See also:

matplotlib.pyplot.subplots

Examples

Adding three subplots in the space occupied by a single subplot:

```
fig = plt.figure()
gs0 = fig.add_gridspec(3, 1)
ax1 = fig.add_subplot(gs0[0])
ax2 = fig.add_subplot(gs0[1])
gssub = gs0[2].subgridspec(1, 3)
for i in range(3):
    fig.add_subplot(gssub[0, i])
```

Examples using `matplotlib.gridspec.SubplotSpec`

- *Customizing Figure Layouts Using GridSpec and Other Functions*
- *Constrained Layout Guide*
- *Tight Layout guide*

matplotlib.gridspec.GridSpecBase

class matplotlib.gridspec.**GridSpecBase**(*nrows*, *ncols*, *height_ratios=None*, *width_ratios=None*)

Bases: `object`

A base class of GridSpec that specifies the geometry of the grid that a subplot will be placed.

Parameters

nrows, ncols

[int] The number of rows and columns of the grid.

width_ratios

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width.

height_ratios

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each column gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height.

`__dict__ = mappingproxy({'__module__': 'matplotlib.gridspec', '__doc__': '\n A base class`

`__getitem__`(*self*, *key*)

Create and return a *SubplotSpec* instance.

`__init__`(*self*, *nrows*, *ncols*, *height_ratios=None*, *width_ratios=None*)

Parameters

nrows, ncols

[int] The number of rows and columns of the grid.

width_ratios

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of

`width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width.

height_ratios

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each column gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height.

`__module__ = 'matplotlib.gridspec'`

`__repr__`(*self*)
Return repr(self).

`__weakref__`
list of weak references to the object (if defined)

`get_geometry`(*self*)
Return a tuple containing the number of rows and columns in the grid.

`get_grid_positions`(*self*, *fig*, *raw=False*)
Return the positions of the grid cells in figure coordinates.

Parameters

fig

[*Figure*] The figure the grid should be applied to. The subplot parameters (margins and spacing between subplots) are taken from *fig*.

raw

[bool, default: False] If *True*, the subplot parameters of the figure are not taken into account. The grid spans the range [0, 1] in both directions without margins and there is no space between grid cells. This is used for constrained_layout.

Returns

bottoms, tops, lefts, rights

[array] The bottom, top, left, right positions of the grid cells in figure coordinates.

`get_height_ratios`(*self*)
Return the height ratios.

This is *None* if no height ratios have been set explicitly.

`get_subplot_params`(*self*, *figure=None*)

`get_width_ratios`(*self*)
Return the width ratios.

This is *None* if no width ratios have been set explicitly.

`property ncols`
The number of columns in the grid.

`new_subplotspec`(*self*, *loc*, *rowspan=1*, *colspan=1*)
Create and return a *SubplotSpec* instance.

Parameters

loc

[(int, int)] The position of the subplot in the grid as `(row_index, column_index)`.

rowspan, colspan

[int, default: 1] The number of rows and columns the subplot should span in the grid.

`property nrows`
The number of rows in the grid.

`set_height_ratios`(*self*, *height_ratios*)
Set the relative heights of the rows.

height_ratios must be of length *nrows*. Each row gets a relative height of `height_ratios[i] / sum(height_ratios)`.

`set_width_ratios`(*self*, *width_ratios*)
Set the relative widths of the columns.

width_ratios must be of length *ncols*. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`.

`subplots`(*self*, ***, *sharex=False*, *sharey=False*, *squeeze=True*, *subplot_kw=None*)
Add all subplots specified by this *GridSpec* to its parent figure.

This utility wrapper makes it convenient to create common layouts of subplots in a single call.

Parameters

sharex, sharey

[bool or {'none', 'all', 'row', 'col'}, default: False] Controls sharing of properties among x (*sharex*) or y (*sharey*) axes:

- True or 'all': x- or y-axis will be shared among all subplots.
- False or 'none': each subplot x- or y-axis will be independent.
- 'row': each subplot row will share an x- or y-axis.

- 'col': each subplot column will share an x- or y-axis.

When subplots have a shared x-axis along a column, only the x tick labels of the bottom subplot are created. Similarly, when subplots have a shared y-axis along a row, only the y tick labels of the first column subplot are created. To later turn other subplots' ticklabels on, use *tick_params*.

squeeze

[bool, optional, default: True]

- If True, extra dimensions are squeezed out from the returned array of Axes:
  - if only one subplot is constructed (nrows=ncols=1), the resulting single Axes object is returned as a scalar.
  - for Nx1 or 1xM subplots, the returned object is a 1D numpy object array of Axes objects.
  - for NxM, subplots with N>1 and M>1 are returned as a 2D array.
- If False, no squeezing at all is done: the returned Axes object is always a 2D array containing Axes instances, even if it ends up being 1x1.

subplot_kw

[dict, optional] Dict with keywords passed to the *add_subplot* call used to create each subplot.

Returns

ax

[*Axes* object or array of Axes objects.] *ax* can be either a single *Axes* object or an array of Axes objects if more than one subplot was created. The dimensions of the resulting array can be controlled with the squeeze keyword, see above.

matplotlib.gridspec.GridSpecFromSubplotSpec

class matplotlib.gridspec.**GridSpecFromSubplotSpec**(*nrows*, *ncols*, *subplot_spec*, *wspace=None*, *hspace=None*, *height_ratios=None*, *width_ratios=None*)

Bases: *matplotlib.gridspec.GridSpecBase*

GridSpec whose subplot layout parameters are inherited from the location specified by a given SubplotSpec.

The number of rows and number of columns of the grid need to be set. An instance of SubplotSpec is also needed to be set from which the layout parameters will be inherited. The wspace and hspace of the layout can be optionally specified or the default values (from the figure or rcParams) will be used.

__init__(*self*, *nrows*, *ncols*, *subplot_spec*, *wspace=None*, *hspace=None*, *height_ratios=None*, *width_ratios=None*)

The number of rows and number of columns of the grid need to be set. An instance of SubplotSpec is also needed to be set from which the layout parameters will be inherited. The wspace and hspace of the layout can be optionally specified or the default values (from the figure or rcParams) will be used.

__module__ = 'matplotlib.gridspec'

get_subplot_params(*self*, *figure=None*)

Return a dictionary of subplot layout parameters.

`get_topmost_subplotspec`(*self*)
Return the topmost *SubplotSpec* instance associated with the subplot.

Examples using `matplotlib.gridspec.GridSpecFromSubplotSpec`

- sphx_glr_gallery_subplots_axes_and_figures_demo_constrained_layout.py

18.27 `matplotlib.image`

The image module supports basic image loading, rescaling and display operations.

`class matplotlib.image.`**`AxesImage`**(*ax*, *cmap=None*, *norm=None*, *interpolation=None*, *origin=None*, *extent=None*, *filternorm=True*, *filterrad=4.0*, *resample=False*, ***kwargs*)
Bases: `matplotlib.image._ImageBase`

An image attached to an Axes.

Parameters

ax

[*Axes*] The axes the image will belong to.

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

norm

[*Normalize*] Maps luminance to 0-1.

interpolation

[str, default: `rcParams["image.interpolation"]` (default: `'antialiased'`)] Supported values are 'none', 'antialiased', 'nearest', 'bilinear', 'bicubic', 'spline16', 'spline36', 'hanning', 'hamming', 'hermite', 'kaiser', 'quadric', 'catrom', 'gaussian', 'bessel', 'mitchell', 'sinc', 'lanczos'.

origin

[{'upper', 'lower'}, default: `rcParams["image.origin"]` (default: `'upper'`)] Place the [0, 0] index of the array in the upper left or lower left corner of the axes. The convention 'upper' is typically used for matrices and images.

extent

[tuple, optional] The data axes (left, right, bottom, top) for making image plots registered with data plots. Default is to label the pixel centers with the zero-based row and column indices.

filternorm

[bool, default: True] A parameter for the antigrain image resize filter (see the antigrain documentation). If filternorm is set, the filter normalizes integer values and corrects the rounding errors. It doesn't do anything with the source floating point values, it corrects only integers according to the rule of 1.0 which means that any sum of pixel weights must be equal to 1.0. So, the filter function must produce a graph of the proper shape.

filterrad

[float > 0, default: 4] The filter radius for filters that have a radius parameter, i.e. when interpolation is one of: 'sinc', 'lanczos' or 'blackman'.

resample

[bool, default: False] When True, use a full resampling method. When False, only resample when the output image is larger than the input image.

****kwargs**

[*Artist* properties]

Parameters

norm

[*matplotlib.colors.Normalize* (or subclass thereof)] The normalizing object which scales data, typically into the interval `[0, 1]`. If *None*, *norm* defaults to a *colors.Normalize* object which initializes its scaling based on the first data processed.

cmap

[str or *Colormap*] The colormap used to map normalized data values to RGBA colors.

`format_cursor_data`(*self*, *data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

`get_cursor_data`(*self*, *event*)
Return the image value at the event position or *None* if the event is outside the image.

See also:

matplotlib.artist.Artist.get_cursor_data

`get_extent`(*self*)
Return the image extent as tuple (left, right, bottom, top).

`get_window_extent`(*self*, *renderer=None*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`make_image`(*self*, *renderer*, *magnification=1.0*, *unsampled=False*)
Normalize, rescale, and colormap this image's data for rendering using *renderer*, with the given *magnification*.

If *unsampled* is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

Returns

image

[(M, N, 4) uint8 array] The RGBA image, resampled unless *unsampled* is True.

x, y

[float] The upper left corner where the image should be drawn, in pixel space.

trans

[Affine2D] The affine transformation from image to pixel space.

`set_extent`(*self*, *extent*)
Set the image extent.

Parameters

extent

[4-tuple of float] The position and size of the image as tuple `(left, right, bottom, top)` in data coordinates.

Notes

This updates `ax.dataLim`, and, if autoscaling, sets `ax.viewLim` to tightly fit the image, regardless of `dataLim`. Autoscaling state is not changed, so following this with `ax.autoscale_view()` will redo the autoscaling in accord with `dataLim`.

`class matplotlib.image.BboxImage`(*bbox*, *cmap=None*, *norm=None*, *interpolation=None*, *origin=None*, *filternorm=True*, *filterrad=4.0*, *resample=False*, ***kwargs*)
Bases: `matplotlib.image._ImageBase`

The Image class whose size is determined by the given bbox.

cmap is a colors.Colormap instance norm is a colors.Normalize instance to map luminance to 0-1

kwargs are an optional list of Artist keyword args

`contains`(*self*, *mouseevent*)
Test whether the mouse event occurred within the image.

`get_transform`(*self*)
Return the *Transform* instance used by this artist.

`get_window_extent`(*self*, *renderer=None*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to

unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`make_image`(*self*, *renderer*, *magnification=1.0*, *unsampled=False*)
Normalize, rescale, and colormap this image's data for rendering using *renderer*, with the given *magnification*.

If *unsampled* is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

Returns

image

[(M, N, 4) uint8 array] The RGBA image, resampled unless *unsampled* is True.

x, y

[float] The upper left corner where the image should be drawn, in pixel space.

trans

[Affine2D] The affine transformation from image to pixel space.

`class matplotlib.image.FigureImage`(*fig*, *cmap=None*, *norm=None*, *offsetx=0*, *offsety=0*, *origin=None*, ***kwargs*)
Bases: `matplotlib.image._ImageBase`

An image attached to a figure.

cmap is a colors.Colormap instance norm is a colors.Normalize instance to map luminance to 0-1

kwargs are an optional list of Artist keyword args

`get_extent`(*self*)
Return the image extent as tuple (left, right, bottom, top).

`make_image`(*self*, *renderer*, *magnification=1.0*, *unsampled=False*)
Normalize, rescale, and colormap this image's data for rendering using *renderer*, with the given *magnification*.

If *unsampled* is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

Returns

image

[(M, N, 4) uint8 array] The RGBA image, resampled unless *unsampled* is True.

x, y

[float] The upper left corner where the image should be drawn, in pixel space.

trans

[Affine2D] The affine transformation from image to pixel space.

`set_data`(*self*, *A*)
Set the image array.

`zorder = 0`

`class matplotlib.image.NonUniformImage`(*ax*, *, *interpolation='nearest'*, ***kwargs*)
Bases: *matplotlib.image.AxesImage*

Parameters

interpolation

[{'nearest', 'bilinear'}, default: 'nearest']

****kwargs**

All other keyword arguments are identical to those of *AxesImage*.

`get_extent`(*self*)
Return the image extent as tuple (left, right, bottom, top).

`property is_grayscale`

`make_image`(*self*, *renderer*, *magnification=1.0*, *unsampled=False*)
Normalize, rescale, and colormap this image's data for rendering using *renderer*, with the given *magnification*.

If *unsampled* is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

Returns

image

[(M, N, 4) uint8 array] The RGBA image, resampled unless *unsampled* is True.

x, y

[float] The upper left corner where the image should be drawn, in pixel space.

trans

[Affine2D] The affine transformation from image to pixel space.

`set_array`(*self*, **args*)
Retained for backwards compatibility - use set_data instead.

Parameters

A

[array-like]

set_cmap(*self*, *cmap*)
Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

set_data(*self*, *x*, *y*, *A*)
Set the grid for the pixel centers, and the pixel values.

Parameters

x, y

[1D array-like] Monotonic arrays of shapes (N,) and (M,), respectively, specifying pixel centers.

A

[array-like] (M, N) ndarray or masked array of values to be colormapped, or (M, N, 3) RGB array, or (M, N, 4) RGBA array.

set_filternorm(*self*, *s*)
Set whether the resize filter normalizes the weights.

See help for *imshow*.

Parameters

filternorm

[bool]

set_filterrad(*self*, *s*)
Set the resize filter radius only applicable to some interpolation schemes -- see help for imshow

Parameters

filterrad

[positive float]

set_interpolation(*self*, *s*)

Parameters

s

[{'nearest', 'bilinear'} or None] If None, use `rcParams["image.interpolation"]` (default: `'antialiased'`).

`set_norm`(*self*, *norm*)

Set the normalization instance.

Parameters

norm

[*Normalize* or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`class matplotlib.image.PcolorImage`(*ax*, *x=None*, *y=None*, *A=None*, *cmap=None*, *norm=None*, ***kwargs*)

Bases: *matplotlib.image.AxesImage*

Make a pcolor-style plot with an irregular rectangular grid.

This uses a variation of the original irregular image code, and it is used by pcolorfast for the corresponding grid type.

Parameters

ax

[*Axes*] The axes the image will belong to.

x, y

[1D array-like, optional] Monotonic arrays of length N+1 and M+1, respectively, specifying rectangle boundaries. If not given, will default to `range(N + 1)` and `range(M + 1)`, respectively.

A

[array-like] The data to be color-coded. The interpretation depends on the shape:

- (M, N) ndarray or masked array: values to be colormapped
- (M, N, 3): RGB array
- (M, N, 4): RGBA array

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

norm

[*Normalize*] Maps luminance to 0-1.

****kwargs**

[*Artist* properties]

`get_cursor_data`(*self*, *event*)

Return the image value at the event position or *None* if the event is outside the image.

See also:

matplotlib.artist.Artist.get_cursor_data

`property is_grayscale`

`make_image`(*self*, *renderer*, *magnification=1.0*, *unsampled=False*)

Normalize, rescale, and colormap this image's data for rendering using *renderer*, with the given *magnification*.

If *unsampled* is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

Returns

image

[(M, N, 4) uint8 array] The RGBA image, resampled unless *unsampled* is True.

x, y

[float] The upper left corner where the image should be drawn, in pixel space.

trans

[Affine2D] The affine transformation from image to pixel space.

`set_array`(*self*, **args*)

Retained for backwards compatibility - use set_data instead.

Parameters

A

[array-like]

set_data(*self*, *x*, *y*, *A*)

Set the grid for the rectangle boundaries, and the data values.

Parameters

x, y

[1D array-like, optional] Monotonic arrays of length N+1 and M+1, respectively, specifying rectangle boundaries. If not given, will default to `range(N + 1)` and `range(M + 1)`, respectively.

A

[array-like] The data to be color-coded. The interpretation depends on the shape:

- (M, N) ndarray or masked array: values to be colormapped
- (M, N, 3): RGB array
- (M, N, 4): RGBA array

matplotlib.image.composite_images(*images*, *renderer*, *magnification=1.0*)

Composite a number of RGBA images into one. The images are composited in the order in which they appear in the *images* list.

Parameters

images

[list of Images] Each must have a `make_image` method. For each image, `can_composite` should return `True`, though this is not enforced by this function. Each image must have a purely affine transformation with no shear.

renderer

[*RendererBase*]

magnification

[float, default: 1] The additional magnification to apply for the renderer in use.

Returns

image

[uint8 3d array] The composited RGBA image.

offset_x, offset_y

[float] The (left, bottom) offset where the composited image should be placed in the output figure.

matplotlib.image.**imread**(*fname*, *format=None*)

Read an image from a file into an array.

Parameters

fname

[str or file-like] The image file to read: a filename, a URL or a file-like object opened in read-binary mode.

format

[str, optional] The image file format assumed for reading the data. If not given, the format is deduced from the filename. If nothing can be deduced, PNG is tried.

Returns

`numpy.array`

The image data. The returned array has shape

- (M, N) for grayscale images.
- (M, N, 3) for RGB images.
- (M, N, 4) for RGBA images.

matplotlib.image.**imsave**(*fname*, *arr*, *vmin=None*, *vmax=None*, *cmap=None*, *format=None*, *origin=None*, *dpi=100*, *, *metadata=None*, *pil_kwargs=None*)

Save an array as an image file.

Parameters

fname

[str or path-like or file-like] A path or a file-like object to store the image in. If *format* is not set, then the output format is inferred from the extension of *fname*, if any, and from `rcParams["savefig.format"]` (default: `'png'`) otherwise. If *format* is set, it determines the output format.

arr

[array-like] The image data. The shape can be one of MxN (luminance), MxNx3 (RGB) or MxNx4 (RGBA).

vmin, vmax

[float, optional] *vmin* and *vmax* set the color scaling for the image by fixing the values that map to the colormap color limits. If either *vmin* or *vmax* is None, that limit is determined from the *arr* min/max value.

cmap

[str or *Colormap*, default: rcParams["image.cmap"] (default: 'viridis')] A Colormap instance or registered colormap name. The colormap maps scalar data to colors. It is ignored for RGB(A) data.

format

[str, optional] The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under *fname*.

origin

[{'upper', 'lower'}, default: rcParams["image.origin"] (default: 'upper')] Indicates whether the (0, 0) index of the array is in the upper left or lower left corner of the axes.

dpi

[float] The DPI to store in the metadata of the file. This does not affect the resolution of the output image. Depending on file format, this may be rounded to the nearest integer.

metadata

[dict, optional] Metadata in the image file. The supported keys depend on the output format, see the documentation of the respective backends for more information.

pil_kwargs

[dict, optional] Keyword arguments passed to PIL.Image.Image.save. If the 'pnginfo' key is present, it completely overrides *metadata*, including the default 'Software' key.

matplotlib.image.**pil_to_array**(*pilImage*)

Load a PIL image and return it as a numpy int array.

Returns

numpy.array

The array shape depends on the image type:

- (M, N) for grayscale images.
- (M, N, 3) for RGB images.
- (M, N, 4) for RGBA images.

matplotlib.image.**thumbnail**(*infile*, *thumbfile*, *scale=0.1*, *interpolation='bilinear'*, *preview=False*)

Make a thumbnail of image in *infile* with output filename *thumbfile*.

See /gallery/misc/image_thumbnail_sgskip.

Parameters

infile

[str or file-like] The image file. Matplotlib relies on Pillow for image reading, and thus supports a wide range of file formats, including PNG, JPG, TIFF and others.

thumbfile

[str or file-like] The thumbnail filename.

scale

[float, default: 0.1] The scale factor for the thumbnail.

interpolation

[str, default: 'bilinear'] The interpolation scheme used in the resampling. See the *interpolation* parameter of *imshow* for possible values.

preview

[bool, default: False] If True, the default backend (presumably a user interface backend) will be used which will cause a figure to be raised if *show* is called. If it is False, the figure is created using *FigureCanvasBase* and the drawing backend is selected as *Figure.savefig* would normally do.

Returns

Figure

The figure instance containing the thumbnail.

18.28 matplotlib.legend

The legend module defines the Legend class, which is responsible for drawing legends associated with axes and/or figures.

Important: It is unlikely that you would ever create a Legend instance manually. Most users would normally create a legend via the *legend* function. For more details on legends there is also a *legend guide*.

The *Legend* class is a container of legend handles and legend texts.

The legend handler map specifies how to create legend handles from artists (lines, patches, etc.) in the axes or figures. Default legend handlers are defined in the

legend_handler module. While not all artist types are covered by the default legend handlers, custom legend handlers can be defined to support arbitrary objects.

See the *legend guide* for more information.

class matplotlib.legend.**DraggableLegend**(*legend*, *use_blit=False*, *update='loc'*)

Bases: *matplotlib.offsetbox.DraggableOffsetBox*

Wrapper around a *Legend* to support mouse dragging.

Parameters

legend

[*Legend*] The *Legend* instance to wrap.

use_blit

[bool, optional] Use blitting for faster image composition. For details see *FuncAnimation*.

update

[{'loc', 'bbox'}, optional] If "loc", update the *loc* parameter of the legend upon finalizing. If "bbox", update the *bbox_to_anchor* parameter.

finalize_offset(*self*)

class matplotlib.legend.**Legend**(*parent*, *handles*, *labels*, *loc=None*, *numpoints=None*, *markerscale=None*, *markerfirst=True*, *scatterpoints=None*, *scatteryoffsets=None*, *prop=None*, *fontsize=None*, *labelcolor=None*, *borderpad=None*, *labelspacing=None*, *handlelength=None*, *handleheight=None*, *handletextpad=None*, *borderaxespad=None*, *columnspacing=None*, *ncol=1*, *mode=None*, *fancybox=None*, *shadow=None*, *title=None*, *title_fontsize=None*, *framealpha=None*, *edgecolor=None*, *facecolor=None*, *bbox_to_anchor=None*, *bbox_transform=None*, *frameon=None*, *handler_map=None*)

Bases: *matplotlib.artist.Artist*

Place a legend on the axes at location loc.

Parameters

parent

[*Axes* or *Figure*] The artist that contains the legend.

handles

[list of *Artist*] A list of Artists (lines, patches) to be added to the legend.

labels

[list of str] A list of labels to show next to the artists. The length of handles and labels should be the same. If they are not, they are truncated to the smaller of both lengths.

Other Parameters

loc

[str or pair of floats, default: `rcParams["legend.loc"]` (default: `'best'`) ('best' for axes, 'upper right' for figures)] The location of the legend.

The strings `'upper left'`, `'upper right'`, `'lower left'`, `'lower right'` place the legend at the corresponding corner of the axes/figure.

The strings `'upper center'`, `'lower center'`, `'center left'`, `'center right'` place the legend at the center of the corresponding edge of the axes/figure.

The string `'center'` places the legend at the center of the axes/figure.

The string `'best'` places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case *bbox_to_anchor* will be ignored).

For back-compatibility, `'center right'` (but no other location) can also be spelled `'right'`, and each "string" locations can also be given as a numeric value:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*. Defaults to `axes.bbox` (if called as a method to *Axes.legend*) or `figure.bbox` (if *Figure.legend*). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by *bbox_transform*, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox `(x, y, width, height)` that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple `(x, y)` places the corner of the legend specified by *loc* at x, y. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

ncol

[int, default: 1] The number of columns that the legend has.

prop

[None or *matplotlib.font_manager.FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

labelcolor

[str or list] Sets the color of the text in the legend. Can be a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

numpoints

[int, default: `rcParams["legend.numpoints"]` (default: `1`)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).

scatterpoints

[int, default: `rcParams["legend.scatterpoints"]` (default: `1`)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).

scatteryoffsets

[iterable of floats, default: `[0.375, 0.5, 0.3125]`] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to `[0.5]`.

markerscale

[float, default: `rcParams["legend.markerscale"]` (default: `1.0`)] The relative size of legend markers compared with the originally drawn ones.

markerfirst

[bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

frameon

[bool, default: `rcParams["legend.frameon"]` (default: `True`)] Whether the legend should be drawn on a patch (frame).

fancybox

[bool, default: `rcParams["legend.fancybox"]` (default: `True`)] Whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend's background.

shadow

[bool, default: rcParams["legend.shadow"] (default: False)] Whether to draw a shadow behind the legend.

framealpha

[float, default: rcParams["legend.framealpha"] (default: 0.8)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is None, the default value is ignored.

facecolor

["inherit" or color, default: rcParams["legend.facecolor"] (default: 'inherit')] The legend's background color. If "inherit", use rcParams["axes.facecolor"] (default: 'white').

edgecolor

["inherit" or color, default: rcParams["legend.edgecolor"] (default: '0.8')] The legend's background patch edge color. If "inherit", use take rcParams["axes.edgecolor"] (default: 'black').

mode

[{"expand", None}] If *mode* is set to "expand" the legend will be horizontally expanded to fill the axes area (or *bbox_to_anchor* if defines the legend's size).

bbox_transform

[None or *matplotlib.transforms.Transform*] The transform for the bounding box (*bbox_to_anchor*). For a value of None (default) the Axes' transAxes transform will be used.

title

[str or None] The legend's title. Default is no title (None).

title_fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: rcParams["legend.title_fontsize"] (default: None)] The font size of the legend's title.

borderpad

[float, default: rcParams["legend.borderpad"] (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

labelspacing

[float, default: rcParams["legend.labelspacing"] (default: 0.5)] The vertical space between the legend entries, in font-size units.

handlelength

[float, default: rcParams["legend.handlelength"] (default: 2.0)]
The length of the legend handles, in font-size units.

handletextpad

[float, default: rcParams["legend.handletextpad"] (default: 0.8)]
The pad between the legend handle and text, in font-size units.

borderaxespad

[float, default: rcParams["legend.borderaxespad"] (default: 0.5)]
The pad between the axes and legend border, in font-size units.

columnspacing

[float, default: rcParams["legend.columnspacing"] (default: 2.0)]
The spacing between columns, in font-size units.

handler_map

[dict or None] The custom dictionary mapping instances or types to a legend handler. This *handler_map* updates the default handler map found at *matplotlib.legend.Legend.get_legend_handler_map*.

Notes

Users can specify any arbitrary location for the legend using the *bbox_to_anchor* keyword argument. *bbox_to_anchor* can be a *BboxBase* (or derived therefrom) or a tuple of 2 or 4 floats. See *set_bbox_to_anchor* for more detail.

The legend location can be specified by setting *loc* with a tuple of 2 floats, which is interpreted as the lower-left corner of the legend in the normalized axes coordinate.

```
codes = {'best': 0, 'center': 10, 'center left': 6, 'center right': 7, 'lower center': 8
```

`contains`(*self*, *event*)
Test whether the artist contains the mouse event.

Parameters

mouseevent

[*matplotlib.backend_bases.MouseEvent*]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`draw_frame`(*self*, *b*)
Set whether the legend box patch is drawn.

Parameters

b

[bool]

`get_bbox_to_anchor`(*self*)
Return the bbox that the legend will be anchored to.

`get_children`(*self*)
Return a list of the child *Artist*s of this *Artist*.

`classmethod get_default_handler_map`()
A class method that returns the default handler map.

`get_draggable`(*self*)
Return `True` if the legend is draggable, `False` otherwise.

`get_frame`(*self*)
Return the *Rectangle* used to frame the legend.

`get_frame_on`(*self*)
Get whether the legend box patch is drawn.

`static get_legend_handler`(*legend_handler_map*, *orig_handle*)
Return a legend handler from *legend_handler_map* that corresponds to *orig_handler*.

legend_handler_map should be a dictionary object (that is returned by the get_legend_handler_map method).

It first checks if the *orig_handle* itself is a key in the *legend_handler_map* and return the associated value. Otherwise, it checks for each of the classes in its method-resolution-order. If no matching key is found, it returns `None`.

`get_legend_handler_map`(*self*)
Return the handler map.

`get_lines`(*self*)
Return the list of *Line2D*s in the legend.

`get_patches`(*self*)
Return the list of *Patch*s in the legend.

`get_texts`(*self*)
Return the list of *Text*s in the legend.

`get_tightbbox`(*self*, *renderer*)
Like *Legend.get_window_extent*, but uses the box for the legend.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

BboxBase

The bounding box in figure pixel coordinates.

`get_title`(*self*)
Return the *Text* instance for the legend title.

`get_window_extent`(*self*, *renderer=None*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`set_bbox_to_anchor`(*self*, *bbox*, *transform=None*)
Set the bbox that the legend will be anchored to.

Parameters

bbox

[*BboxBase* or tuple] The bounding box can be specified in the following ways:

- A *BboxBase* instance
- A tuple of `(left, bottom, width, height)` in the given transform (normalized axes coordinate if None)
- A tuple of `(left, bottom)` where the width and height will be assumed to be zero.
- *None*, to remove the bbox anchoring, and use the parent bbox.

transform

[*Transform*, optional] A transform to apply to the bounding box. If not specified, this will use a transform to the bounding box of the parent.

`classmethod set_default_handler_map`(*handler_map*)

A class method to set the default handler map.

`set_draggable`(*self*, *state*, *use_blit=False*, *update='loc'*)

Enable or disable mouse dragging support of the legend.

Parameters

state

[bool] Whether mouse dragging is enabled.

use_blit

[bool, optional] Use blitting for faster image composition. For details see *FuncAnimation*.

update

[{'loc', 'bbox'}, optional] The legend parameter to be changed when dragged:

- 'loc': update the *loc* parameter of the legend
- 'bbox': update the *bbox_to_anchor* parameter of the legend

Returns

DraggableLegend **or** ***None***

If *state* is `True` this returns the *DraggableLegend* helper instance. Otherwise this returns *None*.

`set_frame_on`(*self*, *b*)
Set whether the legend box patch is drawn.

Parameters

b

[bool]

`set_title`(*self*, *title*, *prop=None*)
Set the legend title. Fontproperties can be optionally set with *prop* parameter.

`classmethod update_default_handler_map`(*handler_map*)
A class method to update the default handler map.

`zorder = 5`

18.29 matplotlib.legend_handler

Default legend handlers.

It is strongly encouraged to have read the *legend guide* before this documentation.

Legend handlers are expected to be a callable object with a following signature.

```
legend_handler(legend, orig_handle, fontsize, handlebox)
```

Where *legend* is the legend itself, *orig_handle* is the original plot, *fontsize* is the fontsize in pixels, and *handlebox* is a OffsetBox instance. Within the call, you should create relevant artists (using relevant properties from the *legend* and/or *orig_handle*) and add them into the handlebox. The artists needs to be scaled according to the fontsize (note that the size is in pixel, i.e., this is dpi-scaled value).

This module includes definition of several legend handler classes derived from the base class (HandlerBase) with the following method:

```
def legend_artist(self, legend, orig_handle, fontsize, handlebox)
```

`class matplotlib.legend_handler.HandlerBase`(*xpad=0.0*, *ypad=0.0*, *update_func=None*)
A Base class for default legend handlers.

The derived classes are meant to override *create_artists* method, which has a following signature.:

```
def create_artists(self, legend, orig_handle,
                   xdescent, ydescent, width, height, fontsize,
                   trans):
```

The overridden method needs to create artists of the given transform that fits in the given dimension (xdescent, ydescent, width, height) that are scaled by fontsize if necessary.

`adjust_drawing_area`(*self*, *legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*)

`create_artists`(*self*, *legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

`legend_artist`(*self*, *legend*, *orig_handle*, *fontsize*, *handlebox*)

Return the artist that this HandlerBase generates for the given original artist/handle.

Parameters

legend

[*Legend*] The legend for which these legend artists are being created.

orig_handle

[*matplotlib.artist.Artist* or similar] The object for which these legend artists are being created.

fontsize

[int] The fontsize in pixels. The artists being created should be scaled according to the given fontsize.

handlebox

[*matplotlib.offsetbox.OffsetBox*] The box which has been created to hold this legend entry's artists. Artists created in the *legend_artist* method must be added to this handlebox inside this method.

`update_prop`(*self*, *legend_handle*, *orig_handle*, *legend*)

class matplotlib.legend_handler.`HandlerCircleCollection`(*yoffsets=None*, *sizes=None*, ***kw*)

Handler for *CircleCollection*s.

Parameters

numpoints

[int] Number of points to show in legend entry.

yoffsets

[array of floats] Length *numpoints* list of y offsets for each point in legend entry.

Notes

Any other keyword arguments are given to *HandlerNpoints*.

`create_collection`(*self*, *orig_handle*, *sizes*, *offsets*, *transOffset*)

`class matplotlib.legend_handler.HandlerErrorbar`(*xerr_size=0.5*, *yerr_size=None*, *marker_pad=0.3*, *numpoints=None*, ***kw*)

Handler for Errorbars.

Parameters

marker_pad

[float] Padding between points in legend entry.

numpoints

[int] Number of points to show in legend entry.

Notes

Any other keyword arguments are given to *HandlerNpoints*.

`create_artists`(*self*, *legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

`get_err_size`(*self*, *legend*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*)

`class matplotlib.legend_handler.HandlerLine2D`(*marker_pad=0.3*, *numpoints=None*, ***kw*)

Handler for *Line2D* instances.

Parameters

marker_pad

[float] Padding between points in legend entry.

numpoints

[int] Number of points to show in legend entry.

Notes

Any other keyword arguments are given to *HandlerNpoints*.

`create_artists`(*self*, *legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

`class matplotlib.legend_handler.HandlerLineCollection`(*marker_pad=0.3*, *numpoints=None*, ***kw*)

Handler for *LineCollection* instances.

Parameters

marker_pad

[float] Padding between points in legend entry.

numpoints

[int] Number of points to show in legend entry.

Notes

Any other keyword arguments are given to *HandlerNpoints*.

`create_artists`(*self*, *legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

`get_numpoints`(*self*, *legend*)

`class matplotlib.legend_handler.HandlerNpoints`(*marker_pad=0.3*, *numpoints=None*, ***kw*)

A legend handler that shows *numpoints* points in the legend entry.

Parameters

marker_pad

[float] Padding between points in legend entry.

numpoints

[int] Number of points to show in legend entry.

Notes

Any other keyword arguments are given to *HandlerBase*.

`get_numpoints`(*self*, *legend*)

`get_xdata`(*self*, *legend*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*)

class matplotlib.legend_handler.**HandlerNpointsYoffsets**(*numpoints=None*, *yoffsets=None*, ***kw*)

A legend handler that shows *numpoints* in the legend, and allows them to be individually offset in the y-direction.

Parameters

numpoints

[int] Number of points to show in legend entry.

yoffsets

[array of floats] Length *numpoints* list of y offsets for each point in legend entry.

Notes

Any other keyword arguments are given to *HandlerNpoints*.

get_ydata(*self*, *legend*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*)

class matplotlib.legend_handler.**HandlerPatch**(*patch_func=None*, ***kw*)

Handler for *Patch* instances.

Parameters

patch_func

[callable, optional] The function that creates the legend key artist. *patch_func* should have the signature:

```
def patch_func(legend=legend, orig_handle=orig_handle,
               xdescent=xdescent, ydescent=ydescent,
               width=width, height=height, fontsize=fontsize)
```

Subsequently the created artist will have its `update_prop` method called and the appropriate transform will be applied.

Notes

Any other keyword arguments are given to *HandlerBase*.

create_artists(*self*, *legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

class matplotlib.legend_handler.**HandlerPathCollection**(*yoffsets=None*, *sizes=None*, ***kw*)

Handler for *PathCollection*s, which are used by *scatter*.

Parameters

numpoints

[int] Number of points to show in legend entry.

yoffsets

[array of floats] Length *numpoints* list of y offsets for each point in legend entry.

Notes

Any other keyword arguments are given to *HandlerNpoints*.

`create_collection`(*self*, *orig_handle*, *sizes*, *offsets*, *transOffset*)

`class matplotlib.legend_handler.HandlerPolyCollection`(*xpad=0.0*, *ypad=0.0*, *update_func=None*)

Handler for *PolyCollection* used in *fill_between* and *stackplot*.

`create_artists`(*self*, *legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

`class matplotlib.legend_handler.HandlerRegularPolyCollection`(*yoffsets=None*, *sizes=None*, ***kw*)

Handler for *RegularPolyCollection*s.

Parameters

numpoints

[int] Number of points to show in legend entry.

yoffsets

[array of floats] Length *numpoints* list of y offsets for each point in legend entry.

Notes

Any other keyword arguments are given to *HandlerNpoints*.

`create_artists`(*self*, *legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

`create_collection`(*self*, *orig_handle*, *sizes*, *offsets*, *transOffset*)

`get_numpoints`(*self*, *legend*)

`get_sizes`(*self*, *legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*)

`update_prop`(*self*, *legend_handle*, *orig_handle*, *legend*)

class matplotlib.legend_handler.**HandlerStem**(*marker_pad=0.3*, *numpoints=None*, *bottom=None*, *yoffsets=None*, ***kw*)

Handler for plots produced by *stem*.

Parameters

marker_pad

[float, default: 0.3] Padding between points in legend entry.

numpoints

[int, optional] Number of points to show in legend entry.

bottom

[float, optional]

yoffsets

[array of floats, optional] Length *numpoints* list of y offsets for each point in legend entry.

Notes

Any other keyword arguments are given to *HandlerNpointsYoffsets*.

create_artists(*self*, *legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

get_ydata(*self*, *legend*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*)

class matplotlib.legend_handler.**HandlerTuple**(*ndivide=1*, *pad=None*, ***kwargs*)

Handler for Tuple.

Additional kwargs are passed through to *HandlerBase*.

Parameters

ndivide

[int, default: 1] The number of sections to divide the legend area into. If None, use the length of the input tuple.

pad

[float, default: `rcParams["legend.borderpad"]` (default: `0.4`)] Padding in units of fraction of font size.

create_artists(*self*, *legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

matplotlib.legend_handler.**update_from_first_child**(*tgt*, *src*)

18.30 matplotlib.lines

The 2D line class which can draw with a variety of line styles, markers and colors.

18.30.1 Classes

Line2D(xdata, ydata[, linewidth, linestyle, ...])	A line - the line can have both a solid linestyle connecting all the vertices, and a marker at each vertex.
VertexSelector(line)	Manage the callbacks to maintain a list of selected vertices for *Line2D*.

matplotlib.lines.Line2D

class matplotlib.lines.**Line2D**(*xdata*, *ydata*, *linewidth=None*, *linestyle=None*, *color=None*, *marker=None*, *markersize=None*, *markeredgewidth=None*, *markeredgecolor=None*, *markerfacecolor=None*, *markerfacecoloralt='none'*, *fillstyle=None*, *antialiased=None*, *dash_capstyle=None*, *solid_capstyle=None*, *dash_joinstyle=None*, *solid_joinstyle=None*, *pickradius=5*, *drawstyle=None*, *markevery=None*, ***kwargs*)

Bases: *matplotlib.artist.Artist*

A line - the line can have both a solid linestyle connecting all the vertices, and a marker at each vertex. Additionally, the drawing of the solid line is influenced by the drawstyle, e.g., one can create "stepped" lines in various styles.

Create a *Line2D* instance with *x* and *y* data in sequences of *xdata*, *ydata*.

Additional keyword arguments are *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}

Table 141 – continued from previous page

Property	Description
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See *set_linestyle()* for a description of the line styles, *set_marker()* for a description of the markers, and *set_drawstyle()* for a description of the draw styles.

__init__(*self*, *xdata*, *ydata*, *linewidth=None*, *linestyle=None*, *color=None*, *marker=None*, *markersize=None*, *markeredgewidth=None*, *markeredgecolor=None*, *markerfacecolor=None*, *markerfacecoloralt='none'*, *fillstyle=None*, *antialiased=None*, *dash_capstyle=None*, *solid_capstyle=None*, *dash_joinstyle=None*, *solid_joinstyle=None*, *pickradius=5*, *drawstyle=None*, *markevery=None*, ***kwargs*)

Create a *Line2D* instance with *x* and *y* data in sequences of *xdata*, *ydata*.

Additional keyword arguments are *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See *set_linestyle()* for a description of the line styles, *set_marker()* for a description of the markers, and *set_drawstyle()* for a description of the draw styles.

__module__ = 'matplotlib.lines'

__str__(*self*)
Return str(self).

property axes
The *Axes* instance the artist resides in, or *None*.

contains(*self*, *mouseevent*)
Test whether *mouseevent* occurred on the line.

An event is deemed to have occurred "on" the line if it is less than `self.pickradius` (default: 5 points) away from it. Use *get_pickradius* or *set_pickradius* to get or set the pick radius.

Parameters

mouseevent

[*matplotlib.backend_bases.MouseEvent*]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] A dictionary `{'ind': pointlist}`, where *pointlist* is a list of points of the line that are within the pickradius around the event position.

TODO: sort returned indices by distance

draw(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

```
drawStyleKeys = ['default', 'steps-mid', 'steps-pre', 'steps-post', 'steps']
```

```
drawStyles = {'default': '_draw_lines', 'steps': '_draw_steps_pre', 'steps-mid': '_draw_s
```

```
fillStyles = ('full', 'left', 'right', 'bottom', 'top', 'none')
```

```
filled_markers = ('o', 'v', '^', '<', '>', '8', 's', 'p', '*', 'h', 'H', 'D', 'd', 'P', 'X
```

`get_aa`(*self*)
Alias for *get_antialiased*.

`get_antialiased`(*self*)
Return whether antialiased rendering is used.

`get_c`(*self*)
Alias for *get_color*.

`get_color`(*self*)
Return the line color.

See also *set_color*.

`get_dash_capstyle`(*self*)
Return the cap style for dashed lines.

See also *set_dash_capstyle*.

`get_dash_joinstyle`(*self*)
Return the join style for dashed lines.

See also *set_dash_joinstyle*.

`get_data`(*self*, *orig=True*)
Return the xdata, ydata.

If *orig* is *True*, return the original data.

`get_drawstyle`(*self*)
Return the drawstyle.

See also *set_drawstyle*.

`get_ds`(*self*)
Alias for *get_drawstyle*.

`get_fillstyle`(*self*)
Return the marker fill style.

See also *set_fillstyle*.

`get_linestyle`(*self*)
Return the linestyle.

See also *set_linestyle*.

`get_linewidth`(*self*)
Return the linewidth in points.

See also *set_linewidth*.

`get_ls`(*self*)
Alias for *get_linestyle*.

`get_lw`(*self*)
Alias for *get_linewidth*.

`get_marker`(*self*)
Return the line marker.

See also *set_marker*.

`get_markeredgecolor`(*self*)
Return the marker edge color.

See also *set_markeredgecolor*.

`get_markeredgewidth`(*self*)
Return the marker edge width in points.

See also *set_markeredgewidth*.

`get_markerfacecolor`(*self*)
Return the marker face color.

See also *set_markerfacecolor*.

`get_markerfacecoloralt`(*self*)
Return the alternate marker face color.

See also *set_markerfacecoloralt*.

`get_markersize`(*self*)
Return the marker size in points.

See also *set_markersize*.

`get_markevery`(*self*)
Return the markevery setting for marker subsampling.

See also *set_markevery*.

`get_mec`(*self*)
Alias for *get_markeredgecolor*.

`get_mew`(*self*)
Alias for *get_markeredgewidth*.

`get_mfc`(*self*)
Alias for *get_markerfacecolor*.

`get_mfcalt`(*self*)
Alias for *get_markerfacecoloralt*.

get_ms(*self*)
Alias for *get_markersize*.

get_path(*self*)
Return the *Path* object associated with this line.

get_pickradius(*self*)
Return the pick radius used for containment tests.

See *contains* for more details.

get_solid_capstyle(*self*)
Return the cap style for solid lines.

See also *set_solid_capstyle*.

get_solid_joinstyle(*self*)
Return the join style for solid lines.

See also *set_solid_joinstyle*.

get_window_extent(*self*, *renderer*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_xdata(*self*, *orig=True*)
Return the xdata.

If *orig* is *True*, return the original data, else the processed data.

get_xydata(*self*)
Return the *xy* data as a Nx2 numpy array.

get_ydata(*self*, *orig=True*)
Return the ydata.

If *orig* is *True*, return the original data, else the processed data.

is_dashed(*self*)
Return whether line has a dashed linestyle.

See also *set_linestyle*.

```
lineStyles = {'': '_draw_nothing', ' ': '_draw_nothing', '-': '_draw_solid', '--': '_dra
```

```
markers = {'.': 'point', ',': 'pixel', 'o': 'circle', 'v': 'triangle_down', '^': 'triang
```

property pickradius
Return the pick radius used for containment tests.

See *contains* for more details.

recache(*self*, *always=False*)

recache_always(*self*)

set_aa(*self*, *b*)
Alias for *set_antialiased*.

set_antialiased(*self*, *b*)
Set whether to use antialiased rendering.

Parameters

b

[bool]

set_c(*self*, *color*)
Alias for *set_color*.

set_color(*self*, *color*)
Set the color of the line.

Parameters

color

[color]

set_dash_capstyle(*self*, *s*)
Set the cap style for dashed lines.

Parameters

s

[{'butt', 'round', 'projecting'}] For examples see /gallery/lines_bars_and_markers/joinstyle.

set_dash_joinstyle(*self*, *s*)
Set the join style for dashed lines.

Parameters

s

[{'miter', 'round', 'bevel'}] For examples see /gallery/lines_bars_and_markers/joinstyle.

`set_dashes`(*self*, *seq*)
Set the dash sequence.

The dash sequence is a sequence of floats of even length describing the length of dashes and spaces in points.

For example, (5, 2, 1, 2) describes a sequence of 5 point and 1 point dashes separated by 2 point spaces.

Parameters

seq

[sequence of floats (on/off ink in points) or (None, None)] If *seq* is empty or `(None, None)`, the linestyle will be set to solid.

`set_data`(*self*, **args*)
Set the x and y data.

Parameters

***args**

[(2, N) array or two 1D arrays]

`set_drawstyle`(*self*, *drawstyle*)
Set the drawstyle of the plot.

The drawstyle determines how the points are connected.

Parameters

drawstyle

[{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'] For 'default', the points are connected with straight lines.

The steps variants connect the points with step-like lines, i.e. horizontal lines with vertical steps. They differ in the location of the step:

- 'steps-pre': The step is at the beginning of the line segment, i.e. the line will be at the y-value of point to the right.
- 'steps-mid': The step is halfway between the points.
- 'steps-post: The step is at the end of the line segment, i.e. the line will be at the y-value of the point to the left.
- 'steps' is equal to 'steps-pre' and is maintained for backward-compatibility.

For examples see /gallery/lines_bars_and_markers/step_demo.

`set_ds`(*self*, *drawstyle*)
Alias for *set_drawstyle*.

`set_fillstyle`(*self*, *fs*)
Set the marker fill style.

Parameters

fs

[{'full', 'left', 'right', 'bottom', 'top', 'none'}] Possible values:

- 'full': Fill the whole marker with the *markerfacecolor*.
- 'left', 'right', 'bottom', 'top': Fill the marker half at the given side with the *markerfacecolor*. The other half of the marker is filled with *markerfacecoloralt*.
- 'none': No filling.

For examples see marker_fill_styles.

`set_linestyle`(*self*, *ls*)
Set the linestyle of the line.

Parameters

ls

[{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}] Possible values:

- A string:

Linestyle	Description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line
`'None'` or `' '` or `''`	draw nothing

- Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq)
```

where `onoffseq` is an even length tuple of on and off ink in points. See also *set_dashes()*.

For examples see /gallery/lines_bars_and_markers/linestyles.

`set_linewidth`(*self*, *w*)
Set the line width in points.

Parameters

w

[float] Line width, in points.

`set_ls`(*self*, *ls*)
Alias for *set_linestyle*.

`set_lw`(*self*, *w*)
Alias for *set_linewidth*.

`set_marker`(*self*, *marker*)
Set the line marker.

Parameters

marker

[marker style string, *Path* or *MarkerStyle*] See *markers* for full description of possible arguments.

`set_markeredgecolor`(*self*, *ec*)
Set the marker edge color.

Parameters

ec

[color]

`set_markeredgewidth`(*self*, *ew*)
Set the marker edge width in points.

Parameters

ew

[float] Marker edge width, in points.

`set_markerfacecolor`(*self*, *fc*)
Set the marker face color.

Parameters

fc

[color]

`set_markerfacecoloralt`(*self*, *fc*)
Set the alternate marker face color.

Parameters

fc

[color]

`set_markersize`(*self*, *sz*)
Set the marker size in points.

Parameters

sz

[float] Marker size, in points.

`set_markevery`(*self*, *every*)
Set the markevery property to subsample the plot when using markers.

e.g., if `every=5`, every 5-th marker will be plotted.

Parameters

every

[None or int or (int, int) or slice or List[int] or float or (float, float) or List[bool]] Which markers to plot.

- every=None, every point will be plotted.
- every=N, every N-th marker will be plotted starting with marker 0.
- every=(start, N), every N-th marker, starting at point start, will be plotted.
- every=slice(start, end, N), every N-th marker, starting at point start, up to but not including point end, will be plotted.
- every=[i, j, m, n], only markers at points i, j, m, and n will be plotted.
- every=[True, False, True], positions that are True will be plotted.
- every=0.1, (i.e. a float) then markers will be spaced at approximately equal distances along the line; the distance along the line between markers is determined by multiplying the display-coordinate distance of the axes bounding-box diagonal by the value of every.
- every=(0.5, 0.1) (i.e. a length-2 tuple of float), the same functionality as every=0.1 is exhibited but the first marker will be 0.5 multiplied by the display-coordinate-diagonal-distance along the line.

For examples see /gallery/lines_bars_and_markers/markevery_demo.

Notes

Setting the markevery property will only show markers at actual data points. When using float arguments to set the markevery property on irregularly spaced data, the markers will likely not appear evenly spaced because the actual data points do not coincide with the theoretical spacing between markers.

When using a start offset to specify the first marker, the offset will be from the first data point which may be different from the first the visible data point if the plot is zoomed in.

If zooming in on a plot when using float arguments then the actual data points that have markers will change because the distance between markers is always determined from the display-coordinates axes-bounding-box-diagonal regardless of the actual axes data limits.

`set_mec`(*self*, *ec*)
Alias for *set_markeredgecolor*.

`set_mew`(*self*, *ew*)
Alias for *set_markeredgewidth*.

`set_mfc`(*self*, *fc*)
Alias for *set_markerfacecolor*.

`set_mfcalt`(*self*, *fc*)
Alias for *set_markerfacecoloralt*.

`set_ms`(*self*, *sz*)
Alias for *set_markersize*.

`set_picker`(*self*, *p*)
Define the picking behavior of the artist.

Parameters

picker

[None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you

want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set_pickradius* instead.

set_pickradius(*self*, *d*)
Set the pick radius used for containment tests.

See *contains* for more details.

Parameters

d

[float] Pick radius, in points.

set_solid_capstyle(*self*, *s*)
Set the cap style for solid lines.

Parameters

s

[{'butt', 'round', 'projecting'}] For examples see /gallery/lines_bars_and_markers/joinstyle.

set_solid_joinstyle(*self*, *s*)
Set the join style for solid lines.

Parameters

s

[{'miter', 'round', 'bevel'}] For examples see /gallery/lines_bars_and_markers/joinstyle.

set_transform(*self*, *t*)
Set the Transformation instance used by this artist.

Parameters

t

[*matplotlib.transforms.Transform*]

set_xdata(*self*, *x*)
Set the data array for x.

Parameters

x

[1D array]

`set_ydata`(*self*, *y*)
Set the data array for y.

Parameters

y

[1D array]

`update_from`(*self*, *other*)
Copy properties from *other* to self.

```
validCap = ('butt', 'round', 'projecting')
```

```
validJoin = ('miter', 'round', 'bevel')
```

```
zorder = 2
```

matplotlib.lines.VertexSelector

class matplotlib.lines.**VertexSelector**(*line*)

Bases: object

Manage the callbacks to maintain a list of selected vertices for *Line2D*. Derived classes should override *process_selected()* to do something with the picks.

Here is an example which highlights the selected verts with red circles:

```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.lines as lines

class HighlightSelected(lines.VertexSelector):
    def __init__(self, line, fmt='ro', **kwargs):
        lines.VertexSelector.__init__(self, line)
        self.markers, = self.axes.plot([], [], fmt, **kwargs)

    def process_selected(self, ind, xs, ys):
        self.markers.set_data(xs, ys)
        self.canvas.draw()

fig, ax = plt.subplots()
x, y = np.random.rand(2, 30)
line, = ax.plot(x, y, 'bs-', picker=5)

selector = HighlightSelected(line)
plt.show()
```

Initialize the class with a *Line2D* instance. The line should already be added to some *matplotlib.axes.Axes* instance and should have the picker property set.

__dict__ = mappingproxy({'__module__': 'matplotlib.lines', '__doc__': "\n Manage the call

__init__(*self*, *line*)

Initialize the class with a *Line2D* instance. The line should already be added to some *matplotlib.axes.Axes* instance and should have the picker property set.

__module__ = 'matplotlib.lines'

__weakref__

list of weak references to the object (if defined)

onpick(*self*, *event*)

When the line is picked, update the set of selected indices.

process_selected(*self*, *ind*, *xs*, *ys*)
Default "do nothing" implementation of the *process_selected()* method.

Parameters

ind

[list of int] The indices of the selected vertices.

xs, ys

[array-like] The coordinates of the selected vertices.

Examples using matplotlib.lines.VertexSelector

18.30.2 Functions

segment_hits(cx, cy, x, y, radius)	Return the indices of the segments in the polyline with coordinates (*cx*, *cy*) that are within a distance *radius* of the point (*x*, *y*).

matplotlib.lines.segment_hits

matplotlib.lines.**segment_hits**(*cx*, *cy*, *x*, *y*, *radius*)
Return the indices of the segments in the polyline with coordinates (*cx*, *cy*) that are within a distance *radius* of the point (*x*, *y*).

Examples using matplotlib.lines.segment_hits

18.31 matplotlib.markers

Functions to handle markers; used by the marker functionality of *plot* and *scatter*.

All possible markers are defined here:

marker	symbol	description
"."		point
","		pixel
"o"		circle
"v"		triangle_down
"^"		triangle_up

Table 144 -

marker	symbol	description
"<"		triangle_left
">"		triangle_right
"1"		tri_down
"2"		tri_up
"3"		tri_left
"4"		tri_right
"8"		octagon
"s"		square
"p"		pentagon
"P"		plus (filled)
"*"		star
"h"		hexagon1
"H"		hexagon2
"+"		plus
"x"		x
"X"		x (filled)
"D"		diamond
"d"		thin_diamond
"|"		vline
"_"		hline
0 (TICKLEFT)		tickleft
1 (TICKRIGHT)		tickright
2 (TICKUP)		tickup
3 (TICKDOWN)		tickdown
4 (CARETLEFT)		caretleft
5 (CARETRIGHT)		caretright
6 (CARETUP)		caretup
7 (CARETDOWN)		caretdown
8 (CARETLEFTBASE)		caretleft (centered at base)
9 (CARETRIGHTBASE)		caretright (centered at base)
10 (CARETUPBASE)		caretup (centered at base)
11 (CARETDOWNBASE)		caretdown (centered at base)
"None", " " or ""		nothing

Table 144 -

marker	symbol	description
`'$...$'`		Render the string using mathtext. E.g `"$f$"` for marker showing t
`verts`		A list of (x, y) pairs used for Path vertices. The center of the mark
path		A *`Path`* instance.
`(numsides, 0, angle)`		A regular polygon with `numsides` sides, rotated by `angle`.
`(numsides, 1, angle)`		A star-like symbol with `numsides` sides, rotated by `angle`.
`(numsides, 2, angle)`		An asterisk with `numsides` sides, rotated by `angle`.

`None` is the default which means 'nothing', however this table is referred to from other docs for the valid inputs from marker inputs and in those cases `None` still means 'default'.

Note that special symbols can be defined via the *STIX math font*, e.g. `"$\u266B$"`. For an overview over the STIX font symbols refer to the STIX font table. Also see the /gallery/text_labels_and_annotations/stix_fonts_demo.

Integer numbers from `0` to `11` create lines and triangles. Those are equally accessible via capitalized variables, like `CARETDOWNBASE`. Hence the following are equivalent:

```
plt.plot([1, 2, 3], marker=11)
plt.plot([1, 2, 3], marker=matplotlib.markers.CARETDOWNBASE)
```

Examples showing the use of markers:

- /gallery/lines_bars_and_markers/marker_reference
- /gallery/shapes_and_collections/marker_path
- /gallery/lines_bars_and_markers/scatter_star_poly

18.31.1 Classes

`MarkerStyle`([marker, fillstyle])	A class representing marker types.

matplotlib.markers.MarkerStyle

class matplotlib.markers.**MarkerStyle**(*marker=None*, *fillstyle=None*)

Bases: `object`

A class representing marker types.

Attributes

markers

[list] All known markers.

filled_markers

[list] All known filled markers. This is a subset of *markers*.

fillstyles

[list] The supported fillstyles.

Parameters

marker

[str or array-like or None, default: None] *None* means no marker. For other possible marker values see the module docstring *matplotlib.markers*.

fillstyle

[str, default: 'full'] One of 'full', 'left', 'right', 'bottom', 'top', 'none'.

`__bool__`(*self*)

`__dict__ = mappingproxy({'__module__': 'matplotlib.markers', '__doc__': '\n A class repre`

`__init__`(*self*, *marker=None*, *fillstyle=None*)

Parameters

marker

[str or array-like or None, default: None] *None* means no marker. For other possible marker values see the module docstring *matplotlib.markers*.

fillstyle

[str, default: 'full'] One of 'full', 'left', 'right', 'bottom', 'top', 'none'.

`__module__ = 'matplotlib.markers'`

`__weakref__`
list of weak references to the object (if defined)

`filled_markers = ('o', 'v', '^', '<', '>', '8', 's', 'p', '*', 'h', 'H', 'D', 'd', 'P', 'X`

`fillstyles = ('full', 'left', 'right', 'bottom', 'top', 'none')`

`get_alt_path`(*self*)
Return a *Path* for the alternate part of the marker.

For unfilled markers, this is *None*; for filled markers, this is the area to be drawn with *markerfacecoloralt*.

`get_alt_transform`(*self*)
Return the transform to be applied to the *Path* from *MarkerStyle.get_alt_path()*.

get_capstyle(*self*)

get_fillstyle(*self*)

get_joinstyle(*self*)

get_marker(*self*)

get_path(*self*)
Return a *Path* for the primary part of the marker.

For unfilled markers this is the whole marker, for filled markers, this is the area to be drawn with *markerfacecolor*.

get_snap_threshold(*self*)

get_transform(*self*)
Return the transform to be applied to the *Path* from *MarkerStyle.get_path()*.

is_filled(*self*)

markers = {'.': 'point', ',': 'pixel', 'o': 'circle', 'v': 'triangle_down', '^': 'triang

set_fillstyle(*self*, *fillstyle*)
Set the fillstyle.

Parameters

fillstyle

[{'full', 'left', 'right', 'bottom', 'top', 'none'}] The part of the marker surface that is colored with markerfacecolor.

set_marker(*self*, *marker*)
Set the marker.

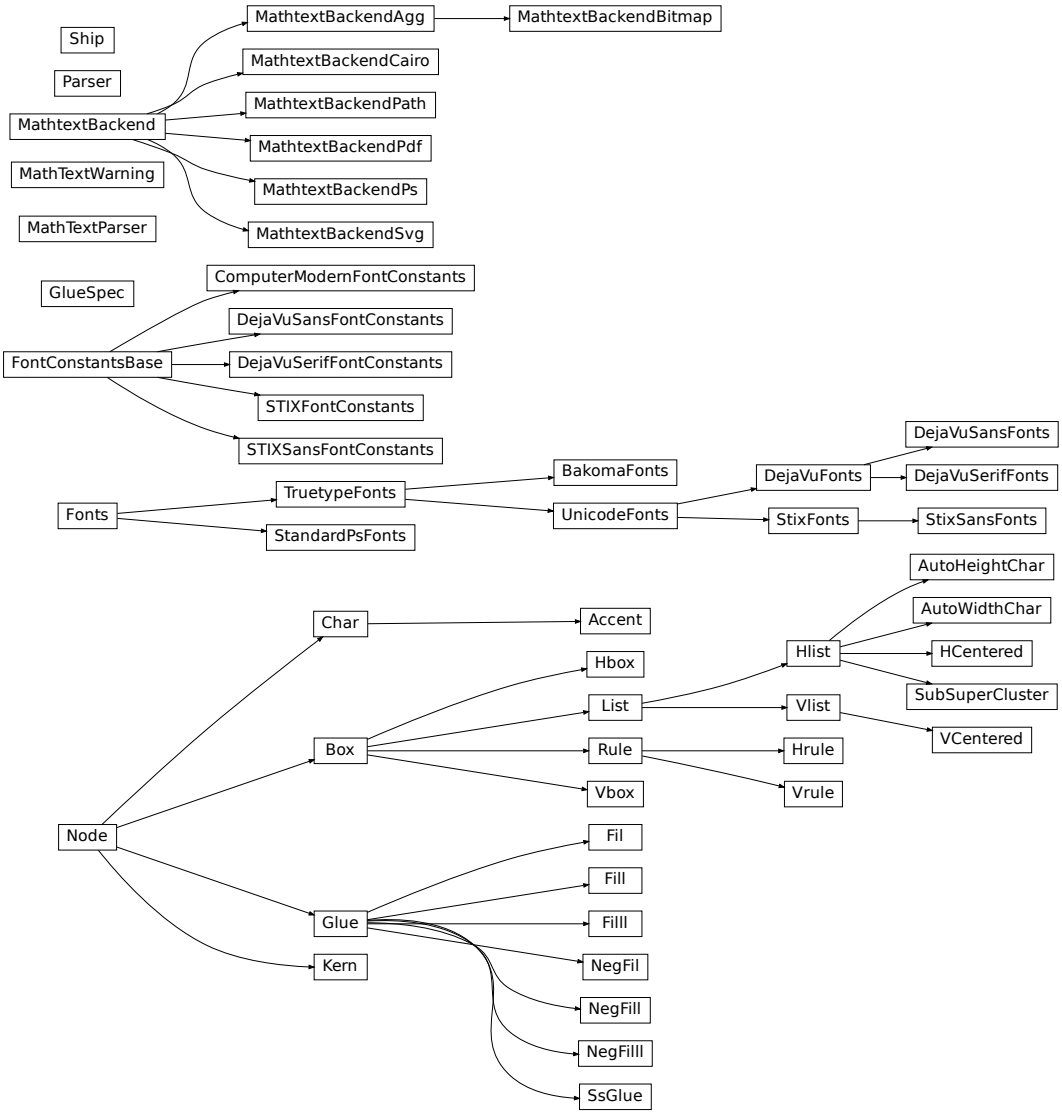
Parameters

marker

[str or array-like or None, default: None] *None* means no marker. For other possible marker values see the module docstring *matplotlib.markers*.

Examples using `matplotlib.markers.MarkerStyle`

18.32 matplotlib.mathtext



A module for parsing a subset of the TeX math syntax and rendering it to a Matplotlib backend.

For a tutorial of its usage, see *Writing mathematical expressions*. This document is primarily concerned with implementation details.

The module uses pyparsing to parse the TeX expression.

The Bakoma distribution of the TeX Computer Modern fonts, and STIX fonts are supported. There is experimental support for using arbitrary fonts, but results may vary without proper tweaking and metrics for those fonts.

class matplotlib.mathtext.**Accent**(*c*, *state*, *math=True*)

Bases: *matplotlib.mathtext.Char*

The font metrics need to be dealt with differently for accents, since they are already offset correctly from the baseline in TrueType fonts.

grow(*self*)

Grows one level larger. There is no limit to how big something can get.

render(*self*, *x*, *y*)

Render the character to the canvas.

shrink(*self*)

Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

class matplotlib.mathtext.**AutoHeightChar**(*c*, *height*, *depth*, *state*, *always=False*, *factor=None*)

Bases: *matplotlib.mathtext.Hlist*

A character as close to the given height and depth as possible.

When using a font with multiple height versions of some characters (such as the BaKoMa fonts), the correct glyph will be selected, otherwise this will always just return a scaled version of the glyph.

class matplotlib.mathtext.**AutoWidthChar**(*c*, *width*, *state*, *always=False*, *char_class=<class 'matplotlib.mathtext.Char'>*)

Bases: *matplotlib.mathtext.Hlist*

A character as close to the given width as possible.

When using a font with multiple width versions of some characters (such as the BaKoMa fonts), the correct glyph will be selected, otherwise this will always just return a scaled version of the glyph.

class matplotlib.mathtext.**BakomaFonts**(**args*, ***kwargs*)

Bases: *matplotlib.mathtext.TruetypeFonts*

Use the Bakoma TrueType fonts for rendering.

Symbols are strewn about a number of font files, each of which has its own proprietary 8-bit encoding.

Parameters

default_font_prop: `~.font_manager.FontProperties`

The default non-math font, or the base font for Unicode (generic) font rendering.

mathtext_backend: `MathtextBackend` subclass

Backend to which rendering is actually delegated.

`alias = '\\]'`

`get_sized_alternatives_for_symbol`(*self*, *fontname*, *sym*)
Override if your font provides multiple sizes of the same symbol. Should return a list of symbols matching *sym* in various sizes. The expression renderer will select the most appropriate size for a given situation from this list.

`target = ']'`

`class matplotlib.mathtext.Box`(*width*, *height*, *depth*)
Bases: *matplotlib.mathtext.Node*

A node with a physical location.

`grow`(*self*)
Grows one level larger. There is no limit to how big something can get.

`render`(*self*, *x1*, *y1*, *x2*, *y2*)

`shrink`(*self*)
Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

`class matplotlib.mathtext.Char`(*c*, *state*, *math=True*)
Bases: *matplotlib.mathtext.Node*

A single character.

Unlike TeX, the font information and metrics are stored with each *Char* to make it easier to lookup the font metrics when needed. Note that TeX boxes have a width, height, and depth, unlike Type1 and TrueType which use a full bounding box and an advance in the x-direction. The metrics must be converted to the TeX model, and the advance (if different from width) must be converted into a *Kern* node when the *Char* is added to its parent *Hlist*.

`get_kerning`(*self*, *next*)
Return the amount of kerning between this and the given character.

This method is called when characters are strung together into *Hlist* to create *Kern* nodes.

`grow`(*self*)
Grows one level larger. There is no limit to how big something can get.

`is_slanted`(*self*)

`render`(*self*, *x*, *y*)
Render the character to the canvas

shrink(*self*)
Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

class matplotlib.mathtext.ComputerModernFontConstants
Bases: *matplotlib.mathtext.FontConstantsBase*

delta = 0.075

delta_integral = 0.3

delta_slanted = 0.3

script_space = 0.075

sub1 = 0.2

sub2 = 0.3

subdrop = 0.2

sup1 = 0.45

class matplotlib.mathtext.DejaVuFonts(**args*, ***kwargs*)
Bases: *matplotlib.mathtext.UnicodeFonts*

Parameters

default_font_prop: `~.font_manager.FontProperties`

The default non-math font, or the base font for Unicode (generic) font rendering.

mathtext_backend: `MathtextBackend` subclass

Backend to which rendering is actually delegated.

use_cmex = False

class matplotlib.mathtext.DejaVuSansFontConstants
Bases: *matplotlib.mathtext.FontConstantsBase*

class matplotlib.mathtext.DejaVuSansFonts(**args*, ***kwargs*)
Bases: *matplotlib.mathtext.DejaVuFonts*

A font handling class for the DejaVu Sans fonts

If a glyph is not found it will fallback to Stix Sans

Parameters

default_font_prop: `~.font_manager.FontProperties`

The default non-math font, or the base font for Unicode (generic) font rendering.

mathtext_backend: `MathtextBackend` subclass

Backend to which rendering is actually delegated.

class matplotlib.mathtext.**DejaVuSerifFontConstants**
Bases: *matplotlib.mathtext.FontConstantsBase*

class matplotlib.mathtext.**DejaVuSerifFonts**(**args*, ***kwargs*)
Bases: *matplotlib.mathtext.DejaVuFonts*

A font handling class for the DejaVu Serif fonts

If a glyph is not found it will fallback to Stix Serif

Parameters

default_font_prop: `~.font_manager.FontProperties`

The default non-math font, or the base font for Unicode (generic) font rendering.

mathtext_backend: `MathtextBackend` subclass

Backend to which rendering is actually delegated.

matplotlib.mathtext.**Error**(*msg*)
Helper class to raise parser errors.

class matplotlib.mathtext.**Fil**(***kwargs*)
Bases: *matplotlib.mathtext.Glue*

[*Deprecated*]

Notes

Deprecated since version 3.3:

class matplotlib.mathtext.**Fill**(***kwargs*)
Bases: *matplotlib.mathtext.Glue*

[*Deprecated*]

Notes

Deprecated since version 3.3:

class matplotlib.mathtext.**Filll**(***kwargs*)
Bases: *matplotlib.mathtext.Glue*

[*Deprecated*]

Notes

Deprecated since version 3.3:

class matplotlib.mathtext.**FontConstantsBase**

Bases: object

A set of constants that controls how certain things, such as sub- and superscripts are laid out. These are all metrics that can't be reliably retrieved from the font metrics in the font itself.

```
delta = 0.025

delta_integral = 0.1

delta_slanted = 0.2

script_space = 0.05

sub1 = 0.3

sub2 = 0.5

subdrop = 0.4

sup1 = 0.7
```

class matplotlib.mathtext.**Fonts**(*default_font_prop*, *mathtext_backend*)

Bases: object

An abstract base class for a system of fonts to use for mathtext.

The class must be able to take symbol keys and font file names and return the character metrics. It also delegates to a backend class to do the actual drawing.

Parameters

default_font_prop: `~.font_manager.FontProperties`

The default non-math font, or the base font for Unicode (generic) font rendering.

mathtext_backend: `MathtextBackend` subclass

Backend to which rendering is actually delegated.

destroy(*self*)

Fix any cyclical references before the object is about to be destroyed.

get_kern(*self*, *font1*, *fontclass1*, *sym1*, *fontsize1*, *font2*, *fontclass2*, *sym2*, *fontsize2*, *dpi*)

Get the kerning distance for font between *sym1* and *sym2*.

fontX: one of the TeX font names:

```
tt, it, rm, cal, sf, bf or default/regular (non-math)
```

fontclassX: TODO

symX: a symbol in raw TeX form. e.g., '1', 'x' or 'sigma'

fontsizeX: the fontsize in points

dpi: the current dots-per-inch

`get_metrics`(*self*, *font*, *font_class*, *sym*, *fontsize*, *dpi*, *math=True*)

font: one of the TeX font names:

```
tt, it, rm, cal, sf, bf or default/regular (non-math)
```

font_class: TODO

sym: a symbol in raw TeX form. e.g., '1', 'x' or 'sigma'

fontsize: font size in points

dpi: current dots-per-inch

math: whether sym is a math character

Returns an object with the following attributes:

- *advance*: The advance distance (in points) of the glyph.
- *height*: The height of the glyph in points.
- *width*: The width of the glyph in points.
- *xmin*, *xmax*, *ymin*, *ymax* - the ink rectangle of the glyph
- *iceberg* - the distance from the baseline to the top of the glyph. This corresponds to TeX's definition of "height".

`get_results`(*self*, *box*)

Get the data needed by the backend to render the math expression. The return value is backend-specific.

`get_sized_alternatives_for_symbol`(*self*, *fontname*, *sym*)

Override if your font provides multiple sizes of the same symbol. Should return a list of symbols matching *sym* in various sizes. The expression renderer will select the most appropriate size for a given situation from this list.

`get_underline_thickness`(*self*, *font*, *fontsize*, *dpi*)

Get the line thickness that matches the given font. Used as a base unit for drawing lines such as in a fraction or radical.

`get_used_characters`(*self*)

Get the set of characters that were used in the math expression. Used by backends that need to subset fonts so they know which glyphs to include.

`get_xheight`(*self*, *font*, *fontsize*, *dpi*)

Get the xheight for the given *font* and *fontsize*.

render_glyph(*self*, *ox*, *oy*, *facename*, *font_class*, *sym*, *fontsize*, *dpi*)
Draw a glyph at

- *ox*, *oy*: position
- *facename*: One of the TeX face names
- *font_class*:
- *sym*: TeX symbol name or single character
- *fontsize*: fontsize in points
- *dpi*: The dpi to draw at.

render_rect_filled(*self*, *x1*, *y1*, *x2*, *y2*)
Draw a filled rectangle from (*x1*, *y1*) to (*x2*, *y2*).

set_canvas_size(*self*, *w*, *h*, *d*)
Set the size of the buffer used to render the math expression. Only really necessary for the bitmap backends.

class matplotlib.mathtext.Glue(*glue_type*, *copy=<deprecated parameter>*)
Bases: *matplotlib.mathtext.Node*

Most of the information in this object is stored in the underlying _GlueSpec class, which is shared between multiple glue objects. (This is a memory optimization which probably doesn't matter anymore, but it's easier to stick to what TeX does.)

property glue_subtype

grow(*self*)
Grows one level larger. There is no limit to how big something can get.

shrink(*self*)
Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

class matplotlib.mathtext.GlueSpec(**kwargs*)
Bases: object

[*Deprecated*] See *Glue*.

Notes

Deprecated since version 3.3.

copy(*self*)

classmethod factory(*glue_type*)

class matplotlib.mathtext.HCentered(*elements*)
Bases: *matplotlib.mathtext.Hlist*

A convenience class to create an *Hlist* whose contents are centered within its enclosing box.

class matplotlib.mathtext.Hbox(*width*)

Bases: *matplotlib.mathtext.Box*

A box with only width (zero height and depth).

class matplotlib.mathtext.Hlist(*elements*, *w=0.0*, *m='additional'*, *do_kern=True*)

Bases: *matplotlib.mathtext.List*

A horizontal list of boxes.

hpack(*self*, *w=0.0*, *m='additional'*)

Compute the dimensions of the resulting boxes, and adjust the glue if one of those dimensions is pre-specified. The computed sizes normally enclose all of the material inside the new box; but some items may stick out if negative glue is used, if the box is overfull, or if a \vbox includes other boxes that have been shifted left.

Parameters

w

[float, default: 0] A width.

m

[{'exactly', 'additional'}, default: 'additional'] Whether to produce a box whose width is 'exactly' *w*; or a box with the natural width of the contents, plus *w* ('additional').

Notes

The defaults produce a box with the natural width of the contents.

kern(*self*)

Insert *Kern* nodes between *Char* nodes to set kerning.

The *Char* nodes themselves determine the amount of kerning they need (in *get_kerning*), and this function just creates the correct linked list.

class matplotlib.mathtext.Hrule(*state*, *thickness=None*)

Bases: *matplotlib.mathtext.Rule*

Convenience class to create a horizontal rule.

class matplotlib.mathtext.Kern(*width*)

Bases: *matplotlib.mathtext.Node*

A *Kern* node has a width field to specify a (normally negative) amount of spacing. This spacing correction appears in horizontal lists between letters like A and V when the font designer said that it looks better to move them closer together

or further apart. A kern node can also appear in a vertical list, when its *width* denotes additional spacing in the vertical direction.

`depth = 0`

`grow`(*self*)
Grows one level larger. There is no limit to how big something can get.

`height = 0`

`shrink`(*self*)
Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

`class matplotlib.mathtext.List`(*elements*)
Bases: *matplotlib.mathtext.Box*

A list of nodes (either horizontal or vertical).

`grow`(*self*)
Grows one level larger. There is no limit to how big something can get.

`shrink`(*self*)
Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

`class matplotlib.mathtext.MathTextParser`(*output*)
Bases: `object`

Create a MathTextParser for the given backend *output*.

`get_depth`(*self*, *texstr*, *dpi=120*, *fontsize=14*)

Parameters

texstr

[str] A valid mathtext string, e.g., r'IQ: $sigma_i=15$'.

dpi

[float] The dots-per-inch setting used to render the text.

Returns

int

Offset of the baseline from the bottom of the image, in pixels.

`parse`(*self*, *s*, *dpi=72*, *prop=None*)
Parse the given math expression *s* at the given *dpi*. If *prop* is provided, it is a *FontProperties* object specifying the "default" font to use in the math expression, used for all non-math text.

The results are cached, so multiple calls to *parse* with the same expression should be fast.

to_mask(*self*, *texstr*, *dpi=120*, *fontsize=14*)

Parameters

texstr

[str] A valid mathtext string, e.g., r'IQ: $sigma_i=15$'.

dpi

[float] The dots-per-inch setting used to render the text.

fontsize

[int] The font size in points

Returns

array

[2D uint8 alpha] Mask array of rasterized tex.

depth

[int] Offset of the baseline from the bottom of the image, in pixels.

to_png(*self*, *filename*, *texstr*, *color='black'*, *dpi=120*, *fontsize=14*)

Render a tex expression to a PNG file.

Parameters

filename

A writable filename or fileobject.

texstr

[str] A valid mathtext string, e.g., r'IQ: $sigma_i=15$'.

color

[color] The text color.

dpi

[float] The dots-per-inch setting used to render the text.

fontsize

[int] The font size in points.

Returns

int

Offset of the baseline from the bottom of the image, in pixels.

to_rgba(*self*, *texstr*, *color='black'*, *dpi=120*, *fontsize=14*)

Parameters

texstr

[str] A valid mathtext string, e.g., r'IQ: $sigma_i=15$'.

color

[color] The text color.

dpi

[float] The dots-per-inch setting used to render the text.

fontsize

[int] The font size in points.

Returns

array

[(M, N, 4) array] RGBA color values of rasterized tex, colorized with *color*.

depth

[int] Offset of the baseline from the bottom of the image, in pixels.

exception matplotlib.mathtext.**MathTextWarning**

Bases: Warning

class matplotlib.mathtext.**MathtextBackend**

Bases: object

The base class for the mathtext backend-specific code. *MathtextBackend* subclasses interface between mathtext and specific Matplotlib graphics backends.

Subclasses need to override the following:

- *render_glyph()*
- *render_rect_filled()*
- *get_results()*

And optionally, if you need to use a FreeType hinting style:

- *get_hinting_type()*

get_hinting_type(*self*)

Get the FreeType hinting type to use with this particular backend.

get_results(*self*, *box*)
Return a backend-specific tuple to return to the backend after all processing is done.

render_glyph(*self*, *ox*, *oy*, *info*)
Draw a glyph described by *info* to the reference point (*ox*, *oy*).

render_rect_filled(*self*, *x1*, *y1*, *x2*, *y2*)
Draw a filled black rectangle from (*x1*, *y1*) to (*x2*, *y2*).

set_canvas_size(*self*, *w*, *h*, *d*)
Set the dimension of the drawing canvas.

class matplotlib.mathtext.MathtextBackendAgg
Bases: *matplotlib.mathtext.MathtextBackend*

Render glyphs and rectangles to an FTImage buffer, which is later transferred to the Agg image by the Agg backend.

get_hinting_type(*self*)
Get the FreeType hinting type to use with this particular backend.

get_results(*self*, *box*, *used_characters*)
Return a backend-specific tuple to return to the backend after all processing is done.

render_glyph(*self*, *ox*, *oy*, *info*)
Draw a glyph described by *info* to the reference point (*ox*, *oy*).

render_rect_filled(*self*, *x1*, *y1*, *x2*, *y2*)
Draw a filled black rectangle from (*x1*, *y1*) to (*x2*, *y2*).

set_canvas_size(*self*, *w*, *h*, *d*)
Set the dimension of the drawing canvas.

class matplotlib.mathtext.MathtextBackendBitmap
Bases: *matplotlib.mathtext.MathtextBackendAgg*

get_results(*self*, *box*, *used_characters*)
Return a backend-specific tuple to return to the backend after all processing is done.

class matplotlib.mathtext.MathtextBackendCairo
Bases: *matplotlib.mathtext.MathtextBackend*

Store information to write a mathtext rendering to the Cairo backend.

get_results(*self*, *box*, *used_characters*)
Return a backend-specific tuple to return to the backend after all processing is done.

render_glyph(*self*, *ox*, *oy*, *info*)
Draw a glyph described by *info* to the reference point (*ox*, *oy*).

render_rect_filled(*self*, *x1*, *y1*, *x2*, *y2*)
Draw a filled black rectangle from (*x1*, *y1*) to (*x2*, *y2*).

class matplotlib.mathtext.MathtextBackendPath
Bases: *matplotlib.mathtext.MathtextBackend*

Store information to write a mathtext rendering to the text path machinery.

get_results(*self*, *box*, *used_characters*)
Return a backend-specific tuple to return to the backend after all processing is done.

render_glyph(*self*, *ox*, *oy*, *info*)
Draw a glyph described by *info* to the reference point (*ox*, *oy*).

render_rect_filled(*self*, *x1*, *y1*, *x2*, *y2*)
Draw a filled black rectangle from (*x1*, *y1*) to (*x2*, *y2*).

class matplotlib.mathtext.MathtextBackendPdf
Bases: *matplotlib.mathtext.MathtextBackend*

Store information to write a mathtext rendering to the PDF backend.

get_results(*self*, *box*, *used_characters*)
Return a backend-specific tuple to return to the backend after all processing is done.

render_glyph(*self*, *ox*, *oy*, *info*)
Draw a glyph described by *info* to the reference point (*ox*, *oy*).

render_rect_filled(*self*, *x1*, *y1*, *x2*, *y2*)
Draw a filled black rectangle from (*x1*, *y1*) to (*x2*, *y2*).

class matplotlib.mathtext.MathtextBackendPs
Bases: *matplotlib.mathtext.MathtextBackend*

Store information to write a mathtext rendering to the PostScript backend.

get_results(*self*, *box*, *used_characters*)
Return a backend-specific tuple to return to the backend after all processing is done.

render_glyph(*self*, *ox*, *oy*, *info*)
Draw a glyph described by *info* to the reference point (*ox*, *oy*).

render_rect_filled(*self*, *x1*, *y1*, *x2*, *y2*)
Draw a filled black rectangle from (*x1*, *y1*) to (*x2*, *y2*).

class matplotlib.mathtext.MathtextBackendSvg
Bases: *matplotlib.mathtext.MathtextBackend*

Store information to write a mathtext rendering to the SVG backend.

get_results(*self*, *box*, *used_characters*)
Return a backend-specific tuple to return to the backend after all processing is done.

render_glyph(*self*, *ox*, *oy*, *info*)
Draw a glyph described by *info* to the reference point (*ox*, *oy*).

render_rect_filled(*self*, *x1*, *y1*, *x2*, *y2*)
Draw a filled black rectangle from (*x1*, *y1*) to (*x2*, *y2*).

class matplotlib.mathtext.NegFil(**kwargs)
Bases: *matplotlib.mathtext.Glue*

[*Deprecated*]

Notes

Deprecated since version 3.3:

class matplotlib.mathtext.NegFill(**kwargs)
Bases: *matplotlib.mathtext.Glue*

[*Deprecated*]

Notes

Deprecated since version 3.3:

class matplotlib.mathtext.NegFilll(**kwargs)
Bases: *matplotlib.mathtext.Glue*

[*Deprecated*]

Notes

Deprecated since version 3.3:

class matplotlib.mathtext.Node
Bases: object

A node in the TeX box model.

get_kerning(*self*, *next*)

grow(*self*)
Grows one level larger. There is no limit to how big something can get.

render(*self*, *x*, *y*)

shrink(*self*)
Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

class matplotlib.mathtext.Parser
Bases: object

A pyparsing-based parser for strings containing math expressions.

Raw text may also appear outside of pairs of $.

The grammar is based directly on that in TeX, though it cuts a few corners.

class State(*font_output*, *font*, *font_class*, *fontsize*, *dpi*)

Bases: object

Stores the state of the parser.

States are pushed and popped from a stack as necessary, and the "current" state is always at the top of the stack.

copy(*self*)

property font

accent(*self*, *s*, *loc*, *toks*)

accentprefixed(*self*, *s*, *loc*, *toks*)

auto_delim(*self*, *s*, *loc*, *toks*)

binom(*self*, *s*, *loc*, *toks*)

c_over_c(*self*, *s*, *loc*, *toks*)

customspace(*self*, *s*, *loc*, *toks*)

dfrac(*self*, *s*, *loc*, *toks*)

end_group(*self*, *s*, *loc*, *toks*)

font(*self*, *s*, *loc*, *toks*)

frac(*self*, *s*, *loc*, *toks*)

function(*self*, *s*, *loc*, *toks*)

genfrac(*self*, *s*, *loc*, *toks*)

get_state(*self*)

Get the current *State* of the parser.

group(*self*, *s*, *loc*, *toks*)

is_between_brackets(*self*, *s*, *loc*)

is_dropsub(*self*, *nucleus*)

is_overunder(*self*, *nucleus*)

is_slanted(*self*, *nucleus*)

main(*self*, *s*, *loc*, *toks*)

math(*self*, *s*, *loc*, *toks*)

math_string(*self*, *s*, *loc*, *toks*)

non_math(*self*, *s*, *loc*, *toks*)

operatorname(*self*, *s*, *loc*, *toks*)

overline(*self*, *s*, *loc*, *toks*)

parse(*self*, *s*, *fonts_object*, *fontsize*, *dpi*)
Parse expression *s* using the given *fonts_object* for output, at the given *fontsize* and *dpi*.

Returns the parse tree of *Node* instances.

pop_state(*self*)
Pop a *State* off of the stack.

push_state(*self*)
Push a new *State* onto the stack, copying the current state.

required_group(*self*, *s*, *loc*, *toks*)

simple_group(*self*, *s*, *loc*, *toks*)

space(*self*, *s*, *loc*, *toks*)

sqrt(*self*, *s*, *loc*, *toks*)

start_group(*self*, *s*, *loc*, *toks*)

subsuper(*self*, *s*, *loc*, *toks*)

symbol(*self*, *s*, *loc*, *toks*)

unknown_symbol(*self*, *s*, *loc*, *toks*)

class matplotlib.mathtext.**Rule**(*width*, *height*, *depth*, *state*)
Bases: *matplotlib.mathtext.Box*

A solid black rectangle.

It has *width*, *depth*, and *height* fields just as in an *Hlist*. However, if any of these dimensions is inf, the actual value will be determined by running the rule up to the boundary of the innermost enclosing box. This is called a "running dimension". The width is never running in an *Hlist*; the height and depth are never running in a *Vlist*.

render(*self*, *x*, *y*, *w*, *h*)

class matplotlib.mathtext.**STIXFontConstants**
Bases: *matplotlib.mathtext.FontConstantsBase*

delta = 0.05

delta_integral = 0.3

delta_slanted = 0.3

script_space = 0.1

sub2 = 0.6

sup1 = 0.8

class matplotlib.mathtext.**STIXSansFontConstants**
Bases: *matplotlib.mathtext.FontConstantsBase*

delta_integral = 0.3

delta_slanted = 0.6

script_space = 0.05

sup1 = 0.8

class matplotlib.mathtext.Ship
Bases: object

Ship boxes to output once they have been set up, this sends them to output.

Since boxes can be inside of boxes inside of boxes, the main work of *Ship* is done by two mutually recursive routines, *hlist_out* and *vlist_out*, which traverse the *Hlist* nodes and *Vlist* nodes inside of horizontal and vertical boxes. The global variables used in TeX to store state as it processes have become member variables here.

static clamp(*value*)

hlist_out(*self*, *box*)

vlist_out(*self*, *box*)

class matplotlib.mathtext.SsGlue(**kwargs*)
Bases: *matplotlib.mathtext.Glue*

[*Deprecated*]

Notes

Deprecated since version 3.3:

class matplotlib.mathtext.StandardPsFonts(*default_font_prop*)
Bases: *matplotlib.mathtext.Fonts*

Use the standard postscript fonts for rendering to backend_ps

Unlike the other font classes, BakomaFont and UnicodeFont, this one requires the Ps backend.

Parameters

default_font_prop: `~.font_manager.FontProperties`

The default non-math font, or the base font for Unicode (generic) font rendering.

mathtext_backend: `MathtextBackend` subclass

Backend to which rendering is actually delegated.

basepath = '/usr/local/lib64/python3.8/site-packages/matplotlib/mpl-data/fonts/afm'

fontmap = {'cal': 'pzcmi8a', 'rm': 'pncr8a', 'tt': 'pcrr8a', 'it': 'pncri8a', 'sf': 'phv

`get_kern`(*self*, *font1*, *fontclass1*, *sym1*, *fontsize1*, *font2*, *fontclass2*, *sym2*, *fontsize2*, *dpi*)
Get the kerning distance for font between *sym1* and *sym2*.

fontX: one of the TeX font names:

```
tt, it, rm, cal, sf, bf or default/regular (non-math)
```

fontclassX: TODO

symX: a symbol in raw TeX form. e.g., '1', 'x' or 'sigma'

fontsizeX: the fontsize in points

dpi: the current dots-per-inch

`get_underline_thickness`(*self*, *font*, *fontsize*, *dpi*)
Get the line thickness that matches the given font. Used as a base unit for drawing lines such as in a fraction or radical.

`get_xheight`(*self*, *font*, *fontsize*, *dpi*)
Get the xheight for the given *font* and *fontsize*.

`class matplotlib.mathtext.StixFonts`(**args*, ***kwargs*)
Bases: *matplotlib.mathtext.UnicodeFonts*

A font handling class for the STIX fonts.

In addition to what UnicodeFonts provides, this class:

- supports "virtual fonts" which are complete alpha numeric character sets with different font styles at special Unicode code points, such as "Blackboard".
- handles sized alternative characters for the STIXSizeX fonts.

Parameters

default_font_prop: `~.font_manager.FontProperties`

The default non-math font, or the base font for Unicode (generic) font rendering.

mathtext_backend: `MathtextBackend` subclass

Backend to which rendering is actually delegated.

`cm_fallback = False`

`get_sized_alternatives_for_symbol`(*self*, *fontname*, *sym*)
Override if your font provides multiple sizes of the same symbol. Should return a list of symbols matching *sym* in various sizes. The expression renderer will select the most appropriate size for a given situation from this list.

`use_cmex = False`

class matplotlib.mathtext.StixSansFonts(*args, **kwargs)

Bases: *matplotlib.mathtext.StixFonts*

A font handling class for the STIX fonts (that uses sans-serif characters by default).

Parameters

default_font_prop: `~.font_manager.FontProperties`

The default non-math font, or the base font for Unicode (generic) font rendering.

mathtext_backend: `MathtextBackend` subclass

Backend to which rendering is actually delegated.

class matplotlib.mathtext.SubSuperCluster

Bases: *matplotlib.mathtext.Hlist*

A hack to get around that fact that this code does a two-pass parse like TeX. This lets us store enough information in the hlist itself, namely the nucleus, sub- and super-script, such that if another script follows that needs to be attached, it can be reconfigured on the fly.

class matplotlib.mathtext.TruetypeFonts(*default_font_prop*, *mathtext_backend*)

Bases: *matplotlib.mathtext.Fonts*

A generic base class for all font setups that use Truetype fonts (through FT2Font).

Parameters

default_font_prop: `~.font_manager.FontProperties`

The default non-math font, or the base font for Unicode (generic) font rendering.

mathtext_backend: `MathtextBackend` subclass

Backend to which rendering is actually delegated.

destroy(*self*)

Fix any cyclical references before the object is about to be destroyed.

get_kern(*self*, *font1*, *fontclass1*, *sym1*, *fontsize1*, *font2*, *fontclass2*, *sym2*, *fontsize2*, *dpi*)

Get the kerning distance for font between *sym1* and *sym2*.

fontX: one of the TeX font names:

```
tt, it, rm, cal, sf, bf or default/regular (non-math)
```

fontclassX: TODO

symX: a symbol in raw TeX form. e.g., '1', 'x' or 'sigma'

fontsizeX: the fontsize in points

dpi: the current dots-per-inch

`get_underline_thickness`(*self*, *font*, *fontsize*, *dpi*)
Get the line thickness that matches the given font. Used as a base unit for drawing lines such as in a fraction or radical.

`get_xheight`(*self*, *fontname*, *fontsize*, *dpi*)
Get the xheight for the given *font* and *fontsize*.

`class matplotlib.mathtext.UnicodeFonts`(**args*, ***kwargs*)
Bases: *matplotlib.mathtext.TruetypeFonts*

An abstract base class for handling Unicode fonts.

While some reasonably complete Unicode fonts (such as DejaVu) may work in some situations, the only Unicode font I'm aware of with a complete set of math symbols is STIX.

This class will "fallback" on the Bakoma fonts when a required symbol can not be found in the font.

Parameters

default_font_prop: `~.font_manager.FontProperties`

The default non-math font, or the base font for Unicode (generic) font rendering.

mathtext_backend: `MathtextBackend` subclass

Backend to which rendering is actually delegated.

`get_sized_alternatives_for_symbol`(*self*, *fontname*, *sym*)
Override if your font provides multiple sizes of the same symbol. Should return a list of symbols matching *sym* in various sizes. The expression renderer will select the most appropriate size for a given situation from this list.

`use_cmex = True`

`class matplotlib.mathtext.VCentered`(*elements*)
Bases: *matplotlib.mathtext.Vlist*

A convenience class to create a *Vlist* whose contents are centered within its enclosing box.

`class matplotlib.mathtext.Vbox`(*height*, *depth*)
Bases: *matplotlib.mathtext.Box*

A box with only height (zero width).

`class matplotlib.mathtext.Vlist`(*elements*, *h=0.0*, *m='additional'*)
Bases: *matplotlib.mathtext.List*

A vertical list of boxes.

vpack(*self*, *h=0.0*, *m='additional'*, *l=inf*)

Compute the dimensions of the resulting boxes, and to adjust the glue if one of those dimensions is pre-specified.

Parameters

h

[float, default: 0] A height.

m

[{'exactly', 'additional'}, default: 'additional'] Whether to produce a box whose height is 'exactly' *w*; or a box with the natural height of the contents, plus *w* ('additional').

l

[float, default: np.inf] The maximum height.

Notes

The defaults produce a box with the natural height of the contents.

class matplotlib.mathtext.Vrule(*state*)

Bases: *matplotlib.mathtext.Rule*

Convenience class to create a vertical rule.

matplotlib.mathtext.get_unicode_index(*symbol*, *math=True*)

Return the integer index (from the Unicode table) of *symbol*.

Parameters

symbol

[str] A single unicode character, a TeX command (e.g. r'pi') or a Type1 symbol name (e.g. 'phi').

math

[bool, default: True] If False, always treat as a single unicode character.

matplotlib.mathtext.math_to_image(*s*, *filename_or_obj*, *prop=None*, *dpi=None*, *format=None*)

Given a math expression, renders it in a closely-clipped bounding box to an image file.

Parameters

s

[str] A math expression. The math portion must be enclosed in dollar signs.

filename_or_obj

[str or path-like or file-like] Where to write the image data.

prop

[*FontProperties*, optional] The size and style of the text.

dpi

[float, optional] The output dpi. If not set, the dpi is determined as for *Figure.savefig*.

format

[str, optional] The output format, e.g., 'svg', 'pdf', 'ps' or 'png'. If not set, the format is determined as for *Figure.savefig*.

18.33 matplotlib.mlab

Numerical python functions written for compatibility with MATLAB commands with the same names. Most numerical python functions can be found in the numpy and scipy libraries. What remains here is code for performing spectral computations.

18.33.1 Spectral functions

cohere

Coherence (normalized cross spectral density)

csd

Cross spectral density using Welch's average periodogram

detrend

Remove the mean or best fit line from an array

psd

Power spectral density using Welch's average periodogram

specgram

Spectrogram (spectrum over segments of time)

complex_spectrum

Return the complex-valued frequency spectrum of a signal

magnitude_spectrum

Return the magnitude of the frequency spectrum of a signal

angle_spectrum

Return the angle (wrapped phase) of the frequency spectrum of a signal

phase_spectrum

Return the phase (unwrapped angle) of the frequency spectrum of a signal

detrend_mean

Remove the mean from a line.

detrend_linear

Remove the best fit line from a line.

detrend_none

Return the original line.

stride_windows

Get all windows in an array in a memory-efficient manner

stride_repeat

Repeat an array in a memory-efficient manner

apply_window

Apply a window along a given axis

class matplotlib.mlab.**GaussianKDE**(*dataset*, *bw_method=None*)

Bases: object

Representation of a kernel-density estimate using Gaussian kernels.

Parameters

dataset

[array-like] Datapoints to estimate from. In case of univariate data this is a 1-D array, otherwise a 2-D array with shape (# of dims, # of data).

bw_method

[str, scalar or callable, optional] The method used to calculate the estimator bandwidth. This can be 'scott', 'silverman', a scalar constant or a callable. If a scalar, this will be used directly as `kde.factor`. If a callable, it should take a *GaussianKDE* instance as only parameter and return a scalar. If None (default), 'scott' is used.

Attributes

dataset

[ndarray] The dataset with which `gaussian_kde` was initialized.

dim

[int] Number of dimensions.

num_dp

[int] Number of datapoints.

factor

[float] The bandwidth factor, obtained from `kde.covariance_factor`, with which the covariance matrix is multiplied.

covariance

[ndarray] The covariance matrix of *dataset*, scaled by the calculated bandwidth (`kde.factor`).

inv_cov

[ndarray] The inverse of *covariance*.

Methods

kde.evaluate(points)	(ndarray) Evaluate the estimated pdf on a provided set of points.
kde(points)	(ndarray) Same as kde.evaluate(points)

`covariance_factor`(*self*)

`evaluate`(*self*, *points*)

Evaluate the estimated pdf on a set of points.

Parameters

points

[(# of dimensions, # of points)-array] Alternatively, a (# of dimensions,) vector can be passed in and treated as a single point.

Returns

(# of points,)-array

The values at each point.

Raises

ValueError

[if the dimensionality of the input points is different] than the dimensionality of the KDE.

`scotts_factor`(*self*)

`silverman_factor`(*self*)

`matplotlib.mlab.`**`angle_spectrum`**(*x*, *Fs=None*, *window=None*, *pad_to=None*, *sides=None*)

Compute the angle of the frequency spectrum (wrapped phase spectrum) of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Returns

spectrum

[1-D array] The angle of the frequency spectrum (wrapped phase spectrum).

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

See also:

psd

Returns the power spectral density.

complex_spectrum

Returns the complex-valued frequency spectrum.

magnitude_spectrum

Returns the absolute value of the *complex_spectrum*.

angle_spectrum

Returns the angle of the *complex_spectrum*.

phase_spectrum

Returns the phase (unwrapped angle) of the *complex_spectrum*.

specgram

Can return the complex spectrum of segments within the signal.

matplotlib.mlab.**apply_window**(*x*, *window*, *axis=0*, *return_window=None*)

[*Deprecated*] Apply the given window to the given 1D or 2D array along the given axis.

Parameters

x

[1D or 2D array or sequence] Array or sequence containing the data.

window

[function or array.] Either a function to generate a window or an array with length *x*.shape[*axis*]

axis

[int] The axis over which to do the repetition. Must be 0 or 1. The default is 0

return_window

[bool] If true, also return the 1D values of the window that was applied

Notes

Deprecated since version 3.2.

matplotlib.mlab.**cohere**(*x*, *y*, *NFFT=256*, *Fs=2*, *detrend=<function detrend_none at 0x7f5434697820>*, *window=<function window_hanning at 0x7f5434697160>*, *noverlap=0*, *pad_to=None*, *sides='default'*, *scale_by_freq=None*)

The coherence between *x* and *y*. Coherence is the normalized cross spectral density:

$$C_{xy} = \frac{|P_{xy}|^2}{P_{xx}P_{yy}}$$

Parameters

x, y

Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum

distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The *mlab* module defines *detrend_none*, *detrend_mean*, and *detrend_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend_none*. 'mean' calls *detrend_mean*. 'linear' calls *detrend_linear*.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int] The number of points of overlap between blocks. The default value is 0 (no overlap).

Returns

The return value is the tuple (*Cxy*, *f*), where *f* are the frequencies of the coherence vector. For cohere, scaling the individual densities by the sampling frequency has no effect, since the factors cancel out.

See also:

psd(), *csd()*

For information about the methods used to compute P_{xy}, P_{xx} and P_{yy}.

matplotlib.mlab.**complex_spectrum**(*x*, *Fs=None*, *window=None*, *pad_to=None*, *sides=None*)

Compute the complex-valued frequency spectrum of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Returns

spectrum

[1-D array] The complex-valued frequency spectrum.

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

See also:

psd

Returns the power spectral density.

complex_spectrum

Returns the complex-valued frequency spectrum.

magnitude_spectrum

Returns the absolute value of the *complex_spectrum*.

angle_spectrum

Returns the angle of the *complex_spectrum*.

phase_spectrum

Returns the phase (unwrapped angle) of the *complex_spectrum*.

specgram

Can return the complex spectrum of segments within the signal.

matplotlib.mlab.**csd**(*x*, *y*, *NFFT=None*, *Fs=None*, *detrend=None*, *window=None*, *noverlap=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*)

Compute the cross-spectral density.

The cross spectral density P_{xy} by Welch's average periodogram method. The vectors *x* and *y* are divided into *NFFT* length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The product of the direct FFTs of *x* and *y* are averaged over each segment to compute P_{xy}, with a scaling to correct for power loss due to windowing.

If len(*x*) < *NFFT* or len(*y*) < *NFFT*, they will be zero padded to *NFFT*.

Parameters

x, y

[1-D arrays or sequences] Arrays or sequences containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors

see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The *mlab* module defines *detrend_none*, *detrend_mean*, and *detrend_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend_none*. 'mean' calls *detrend_mean*. 'linear' calls *detrend_linear*.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int] The number of points of overlap between segments. The default value is 0 (no overlap).

Returns

Pxy

[1-D array] The values for the cross spectrum P_{xy} before scaling (real valued)

freqs

[1-D array] The frequencies corresponding to the elements in *Pxy*

See also:

psd

equivalent to setting `y = x`.

References

Bendat & Piersol -- Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

`matplotlib.mlab.`**detrend**(*x*, *key=None*, *axis=None*)

Return x with its trend removed.

Parameters

x

[array or sequence] Array or sequence containing the data.

key

[{'default', 'constant', 'mean', 'linear', 'none'} or function] The detrending algorithm to use. 'default', 'mean', and 'constant' are the same as *detrend_mean*. 'linear' is the same as *detrend_linear*. 'none' is the same as *detrend_none*. The default is 'mean'. See the corresponding functions for more details regarding the algorithms. Can also be a function that carries out the detrend operation.

axis

[int] The axis along which to do the detrending.

See also:

detrend_mean

Implementation of the 'mean' algorithm.

detrend_linear

Implementation of the 'linear' algorithm.

detrend_none

Implementation of the 'none' algorithm.

matplotlib.mlab.**detrend_linear**(*y*)

Return x minus best fit line; 'linear' detrending.

Parameters

y

[0-D or 1-D array or sequence] Array or sequence containing the data

axis

[int] The axis along which to take the mean. See numpy.mean for a description of this argument.

See also:

detrend_mean

Another detrend algorithm.

detrend_none

Another detrend algorithm.

detrend

A wrapper around all the detrend algorithms.

matplotlib.mlab.**detrend_mean**(*x*, *axis=None*)

Return x minus the mean(x).

Parameters

x

[array or sequence] Array or sequence containing the data Can have any dimensionality

axis

[int] The axis along which to take the mean. See numpy.mean for a description of this argument.

See also:

detrend_linear

Another detrend algorithm.

detrend_none

Another detrend algorithm.

detrend

A wrapper around all the detrend algorithms.

matplotlib.mlab.**detrend_none**(*x*, *axis=None*)

Return x: no detrending.

Parameters

x

[any object] An object containing the data

axis

[int] This parameter is ignored. It is included for compatibility with detrend_mean

See also:

detrend_mean

Another detrend algorithm.

detrend_linear

Another detrend algorithm.

detrend

A wrapper around all the detrend algorithms.

matplotlib.mlab.**magnitude_spectrum**(*x*, *Fs=None*, *window=None*, *pad_to=None*, *sides=None*)

Compute the magnitude (absolute value) of the frequency spectrum of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Returns

spectrum

[1-D array] The magnitude (absolute value) of the frequency spectrum.

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

See also:

psd

Returns the power spectral density.

complex_spectrum

Returns the complex-valued frequency spectrum.

magnitude_spectrum

Returns the absolute value of the *complex_spectrum*.

angle_spectrum

Returns the angle of the *complex_spectrum*.

phase_spectrum

Returns the phase (unwrapped angle) of the *complex_spectrum*.

specgram

Can return the complex spectrum of segments within the signal.

matplotlib.mlab.**phase_spectrum**(*x*, *Fs=None*, *window=None*, *pad_to=None*, *sides=None*)

Compute the phase of the frequency spectrum (unwrapped phase spectrum) of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Returns

spectrum

[1-D array] The phase of the frequency spectrum (unwrapped phase spectrum).

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

See also:

psd

Returns the power spectral density.

complex_spectrum

Returns the complex-valued frequency spectrum.

magnitude_spectrum

Returns the absolute value of the *complex_spectrum*.

angle_spectrum

Returns the angle of the *complex_spectrum*.

phase_spectrum

Returns the phase (unwrapped angle) of the *complex_spectrum*.

specgram

Can return the complex spectrum of segments within the signal.

matplotlib.mlab.**psd**(*x*, *NFFT=None*, *Fs=None*, *detrend=None*, *window=None*, *noverlap=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*)

Compute the power spectral density.

The power spectral density P_{xx} by Welch's average periodogram method. The vector *x* is divided into *NFFT* length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The $|\mathrm{fft}(i)|^2$ of each segment i are averaged to compute P_{xx}.

If len(*x*) < *NFFT*, it will be zero padded to *NFFT*.

Parameters

x

[1-D array or sequence] Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The *mlab* module defines *detrend_none*, *detrend_mean*, and *detrend_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend_none*. 'mean' calls *detrend_mean*. 'linear' calls *detrend_linear*.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int] The number of points of overlap between segments. The default value is 0 (no overlap).

Returns

Pxx

[1-D array] The values for the power spectrum P_{xx} (real valued)

freqs

[1-D array] The frequencies corresponding to the elements in *Pxx*

See also:

specgram

specgram differs in the default overlap; in not returning the mean of the segment periodograms; and in returning the times of the segments.

magnitude_spectrum

returns the magnitude spectrum.

csd

returns the spectral density between two signals.

References

matplotlib.mlab.**specgram**(*x*, *NFFT=None*, *Fs=None*, *detrend=None*, *window=None*, *noverlap=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*, *mode=None*)

Compute a spectrogram.

Compute and plot a spectrogram of data in x. Data are split into NFFT length segments and the spectrum of each section is computed. The windowing function window is applied to each segment, and the amount of overlap of each segment is specified with noverlap.

Parameters

x

[array-like] 1-D array or sequence.

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The *mlab* module defines *detrend_none*, *detrend_mean*, and *detrend_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend_none*. 'mean' calls *detrend_mean*. 'linear' calls *detrend_linear*.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int, optional] The number of points of overlap between blocks. The default value is 128.

mode

[str, default: 'psd']

What sort of spectrum to use:

'psd'

Returns the power spectral density.

'complex'

Returns the complex-valued frequency spectrum.

'magnitude'

Returns the magnitude spectrum.

'angle'

Returns the phase spectrum without unwrapping.

'phase'

Returns the phase spectrum with unwrapping.

Returns

spectrum

[array-like] 2-D array, columns are the periodograms of successive segments.

freqs

[array-like] 1-D array, frequencies corresponding to the rows in *spectrum*.

t

[array-like] 1-D array, the times corresponding to midpoints of segments (i.e the columns in *spectrum*).

See also:

psd

differs in the overlap and in the return values.

complex_spectrum

similar, but with complex valued frequencies.

magnitude_spectrum

similar single segment when mode is 'magnitude'.

angle_spectrum

similar to single segment when mode is 'angle'.

phase_spectrum

similar to single segment when mode is 'phase'.

Notes

detrend and scale_by_freq only apply when *mode* is set to 'psd'.

matplotlib.mlab.**stride_repeat**(*x*, *n*, *axis=0*)

[*Deprecated*] Repeat the values in an array in a memory-efficient manner. Array x is stacked vertically n times.

Warning: It is not safe to write to the output array. Multiple elements may point to the same piece of memory, so modifying one value may change others.

Parameters

x

[1D array or sequence] Array or sequence containing the data.

n

[int] The number of time to repeat the array.

axis

[int] The axis along which the data will run.

Notes

Deprecated since version 3.2.

References

stackoverflow: Repeat NumPy array without replicating data?

matplotlib.mlab.**stride_windows**(*x*, *n*, *noverlap=None*, *axis=0*)

Get all windows of x with length n as a single array, using strides to avoid data duplication.

> **Warning:** It is not safe to write to the output array. Multiple elements may point to the same piece of memory, so modifying one value may change others.

Parameters

x

[1D array or sequence] Array or sequence containing the data.

n

[int] The number of data points in each window.

noverlap

[int] The overlap between adjacent windows. Default is 0 (no overlap)

axis

[int] The axis along which the windows will run.

References

stackoverflow: Rolling window for 1D arrays in Numpy? stackoverflow: Using strides for an efficient moving average filter

matplotlib.mlab.**window_hanning**(*x*)

Return x times the hanning window of len(x).

See also:

window_none

Another window algorithm.

matplotlib.mlab.**window_none**(*x*)

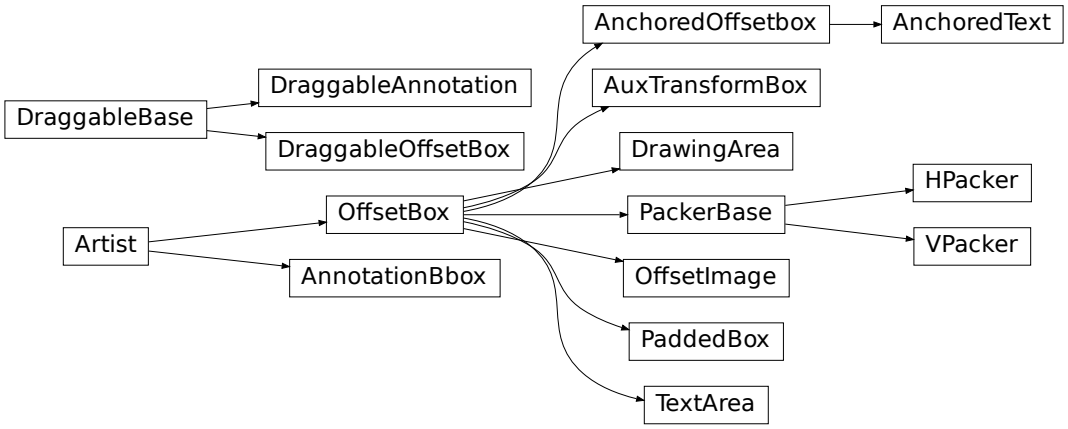
No window function; simply return x.

See also:

window_hanning

Another window algorithm.

18.34 matplotlib.offsetbox



Container classes for *Artist*s.

OffsetBox

The base of all container artists defined in this module.

AnchoredOffsetbox, *AnchoredText*

Anchor and align an arbitrary *Artist* or a text relative to the parent axes or a specific anchor point.

DrawingArea

A container with fixed width and height. Children have a fixed position inside the container and may be clipped.

HPacker, *VPacker*

Containers for layouting their children vertically or horizontally.

PaddedBox

A container to add a padding around an *Artist*.

TextArea

Contains a single *Text* instance.

class matplotlib.offsetbox.**AnchoredOffsetbox**(*loc*, *pad=0.4*, *borderpad=0.5*, *child=None*, *prop=None*, *frameon=True*, *bbox_to_anchor=None*, *bbox_transform=None*, ***kwargs*)

Bases: *matplotlib.offsetbox.OffsetBox*

An offset box placed according to location *loc*.

AnchoredOffsetbox has a single child. When multiple children are needed, use an extra OffsetBox to enclose them. By default, the offset box is anchored against its parent axes. You may explicitly specify the *bbox_to_anchor*.

Parameters

loc

[str] The box location. Supported values:

- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'
- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter *loc* of *Legend* for details.

pad

[float, default: 0.4] Padding around the child as fraction of the fontsize.

borderpad

[float, default: 0.5] Padding between the offsetbox frame and the *bbox_to_anchor*.

child

[*OffsetBox*] The box that will be anchored.

prop

[*FontProperties*] This is only used as a reference for paddings. If not given, `rcParams["legend.fontsize"]` (default: `'medium'`) is used.

frameon

[bool] Whether to draw a frame around the box.

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

bbox_transform

[None or *matplotlib.transforms.Transform*] The transform for the bounding box (*bbox_to_anchor*).

****kwargs**

All other parameters are passed on to *OffsetBox*.

Notes

See *Legend* for a detailed description of the anchoring mechanism.

`codes = {'center': 10, 'center left': 6, 'center right': 7, 'lower center': 8, 'lower le`

`draw`(*self*, *renderer*)
Update the location of children if necessary and draw them to the given *renderer*.

`get_bbox_to_anchor`(*self*)
Return the bbox that the box is anchored to.

`get_child`(*self*)
Return the child.

`get_children`(*self*)
Return the list of children.

`get_extent`(*self*, *renderer*)
Return the extent of the box as (width, height, x, y).

This is the extent of the child plus the padding.

`get_window_extent`(*self*, *renderer*)
Return the bounding box in display space.

`set_bbox_to_anchor`(*self*, *bbox*, *transform=None*)
Set the bbox that the box is anchored to.

bbox can be a Bbox instance, a list of [left, bottom, width, height], or a list of [left, bottom] where the width and height will be assumed to be zero. The bbox will be transformed to display coordinate by the given transform.

`set_child`(*self*, *child*)
Set the child to be anchored.

`update_frame`(*self*, *bbox*, *fontsize=None*)

`zorder = 5`

`class matplotlib.offsetbox.AnchoredText`(*s*, *loc*, *pad=0.4*, *borderpad=0.5*, *prop=None*, ***kwargs*)
Bases: *matplotlib.offsetbox.AnchoredOffsetbox*

AnchoredOffsetbox with Text.

Parameters

s

[str] Text.

loc

[str] Location code. See *AnchoredOffsetbox*.

pad

[float, default: 0.4] Padding around the text as fraction of the fontsize.

borderpad

[float, default: 0.5] Spacing between the offsetbox frame and the *bbox_to_anchor*.

prop

[dict, optional] Dictionary of keyword parameters to be passed to the *Text* instance contained inside AnchoredText.

****kwargs**

All other parameters are passed to *AnchoredOffsetbox*.

`class matplotlib.offsetbox.AnnotationBbox`(*offsetbox*, *xy*, *xybox=None*, *xycoords='data'*, *boxcoords=None*, *frameon=True*, *pad=0.4*, *annotation_clip=None*, *box_alignment=0.5, 0.5*, *bbox_props=None*, *arrowprops=None*, *fontsize=None*, ***kwargs*)
Bases: *matplotlib.artist.Artist*, `matplotlib.text._AnnotationBase`

Container for an *OffsetBox* referring to a specific position *xy*.

Optionally an arrow pointing from the offsetbox to *xy* can be drawn.

This is like *Annotation*, but with *OffsetBox* instead of *Text*.

Parameters

offsetbox

[*OffsetBox*]

xy

[(float, float)] The point *(x, y)* to annotate. The coordinate system is determined by *xycoords*.

xybox

[(float, float), default: *xy*] The position *(x, y)* to place the text at. The coordinate system is determined by *boxcoords*.

xycoords

[str or *Artist* or *Transform* or callable or (float, float), default: 'data'] The coordinate system that *xy* is given in. See the parameter *xycoords* in *Annotation* for a detailed description.

boxcoords

[str or *Artist* or *Transform* or callable or (float, float), default: value of *xycoords*] The coordinate system that *xybox* is given in. See the parameter *textcoords* in *Annotation* for a detailed description.

frameon

[bool, default: True] Whether to draw a frame around the box.

pad

[float, default: 0.4] Padding around the offsetbox.

box_alignment

[(float, float)] A tuple of two floats for a vertical and horizontal alignment of the offset box w.r.t. the *boxcoords*. The lower-left corner is (0, 0) and upper-right corner is (1, 1).

****kwargs**

Other parameters are identical to *Annotation*.

`property anncoords`

`contains(`*self*, *mouseevent*`)`

Test whether the artist contains the mouse event.

Parameters

mouseevent

[*matplotlib.backend_bases.MouseEvent*]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`get_children`(*self*)
Return a list of the child *Artist*s of this *Artist*.

`get_fontsize`(*self*, *s=<deprecated parameter>*)
Return the fontsize in points.

`get_tightbbox`(*self*, *renderer*)
get tight bounding box in display space.

`get_window_extent`(*self*, *renderer*)
get the bounding box in display space.

`set_figure`(*self*, *fig*)
Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_fontsize(*self*, *s=None*)
Set the fontsize in points.

If *s* is not given, reset to `rcParams["legend.fontsize"]` (default: `'medium'`).

update_positions(*self*, *renderer*)
Update the pixel positions of the annotated point and the text.

property xyann

zorder = 3

class matplotlib.offsetbox.**AuxTransformBox**(*aux_transform*)
Bases: *matplotlib.offsetbox.OffsetBox*

Offset Box with the aux_transform. Its children will be transformed with the aux_transform first then will be offsetted. The absolute coordinate of the aux_transform is meaning as it will be automatically adjust so that the left-lower corner of the bounding box of children will be set to (0, 0) before the offset transform.

It is similar to drawing area, except that the extent of the box is not predetermined but calculated from the window extent of its children. Furthermore, the extent of the children will be calculated in the transformed coordinate.

add_artist(*self*, *a*)
Add an *Artist* to the container box.

draw(*self*, *renderer*)
Update the location of children if necessary and draw them to the given *renderer*.

get_extent(*self*, *renderer*)
Return a tuple `width, height, xdescent, ydescent` of the box.

get_offset(*self*)
Return offset of the container.

get_transform(*self*)
Return the *Transform* applied to the children

get_window_extent(*self*, *renderer*)
Return the bounding box in display space.

set_offset(*self*, *xy*)
Set the offset of the container.

Parameters

xy

[(float, float)] The (x, y) coordinates of the offset in display units.

set_transform(*self*, *t*)
set_transform is ignored.

class matplotlib.offsetbox.**DraggableAnnotation**(*annotation*, *use_blit=False*)

Bases: *matplotlib.offsetbox.DraggableBase*

save_offset(*self*)

update_offset(*self*, *dx*, *dy*)

class matplotlib.offsetbox.**DraggableBase**(*ref_artist*, *use_blit=False*)

Bases: object

Helper base class for a draggable artist (legend, offsetbox).

Derived classes must override the following methods:

```
def save_offset(self):
    '''
    Called when the object is picked for dragging; should save the
    reference position of the artist.
    '''

def update_offset(self, dx, dy):
    '''
    Called during the dragging; (*dx*, *dy*) is the pixel offset from
    the point where the mouse drag started.
    '''
```

Optionally, you may override the following method:

```
def finalize_offset(self):
    '''Called when the mouse is released.'''
```

In the current implementation of *DraggableLegend* and *DraggableAnnotation*, *update_offset* places the artists in display coordinates, and *finalize_offset* recalculates their position in axes coordinate and set a relevant attribute.

artist_picker(*self*, *artist*, *evt*)

[*Deprecated*]

Notes

Deprecated since version 3.3:

disconnect(*self*)

Disconnect the callbacks.

finalize_offset(*self*)

on_motion(*self*, *evt*)

on_motion_blit(*self*, *evt*)

[*Deprecated*]

Notes

Deprecated since version 3.3:

`on_pick`(*self*, *evt*)

`on_release`(*self*, *event*)

`save_offset`(*self*)

`update_offset`(*self*, *dx*, *dy*)

`class matplotlib.offsetbox.DraggableOffsetBox`(*ref_artist*, *offsetbox*, *use_blit=False*)

Bases: *matplotlib.offsetbox.DraggableBase*

`get_loc_in_canvas`(*self*)

`save_offset`(*self*)

`update_offset`(*self*, *dx*, *dy*)

`class matplotlib.offsetbox.DrawingArea`(*width*, *height*, *xdescent=0.0*, *ydescent=0.0*, *clip=False*)

Bases: *matplotlib.offsetbox.OffsetBox*

The DrawingArea can contain any Artist as a child. The DrawingArea has a fixed width and height. The position of children relative to the parent is fixed. The children can be clipped at the boundaries of the parent.

Parameters

width, height

[float] Width and height of the container box.

xdescent, ydescent

[float] Descent of the box in x- and y-direction.

clip

[bool] Whether to clip the children to the box.

`add_artist`(*self*, *a*)
Add an *Artist* to the container box.

`property clip_children`
If the children of this DrawingArea should be clipped by DrawingArea bounding box.

`draw`(*self*, *renderer*)
Update the location of children if necessary and draw them to the given *renderer*.

`get_extent`(*self*, *renderer*)
Return width, height, xdescent, ydescent of box.

`get_offset`(*self*)
Return offset of the container.

`get_transform`(*self*)
Return the *Transform* applied to the children.

`get_window_extent`(*self*, *renderer*)
Return the bounding box in display space.

`set_offset`(*self*, *xy*)
Set the offset of the container.

Parameters

xy

[(float, float)] The (x, y) coordinates of the offset in display units.

`set_transform`(*self*, *t*)
set_transform is ignored.

`class matplotlib.offsetbox.HPacker`(*pad=None*, *sep=None*, *width=None*, *height=None*, *align='baseline'*, *mode='fixed'*, *children=None*)
Bases: *matplotlib.offsetbox.PackerBase*

The HPacker has its children packed horizontally. It automatically adjusts the relative positions of children at draw time.

Parameters

pad

[float, optional] The boundary padding in points.

sep

[float, optional] The spacing between items in points.

width, height

[float, optional] Width and height of the container box in pixels, calculated if *None*.

align

[{'top', 'bottom', 'left', 'right', 'center', 'baseline'}] Alignment of boxes.

mode

[{'fixed', 'expand', 'equal'}] The packing mode.

- 'fixed' packs the given `Artists` tight with *sep* spacing.
- 'expand' uses the maximal available space to distribute the artists with equal spacing in between.

- 'equal': Each artist an equal fraction of the available space and is left-aligned (or top-aligned) therein.

children

[list of *Artist*] The artists to pack.

Notes

pad and *sep* are in points and will be scaled with the renderer dpi, while *width* and *height* are in in pixels.

`get_extent_offsets`(*self*, *renderer*)

Update offset of the children and return the extent of the box.

Parameters

renderer

[*RendererBase* subclass]

Returns

width

height

xdescent

ydescent

list of (xoffset, yoffset) pairs

`class matplotlib.offsetbox.OffsetBox`(**args*, ***kwargs*)

Bases: *matplotlib.artist.Artist*

The OffsetBox is a simple container artist.

The child artists are meant to be drawn at a relative position to its parent.

Being an artist itself, all parameters are passed on to *Artist*.

`property axes`

The *Axes* instance the artist resides in, or *None*.

`contains`(*self*, *mouseevent*)

Delegate the mouse event contains-check to the children.

As a container, the *OffsetBox* does not respond itself to mouseevents.

Parameters

mouseevent

[*matplotlib.backend_bases.MouseEvent*]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

See also:

Artist.contains

`draw`(*self*, *renderer*)
Update the location of children if necessary and draw them to the given *renderer*.

`get_children`(*self*)
Return a list of the child *Artist*s.

`get_extent`(*self*, *renderer*)
Return a tuple `width, height, xdescent, ydescent` of the box.

`get_extent_offsets`(*self*, *renderer*)
Update offset of the children and return the extent of the box.

Parameters

renderer

[*RendererBase* subclass]

Returns

width

height

xdescent

ydescent

list of (xoffset, yoffset) pairs

`get_offset`(*self*, *width*, *height*, *xdescent*, *ydescent*, *renderer*)
Return the offset as a tuple (x, y).

The extent parameters have to be provided to handle the case where the offset is dynamically determined by a callable (see *set_offset*).

Parameters

width, height, xdescent, ydescent

Extent parameters.

renderer

[*RendererBase* subclass]

`get_visible_children`(*self*)
Return a list of the visible child *Artist*s.

`get_window_extent`(*self*, *renderer*)
Return the bounding box (*Bbox*) in display space.

`set_figure`(*self*, *fig*)
Set the *Figure* for the *OffsetBox* and all its children.

Parameters

fig

[*Figure*]

`set_height`(*self*, *height*)
Set the height of the box.

Parameters

height

[float]

`set_offset`(*self*, *xy*)
Set the offset.

Parameters

xy

[(float, float) or callable] The (x, y) coordinates of the offset in display units. These can either be given explicitly as a tuple (x, y), or by providing a function that converts the extent into the offset. This function must have the signature:

```
def offset(width, height, xdescent, ydescent, renderer) -> (float,
↪ float)
```

`set_width`(*self*, *width*)
Set the width of the box.

Parameters

width

[float]

class matplotlib.offsetbox.**OffsetImage**(*arr*, *zoom=1*, *cmap=None*, *norm=None*, *interpolation=None*, *origin=None*, *filternorm=True*, *filterrad=4.0*, *resample=False*, *dpi_cor=True*, ***kwargs*)

Bases: *matplotlib.offsetbox.OffsetBox*

draw(*self*, *renderer*)
Update the location of children if necessary and draw them to the given *renderer*.

get_children(*self*)
Return a list of the child *Artist*s.

get_data(*self*)

get_extent(*self*, *renderer*)
Return a tuple `width, height, xdescent, ydescent` of the box.

get_offset(*self*)
Return offset of the container.

get_window_extent(*self*, *renderer*)
Return the bounding box in display space.

get_zoom(*self*)

set_data(*self*, *arr*)

set_zoom(*self*, *zoom*)

class matplotlib.offsetbox.**PackerBase**(*pad=None*, *sep=None*, *width=None*, *height=None*, *align=None*, *mode=None*, *children=None*)

Bases: *matplotlib.offsetbox.OffsetBox*

Parameters

pad

[float, optional] The boundary padding in points.

sep

[float, optional] The spacing between items in points.

width, height

[float, optional] Width and height of the container box in pixels, calculated if *None*.

align

[{'top', 'bottom', 'left', 'right', 'center', 'baseline'}] Alignment of boxes.

mode

[{'fixed', 'expand', 'equal'}] The packing mode.

- 'fixed' packs the given `Artists` tight with *sep* spacing.
- 'expand' uses the maximal available space to distribute the artists with equal spacing in between.
- 'equal': Each artist an equal fraction of the available space and is left-aligned (or top-aligned) therein.

children

[list of *Artist*] The artists to pack.

Notes

pad and *sep* are in points and will be scaled with the renderer dpi, while *width* and *height* are in in pixels.

class matplotlib.offsetbox.PaddedBox(*child*, *pad=None*, *draw_frame=False*, *patch_attrs=None*)

Bases: *matplotlib.offsetbox.OffsetBox*

A container to add a padding around an *Artist*.

The *PaddedBox* contains a *FancyBboxPatch* that is used to visualize it when rendering.

Parameters

child

[*Artist*] The contained *Artist*.

pad

[float] The padding in points. This will be scaled with the renderer dpi. In contrast *width* and *height* are in *pixels* and thus not scaled.

draw_frame

[bool] Whether to draw the contained *FancyBboxPatch*.

patch_attrs

[dict or None] Additional parameters passed to the contained *FancyBboxPatch*.

`draw`(*self*, *renderer*)
Update the location of children if necessary and draw them to the given *renderer*.

`draw_frame`(*self*, *renderer*)

`get_extent_offsets`(*self*, *renderer*)
Update offset of the children and return the extent of the box.

Parameters

renderer

[*RendererBase* subclass]

Returns

width

height

xdescent

ydescent

list of (xoffset, yoffset) pairs

`update_frame`(*self*, *bbox*, *fontsize=None*)

`class matplotlib.offsetbox.TextArea`(*s*, *textprops=None*, *multilinebaseline=None*, *minimumdescent=True*)
Bases: *matplotlib.offsetbox.OffsetBox*

The TextArea is contains a single Text instance. The text is placed at (0, 0) with baseline+left alignment. The width and height of the TextArea instance is the width and height of the its child text.

Parameters

s

[str] The text to be displayed.

textprops

[dict, optional] Dictionary of keyword parameters to be passed to the *Text* instance contained inside TextArea.

multilinebaseline

[bool, optional] If `True`, baseline for multiline text is adjusted so that it is (approximately) center-aligned with singleline text.

minimumdescent

[bool, optional] If `True`, the box has a minimum descent of "p".

`draw`(*self*, *renderer*)
Update the location of children if necessary and draw them to the given *renderer*.

`get_extent`(*self*, *renderer*)
Return a tuple `width, height, xdescent, ydescent` of the box.

`get_minimumdescent`(*self*)
Get minimumdescent.

`get_multilinebaseline`(*self*)
Get multilinebaseline.

`get_offset`(*self*)
Return offset of the container.

`get_text`(*self*)
Return the string representation of this area's text.

`get_window_extent`(*self*, *renderer*)
Return the bounding box in display space.

`set_minimumdescent`(*self*, *t*)
Set minimumdescent.

If True, extent of the single line text is adjusted so that it has minimum descent of "p"

`set_multilinebaseline`(*self*, *t*)
Set multilinebaseline.

If True, baseline for multiline text is adjusted so that it is (approximately) center-aligned with single-line text.

`set_offset`(*self*, *xy*)
Set the offset of the container.

Parameters

xy

[(float, float)] The (x, y) coordinates of the offset in display units.

`set_text`(*self*, *s*)
Set the text of this area as a string.

`set_transform`(*self*, *t*)
set_transform is ignored.

`class matplotlib.offsetbox.VPacker`(*pad=None*, *sep=None*, *width=None*, *height=None*, *align='baseline'*, *mode='fixed'*, *children=None*)
Bases: *matplotlib.offsetbox.PackerBase*

The VPacker has its children packed vertically. It automatically adjusts the relative positions of children at drawing time.

Parameters

pad

[float, optional] The boundary padding in points.

sep

[float, optional] The spacing between items in points.

width, height

[float, optional] Width and height of the container box in pixels, calculated if *None*.

align

[{'top', 'bottom', 'left', 'right', 'center', 'baseline'}] Alignment of boxes.

mode

[{'fixed', 'expand', 'equal'}] The packing mode.

- 'fixed' packs the given `Artists` tight with *sep* spacing.
- 'expand' uses the maximal available space to distribute the artists with equal spacing in between.
- 'equal': Each artist an equal fraction of the available space and is left-aligned (or top-aligned) therein.

children

[list of *Artist*] The artists to pack.

Notes

pad and *sep* are in points and will be scaled with the renderer dpi, while *width* and *height* are in in pixels.

`get_extent_offsets`(*self*, *renderer*)

Update offset of the children and return the extent of the box.

Parameters

renderer

[*RendererBase* subclass]

Returns

width

height

xdescent

ydescent

list of (xoffset, yoffset) pairs

matplotlib.offsetbox.**bbox_artist**(**args*, ***kwargs*)

18.35 matplotlib.patches

18.35.1 Classes

Arc(xy, width, height[, angle, theta1, theta2])	An elliptical arc, i.e.
Arrow(x, y, dx, dy[, width])	An arrow patch.
ArrowStyle(stylename, **kw)	*ArrowStyle* is a container class which defines several arrowstyle classes, which is used to create an arrow path along a given path.
BoxStyle(stylename, **kw)	*BoxStyle* is a container class which defines several boxstyle classes, which are used for *FancyBboxPatch*.
Circle(xy[, radius])	A circle patch.
CirclePolygon(xy[, radius, resolution])	A polygon-approximation of a circle patch.
ConnectionPatch(xyA, xyB, coordsA[, ...])	A patch that connects two points (possibly in different axes).
ConnectionStyle(stylename, **kw)	*ConnectionStyle* is a container class which defines several connectionstyle classes, which is used to create a path between two points.
Ellipse(xy, width, height[, angle])	A scale-free ellipse.
FancyArrow(x, y, dx, dy[, width, ...])	Like Arrow, but lets you set head width and head height independently.
FancyArrowPatch([posA, posB, path, ...])	A fancy arrow patch.
FancyBboxPatch(xy, width, height[, ...])	A fancy box around a rectangle with lower left at *xy* = (*x*, *y*) with specified width and height.
Patch([edgecolor, facecolor, color, ...])	A patch is a 2D artist with a face color and an edge color.
PathPatch(path, **kwargs)	A general polycurve path patch.
Polygon(xy[, closed])	A general polygon patch.
Rectangle(xy, width, height[, angle])	A rectangle defined via an anchor point *xy* and its *width* and *height*.

continues on next page

Table 146 – continued from previous page

RegularPolygon(xy, numVertices[, radius, ...])	A regular polygon patch.
Shadow(patch, ox, oy[, props])	Create a shadow of the given *patch*.
Wedge(center, r, theta1, theta2[, width])	Wedge shaped patch.

matplotlib.patches.Arc

`class matplotlib.patches.Arc(`*xy*, *width*, *height*, *angle=0.0*, *theta1=0.0*, *theta2=360.0*, ***kwargs*`)`

Bases: *matplotlib.patches.Ellipse*

An elliptical arc, i.e. a segment of an ellipse.

Due to internal optimizations, there are certain restrictions on using Arc:

- The arc cannot be filled.
- The arc must be used in an *Axes* instance. It can not be added directly to a *Figure* because it is optimized to only render the segments that are inside the axes bounding box with high resolution.

Parameters

xy

[(float, float)] The center of the ellipse.

width

[float] The length of the horizontal axis.

height

[float] The length of the vertical axis.

angle

[float] Rotation of the ellipse in degrees (counterclockwise).

theta1, theta2

[float, default: 0, 360] Starting and ending angles of the arc in degrees. These values are relative to *angle*, e.g. if *angle* = 45 and *theta1* = 90 the absolute starting angle is 135. Default *theta1* = 0, *theta2* = 360, i.e. a complete ellipse. The arc is drawn in the counterclockwise direction. Angles greater than or equal to 360, or smaller than 0, are represented by an equivalent angle in the range [0, 360), by taking the input value mod 360.

Other Parameters

****kwargs**

[*Patch* properties] Most *Patch* properties are supported as keyword arguments, with the exception of *fill* and *facecolor* because filling is not supported.

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

`__init__`(*self*, *xy*, *width*, *height*, *angle=0.0*, *theta1=0.0*, *theta2=360.0*, ***kwargs*)

Parameters

xy

[(float, float)] The center of the ellipse.

width

[float] The length of the horizontal axis.

height

[float] The length of the vertical axis.

angle

[float] Rotation of the ellipse in degrees (counterclockwise).

theta1, theta2

[float, default: 0, 360] Starting and ending angles of the arc in degrees. These values are relative to *angle*, e.g. if *angle* = 45 and *theta1* = 90 the absolute starting angle is 135. Default *theta1* = 0, *theta2* = 360, i.e. a complete ellipse. The arc is drawn in the counterclockwise direction. Angles greater than or equal to 360, or smaller than 0, are represented by an equivalent angle in the range [0, 360), by taking the input value mod 360.

Other Parameters

****kwargs**

[*Patch* properties] Most *Patch* properties are supported as keyword arguments, with the exception of *fill* and *facecolor* because filling is not supported.

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object

Table 148 – continued from previous page

Property	Description
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

`__module__ = 'matplotlib.patches'`

`__str__`(*self*)
Return str(self).

`draw`(*self*, *renderer*)
Draw the arc to the given *renderer*.

Notes

Ellipses are normally drawn using an approximation that uses eight cubic Bezier splines. The error of this approximation is 1.89818e-6, according to this unverified source:

> Lancaster, Don. *Approximating a Circle or an Ellipse Using Four Bezier Cubic Splines.*
>
> https://www.tinaja.com/glib/ellipse4.pdf

There is a use case where very large ellipses must be drawn with very high accuracy, and it is too expensive to render the entire ellipse with enough segments (either splines or line segments). Therefore, in the case where either radius of the ellipse is large enough that the error of the spline approximation will be visible (greater than one pixel offset from the ideal), a different technique is used.

In that case, only the visible parts of the ellipse are drawn, with each visible arc using a fixed number of spline segments (8). The algorithm proceeds as follows:

1. The points where the ellipse intersects the axes bounding box are located. (This is done be performing an inverse transformation on the axes bbox such that it is relative to the unit circle -- this makes the intersection calculation much easier than doing rotated ellipse intersection directly).

This uses the "line intersecting a circle" algorithm from:

Vince, John. *Geometry for Computer Graphics: Formulae, Examples & Proofs.* London: Springer-Verlag, 2005.

2. The angles of each of the intersection points are calculated.
3. Proceeding counterclockwise starting in the positive x-direction, each of the visible arc-segments between the pairs of vertices are drawn using the Bezier arc approximation technique implemented in *Path.arc*.

Examples using `matplotlib.patches.Arc`

- sphx_glr_gallery_units_ellipse_with_units.py
- *Sample plots in Matplotlib*

matplotlib.patches.Arrow

`class matplotlib.patches.Arrow`(*x*, *y*, *dx*, *dy*, *width=1.0*, ***kwargs*)

Bases: *matplotlib.patches.Patch*

An arrow patch.

Draws an arrow from (*x*, *y*) to (*x* + *dx*, *y* + *dy*). The width of the arrow is scaled by *width*.

Parameters

x

[float] x coordinate of the arrow tail.

y

[float] y coordinate of the arrow tail.

dx

[float] Arrow length in the x direction.

dy

[float] Arrow length in the y direction.

width

[float, default: 1] Scale factor for the width of the arrow. With a default value of 1, the tail width is 0.2 and head width is 0.6.

****kwargs**

Keyword arguments control the *Patch* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

See also:

FancyArrow

Patch that allows independent control of the head and tail properties.

`__init__`(*self*, *x*, *y*, *dx*, *dy*, *width=1.0*, ***kwargs*)

Draws an arrow from (*x*, *y*) to (*x* + *dx*, *y* + *dy*). The width of the arrow is scaled by *width*.

Parameters

x

[float] x coordinate of the arrow tail.

y

[float] y coordinate of the arrow tail.

dx

[float] Arrow length in the x direction.

dy

[float] Arrow length in the y direction.

width

[float, default: 1] Scale factor for the width of the arrow. With a default value of 1, the tail width is 0.2 and head width is 0.6.

****kwargs**

Keyword arguments control the *Patch* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown

See also:

FancyArrow

Patch that allows independent control of the head and tail properties.

__module__ = 'matplotlib.patches'

__str__(*self*)
Return str(self).

get_patch_transform(*self*)
Return the *Transform* instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

get_path(*self*)
Return the path of this patch.

Examples using `matplotlib.patches.Arrow`

- sphx_glr_gallery_shapes_and_collections_arrow_guide.py
- sphx_glr_gallery_shapes_and_collections_artist_reference.py

matplotlib.patches.ArrowStyle

class matplotlib.patches.**ArrowStyle**(*stylename*, ***kw*)
Bases: `matplotlib.patches._Style`

ArrowStyle is a container class which defines several arrowstyle classes, which is used to create an arrow path along a given path. These are mainly used with *FancyArrowPatch*.

A arrowstyle object can be either created as:

```
ArrowStyle.Fancy(head_length=.4, head_width=.4, tail_width=.4)
```

or:

```
ArrowStyle("Fancy", head_length=.4, head_width=.4, tail_width=.4)
```

or:

```
ArrowStyle("Fancy, head_length=.4, head_width=.4, tail_width=.4")
```

The following classes are defined

Class	Name	Attrs
Curve	-	None
CurveB	->	head_length=0.4, head_width=0.2
BracketB	-[	widthB=1.0, lengthB=0.2, angleB=None
CurveFilledB	-|>	head_length=0.4, head_width=0.2
CurveA	<-	head_length=0.4, head_width=0.2
CurveAB	<->	head_length=0.4, head_width=0.2
CurveFilledA	<|-	head_length=0.4, head_width=0.2
CurveFilledAB	<|-|>	head_length=0.4, head_width=0.2
BracketA	]-	widthA=1.0, lengthA=0.2, angleA=None
BracketAB	]-[	widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0, lengthB=0.2, angleB=None
Fancy	fancy	head_length=0.4, head_width=0.4, tail_width=0.4
Simple	simple	head_length=0.5, head_width=0.5, tail_width=0.2
Wedge	wedge	tail_width=0.3, shrink_factor=0.5
BarAB	|-|	widthA=1.0, angleA=None, widthB=1.0, angleB=None

An instance of any arrow style class is a callable object, whose call signature is:

```
__call__(self, path, mutation_size, linewidth, aspect_ratio=1.)
```

and it returns a tuple of a *Path* instance and a boolean value. *path* is a *Path* instance along which the arrow will be drawn. *mutation_size* and *aspect_ratio* have the same meaning as in *BoxStyle*. *linewidth* is a line width to be stroked. This is meant to be used to correct the location of the head so that it does not overshoot the destination point, but not all classes support it.

Return the instance of the subclass with the given style name.

`class BarAB(`*widthA=1.0*, *angleA=None*, *widthB=1.0*, *angleB=None*`)`

Bases: `matplotlib.patches.ArrowStyle._Bracket`

An arrow with vertical bars `|` at both ends.

Parameters

widthA

[float, default: 1.0] Width of the bracket.

angleA

[float, default: None] Angle between the bracket and the line.

widthB

[float, default: 1.0] Width of the bracket.

angleB

[float, default: None] Angle between the bracket and the line.

`__init__`(*self*, *widthA=1.0*, *angleA=None*, *widthB=1.0*, *angleB=None*)

Parameters

widthA

[float, default: 1.0] Width of the bracket.

angleA

[float, default: None] Angle between the bracket and the line.

widthB

[float, default: 1.0] Width of the bracket.

angleB

[float, default: None] Angle between the bracket and the line.

`__module__ = 'matplotlib.patches'`

`class BracketA`(*widthA=1.0*, *lengthA=0.2*, *angleA=None*)

Bases: `matplotlib.patches.ArrowStyle._Bracket`

An arrow with an outward square bracket at its start.

Parameters

widthA

[float, default: 1.0] Width of the bracket.

lengthA

[float, default: 0.2] Length of the bracket.

angleA

[float, default: None] Angle between the bracket and the line.

`__init__`(*self*, *widthA=1.0*, *lengthA=0.2*, *angleA=None*)

Parameters

widthA

[float, default: 1.0] Width of the bracket.

lengthA

[float, default: 0.2] Length of the bracket.

angleA

[float, default: None] Angle between the bracket and the line.

`__module__ = 'matplotlib.patches'`

`class BracketAB(`*widthA=1.0*, *lengthA=0.2*, *angleA=None*, *widthB=1.0*, *lengthB=0.2*, *angleB=None*`)`

Bases: `matplotlib.patches.ArrowStyle._Bracket`

An arrow with outward square brackets at both ends.

Parameters

widthA

[float, default: 1.0] Width of the bracket.

lengthA

[float, default: 0.2] Length of the bracket.

angleA

[float, default: None] Angle between the bracket and the line.

widthB

[float, default: 1.0] Width of the bracket.

lengthB

[float, default: 0.2] Length of the bracket.

angleB

[float, default: None] Angle between the bracket and the line.

`__init__(`*self*, *widthA=1.0*, *lengthA=0.2*, *angleA=None*, *widthB=1.0*, *lengthB=0.2*, *angleB=None*`)`

Parameters

widthA

[float, default: 1.0] Width of the bracket.

lengthA

[float, default: 0.2] Length of the bracket.

angleA

[float, default: None] Angle between the bracket and the line.

widthB

[float, default: 1.0] Width of the bracket.

lengthB

[float, default: 0.2] Length of the bracket.

angleB

[float, default: None] Angle between the bracket and the line.

`__module__ = 'matplotlib.patches'`

`class BracketB(`*widthB=1.0*, *lengthB=0.2*, *angleB=None*`)`

Bases: `matplotlib.patches.ArrowStyle._Bracket`

An arrow with an outward square bracket at its end.

Parameters

widthB

[float, default: 1.0] Width of the bracket.

lengthB

[float, default: 0.2] Length of the bracket.

angleB

[float, default: None] Angle between the bracket and the line.

`__init__(`*self*, *widthB=1.0*, *lengthB=0.2*, *angleB=None*`)`

Parameters

widthB

[float, default: 1.0] Width of the bracket.

lengthB

[float, default: 0.2] Length of the bracket.

angleB

[float, default: None] Angle between the bracket and the line.

`__module__ = 'matplotlib.patches'`

`class Curve`

Bases: `matplotlib.patches.ArrowStyle._Curve`

A simple curve without any arrow head.

The arrows are drawn if *beginarrow* and/or *endarrow* are true. *head_length* and *head_width* determines the size of the arrow relative to the *mutation scale*. The arrowhead at the begin (or end) is closed if fillbegin (or fillend) is True.

`__init__(`*self*`)`

The arrows are drawn if *beginarrow* and/or *endarrow* are true. *head_length* and *head_width* determines the size of the arrow relative to the *mutation scale*. The arrowhead at the begin (or end) is closed if fillbegin (or fillend) is True.

__module__ = 'matplotlib.patches'

class CurveA(*head_length=0.4*, *head_width=0.2*)
Bases: matplotlib.patches.ArrowStyle._Curve

An arrow with a head at its begin point.

Parameters

head_length

[float, default: 0.4] Length of the arrow head.

head_width

[float, default: 0.2] Width of the arrow head.

__init__(*self*, *head_length=0.4*, *head_width=0.2*)

Parameters

head_length

[float, default: 0.4] Length of the arrow head.

head_width

[float, default: 0.2] Width of the arrow head.

__module__ = 'matplotlib.patches'

class CurveAB(*head_length=0.4*, *head_width=0.2*)
Bases: matplotlib.patches.ArrowStyle._Curve

An arrow with heads both at the begin and the end point.

Parameters

head_length

[float, default: 0.4] Length of the arrow head.

head_width

[float, default: 0.2] Width of the arrow head.

__init__(*self*, *head_length=0.4*, *head_width=0.2*)

Parameters

head_length

[float, default: 0.4] Length of the arrow head.

head_width

[float, default: 0.2] Width of the arrow head.

__module__ = 'matplotlib.patches'

class CurveB(*head_length=0.4*, *head_width=0.2*)
Bases: matplotlib.patches.ArrowStyle._Curve

An arrow with a head at its end point.

Parameters

head_length

[float, default: 0.4] Length of the arrow head.

head_width

[float, default: 0.2] Width of the arrow head.

__init__(*self*, *head_length=0.4*, *head_width=0.2*)

Parameters

head_length

[float, default: 0.4] Length of the arrow head.

head_width

[float, default: 0.2] Width of the arrow head.

__module__ = 'matplotlib.patches'

class CurveFilledA(*head_length=0.4*, *head_width=0.2*)
Bases: matplotlib.patches.ArrowStyle._Curve

An arrow with filled triangle head at the begin.

Parameters

head_length

[float, default: 0.4] Length of the arrow head.

head_width

[float, default: 0.2] Width of the arrow head.

__init__(*self*, *head_length=0.4*, *head_width=0.2*)

Parameters

head_length

[float, default: 0.4] Length of the arrow head.

head_width

[float, default: 0.2] Width of the arrow head.

__module__ = 'matplotlib.patches'

class CurveFilledAB(*head_length=0.4*, *head_width=0.2*)
Bases: matplotlib.patches.ArrowStyle._Curve

An arrow with filled triangle heads at both ends.

Parameters

head_length

[float, default: 0.4] Length of the arrow head.

head_width

[float, default: 0.2] Width of the arrow head.

`__init__`(*self*, *head_length=0.4*, *head_width=0.2*)

Parameters

head_length

[float, default: 0.4] Length of the arrow head.

head_width

[float, default: 0.2] Width of the arrow head.

`__module__ = 'matplotlib.patches'`

`class CurveFilledB`(*head_length=0.4*, *head_width=0.2*)

Bases: `matplotlib.patches.ArrowStyle._Curve`

An arrow with filled triangle head at the end.

Parameters

head_length

[float, default: 0.4] Length of the arrow head.

head_width

[float, default: 0.2] Width of the arrow head.

`__init__`(*self*, *head_length=0.4*, *head_width=0.2*)

Parameters

head_length

[float, default: 0.4] Length of the arrow head.

head_width

[float, default: 0.2] Width of the arrow head.

`__module__ = 'matplotlib.patches'`

`class Fancy`(*head_length=0.4*, *head_width=0.4*, *tail_width=0.4*)

Bases: `matplotlib.patches.ArrowStyle._Base`

A fancy arrow. Only works with a quadratic Bezier curve.

Parameters

head_length

[float, default: 0.4] Length of the arrow head.

head_width

[float, default: 0.4] Width of the arrow head.

tail_width

[float, default: 0.4] Width of the arrow tail.

`__init__`(*self*, *head_length=0.4*, *head_width=0.4*, *tail_width=0.4*)

Parameters

head_length

[float, default: 0.4] Length of the arrow head.

head_width

[float, default: 0.4] Width of the arrow head.

tail_width

[float, default: 0.4] Width of the arrow tail.

`__module__ = 'matplotlib.patches'`

`transmute`(*self*, *path*, *mutation_size*, *linewidth*)

The transmute method is the very core of the ArrowStyle class and must be overridden in the subclasses. It receives the path object along which the arrow will be drawn, and the mutation_size, with which the arrow head etc. will be scaled. The linewidth may be used to adjust the path so that it does not pass beyond the given points. It returns a tuple of a Path instance and a boolean. The boolean value indicate whether the path can be filled or not. The return value can also be a list of paths and list of booleans of a same length.

`class Simple`(*head_length=0.5*, *head_width=0.5*, *tail_width=0.2*)

Bases: `matplotlib.patches.ArrowStyle._Base`

A simple arrow. Only works with a quadratic Bezier curve.

Parameters

head_length

[float, default: 0.5] Length of the arrow head.

head_width

[float, default: 0.5] Width of the arrow head.

tail_width

[float, default: 0.2] Width of the arrow tail.

`__init__`(*self*, *head_length=0.5*, *head_width=0.5*, *tail_width=0.2*)

Parameters

head_length

[float, default: 0.5] Length of the arrow head.

head_width

[float, default: 0.5] Width of the arrow head.

tail_width

[float, default: 0.2] Width of the arrow tail.

`__module__ = 'matplotlib.patches'`

`transmute`(*self*, *path*, *mutation_size*, *linewidth*)

The transmute method is the very core of the ArrowStyle class and must be overridden in the subclasses. It receives the path object along which the arrow will be drawn, and the mutation_size, with which the arrow head etc. will be scaled. The linewidth may be used to adjust the path so that it does not pass beyond the given points. It returns a tuple of a Path instance and a boolean. The boolean value indicate whether the path can be filled or not. The return value can also be a list of paths and list of booleans of a same length.

`class Wedge`(*tail_width=0.3*, *shrink_factor=0.5*)

Bases: `matplotlib.patches.ArrowStyle._Base`

Wedge(?) shape. Only works with a quadratic Bezier curve. The begin point has a width of the tail_width and the end point has a width of 0. At the middle, the width is shrink_factor*tail_width.

Parameters

tail_width

[float, default: 0.3] Width of the tail.

shrink_factor

[float, default: 0.5] Fraction of the arrow width at the middle point.

`__init__`(*self*, *tail_width=0.3*, *shrink_factor=0.5*)

Parameters

tail_width

[float, default: 0.3] Width of the tail.

shrink_factor

[float, default: 0.5] Fraction of the arrow width at the middle point.

`__module__ = 'matplotlib.patches'`

`transmute`(*self*, *path*, *mutation_size*, *linewidth*)

The transmute method is the very core of the ArrowStyle class and must be overridden in the subclasses. It receives the path object along which the arrow will be drawn, and the mutation_size, with which the arrow head etc. will be scaled. The linewidth may be used to adjust the path so that it does not pass beyond the given points. It returns a tuple of a Path instance and a boolean. The boolean value indicate whether the path can be filled or not. The return value can also be a list of paths and list of booleans of a same length.

```
__module__ = 'matplotlib.patches'
```

Examples using `matplotlib.patches.ArrowStyle`

- sphx_glr_gallery_text_labels_and_annotations_fancyarrow_demo.py

matplotlib.patches.BoxStyle

`class matplotlib.patches.BoxStyle`(*stylename*, ***kw*)

Bases: `matplotlib.patches._Style`

BoxStyle is a container class which defines several boxstyle classes, which are used for *FancyBboxPatch*.

A style object can be created as:

```
BoxStyle.Round(pad=0.2)
```

or:

```
BoxStyle("Round", pad=0.2)
```

or:

```
BoxStyle("Round, pad=0.2")
```

The following boxstyle classes are defined.

Class	Name	Attrs
Circle	`circle`	pad=0.3
DArrow	`darrow`	pad=0.3
LArrow	`larrow`	pad=0.3
RArrow	`rarrow`	pad=0.3
Round	`round`	pad=0.3, rounding_size=None
Round4	`round4`	pad=0.3, rounding_size=None
Roundtooth	`roundtooth`	pad=0.3, tooth_size=None
Sawtooth	`sawtooth`	pad=0.3, tooth_size=None
Square	`square`	pad=0.3

An instance of any boxstyle class is an callable object, whose call signature is:

```
__call__(self, x0, y0, width, height, mutation_size, aspect_ratio=1.)
```

and returns a *Path* instance. *x0*, *y0*, *width* and *height* specify the location and size of the box to be drawn. *mutation_scale* determines the overall size of the mutation (by which I mean the transformation of the rectangle to the fancy box). *mutation_aspect* determines the aspect-ratio of the mutation.

Return the instance of the subclass with the given style name.

`class Circle(`*pad=0.3*`)`

Bases: `matplotlib.patches.BoxStyle._Base`

A circular box.

Parameters

pad

[float, default: 0.3] The amount of padding around the original box.

`__init__(`*self*, *pad=0.3*`)`

Initialize self. See help(type(self)) for accurate signature.

`__module__ = 'matplotlib.patches'`

`transmute(`*self*, *x0*, *y0*, *width*, *height*, *mutation_size*`)`

Return the *Path* outlining the given rectangle.

`class DArrow(`*pad=0.3*`)`

Bases: `matplotlib.patches.BoxStyle._Base`

A box in the shape of a two-way arrow.

Parameters

pad

[float, default: 0.3] The amount of padding around the original box.

`__init__(`*self*, *pad=0.3*`)`

Initialize self. See help(type(self)) for accurate signature.

`__module__ = 'matplotlib.patches'`

`transmute(`*self*, *x0*, *y0*, *width*, *height*, *mutation_size*`)`

Return the *Path* outlining the given rectangle.

`class LArrow(`*pad=0.3*`)`

Bases: `matplotlib.patches.BoxStyle._Base`

A box in the shape of a left-pointing arrow.

Parameters

pad

[float, default: 0.3] The amount of padding around the original box.

`__init__`(*self*, *pad=0.3*)
Initialize self. See help(type(self)) for accurate signature.

`__module__ = 'matplotlib.patches'`

`transmute`(*self*, *x0*, *y0*, *width*, *height*, *mutation_size*)
Return the *Path* outlining the given rectangle.

`class RArrow`(*pad=0.3*)
Bases: *matplotlib.patches.BoxStyle.LArrow*

A box in the shape of a right-pointing arrow.

Parameters

pad

[float, default: 0.3] The amount of padding around the original box.

`__init__`(*self*, *pad=0.3*)
Initialize self. See help(type(self)) for accurate signature.

`__module__ = 'matplotlib.patches'`

`transmute`(*self*, *x0*, *y0*, *width*, *height*, *mutation_size*)
Return the *Path* outlining the given rectangle.

`class Round`(*pad=0.3*, *rounding_size=None*)
Bases: `matplotlib.patches.BoxStyle._Base`

A box with round corners.

Parameters

pad

[float, default: 0.3] The amount of padding around the original box.

rounding_size

[float, default: *pad*] Radius of the corners.

`__init__`(*self*, *pad=0.3*, *rounding_size=None*)
Initialize self. See help(type(self)) for accurate signature.

`__module__ = 'matplotlib.patches'`

transmute(*self*, *x0*, *y0*, *width*, *height*, *mutation_size*)
Return the *Path* outlining the given rectangle.

class Round4(*pad=0.3*, *rounding_size=None*)
Bases: matplotlib.patches.BoxStyle._Base

A box with rounded edges.

Parameters

pad

[float, default: 0.3] The amount of padding around the original box.

rounding_size

[float, default: *pad*/2] Rounding of edges.

__init__(*self*, *pad=0.3*, *rounding_size=None*)
Initialize self. See help(type(self)) for accurate signature.

__module__ = 'matplotlib.patches'

transmute(*self*, *x0*, *y0*, *width*, *height*, *mutation_size*)
Return the *Path* outlining the given rectangle.

class Roundtooth(*pad=0.3*, *tooth_size=None*)
Bases: *matplotlib.patches.BoxStyle.Sawtooth*

A box with a rounded sawtooth outline.

Parameters

pad

[float, default: 0.3] The amount of padding around the original box.

tooth_size

[float, default: *pad*/2] Size of the sawtooth.

__init__(*self*, *pad=0.3*, *tooth_size=None*)
Initialize self. See help(type(self)) for accurate signature.

__module__ = 'matplotlib.patches'

transmute(*self*, *x0*, *y0*, *width*, *height*, *mutation_size*)
Return the *Path* outlining the given rectangle.

class Sawtooth(*pad=0.3*, *tooth_size=None*)
Bases: matplotlib.patches.BoxStyle._Base

A box with a sawtooth outline.

Parameters

pad

[float, default: 0.3] The amount of padding around the original box.

tooth_size

[float, default: *pad*/2] Size of the sawtooth.

`__init__`(*self*, *pad=0.3*, *tooth_size=None*)
Initialize self. See help(type(self)) for accurate signature.

`__module__ = 'matplotlib.patches'`

`transmute`(*self*, *x0*, *y0*, *width*, *height*, *mutation_size*)
Return the *Path* outlining the given rectangle.

`class Square`(*pad=0.3*)
Bases: `matplotlib.patches.BoxStyle._Base`

A square box.

Parameters

pad

[float, default: 0.3] The amount of padding around the original box.

`__init__`(*self*, *pad=0.3*)
Initialize self. See help(type(self)) for accurate signature.

`__module__ = 'matplotlib.patches'`

`transmute`(*self*, *x0*, *y0*, *width*, *height*, *mutation_size*)
Return the *Path* outlining the given rectangle.

`__module__ = 'matplotlib.patches'`

Examples using `matplotlib.patches.BoxStyle`

- sphx_glr_gallery_shapes_and_collections_fancybox_demo.py

matplotlib.patches.Circle

class matplotlib.patches.Circle(*xy*, *radius=5*, ***kwargs*)

Bases: *matplotlib.patches.Ellipse*

A circle patch.

Create a true circle at center *xy* = (*x*, *y*) with given *radius*.

Unlike *CirclePolygon* which is a polygonal approximation, this uses Bezier splines and is much closer to a scale-free circle.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

__init__(*self*, *xy*, *radius=5*, ***kwargs*)
Create a true circle at center *xy* = (*x*, *y*) with given *radius*.

Unlike *CirclePolygon* which is a polygonal approximation, this uses Bezier splines and is much closer to a scale-free circle.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

__module__ = 'matplotlib.patches'

__str__(*self*)
Return str(self).

get_radius(*self*)
Return the radius of the circle.

`property radius`
Return the radius of the circle.

`set_radius`(*self*, *radius*)
Set the radius of the circle.

Parameters

radius

[float]

matplotlib.patches.CirclePolygon

class matplotlib.patches.CirclePolygon(*xy*, *radius=5*, *resolution=20*, ***kwargs*)

Bases: *matplotlib.patches.RegularPolygon*

A polygon-approximation of a circle patch.

Create a circle at *xy* = (*x*, *y*) with given *radius*.

This circle is approximated by a regular polygon with *resolution* sides. For a smoother circle drawn with splines, see *Circle*.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

__init__(*self*, *xy*, *radius=5*, *resolution=20*, ***kwargs*)

Create a circle at *xy* = (*x*, *y*) with given *radius*.

This circle is approximated by a regular polygon with *resolution* sides. For a smoother circle drawn with splines, see *Circle*.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

__module__ = 'matplotlib.patches'

__str__(*self*)

Return str(self).

Examples using `matplotlib.patches.CirclePolygon`

matplotlib.patches.ConnectionPatch

class matplotlib.patches.**ConnectionPatch**(*xyA*, *xyB*, *coordsA*, *coordsB=None*, *axesA=None*, *axesB=None*, *arrowstyle='-'*, *connectionstyle='arc3'*, *patchA=None*, *patchB=None*, *shrinkA=0.0*, *shrinkB=0.0*, *mutation_scale=10.0*, *mutation_aspect=None*, *clip_on=False*, *dpi_cor=1.0*, ***kwargs*)

Bases: *matplotlib.patches.FancyArrowPatch*

A patch that connects two points (possibly in different axes).

Connect point *xyA* in *coordsA* with point *xyB* in *coordsB*.

Valid keys are

Key	Description
arrowstyle	the arrow style
connectionstyle	the connection style
relpos	default is (0.5, 0.5)
patchA	default is bounding box of the text
patchB	default is None
shrinkA	default is 2 points
shrinkB	default is 2 points
mutation_scale	default is text size (in points)
mutation_aspect	default is 1.
?	any key for *matplotlib.patches.PathPatch*

coordsA and *coordsB* are strings that indicate the coordinates of *xyA* and *xyB*.

Property	Description
'figure points'	points from the lower left corner of the figure
'figure pixels'	pixels from the lower left corner of the figure
'figure fraction'	0, 0 is lower left of figure and 1, 1 is upper right
'axes points'	points from lower left corner of axes
'axes pixels'	pixels from lower left corner of axes
'axes fraction'	0, 0 is lower left of axes and 1, 1 is upper right
'data'	use the coordinate system of the object being annotated (default)
'offset points'	offset (in points) from the *xy* value
'polar'	you can specify *theta*, *r* for the annotation, even in cartesian plots. Note that if you are using a polar axes, you do not need to specify polar for the coordinate system since that is the native "data" coordinate system.

Alternatively they can be set to any valid *Transform*.

Note: Using *ConnectionPatch* across two *Axes* instances is not directly compatible with *constrained layout*. Add the artist directly to the *Figure* instead of adding it to a specific Axes.

```
fig, ax = plt.subplots(1, 2, constrained_layout=True)
con = ConnectionPatch(..., axesA=ax[0], axesB=ax[1])
fig.add_artist(con)
```

`__init__`(*self*, *xyA*, *xyB*, *coordsA*, *coordsB=None*, *axesA=None*, *axesB=None*, *arrowstyle='-'*, *connectionstyle='arc3'*, *patchA=None*, *patchB=None*, *shrinkA=0.0*, *shrinkB=0.0*, *mutation_scale=10.0*, *mutation_aspect=None*, *clip_on=False*, *dpi_cor=1.0*, ***kwargs*)

Connect point *xyA* in *coordsA* with point *xyB* in *coordsB*.

Valid keys are

Key	Description
arrowstyle	the arrow style
connectionstyle	the connection style
relpos	default is (0.5, 0.5)
patchA	default is bounding box of the text
patchB	default is None
shrinkA	default is 2 points
shrinkB	default is 2 points
mutation_scale	default is text size (in points)
mutation_aspect	default is 1.
?	any key for *matplotlib.patches.PathPatch*

coordsA and *coordsB* are strings that indicate the coordinates of *xyA* and *xyB*.

Property	Description
'figure points'	points from the lower left corner of the figure
'figure pixels'	pixels from the lower left corner of the figure
'figure fraction'	0, 0 is lower left of figure and 1, 1 is upper right
'axes points'	points from lower left corner of axes
'axes pixels'	pixels from lower left corner of axes
'axes fraction'	0, 0 is lower left of axes and 1, 1 is upper right
'data'	use the coordinate system of the object being annotated (default)
'offset points'	offset (in points) from the *xy* value
'polar'	you can specify *theta*, *r* for the annotation, even in cartesian plots. Note that if you are using a polar axes, you do not need to specify polar for the coordinate system since that is the native "data" coordinate system.

Alternatively they can be set to any valid *Transform*.

Note: Using *ConnectionPatch* across two *Axes* instances is not directly compatible with *constrained layout*. Add the artist directly to the *Figure* instead of adding it to a specific Axes.

```
fig, ax = plt.subplots(1, 2, constrained_layout=True)
con = ConnectionPatch(..., axesA=ax[0], axesB=ax[1])
fig.add_artist(con)
```

__module__ = 'matplotlib.patches'

__str__(*self*)
Return str(self).

draw(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_annotation_clip(*self*)
Return the clipping behavior.

See *set_annotation_clip* for the meaning of the return value.

get_path_in_displaycoord(*self*)
Return the mutated path of the arrow in display coordinates.

set_annotation_clip(*self*, *b*)
Set the clipping behavior.

Parameters

b

[bool or None]

- *False*: The annotation will always be drawn regardless of its position.

- *True*: The annotation will only be drawn if `self.xy` is inside the axes.
- *None*: The annotation will only be drawn if `self.xy` is inside the axes and `self.xycoords == "data"`.

Examples using `matplotlib.patches.ConnectionPatch`

- sphx_glr_gallery_pie_and_polar_charts_bar_of_pie.py
- sphx_glr_gallery_userdemo_connect_simple01.py
- *Constrained Layout Guide*

matplotlib.patches.ConnectionStyle

class matplotlib.patches.**ConnectionStyle**(*stylename*, ***kw*)

Bases: `matplotlib.patches._Style`

ConnectionStyle is a container class which defines several connectionstyle classes, which is used to create a path between two points. These are mainly used with *FancyArrowPatch*.

A connectionstyle object can be either created as:

```
ConnectionStyle.Arc3(rad=0.2)
```

or:

```
ConnectionStyle("Arc3", rad=0.2)
```

or:

```
ConnectionStyle("Arc3, rad=0.2")
```

The following classes are defined

Class	Name	Attrs
Angle	`angle`	angleA=90, angleB=0, rad=0.0
Angle3	`angle3`	angleA=90, angleB=0
Arc	`arc`	angleA=0, angleB=0, armA=None, armB=None, rad=0.0
Arc3	`arc3`	rad=0.0
Bar	`bar`	armA=0.0, armB=0.0, fraction=0.3, angle=None

An instance of any connection style class is an callable object, whose call signature is:

```
__call__(self, posA, posB,
         patchA=None, patchB=None,
         shrinkA=2., shrinkB=2.)
```

and it returns a *Path* instance. *posA* and *posB* are tuples of (x, y) coordinates of the two points to be connected. *patchA* (or *patchB*) is given, the returned path is clipped so that it start (or end) from the boundary of the patch. The path is further shrunk by *shrinkA* (or *shrinkB*) which is given in points.

Return the instance of the subclass with the given style name.

`class Angle(`*angleA=90*, *angleB=0*, *rad=0.0*`)`

Bases: `matplotlib.patches.ConnectionStyle._Base`

Creates a piecewise continuous quadratic Bezier path between two points. The path has a one passing-through point placed at the intersecting point of two lines which cross the start and end point, and have a slope of angleA and angleB, respectively. The connecting edges are rounded with *rad*.

angleA

starting angle of the path

angleB

ending angle of the path

rad

rounding radius of the edge

`__init__(`*self*, *angleA=90*, *angleB=0*, *rad=0.0*`)`

angleA

starting angle of the path

angleB

ending angle of the path

rad

rounding radius of the edge

`__module__ = 'matplotlib.patches'`

`connect(`*self*, *posA*, *posB*`)`

`class Angle3(`*angleA=90*, *angleB=0*`)`

Bases: `matplotlib.patches.ConnectionStyle._Base`

Creates a simple quadratic Bezier curve between two points. The middle control points is placed at the intersecting point of two lines which cross the start and end point, and have a slope of angleA and angleB, respectively.

angleA

starting angle of the path

angleB

ending angle of the path

`__init__`(*self*, *angleA=90*, *angleB=0*)

angleA

starting angle of the path

angleB

ending angle of the path

`__module__ = 'matplotlib.patches'`

`connect`(*self*, *posA*, *posB*)

`class Arc`(*angleA=0*, *angleB=0*, *armA=None*, *armB=None*, *rad=0.0*)

Bases: `matplotlib.patches.ConnectionStyle._Base`

Creates a piecewise continuous quadratic Bezier path between two points. The path can have two passing-through points, a point placed at the distance of armA and angle of angleA from point A, another point with respect to point B. The edges are rounded with *rad*.

***angleA* :**

starting angle of the path

***angleB* :**

ending angle of the path

***armA* :**

length of the starting arm

***armB* :**

length of the ending arm

***rad* :**

rounding radius of the edges

`__init__`(*self*, *angleA=0*, *angleB=0*, *armA=None*, *armB=None*, *rad=0.0*)

***angleA* :**

starting angle of the path

***angleB* :**

ending angle of the path

***armA* :**

length of the starting arm

***armB* :**

length of the ending arm

***rad* :**

rounding radius of the edges

`__module__ = 'matplotlib.patches'`

`connect`(*self*, *posA*, *posB*)

`class Arc3`(*rad=0.0*)

Bases: `matplotlib.patches.ConnectionStyle._Base`

Creates a simple quadratic Bezier curve between two points. The curve is created so that the middle control point (C1) is located at the same distance from the start (C0) and end points(C2) and the distance of the C1 to the line connecting C0-C2 is *rad* times the distance of C0-C2.

rad

curvature of the curve.

`__init__`(*self*, *rad=0.0*)

rad

curvature of the curve.

`__module__ = 'matplotlib.patches'`

`connect`(*self*, *posA*, *posB*)

`class Bar`(*armA=0.0*, *armB=0.0*, *fraction=0.3*, *angle=None*)

Bases: `matplotlib.patches.ConnectionStyle._Base`

A line with *angle* between A and B with *armA* and *armB*. One of the arms is extended so that they are connected in a right angle. The length of armA is determined by (*armA* + *fraction* x AB distance). Same for armB.

Parameters

armA

[float] minimum length of armA

armB

[float] minimum length of armB

fraction

[float] a fraction of the distance between two points that will be added to armA and armB.

angle

[float or None] angle of the connecting line (if None, parallel to A and B)

`__init__`(*self*, *armA=0.0*, *armB=0.0*, *fraction=0.3*, *angle=None*)

Parameters

armA

[float] minimum length of armA

armB

[float] minimum length of armB

fraction

[float] a fraction of the distance between two points that will be added to armA and armB.

angle

[float or None] angle of the connecting line (if None, parallel to A and B)

```
__module__ = 'matplotlib.patches'
```

```
connect(self, posA, posB)
```

```
__module__ = 'matplotlib.patches'
```

Examples using `matplotlib.patches.ConnectionStyle`

matplotlib.patches.Ellipse

```
class matplotlib.patches.Ellipse(xy, width, height, angle=0, **kwargs)
```

Bases: *matplotlib.patches.Patch*

A scale-free ellipse.

Parameters

xy

[(float, float)] xy coordinates of ellipse centre.

width

[float] Total length (diameter) of horizontal axis.

height

[float] Total length (diameter) of vertical axis.

angle

[float, default: 0] Rotation in degrees anti-clockwise.

Notes

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

`__init__`(*self*, *xy*, *width*, *height*, *angle=0*, ***kwargs*)

Parameters

xy

[(float, float)] xy coordinates of ellipse centre.

width

[float] Total length (diameter) of horizontal axis.

height

[float] Total length (diameter) of vertical axis.

angle

[float, default: 0] Rotation in degrees anti-clockwise.

Notes

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None

picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

__module__ = 'matplotlib.patches'

__str__(*self*)
Return str(self).

property angle
Return the angle of the ellipse.

property center
Return the center of the ellipse.

get_angle(*self*)
Return the angle of the ellipse.

get_center(*self*)
Return the center of the ellipse.

get_height(*self*)
Return the height of the ellipse.

get_patch_transform(*self*)
Return the *Transform* instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

get_path(*self*)
Return the path of the ellipse.

get_width(*self*)
Return the width of the ellipse.

property height
Return the height of the ellipse.

set_angle(*self*, *angle*)
Set the angle of the ellipse.

Parameters

angle

[float]

set_center(*self*, *xy*)
Set the center of the ellipse.

Parameters

xy

[(float, float)]

`set_height`(*self*, *height*)
Set the height of the ellipse.

Parameters

height

[float]

`set_width`(*self*, *width*)
Set the width of the ellipse.

Parameters

width

[float]

`property width`
Return the width of the ellipse.

matplotlib.patches.FancyArrow

class matplotlib.patches.**FancyArrow**(*x*, *y*, *dx*, *dy*, *width=0.001*, *length_includes_head=False*, *head_width=None*, *head_length=None*, *shape='full'*, *overhang=0*, *head_starts_at_zero=False*, ***kwargs*)

Bases: *matplotlib.patches.Polygon*

Like Arrow, but lets you set head width and head height independently.

Parameters

width: float, default: 0.001

Width of full arrow tail.

length_includes_head: bool, default: False

True if head is to be counted in calculating the length.

head_width: float or None, default: 3*width

Total width of the full arrow head.

head_length: float or None, default: 1.5*head_width

Length of arrow head.

shape: ['full', 'left', 'right'], default: 'full'

Draw the left-half, right-half, or full arrow.

overhang: float, default: 0

Fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

head_starts_at_zero: bool, default: False

If True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

****kwargs**

Patch properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None

__str__(*self*)
Return str(self).

Examples using matplotlib.patches.FancyArrow

matplotlib.patches.FancyArrowPatch

class matplotlib.patches.**FancyArrowPatch**(*posA=None*, *posB=None*, *path=None*, *arrowstyle='simple'*, *connectionstyle='arc3'*, *patchA=None*, *patchB=None*, *shrinkA=2*, *shrinkB=2*, *mutation_scale=1*, *mutation_aspect=None*, *dpi_cor=1*, ***kwargs*)

Bases: *matplotlib.patches.Patch*

A fancy arrow patch. It draws an arrow using the *ArrowStyle*.

The head and tail positions are fixed at the specified start and end points of the arrow, but the size and shape (in display coordinates) of the arrow does not change when the axis is moved or zoomed.

There are two ways for defining an arrow:

- If *posA* and *posB* are given, a path connecting two points is created according to *connectionstyle*. The path will be clipped with *patchA* and *patchB* and further shrunken by *shrinkA* and *shrinkB*. An arrow is drawn along this resulting path using the *arrowstyle* parameter.
- Alternatively if *path* is provided, an arrow is drawn along this path and *patchA*, *patchB*, *shrinkA*, and *shrinkB* are ignored.

Parameters

posA, posB

[(float, float), default: None] (x, y) coordinates of arrow tail and arrow head respectively.

path

[*Path*, default: None] If provided, an arrow is drawn along this path and *patchA*, *patchB*, *shrinkA*, and *shrinkB* are ignored.

arrowstyle

[str or *ArrowStyle*, default: 'simple']

The *ArrowStyle* with which the fancy arrow is drawn. If a string, it should be one of the available arrowstyle names, with optional comma-separated attributes. The optional attributes are meant to be scaled with the *mutation_scale*. The following arrow styles are available:

Class	Name	Attrs
Curve	`-`	None
CurveB	`->`	head_length=0.4, head_width=0.2
BracketB	`-[`	widthB=1.0, lengthB=0.2, angleB=None
CurveFilledB	`-|>`	head_length=0.4, head_width=0.2
CurveA	`<-`	head_length=0.4, head_width=0.2
CurveAB	`<->`	head_length=0.4, head_width=0.2
CurveFilledA	`<|-`	head_length=0.4, head_width=0.2
CurveFilledAB	`<|-|>`	head_length=0.4, head_width=0.2
BracketA	`]-`	widthA=1.0, lengthA=0.2, angleA=None
BracketAB	`]-[`	widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0, lengthB=0.2, angleB=None
Fancy	`fancy`	head_length=0.4, head_width=0.4, tail_width=0.4
Simple	`simple`	head_length=0.5, head_width=0.5, tail_width=0.2
Wedge	`wedge`	tail_width=0.3, shrink_factor=0.5
BarAB	`|-|`	widthA=1.0, angleA=None, widthB=1.0, angleB=None

connectionstyle

[str or *ConnectionStyle* or None, optional, default: 'arc3']

The *ConnectionStyle* with which *posA* and *posB* are connected. If a string, it should be one of the available connectionstyle names, with optional comma-separated attributes. The following connection styles are available:

Class	Name	Attrs
Angle	`angle`	angleA=90, angleB=0, rad=0.0
Angle3	`angle3`	angleA=90, angleB=0
Arc	`arc`	angleA=0, angleB=0, armA=None, armB=None, rad=0.0
Arc3	`arc3`	rad=0.0
Bar	`bar`	armA=0.0, armB=0.0, fraction=0.3, angle=None

patchA, patchB

[*Patch*, default: None] Head and tail patches, respectively.

shrinkA, shrinkB

[float, default: 2] Shrinking factor of the tail and head of the arrow respectively.

mutation_scale

[float, default: 1] Value with which attributes of *arrowstyle* (e.g., *head_length*) will be scaled.

mutation_aspect

[None or float, default: None] The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it.

dpi_cor

[float, default: 1] dpi_cor is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.

Other Parameters

****kwargs**

[*Patch* properties, optional] Here is a list of available *Patch* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object

Table 159 – continued from previous page

Property	Description
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

In contrast to other patches, the default `capstyle` and `joinstyle` for *FancyArrowPatch* are set to `"round"`.

`__init__`(*self*, *posA=None*, *posB=None*, *path=None*, *arrowstyle='simple'*, *connectionstyle='arc3'*, *patchA=None*, *patchB=None*, *shrinkA=2*, *shrinkB=2*, *mutation_scale=1*, *mutation_aspect=None*, *dpi_cor=1*, ***kwargs*)

There are two ways for defining an arrow:

- If *posA* and *posB* are given, a path connecting two points is created according to *connectionstyle*. The path will be clipped with *patchA* and *patchB* and further shrunken by *shrinkA* and *shrinkB*. An arrow is drawn along this resulting path using the *arrowstyle* parameter.
- Alternatively if *path* is provided, an arrow is drawn along this path and *patchA*, *patchB*, *shrinkA*, and *shrinkB* are ignored.

Parameters

posA, posB

[(float, float), default: None] (x, y) coordinates of arrow tail and arrow head respectively.

path

[*Path*, default: None] If provided, an arrow is drawn along this path and *patchA*, *patchB*, *shrinkA*, and *shrinkB* are ignored.

arrowstyle

[str or *ArrowStyle*, default: 'simple']

The *ArrowStyle* with which the fancy arrow is drawn. If a string, it should be one of the available arrowstyle names, with optional comma-separated attributes. The optional at-

tributes are meant to be scaled with the *mutation_scale*. The following arrow styles are available:

Class	Name	Attrs
Curve	-	None
CurveB	->	head_length=0.4, head_width=0.2
BracketB	-[	widthB=1.0, lengthB=0.2, angleB=None
CurveFilledB	-|>	head_length=0.4, head_width=0.2
CurveA	<-	head_length=0.4, head_width=0.2
CurveAB	<->	head_length=0.4, head_width=0.2
CurveFilledA	<|-	head_length=0.4, head_width=0.2
CurveFilledAB	<|-|>	head_length=0.4, head_width=0.2
BracketA	]-	widthA=1.0, lengthA=0.2, angleA=None
BracketAB	]-[	widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0, lengthB=0.2, angleB=None
Fancy	fancy	head_length=0.4, head_width=0.4, tail_width=0.4
Simple	simple	head_length=0.5, head_width=0.5, tail_width=0.2
Wedge	wedge	tail_width=0.3, shrink_factor=0.5
BarAB	|-|	widthA=1.0, angleA=None, widthB=1.0, angleB=None

connectionstyle

[str or *ConnectionStyle* or None, optional, default: 'arc3']

The *ConnectionStyle* with which *posA* and *posB* are connected. If a string, it should be one of the available connectionstyle names, with optional comma-separated attributes. The following connection styles are available:

Class	Name	Attrs
Angle	angle	angleA=90, angleB=0, rad=0.0
Angle3	angle3	angleA=90, angleB=0
Arc	arc	angleA=0, angleB=0, armA=None, armB=None, rad=0.0
Arc3	arc3	rad=0.0
Bar	bar	armA=0.0, armB=0.0, fraction=0.3, angle=None

patchA, patchB

[*Patch*, default: None] Head and tail patches, respectively.

shrinkA, shrinkB

[float, default: 2] Shrinking factor of the tail and head of the arrow respectively.

mutation_scale

[float, default: 1] Value with which attributes of *arrowstyle* (e.g., *head_length*) will be scaled.

mutation_aspect

[None or float, default: None] The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it.

dpi_cor

[float, default: 1] dpi_cor is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.

Other Parameters

****kwargs**

[*Patch* properties, optional] Here is a list of available *Patch* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}

Table 160 – continued from previous page

Property	Description
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

In contrast to other patches, the default `capstyle` and `joinstyle` for *FancyArrowPatch* are set to `"round"`.

`__module__ = 'matplotlib.patches'`

`__str__`(*self*)
Return str(self).

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`get_arrowstyle`(*self*)
Return the arrowstyle object.

`get_connectionstyle`(*self*)
Return the *ConnectionStyle* used.

`get_dpi_cor`(*self*)
dpi_cor is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.

Returns

scalar

`get_mutation_aspect`(*self*)
Return the aspect ratio of the bbox mutation.

`get_mutation_scale`(*self*)
Return the mutation scale.

Returns

scalar

`get_path`(*self*)
Return the path of the arrow in the data coordinates. Use get_path_in_displaycoord() method to retrieve the arrow path in display coordinates.

`get_path_in_displaycoord`(*self*)
Return the mutated path of the arrow in display coordinates.

`set_arrowstyle`(*self*, *arrowstyle=None*, ***kw*)
Set the arrow style. Old attributes are forgotten. Without arguments (or with `arrowstyle=None`) returns available box styles as a list of strings.

Parameters

arrowstyle

[None or ArrowStyle or str, default: None] Can be a string with arrowstyle name with optional comma-separated attributes, e.g.:

```
set_arrowstyle("Fancy,head_length=0.2")
```

Alternatively attributes can be provided as keywords, e.g.:

```
set_arrowstyle("fancy", head_length=0.2)
```

`set_connectionstyle`(*self*, *connectionstyle*, ***kw*)
Set the connection style. Old attributes are forgotten.

Parameters

connectionstyle

[str or *ConnectionStyle* or None, optional] Can be a string with connectionstyle name with optional comma-separated attributes, e.g.:

```
set_connectionstyle("arc,angleA=0,armA=30,rad=10")
```

Alternatively, the attributes can be provided as keywords, e.g.:

```
set_connectionstyle("arc", angleA=0,armA=30,rad=10)
```

Without any arguments (or with `connectionstyle=None`), return available styles as a list of strings.

`set_dpi_cor`(*self*, *dpi_cor*)

dpi_cor is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.

Parameters

dpi_cor

[float]

`set_mutation_aspect`(*self*, *aspect*)

Set the aspect ratio of the bbox mutation.

Parameters

aspect

[float]

`set_mutation_scale`(*self*, *scale*)

Set the mutation scale.

Parameters

scale

[float]

`set_patchA`(*self*, *patchA*)

Set the tail patch.

Parameters

patchA

[*patches.Patch*]

`set_patchB`(*self*, *patchB*)

Set the head patch.

Parameters

patchB

[*patches.Patch*]

set_positions(*self*, *posA*, *posB*)

Set the begin and end positions of the connecting path.

Parameters

posA, posB

[None, tuple] (x, y) coordinates of arrow tail and arrow head respectively. If None use current value.

Examples using matplotlib.patches.FancyArrowPatch

- sphx_glr_gallery_pie_and_polar_charts_bar_of_pie.py
- sphx_glr_gallery_shapes_and_collections_arrow_guide.py
- sphx_glr_gallery_userdemo_connect_simple01.py
- sphx_glr_gallery_userdemo_connectionstyle_demo.py

matplotlib.patches.FancyBboxPatch

class matplotlib.patches.**FancyBboxPatch**(*xy*, *width*, *height*, *boxstyle='round'*, *bbox_transmuter=None*, *mutation_scale=1.0*, *mutation_aspect=None*, ***kwargs*)

Bases: *matplotlib.patches.Patch*

A fancy box around a rectangle with lower left at *xy* = (*x*, *y*) with specified width and height.

FancyBboxPatch is similar to *Rectangle*, but it draws a fancy box around the rectangle. The transformation of the rectangle box to the fancy box is delegated to the style classes defined in *BoxStyle*.

Parameters

xy

[float, float] The lower left corner of the box.

width

[float] The width of the box.

height

[float] The height of the box.

boxstyle

[str or *matplotlib.patches.BoxStyle*]

The style of the fancy box. This can either be a *BoxStyle* instance or a string of the style name and optionally comma seprarated attributes (e.g. "Round, pad=0.2"). This string is passed to *BoxStyle* to construct a *BoxStyle* object. See there for a full documentation.

The following box styles are available:

Class	Name	Attrs
Circle	`circle`	pad=0.3
DArrow	`darrow`	pad=0.3
LArrow	`larrow`	pad=0.3
RArrow	`rarrow`	pad=0.3
Round	`round`	pad=0.3, rounding_size=None
Round4	`round4`	pad=0.3, rounding_size=None
Roundtooth	`roundtooth`	pad=0.3, tooth_size=None
Sawtooth	`sawtooth`	pad=0.3, tooth_size=None
Square	`square`	pad=0.3

mutation_scale

[float, default: 1] Scaling factor applied to the attributes of the box style (e.g. pad or rounding_size).

mutation_aspect

[float, optional] The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it. For example, this allows different horizontal and vertical padding.

Other Parameters

****kwargs**

[*Patch* properties]

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown

`__module__ = 'matplotlib.patches'`

`__str__`(*self*)
Return str(self).

`get_bbox`(*self*)
Return the *Bbox*.

`get_boxstyle`(*self*)
Return the boxstyle object.

`get_height`(*self*)
Return the height of the rectangle.

`get_mutation_aspect`(*self*)
Return the aspect ratio of the bbox mutation.

`get_mutation_scale`(*self*)
Return the mutation scale.

`get_path`(*self*)
Return the mutated path of the rectangle.

`get_width`(*self*)
Return the width of the rectangle.

`get_x`(*self*)
Return the left coord of the rectangle.

`get_y`(*self*)
Return the bottom coord of the rectangle.

`set_bounds`(*self*, **args*)
Set the bounds of the rectangle.

Call signatures:

```
set_bounds(left, bottom, width, height)
set_bounds((left, bottom, width, height))
```

Parameters

left, bottom

[float] The coordinates of the bottom left corner of the rectangle.

width, height

[float] The width/height of the rectangle.

`set_boxstyle`(*self, boxstyle=None, **kwargs*)

Set the box style.

Most box styles can be further configured using attributes. Attributes from the previous box style are not reused.

Without argument (or with `boxstyle=None`), the available box styles are returned as a human-readable string.

Parameters

boxstyle

[str]

The name of the box style. Optionally, followed by a comma and a comma-separated list of attributes. The attributes may alternatively be passed separately as keyword arguments.

The following box styles are available:

Class	Name	Attrs
Circle	`circle`	pad=0.3
DArrow	`darrow`	pad=0.3
LArrow	`larrow`	pad=0.3
RArrow	`rarrow`	pad=0.3
Round	`round`	pad=0.3, rounding_size=None
Round4	`round4`	pad=0.3, rounding_size=None
Roundtooth	`roundtooth`	pad=0.3, tooth_size=None
Sawtooth	`sawtooth`	pad=0.3, tooth_size=None
Square	`square`	pad=0.3

****kwargs**

Additional attributes for the box style. See the table above for supported parameters.

Examples

```
set_boxstyle("round,pad=0.2")
set_boxstyle("round", pad=0.2)
```

`set_height`(*self*, *h*)
Set the rectangle height.

Parameters

h

[float]

`set_mutation_aspect`(*self*, *aspect*)
Set the aspect ratio of the bbox mutation.

Parameters

aspect

[float]

`set_mutation_scale`(*self*, *scale*)
Set the mutation scale.

Parameters

scale

[float]

`set_width`(*self*, *w*)
Set the rectangle width.

Parameters

w

[float]

`set_x`(*self*, *x*)
Set the left coord of the rectangle.

Parameters

x

[float]

set_y(*self*, *y*)

Set the bottom coord of the rectangle.

Parameters

y

[float]

Examples using matplotlib.patches.FancyBboxPatch

- sphx_glr_gallery_shapes_and_collections_artist_reference.py
- sphx_glr_gallery_shapes_and_collections_fancybox_demo.py
- sphx_glr_gallery_userdemo_annotate_text_arrow.py

matplotlib.patches.Patch

class matplotlib.patches.Patch(*edgecolor=None*, *facecolor=None*, *color=None*, *linewidth=None*, *linestyle=None*, *antialiased=None*, *hatch=None*, *fill=True*, *capstyle=None*, *joinstyle=None*, ***kwargs*)

Bases: *matplotlib.artist.Artist*

A patch is a 2D artist with a face color and an edge color.

If any of *edgecolor*, *facecolor*, *linewidth*, or *antialiased* are *None*, they default to their rc params setting.

The following kwarg properties are supported

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool

Table 163 – continued from previous page

Property	Description
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

`__init__`(*self*, *edgecolor=None*, *facecolor=None*, *color=None*, *linewidth=None*, *linestyle=None*, *antialiased=None*, *hatch=None*, *fill=True*, *capstyle=None*, *joinstyle=None*, ***kwargs*)

The following kwarg properties are supported

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object

Table 164 – continued from previous page

Property	Description
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

`__module__ = 'matplotlib.patches'`

`contains`(*self*, *mouseevent*, *radius=None*)

Test whether the mouse event occurred in the patch.

Returns

(bool, empty dict)

`contains_point`(*self*, *point*, *radius=None*)

Return whether the given point is inside the patch.

Parameters

point

[(float, float)] The point (x, y) to check, in target coordinates of `self.get_transform()`. These are display coordinates for patches that are added to a figure or axes.

radius

[float, optional] Add an additional margin on the patch in target coordinates of `self.get_transform()`. See *Path.contains_point* for further details.

Returns

bool

Notes

The proper use of this method depends on the transform of the patch. Isolated patches do not have a transform. In this case, the patch creation coordinates and the point coordinates match. The following example checks that the center of a circle is within the circle

```
>>> center = 0, 0
>>> c = Circle(center, radius=1)
>>> c.contains_point(center)
True
```

The convention of checking against the transformed patch stems from the fact that this method is predominantly used to check if display coordinates (e.g. from mouse events) are within the patch. If you want to do the above check with data coordinates, you have to properly transform them first:

```
>>> center = 0, 0
>>> c = Circle(center, radius=1)
>>> plt.gca().add_patch(c)
>>> transformed_center = c.get_transform().transform(center)
>>> c.contains_point(transformed_center)
True
```

`contains_points`(*self*, *points*, *radius=None*)

Return whether the given points are inside the patch.

Parameters

points

[(N, 2) array] The points to check, in target coordinates of `self.get_transform()`. These are display coordinates for patches that are added to a figure or axes. Columns contain x and y values.

radius

[float, optional] Add an additional margin on the patch in target coordinates of `self.get_transform()`. See *Path.contains_point* for further details.

Returns

length-N bool array

Notes

The proper use of this method depends on the transform of the patch. See the notes on *Patch.contains_point*.

draw(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

property fill
Return whether the patch is filled.

get_aa(*self*)
Alias for *get_antialiased*.

get_antialiased(*self*)
Return whether antialiasing is used for drawing.

get_capstyle(*self*)
Return the capstyle.

get_data_transform(*self*)
Return the *Transform* mapping data coordinates to physical coordinates.

get_ec(*self*)
Alias for *get_edgecolor*.

get_edgecolor(*self*)
Return the edge color.

get_extents(*self*)
Return the *Patch*'s axis-aligned extents as a *Bbox*.

get_facecolor(*self*)
Return the face color.

get_fc(*self*)
Alias for *get_facecolor*.

get_fill(*self*)
Return whether the patch is filled.

`get_hatch`(*self*)
Return the hatching pattern.

`get_joinstyle`(*self*)
Return the joinstyle.

`get_linestyle`(*self*)
Return the linestyle.

`get_linewidth`(*self*)
Return the line width in points.

`get_ls`(*self*)
Alias for *get_linestyle*.

`get_lw`(*self*)
Alias for *get_linewidth*.

`get_patch_transform`(*self*)
Return the *Transform* instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

`get_path`(*self*)
Return the path of this patch.

`get_transform`(*self*)
Return the *Transform* applied to the *Patch*.

`get_verts`(*self*)
Return a copy of the vertices used in this patch.

If the patch contains Bezier curves, the curves will be interpolated by line segments. To access the curves as curves, use *get_path*.

`get_window_extent`(*self*, *renderer=None*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`set_aa`(*self*, *aa*)
Alias for *set_antialiased*.

set_alpha(*self*, *alpha*)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[float or None]

set_antialiased(*self*, *aa*)
Set whether to use antialiased rendering.

Parameters

b

[bool or None]

set_capstyle(*self*, *s*)
Set the capstyle.

Parameters

s

[{'butt', 'round', 'projecting'}]

set_color(*self*, *c*)
Set both the edgecolor and the facecolor.

Parameters

c

[color]

See also:

Patch.set_facecolor, *Patch.set_edgecolor*

For setting the edge or face color individually.

set_ec(*self*, *color*)
Alias for *set_edgecolor*.

set_edgecolor(*self*, *color*)
Set the patch edge color.

Parameters

color

[color or None or 'auto']

set_facecolor(*self*, *color*)
Set the patch face color.

Parameters

color

[color or None]

set_fc(*self*, *color*)
Alias for *set_facecolor*.

set_fill(*self*, *b*)
Set whether to fill the patch.

Parameters

b

[bool]

set_hatch(*self*, *hatch*)
Set the hatching pattern.

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_joinstyle(*self*, *s*)
Set the joinstyle.

Parameters

s

[{'miter', 'round', 'bevel'}]

`set_linestyle`(*self*, *ls*)
Set the patch linestyle.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq)
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}] The line style.

`set_linewidth`(*self*, *w*)
Set the patch linewidth in points.

Parameters

w

[float or None]

`set_ls`(*self*, *ls*)
Alias for *set_linestyle*.

`set_lw`(*self*, *w*)
Alias for *set_linewidth*.

`update_from`(*self*, *other*)
Copy properties from *other* to *self*.

```
validCap = ('butt', 'round', 'projecting')
```

```
validJoin = ('miter', 'round', 'bevel')
```

```
zorder = 1
```

matplotlib.patches.PathPatch

class matplotlib.patches.**PathPatch**(*path*, ***kwargs*)

Bases: *matplotlib.patches.Patch*

A general polycurve path patch.

path is a *Path* object.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}

Table 165 – continued from previous page

Property	Description
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

`__init__`(*self*, *path*, ***kwargs*)

path is a *Path* object.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None

Property	Description
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

`__module__ = 'matplotlib.patches'`

`__str__`(*self*)
Return str(self).

`get_path`(*self*)
Return the path of this patch.

`set_path`(*self*, *path*)

Examples using `matplotlib.patches.PathPatch`

- sphx_glr_gallery_lines_bars_and_markers_curve_error_band.py
- sphx_glr_gallery_images_contours_and_fields_image_demo.py

matplotlib.patches.Polygon

class matplotlib.patches.Polygon(*xy*, *closed=True*, ***kwargs*)

Bases: *matplotlib.patches.Patch*

A general polygon patch.

xy is a numpy array with shape Nx2.

If *closed* is *True*, the polygon will be closed so the starting and ending points are the same.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

__init__(*self*, *xy*, *closed=True*, ***kwargs*)
xy is a numpy array with shape Nx2.

If *closed* is *True*, the polygon will be closed so the starting and ending points are the same.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

__module__ = 'matplotlib.patches'

__str__(*self*)
Return str(self).

get_closed(*self*)
Return whether the polygon is closed.

`get_path`(*self*)
Get the *Path* of the polygon.

`get_xy`(*self*)
Get the vertices of the path.

Returns

(N, 2) numpy array

The coordinates of the vertices.

`set_closed`(*self*, *closed*)
Set whether the polygon is closed.

Parameters

closed

[bool] True if the polygon is closed

`set_xy`(*self*, *xy*)
Set the vertices of the polygon.

Parameters

xy

[(N, 2) array-like] The coordinates of the vertices.

Notes

Unlike *Path*, we do not ignore the last input vertex. If the polygon is meant to be closed, and the last point of the polygon is not equal to the first, we assume that the user has not explicitly passed a `CLOSEPOLY` vertex, and add it ourselves.

`property xy`
The vertices of the path as (N, 2) numpy array.

- sphx_glr_gallery_event_handling_trifinder_event_demo.py
- *Annotations*

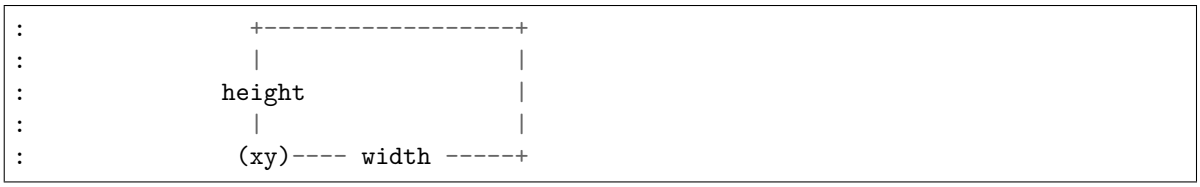
matplotlib.patches.Rectangle

class matplotlib.patches.**Rectangle**(*xy*, *width*, *height*, *angle=0.0*, ***kwargs*)

Bases: *matplotlib.patches.Patch*

A rectangle defined via an anchor point *xy* and its *width* and *height*.

The rectangle extends from `xy[0]` to `xy[0] + width` in x-direction and from `xy[1]` to `xy[1] + height` in y-direction.



One may picture *xy* as the bottom left corner, but which corner *xy* is actually depends on the the direction of the axis and the sign of *width* and *height*; e.g. *xy* would be the bottom right corner if the x-axis was inverted or if *width* was negative.

Parameters

xy

[(float, float)] The anchor point.

width

[float] Rectangle width.

height

[float] Rectangle height.

angle

[float, default: 0] Rotation in degrees anti-clockwise about *xy*.

Other Parameters

****kwargs**

[*Patch* properties]

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None

url	str
visible	bool
zorder	float

`__init__`(*self*, *xy*, *width*, *height*, *angle=0.0*, ***kwargs*)

Parameters

xy

[(float, float)] The anchor point.

width

[float] Rectangle width.

height

[float] Rectangle height.

angle

[float, default: 0] Rotation in degrees anti-clockwise about *xy*.

Other Parameters

****kwargs**

[*Patch* properties]

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

`__module__ = 'matplotlib.patches'`

`__str__`(*self*)
Return str(self).

`get_bbox`(*self*)
Return the *Bbox*.

`get_height`(*self*)
Return the height of the rectangle.

`get_patch_transform`(*self*)
Return the *Transform* instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

`get_path`(*self*)
Return the vertices of the rectangle.

`get_width`(*self*)
Return the width of the rectangle.

`get_x`(*self*)
Return the left coordinate of the rectangle.

`get_xy`(*self*)
Return the left and bottom coords of the rectangle as a tuple.

`get_y`(*self*)
Return the bottom coordinate of the rectangle.

`set_bounds`(*self*, **args*)
Set the bounds of the rectangle as *left*, *bottom*, *width*, *height*.

The values may be passed as separate parameters or as a tuple:

```
set_bounds(left, bottom, width, height)
set_bounds((left, bottom, width, height))
```

`set_height`(*self*, *h*)
Set the height of the rectangle.

`set_width`(*self*, *w*)
Set the width of the rectangle.

`set_x`(*self*, *x*)
Set the left coordinate of the rectangle.

`set_xy`(*self*, *xy*)
Set the left and bottom coordinates of the rectangle.

Parameters

xy

[(float, float)]

`set_y`(*self*, *y*)
Set the bottom coordinate of the rectangle.

property xy
: Return the left and bottom coords of the rectangle as a tuple.

matplotlib.patches.RegularPolygon

class matplotlib.patches.RegularPolygon(*xy*, *numVertices*, *radius=5*, *orientation=0*, ***kwargs*)

Bases: *matplotlib.patches.Patch*

A regular polygon patch.

Parameters

xy

[(float, float)] The center position.

numVertices

[int] The number of vertices.

radius

[float] The distance from the center to each of the vertices.

orientation

[float] The polygon rotation angle (in radians).

****kwargs**

Patch properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}

- sphx_glr_gallery_specialty_plots_radar_chart.py

matplotlib.patches.Shadow

class matplotlib.patches.**Shadow**(*patch*, *ox*, *oy*, *props=<deprecated parameter>*, ***kwargs*)

Bases: *matplotlib.patches.Patch*

Create a shadow of the given *patch*.

By default, the shadow will have the same face color as the *patch*, but darkened.

Parameters

patch

[*Patch*] The patch to create the shadow for.

ox, oy

[float] The shift of the shadow in data coordinates, scaled by a factor of dpi/72.

props

[dict] *deprecated (use kwargs instead)* Properties of the shadow patch.

****kwargs**

Properties of the shadow patch. Supported keys are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*

Table 173 – continued from previous page

Property	Description
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

`__init__`(*self*, *patch*, *ox*, *oy*, *props=<deprecated parameter>*, ***kwargs*)

Create a shadow of the given *patch*.

By default, the shadow will have the same face color as the *patch*, but darkened.

Parameters

patch

[*Patch*] The patch to create the shadow for.

ox, oy

[float] The shift of the shadow in data coordinates, scaled by a factor of dpi/72.

props

[dict] *deprecated (use kwargs instead)* Properties of the shadow patch.

****kwargs**

Properties of the shadow patch. Supported keys are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool

Table 174 – continued from previous page

Property	Description
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

__module__ = 'matplotlib.patches'

__str__(*self*)
Return str(self).

draw(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`get_patch_transform`(*self*)
Return the *Transform* instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

`get_path`(*self*)
Return the path of this patch.

`property props`

Examples using `matplotlib.patches.Shadow`

- sphx_glr_gallery_text_labels_and_annotations_demo_text_path.py
- sphx_glr_gallery_misc_svg_filter_pie.py

matplotlib.patches.Wedge

`class matplotlib.patches.Wedge`(*center*, *r*, *theta1*, *theta2*, *width=None*, ***kwargs*)
Bases: *matplotlib.patches.Patch*

Wedge shaped patch.

A wedge centered at *x*, *y* center with radius *r* that sweeps *theta1* to *theta2* (in degrees). If *width* is given, then a partial wedge is drawn from inner radius *r* - *width* to outer radius *r*.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown

Table 175 – continued from previous page

Property	Description
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

__init__(*self*, *center*, *r*, *theta1*, *theta2*, *width=None*, ***kwargs*)

A wedge centered at *x*, *y* center with radius *r* that sweeps *theta1* to *theta2* (in degrees). If *width* is given, then a partial wedge is drawn from inner radius *r* - *width* to outer radius *r*.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*

Table 176 – continued from previous page

Property	Description
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None

- sphx_glr_gallery_shapes_and_collections_patch_collection.py
- sphx_glr_gallery_misc_svg_filter_pie.py

18.35.2 Functions

bbox_artist(artist, renderer[, props, fill])	A debug function to draw a rectangle around the bounding box returned by an artist's *Artist.get_window_extent* to test whether the artist is returning the correct bbox.
draw_bbox(bbox, renderer[, color, trans])	A debug function to draw a rectangle around the bounding box returned by an artist's *Artist.get_window_extent* to test whether the artist is returning the correct bbox.

matplotlib.patches.bbox_artist

matplotlib.patches.**bbox_artist**(*artist*, *renderer*, *props=None*, *fill=True*)

A debug function to draw a rectangle around the bounding box returned by an artist's *Artist.get_window_extent* to test whether the artist is returning the correct bbox.

props is a dict of rectangle props with the additional property 'pad' that sets the padding around the bbox in points.

Examples using `matplotlib.patches.bbox_artist`

matplotlib.patches.draw_bbox

matplotlib.patches.**draw_bbox**(*bbox*, *renderer*, *color='k'*, *trans=None*)

A debug function to draw a rectangle around the bounding box returned by an artist's *Artist.get_window_extent* to test whether the artist is returning the correct bbox.

Examples using `matplotlib.patches.draw_bbox`

18.36 matplotlib.path

A module for dealing with the polylines used throughout Matplotlib.

The primary class for polyline handling in Matplotlib is *Path*. Almost all vector drawing makes use of *Path*s somewhere in the drawing pipeline.

Whilst a *Path* instance itself cannot be drawn, some *Artist* subclasses, such as *PathPatch* and *PathCollection*, can be used for convenient *Path* visualisation.

class matplotlib.path.Path(*vertices*, *codes=None*, *_interpolation_steps=1*, *closed=False*, *readonly=False*)

Bases: object

A series of possibly disconnected, possibly closed, line and curve segments.

The underlying storage is made up of two parallel numpy arrays:

- *vertices*: an Nx2 float array of vertices
- *codes*: an N-length uint8 array of vertex types, or None

These two arrays always have the same length in the first dimension. For example, to represent a cubic curve, you must provide three vertices as well as three codes `CURVE3`.

The code types are:

- `STOP`

  [1 vertex (ignored)] A marker for the end of the entire path (currently not required and ignored)

- `MOVETO`

  [1 vertex] Pick up the pen and move to the given vertex.

- `LINETO`

  [1 vertex] Draw a line from the current position to the given vertex.

- `CURVE3`

  [1 control point, 1 endpoint] Draw a quadratic Bezier curve from the current position, with the given control point, to the given end point.

- `CURVE4`

  [2 control points, 1 endpoint] Draw a cubic Bezier curve from the current position, with the given control points, to the given end point.

- `CLOSEPOLY`

  [1 vertex (ignored)] Draw a line segment to the start point of the current polyline.

If *codes* is None, it is interpreted as a `MOVETO` followed by a series of `LINETO`.

Users of Path objects should not access the vertices and codes arrays directly. Instead, they should use *iter_segments* or *cleaned* to get the vertex/code pairs. This helps, in particular, to consistently handle the case of *codes* being None.

Some behavior of Path objects can be controlled by rcParams. See the rcParams whose keys start with 'path.'.

Note: The vertices and codes arrays should be treated as immutable -- there are a number of optimizations and assumptions made up front in the constructor

that will not change when the data changes.

Create a new path with the given vertices and codes.

Parameters

vertices

[array-like] The `(N, 2)` float array, masked array or sequence of pairs representing the vertices of the path.

If *vertices* contains masked values, they will be converted to NaNs which are then handled correctly by the Agg PathIterator and other consumers of path data, such as *iter_segments()*.

codes

[array-like or None, optional] n-length array integers representing the codes of the path. If not None, codes must be the same length as vertices. If None, *vertices* will be treated as a series of line segments.

_interpolation_steps

[int, optional] Used as a hint to certain projections, such as Polar, that this path should be linearly interpolated immediately before drawing. This attribute is primarily an implementation detail and is not intended for public use.

closed

[bool, optional] If *codes* is None and closed is True, vertices will be treated as line segments of a closed polygon. Note that the last vertex will then be ignored (as the corresponding code will be set to CLOSEPOLY).

readonly

[bool, optional] Makes the path behave in an immutable way and sets the vertices and codes as read-only arrays.

`CLOSEPOLY = 79`

`CURVE3 = 3`

`CURVE4 = 4`

`LINETO = 2`

`MOVETO = 1`

`NUM_VERTICES_FOR_CODE = {0: 1, 1: 1, 2: 1, 3: 2, 4: 3, 79: 1}`
A dictionary mapping Path codes to the number of vertices that the code expects.

`STOP = 0`

`classmethod arc(`*theta1*, *theta2*, *n=None*, *is_wedge=False*`)`
Return the unit circle arc from angles *theta1* to *theta2* (in degrees).

theta2 is unwrapped to produce the shortest arc within 360 degrees. That is, if *theta2* > *theta1* + 360, the arc will be from *theta1* to *theta2* - 360 and not a full circle plus some extra overlap.

If *n* is provided, it is the number of spline segments to make. If *n* is not provided, the number of spline segments is determined based on the delta between *theta1* and *theta2*.

Masionobe, L. 2003. Drawing an elliptical arc using polylines, quadratic or cubic Bezier curves.

`classmethod circle(`*center=0.0, 0.0*, *radius=1.0*, *readonly=False*`)`
Return a *Path* representing a circle of a given radius and center.

Parameters

center

[(float, float), default: (0, 0)] The center of the circle.

radius

[float, default: 1] The radius of the circle.

readonly

[bool] Whether the created path should have the "readonly" argument set when creating the Path instance.

Notes

The circle is approximated using 8 cubic Bezier curves, as described in

Lancaster, Don. Approximating a Circle or an Ellipse Using Four Bezier Cubic Splines.

`cleaned(`*self*, *transform=None*, *remove_nans=False*, *clip=None*, *quantize=<deprecated parameter>*, *simplify=False*, *curves=False*, *stroke_width=1.0*, *snap=False*, *sketch=None*`)`
Return a new Path with vertices and codes cleaned according to the parameters.

See also:

Path.iter_segments

for details of the keyword arguments.

`clip_to_bbox(`*self*, *bbox*, *inside=True*`)`
Clip the path to the given bounding box.

The path must be made up of one or more closed polygons. This algorithm will not behave correctly for unclosed paths.

If *inside* is `True`, clip to the inside of the box, otherwise to the outside of the box.

`code_type`
alias of `numpy.uint8`

`property codes`
The list of codes in the *Path* as a 1-D numpy array. Each code is one of *STOP*, *MOVETO*, *LINETO*, *CURVE3*, *CURVE4* or *CLOSEPOLY*. For codes that correspond to more than one vertex (*CURVE3* and *CURVE4*), that code will be repeated so that the length of `self.vertices` and `self.codes` is always the same.

`contains_path`(*self*, *path*, *transform=None*)
Return whether this (closed) path completely contains the given path.

If *transform* is not `None`, the path will be transformed before checking for containment.

`contains_point`(*self*, *point*, *transform=None*, *radius=0.0*)
Return whether the (closed) path contains the given point.

Parameters

point

[(float, float)] The point (x, y) to check.

transform

[*matplotlib.transforms.Transform*, optional] If not `None`, *point* will be compared to `self` transformed by *transform*; i.e. for a correct check, *transform* should transform the path into the coordinate system of *point*.

radius

[float, default: 0] Add an additional margin on the path in coordinates of *point*. The path is extended tangentially by *radius/2*; i.e. if you would draw the path with a linewidth of *radius*, all points on the line would still be considered to be contained in the area. Conversely, negative values shrink the area: Points on the imaginary line will be considered outside the area.

Returns

bool

`contains_points`(*self*, *points*, *transform=None*, *radius=0.0*)
Return whether the (closed) path contains the given point.

Parameters

points

[(N, 2) array] The points to check. Columns contain x and y values.

transform

[*matplotlib.transforms.Transform*, optional] If not `None`, *points* will be compared to `self` transformed by *transform*; i.e. for a correct check, *transform* should transform the path into the coordinate system of *points*.

radius

[float, default: 0.] Add an additional margin on the path in coordinates of *points*. The path is extended tangentially by *radius/2*; i.e. if you would draw the path with a linewidth of *radius*, all points on the line would still be considered to be contained in the area. Conversely, negative values shrink the area: Points on the imaginary line will be considered outside the area.

Returns

length-N bool array

`copy`(*self*)
Return a shallow copy of the *Path*, which will share the vertices and codes with the source *Path*.

`deepcopy`(*self*, *memo=None*)
Return a deepcopy of the *Path*. The *Path* will not be readonly, even if the source *Path* is.

`get_extents`(*self*, *transform=None*, ***kwargs*)
Get Bbox of the path.

Parameters

transform

[matplotlib.transforms.Transform, optional] Transform to apply to path before computing extents, if any.

****kwargs**

Forwarded to *iter_bezier*.

Returns

matplotlib.transforms.Bbox

The extents of the path Bbox([[xmin, ymin], [xmax, ymax]])

`static hatch`(*hatchpattern*, *density=6*)
Given a hatch specifier, *hatchpattern*, generates a Path that can be used in a repeated hatching pattern. *density* is the number of lines per unit square.

`interpolated`(*self*, *steps*)
Return a new path resampled to length N x steps.

Codes other than LINETO are not handled correctly.

`intersects_bbox`(*self*, *bbox*, *filled=True*)
Return whether this path intersects a given *Bbox*.

If *filled* is True, then this also returns True if the path completely encloses the *Bbox* (i.e., the path is treated as filled).

The bounding box is always considered filled.

`intersects_path`(*self*, *other*, *filled=True*)
Return whether if this path intersects another given path.

If *filled* is True, then this also returns True if one path completely encloses the other (i.e., the paths are treated as filled).

`iter_bezier`(*self*, ***kwargs*)
Iterate over each bezier curve (lines included) in a Path.

Parameters

****kwargs**

Forwarded to *iter_segments*.

Yields

B

[matplotlib.bezier.BezierSegment] The bezier curves that make up the current path. Note in particular that freestanding points are bezier curves of order 0, and lines are bezier curves of order 1 (with two control points).

code

[Path.code_type] The code describing what kind of curve is being returned. Path.MOVETO, Path.LINETO, Path.CURVE3, Path.CURVE4 correspond to bezier curves with 1, 2, 3, and 4 control points (respectively). Path.CLOSEPOLY is a Path.LINETO with the control points correctly chosen based on the start/end points of the current stroke.

`iter_segments`(*self*, *transform=None*, *remove_nans=True*, *clip=None*, *snap=False*, *stroke_width=1.0*, *simplify=None*, *curves=True*, *sketch=None*)
Iterate over all curve segments in the path.

Each iteration returns a pair `(vertices, code)`, where `vertices` is a sequence of 1-3 coordinate pairs, and `code` is a *Path* code.

Additionally, this method can provide a number of standard cleanups and conversions to the path.

Parameters

transform

[None or *Transform*] If not None, the given affine transformation will be applied to the path.

remove_nans

[bool, optional] Whether to remove all NaNs from the path and skip over them using MOVETO commands.

clip

[None or (float, float, float, float), optional] If not None, must be a four-tuple (x1, y1, x2, y2) defining a rectangle in which to clip the path.

snap

[None or bool, optional] If True, snap all nodes to pixels; if False, don't snap them. If None, snap if the path contains only segments parallel to the x or y axes, and no more than 1024 of them.

stroke_width

[float, optional] The width of the stroke being drawn (used for path snapping).

simplify

[None or bool, optional] Whether to simplify the path by removing vertices that do not affect its appearance. If None, use the *should_simplify* attribute. See also `rcParams["path.simplify"]` (default: `True`) and `rcParams["path.simplify_threshold"]` (default: `0.111111111111`).

curves

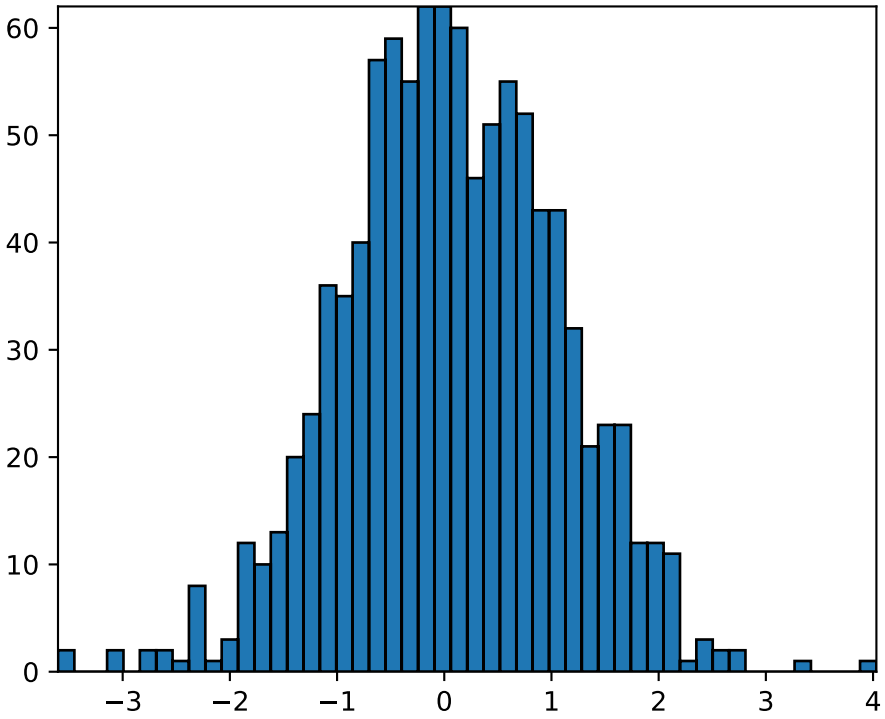
[bool, optional] If True, curve segments will be returned as curve segments. If False, all curves will be converted to line segments.

sketch

[None or sequence, optional] If not None, must be a 3-tuple of the form (scale, length, randomness), representing the sketch parameters.

classmethod **make_compound_path**(**args*)
: Make a compound path from a list of Path objects. Blindly removes all Path.STOP control points.

classmethod **make_compound_path_from_polys**(*XY*)
: Make a compound path object to draw a number of polygons with equal numbers of sides XY is a (numpolys x numsides x 2) numpy array of vertices. Return object is a *Path*



property **readonly**
: `True` if the *Path* is read-only.

property **should_simplify**
: `True` if the vertices array should be simplified.

property **simplify_threshold**
: The fraction of a pixel difference below which vertices will be simplified out.

to_polygons(*self*, *transform=None*, *width=0*, *height=0*, *closed_only=True*)
: Convert this path to a list of polygons or polylines. Each polygon/polyline is an Nx2 array of vertices. In other words, each polygon has no `MOVETO` instructions or curves. This is useful for displaying in backends that do not support compound paths or Bezier curves.

  If *width* and *height* are both non-zero then the lines will be simplified so that vertices outside of (0, 0), (width, height) will be clipped.

If *closed_only* is `True` (default), only closed polygons, with the last point being the same as the first point, will be returned. Any unclosed polylines in the path will be explicitly closed. If *closed_only* is `False`, any unclosed polygons in the path will be returned as unclosed polygons, and the closed polygons will be returned explicitly closed by setting the last point to the same as the first point.

`transformed`(*self*, *transform*)
Return a transformed copy of the path.

See also:

matplotlib.transforms.TransformedPath

A specialized path class that will cache the transformed result and automatically update when the transform changes.

`classmethod unit_circle`()
Return the readonly *Path* of the unit circle.

For most cases, *Path.circle()* will be what you want.

`classmethod unit_circle_righthalf`()
Return a *Path* of the right half of a unit circle.

See *Path.circle* for the reference on the approximation used.

`classmethod unit_rectangle`()
Return a *Path* instance of the unit rectangle from (0, 0) to (1, 1).

`classmethod unit_regular_asterisk`(*numVertices*)
Return a *Path* for a unit regular asterisk with the given numVertices and radius of 1.0, centered at (0, 0).

`classmethod unit_regular_polygon`(*numVertices*)
Return a *Path* instance for a unit regular polygon with the given *numVertices* such that the circumscribing circle has radius 1.0, centered at (0, 0).

`classmethod unit_regular_star`(*numVertices*, *innerCircle=0.5*)
Return a *Path* for a unit regular star with the given numVertices and radius of 1.0, centered at (0, 0).

`property vertices`
The list of vertices in the *Path* as an Nx2 numpy array.

`classmethod wedge`(*theta1*, *theta2*, *n=None*)
Return the unit circle wedge from angles *theta1* to *theta2* (in degrees).

theta2 is unwrapped to produce the shortest wedge within 360 degrees. That is, if *theta2* > *theta1* + 360, the wedge will be from *theta1* to *theta2* - 360 and not a full circle plus some extra overlap.

If *n* is provided, it is the number of spline segments to make. If *n* is not provided, the number of spline segments is determined based on the delta between *theta1* and *theta2*.

See *Path.arc* for the reference on the approximation used.

matplotlib.path.**get_path_collection_extents**(*master_transform*, *paths*, *transforms*, *offsets*, *offset_transform*)

Given a sequence of *Path*s, *Transform*s objects, and offsets, as found in a *PathCollection*, returns the bounding box that encapsulates all of them.

Parameters

master_transform

[*Transform*] Global transformation applied to all paths.

paths

[list of *Path*]

transforms

[list of *Affine2D*]

offsets

[(N, 2) array-like]

offset_transform

[*Affine2D*] Transform applied to the offsets before offsetting the path.

Notes

The way that *paths*, *transforms* and *offsets* are combined follows the same method as for collections: Each is iterated over independently, so if you have 3 paths, 2 transforms and 1 offset, their combinations are as follows:

(A, A, A), (B, B, A), (C, A, A)

18.37 matplotlib.patheffects

Defines classes for path effects. The path effects are supported in *Text*, *Line2D* and *Patch*.

See also:

Path effects guide

class matplotlib.patheffects.**AbstractPathEffect**(*offset=0.0, 0.0*)

Bases: object

A base class for path effects.

Subclasses should override the `draw_path` method to add effect functionality.

Parameters

offset

[pair of floats] The offset to apply to the path, measured in points.

`draw_path`(*self*, *renderer*, *gc*, *tpath*, *affine*, *rgbFace=None*)
Derived should override this method. The arguments are the same as *matplotlib.backend_bases.RendererBase.draw_path()* except the first argument is a renderer.

`class matplotlib.patheffects.Normal`(*offset=0.0, 0.0*)
Bases: *matplotlib.patheffects.AbstractPathEffect*

The "identity" PathEffect.

The Normal PathEffect's sole purpose is to draw the original artist with no special path effect.

Parameters

offset

[pair of floats] The offset to apply to the path, measured in points.

`class matplotlib.patheffects.PathEffectRenderer`(*path_effects*, *renderer*)
Bases: *matplotlib.backend_bases.RendererBase*

Implements a Renderer which contains another renderer.

This proxy then intercepts draw calls, calling the appropriate *AbstractPathEffect* draw method.

Note: Not all methods have been overridden on this RendererBase subclass. It may be necessary to add further methods to extend the PathEffects capabilities further.

Parameters

path_effects

[iterable of *AbstractPathEffect*] The path effects which this renderer represents.

renderer

[*matplotlib.backend_bases.RendererBase* subclass]

`copy_with_path_effect`(*self*, *path_effects*)

draw_markers(*self*, *gc*, *marker_path*, *marker_trans*, *path*, **args*, ***kwargs*)
Draw a marker at each of the vertices in path.

This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of draw_markers that makes multiple calls to *draw_path()*. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

marker_trans

[*matplotlib.transforms.Transform*] An affine transform applied to the marker.

trans

[*matplotlib.transforms.Transform*] An affine transform applied to the path.

draw_path(*self*, *gc*, *tpath*, *affine*, *rgbFace=None*)
Draw a *Path* instance using the given affine transform.

draw_path_collection(*self*, *gc*, *master_transform*, *paths*, **args*, ***kwargs*)
Draw a collection of paths selecting drawing properties from the lists *facecolors*, *edgecolors*, *linewidths*, *linestyles* and *antialiaseds*. *offsets* is a list of offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied.

offset_position may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of *draw_path_collection()* that makes multiple calls to *draw_path()*. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of *draw_path_collection()* can be made globally.

class matplotlib.patheffects.PathPatchEffect(*offset=0, 0*, ***kwargs*)
Bases: *matplotlib.patheffects.AbstractPathEffect*

Draws a *PathPatch* instance whose Path comes from the original PathEffect artist.

Parameters

offset

[pair of floats] The offset to apply to the path, in points.

****kwargs**

All keyword arguments are passed through to the *PathPatch* constructor. The properties which cannot be overridden are "path", "clip_box" "transform" and "clip_path".

`draw_path`(*self*, *renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Derived should override this method. The arguments are the same as *matplotlib.backend_bases.RendererBase.draw_path()* except the first argument is a renderer.

`class matplotlib.patheffects.SimpleLineShadow`(*offset=2, - 2*, *shadow_color='k'*, *alpha=0.3*, *rho=0.3*, ***kwargs*)

Bases: *matplotlib.patheffects.AbstractPathEffect*

A simple shadow via a line.

Parameters

offset

[pair of floats] The offset to apply to the path, in points.

shadow_color

[color, default: 'black'] The shadow color. A value of `None` takes the original artist's color with a scale factor of *rho*.

alpha

[float, default: 0.3] The alpha transparency of the created shadow patch.

rho

[float, default: 0.3] A scale factor to apply to the rgbFace color if `shadow_rgbFace` is `None`.

****kwargs**

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

`draw_path`(*self*, *renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Overrides the standard draw_path to add the shadow offset and necessary color changes for the shadow.

`class matplotlib.patheffects.SimplePatchShadow`(*offset=2, - 2*, *shadow_rgbFace=None*, *alpha=None*, *rho=0.3*, ***kwargs*)

Bases: *matplotlib.patheffects.AbstractPathEffect*

A simple shadow via a filled patch.

Parameters

offset

[pair of floats] The offset of the shadow in points.

shadow_rgbFace

[color] The shadow color.

alpha

[float, default: 0.3] The alpha transparency of the created shadow patch. http://matplotlib.1069221.n5.nabble.com/path-effects-question-td27630.html

rho

[float, default: 0.3] A scale factor to apply to the rgbFace color if `shadow_rgbFace` is not specified.

****kwargs**

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

`draw_path`(*self*, *renderer*, *gc*, *tpath*, *affine*, *rgbFace*)
Overrides the standard draw_path to add the shadow offset and necessary color changes for the shadow.

`class matplotlib.patheffects.Stroke`(*offset=0, 0*, ***kwargs*)
Bases: *matplotlib.patheffects.AbstractPathEffect*

A line based PathEffect which re-draws a stroke.

The path will be stroked with its gc updated with the given keyword arguments, i.e., the keyword arguments should be valid gc parameter values.

`draw_path`(*self*, *renderer*, *gc*, *tpath*, *affine*, *rgbFace*)
Draw the path with updated gc.

`class matplotlib.patheffects.withSimplePatchShadow`(*offset=2, -2*, *shadow_rgbFace=None*, *alpha=None*, *rho=0.3*, ***kwargs*)
Bases: *matplotlib.patheffects.SimplePatchShadow*

A shortcut PathEffect for applying *SimplePatchShadow* and then drawing the original Artist.

With this class you can use

```
artist.set_path_effects([path_effects.withSimplePatchShadow()])
```

as a shortcut for

```
artist.set_path_effects([path_effects.SimplePatchShadow(),
                         path_effects.Normal()])
```

Parameters

offset

[pair of floats] The offset of the shadow in points.

shadow_rgbFace

[color] The shadow color.

alpha

[float, default: 0.3] The alpha transparency of the created shadow patch. http://matplotlib.1069221.n5.nabble.com/path-effects-question-td27630.html

rho

[float, default: 0.3] A scale factor to apply to the rgbFace color if `shadow_rgbFace` is not specified.

****kwargs**

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

`draw_path`(*self*, *renderer*, *gc*, *tpath*, *affine*, *rgbFace*)
Overrides the standard draw_path to add the shadow offset and necessary color changes for the shadow.

`class matplotlib.patheffects.withStroke`(*offset=0, 0*, ***kwargs*)
Bases: *matplotlib.patheffects.Stroke*

A shortcut PathEffect for applying *Stroke* and then drawing the original Artist.

With this class you can use

```
artist.set_path_effects([path_effects.withStroke()])
```

as a shortcut for

```
artist.set_path_effects([path_effects.Stroke(),
                         path_effects.Normal()])
```

The path will be stroked with its gc updated with the given keyword arguments, i.e., the keyword arguments should be valid gc parameter values.

`draw_path`(*self*, *renderer*, *gc*, *tpath*, *affine*, *rgbFace*)
Draw the path with updated gc.

18.38 matplotlib.pyplot

18.38.1 Pyplot function overview

pyplot	*matplotlib.pyplot* is a state-based interface to matplotlib.

matplotlib.pyplot

matplotlib.pyplot is a state-based interface to matplotlib. It provides a MATLAB-like way of plotting.

pyplot is mainly intended for interactive plots and simple cases of programmatic plot generation:

```
import numpy as np
import matplotlib.pyplot as plt

x = np.arange(0, 5, 0.1)
y = np.sin(x)
plt.plot(x, y)
```

The object-oriented API is recommended for more complex plots.

Functions

acorr(x, *[, data])	Plot the autocorrelation of *x*.
angle_spectrum(x[, Fs, Fc, window, pad_to, ...])	Plot the angle spectrum.
annotate(text, xy, *args, **kwargs)	Annotate the point *xy* with text *text*.
arrow(x, y, dx, dy, **kwargs)	Add an arrow to the axes.
autoscale([enable, axis, tight])	Autoscale the axis view to the data (toggle).
autumn()	Set the colormap to "autumn".
axes([arg])	Add an axes to the current figure and make it the current axes.
axhline([y, xmin, xmax])	Add a horizontal line across the axis.
axhspan(ymin, ymax[, xmin, xmax])	Add a horizontal span (rectangle) across the axis.
axis(*args[, emit])	Convenience method to get or set some axis properties.
axline(xy1[, xy2, slope])	Add an infinitely long straight line.
axvline([x, ymin, ymax])	Add a vertical line across the axes.

continues on next page

Table 179 – continued from previous page

axvspan(xmin, xmax[, ymin, ymax])	Add a vertical span (rectangle) across the axes.
bar(x, height[, width, bottom, align, data])	Make a bar plot.
barbs(*args[, data])	Plot a 2D field of barbs.
barh(y, width[, height, left, align])	Make a horizontal bar plot.
bone()	Set the colormap to "bone".
box([on])	Turn the axes box on or off on the current axes.
boxplot(x[, notch, sym, vert, whis, ...])	Make a box and whisker plot.
broken_barh(xranges, yrange, *[, data])	Plot a horizontal sequence of rectangles.
cla()	Clear the current axes.
clabel(CS[, levels])	Label a contour plot.
clf()	Clear the current figure.
clim([vmin, vmax])	Set the color limits of the current image.
close([fig])	Close a figure window.
cohere(x, y[, NFFT, Fs, Fc, detrend, ...])	Plot the coherence between *x* and *y*.
colorbar([mappable, cax, ax])	Add a colorbar to a plot.
connect(s, func)	Bind function *func* to event *s*.
contour(*args[, data])	Plot contours.
contourf(*args[, data])	Plot contours.
cool()	Set the colormap to "cool".
copper()	Set the colormap to "copper".
csd(x, y[, NFFT, Fs, Fc, detrend, window, ...])	Plot the cross-spectral density.
delaxes([ax])	Remove an *Axes* (defaulting to the current axes) from its figure.
disconnect(cid)	Disconnect the callback with id *cid*.
draw()	Redraw the current figure.
draw_if_interactive()	
errorbar(x, y[, yerr, xerr, fmt, ecolor, ...])	Plot y versus x as lines and/or markers with attached errorbars.
eventplot(positions[, orientation, ...])	Plot identical parallel lines at the given positions.
figimage(X[, xo, yo, alpha, norm, cmap, ...])	Add a non-resampled image to the figure.
figlegend(*args, **kwargs)	Place a legend on the figure.
fignum_exists(num)	Return whether the figure with the given id exists.
figtext(x, y, s[, fontdict])	Add text to figure.
figure([num, figsize, dpi, facecolor, ...])	Create a new figure, or activate an existing figure.
fill(*args[, data])	Plot filled polygons.
fill_between(x, y1[, y2, where, ...])	Fill the area between two horizontal curves.

continues on next page

Table 179 – continued from previous page

fill_betweenx(y, x1[, x2, where, step, ...])	Fill the area between two vertical curves.
findobj([o, match, include_self])	Find artist objects.
flag()	Set the colormap to "flag".
gca(**kwargs)	Get the current axes, creating one if necessary.
gcf()	Get the current figure.
gci()	Get the current colorable artist.
get(obj, *args, **kwargs)	Return the value of an object's *property*, or print all of them.
get_current_fig_manager()	Return the figure manager of the current figure.
get_figlabels()	Return a list of existing figure labels.
get_fignums()	Return a list of existing figure numbers.
get_plot_commands()	Get a sorted list of all of the plotting commands.
getp(obj, *args, **kwargs)	Return the value of an object's *property*, or print all of them.
ginput([n, timeout, show_clicks, mouse_add, ...])	Blocking call to interact with a figure.
gray()	Set the colormap to "gray".
grid([b, which, axis])	Configure the grid lines.
hexbin(x, y[, C, gridsize, bins, xscale, ...])	Make a 2D hexagonal binning plot of points *x*, *y*.
hist(x[, bins, range, density, weights, ...])	Plot a histogram.
hist2d(x, y[, bins, range, density, ...])	Make a 2D histogram plot.
hlines(y, xmin, xmax[, colors, linestyles, ...])	Plot horizontal lines at each *y* from *xmin* to *xmax*.
hot()	Set the colormap to "hot".
hsv()	Set the colormap to "hsv".
imread(fname[, format])	Read an image from a file into an array.
imsave(fname, arr, **kwargs)	Save an array as an image file.
imshow(X[, cmap, norm, aspect, ...])	Display data as an image, i.e., on a 2D regular raster.
inferno()	Set the colormap to "inferno".
install_repl_displayhook()	Install a repl display hook so that any stale figure are automatically redrawn when control is returned to the repl.
ioff()	Turn the interactive mode off.
ion()	Turn the interactive mode on.
isinteractive()	Return if pyplot is in "interactive mode" or not.
jet()	Set the colormap to "jet".
legend(*args, **kwargs)	Place a legend on the axes.

continues on next page

Table 179 – continued from previous page

locator_params([axis, tight])	Control behavior of major tick locators.
loglog(*args, **kwargs)	Make a plot with log scaling on both the x and y axis.
magma()	Set the colormap to "magma".
magnitude_spectrum(x[, Fs, Fc, window, ...])	Plot the magnitude spectrum.
margins(*margins[, x, y, tight])	Set or retrieve autoscaling margins.
matshow(A[, fignum])	Display an array as a matrix in a new figure window.
minorticks_off()	Remove minor ticks from the axes.
minorticks_on()	Display minor ticks on the axes.
new_figure_manager(num, *args, **kwargs)	Create a new figure manager instance.
nipy_spectral()	Set the colormap to "nipy_spectral".
pause(interval)	Run the GUI event loop for *interval* seconds.
pcolor(*args[, shading, alpha, norm, cmap, ...])	Create a pseudocolor plot with a non-regular rectangular grid.
pcolormesh(*args[, alpha, norm, cmap, vmin, ...])	Create a pseudocolor plot with a non-regular rectangular grid.
phase_spectrum(x[, Fs, Fc, window, pad_to, ...])	Plot the phase spectrum.
pie(x[, explode, labels, colors, autopct, ...])	Plot a pie chart.
pink()	Set the colormap to "pink".
plasma()	Set the colormap to "plasma".
plot(*args[, scalex, scaley, data])	Plot y versus x as lines and/or markers.
plot_date(x, y[, fmt, tz, xdate, ydate, data])	Plot data that contains dates.
polar(*args, **kwargs)	Make a polar plot.
prism()	Set the colormap to "prism".
psd(x[, NFFT, Fs, Fc, detrend, window, ...])	Plot the power spectral density.
quiver(*args[, data])	Plot a 2D field of arrows.
quiverkey(Q, X, Y, U, label, **kw)	Add a key to a quiver plot.
rc(group, **kwargs)	Set the current *rcParams*.
rc_context([rc, fname])	Return a context manager for temporarily changing rcParams.
rcdefaults()	Restore the *rcParams* from Matplotlib's internal default style.
rgrids([radii, labels, angle, fmt])	Get or set the radial gridlines on the current polar plot.
savefig(*args, **kwargs)	Save the current figure.
sca(ax)	Set the current Axes to *ax* and the current Figure to the parent of *ax*.

continues on next page

Table 179 – continued from previous page

scatter(x, y[, s, c, marker, cmap, norm, ...])	A scatter plot of *y* vs.
sci(im)	Set the current image.
semilogx(*args, **kwargs)	Make a plot with log scaling on the x axis.
semilogy(*args, **kwargs)	Make a plot with log scaling on the y axis.
set_cmap(cmap)	Set the default colormap, and applies it to the current image if any.
setp(obj, *args, **kwargs)	Set a property on an artist object.
show(*[, block])	Display all open figures.
specgram(x[, NFFT, Fs, Fc, detrend, window, ...])	Plot a spectrogram.
spring()	Set the colormap to "spring".
spy(Z[, precision, marker, markersize, ...])	Plot the sparsity pattern of a 2D array.
stackplot(x, *args[, labels, colors, ...])	Draw a stacked area plot.
stem(*args[, linefmt, markerfmt, basefmt, ...])	Create a stem plot.
step(x, y, *args[, where, data])	Make a step plot.
streamplot(x, y, u, v[, density, linewidth, ...])	Draw streamlines of a vector flow.
subplot(*args, **kwargs)	Add a subplot to the current figure.
subplot2grid(shape, loc[, rowspan, colspan, fig])	Create a subplot at a specific location inside a regular grid.
subplot_mosaic(layout, *[, subplot_kw, ...])	Build a layout of Axes based on ASCII art or nested lists.
subplot_tool([targetfig])	Launch a subplot tool window for a figure.
subplots([nrows, ncols, sharex, sharey, ...])	Create a figure and a set of subplots.
subplots_adjust([left, bottom, right, top, ...])	Adjust the subplot layout parameters.
summer()	Set the colormap to "summer".
suptitle(t, **kwargs)	Add a centered title to the figure.
switch_backend(newbackend)	Close all open figures and set the Matplotlib backend.
table([cellText, cellColours, cellLoc, ...])	Add a table to an *Axes*.
text(x, y, s[, fontdict])	Add text to the axes.
thetagrids([angles, labels, fmt])	Get or set the theta gridlines on the current polar plot.
tick_params([axis])	Change the appearance of ticks, tick labels, and gridlines.
ticklabel_format(*[, axis, style, ...])	Configure the *ScalarFormatter* used by default for linear axes.

continues on next page

Table 179 – continued from previous page

tight_layout(*[, pad, h_pad, w_pad, rect])	Adjust the padding between and around subplots.
title(label[, fontdict, loc, pad, y])	Set a title for the axes.
tricontour(*args, **kwargs)	Draw contour lines on an unstructured triangular grid.
tricontourf(*args, **kwargs)	Draw contour regions on an unstructured triangular grid.
tripcolor(*args[, alpha, norm, cmap, vmin, ...])	Create a pseudocolor plot of an unstructured triangular grid.
triplot(*args, **kwargs)	Draw a unstructured triangular grid as lines and/or markers.
twinx([ax])	Make and return a second axes that shares the *x*-axis.
twiny([ax])	Make and return a second axes that shares the *y*-axis.
uninstall_repl_displayhook()	Uninstall the matplotlib display hook.
violinplot(dataset[, positions, vert, ...])	Make a violin plot.
viridis()	Set the colormap to "viridis".
vlines(x, ymin, ymax[, colors, linestyles, ...])	Plot vertical lines.
waitforbuttonpress([timeout])	Blocking call to interact with the figure.
winter()	Set the colormap to "winter".
xcorr(x, y[, normed, detrend, usevlines, ...])	Plot the cross correlation between *x* and *y*.
xkcd([scale, length, randomness])	Turn on xkcd sketch-style drawing mode.This will only have effect on things drawn after this function is called..
xlabel(xlabel[, fontdict, labelpad, loc])	Set the label for the x-axis.
xlim(*args, **kwargs)	Get or set the x limits of the current axes.
xscale(value, **kwargs)	Set the x-axis scale.
xticks([ticks, labels])	Get or set the current tick locations and labels of the x-axis.
ylabel(ylabel[, fontdict, labelpad, loc])	Set the label for the y-axis.
ylim(*args, **kwargs)	Get or set the y-limits of the current axes.
yscale(value, **kwargs)	Set the y-axis scale.
yticks([ticks, labels])	Get or set the current tick locations and labels of the y-axis.

matplotlib.pyplot.acorr

matplotlib.pyplot.acorr(*x*, *, *data=None*, ***kwargs*)

Plot the autocorrelation of *x*.

Parameters

x

[array-like]

detrend

[callable, default: *mlab.detrend_none* (no detrending)] A detrending function applied to *x*. It must have the signature

```
detrend(x: np.ndarray) -> np.ndarray
```

normed

[bool, default: True] If `True`, input vectors are normalised to unit length.

usevlines

[bool, default: True] Determines the plot style.

If `True`, vertical lines are plotted from 0 to the acorr value using *Axes.vlines*. Additionally, a horizontal line is plotted at y=0 using *Axes.axhline*.

If `False`, markers are plotted at the acorr values using *Axes.plot*.

maxlags

[int, default: 10] Number of lags to show. If `None`, will return all `2 * len(x) - 1` lags.

Returns

lags

[array (length `2*maxlags+1`)] The lag vector.

c

[array (length `2*maxlags+1`)] The auto correlation vector.

line

[*LineCollection* or *Line2D*] *Artist* added to the axes of the correlation:

- *LineCollection* if *usevlines* is True.
- *Line2D* if *usevlines* is False.

b

[*Line2D* or None] Horizontal line at 0 if *usevlines* is True None *usevlines* is False.

Other Parameters

linestyle

[*Line2D* property, optional] The linestyle for plotting the data points. Only used if *usevlines* is `False`.

marker

[str, default: 'o'] The marker for plotting the data points. Only used if *usevlines* is `False`.

****kwargs**

Additional parameters are passed to *Axes.vlines* and *Axes.axhline* if *usevlines* is `True`; otherwise they are passed to *Axes.plot*.

Notes

The cross correlation is performed with `numpy.correlate` with `mode = "full"`.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.acorr`

- sphx_glr_gallery_lines_bars_and_markers_xcorr_acorr_demo.py

matplotlib.pyplot.angle_spectrum

matplotlib.pyplot.**angle_spectrum**(*x*, *Fs=None*, *Fc=None*, *window=None*, *pad_to=None*, *sides=None*, *, *data=None*, ***kwargs*)

Plot the angle spectrum.

Compute the angle spectrum (wrapped phase spectrum) of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data.

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

spectrum

[1-D array] The values for the angle spectrum in radians (real valued).

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

line

[*Line2D*] The line created by this function.

Other Parameters

****kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color

Table 180 – continued from previous page

Property	Description
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also:

magnitude_spectrum

Plots the magnitudes of the corresponding frequencies.

phase_spectrum

Plots the unwrapped version of this function.

specgram

Can plot the angle spectrum of segments within the signal in a colormap.

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.angle_spectrum`

matplotlib.pyplot.annotate

`matplotlib.pyplot.`**`annotate`**(*text*, *xy*, **args*, ***kwargs*)

Annotate the point *xy* with text *text*.

In the simplest form, the text is placed at *xy*.

Optionally, the text can be displayed in another position *xytext*. An arrow pointing from the text to the annotated point *xy* can then be added by defining *arrowprops*.

Parameters

text

[str] The text of the annotation. *s* is a deprecated synonym for this parameter.

xy

[(float, float)] The point *(x, y)* to annotate. The coordinate system is determined by *xycoords*.

xytext

[(float, float), default: *xy*] The position *(x, y)* to place the text at. The coordinate system is determined by *textcoords*.

xycoords

[str or *Artist* or *Transform* or callable or (float, float), default: 'data'] The coordinate system that *xy* is given in. The following types of values are supported:

- One of the following strings:

Value	Description
'figure points'	Points from the lower left of the figure
'figure pixels'	Pixels from the lower left of the figure
'figure fraction'	Fraction of figure from lower left
'axes points'	Points from lower left corner of axes
'axes pixels'	Pixels from lower left corner of axes
'axes fraction'	Fraction of axes from lower left
'data'	Use the coordinate system of the object being annotated (default)
'polar'	*(theta, r)* if not native 'data' coordinates

- An *Artist*: *xy* is interpreted as a fraction of the artist's *Bbox*. E.g. *(0, 0)* would be the lower left corner of the bounding box and *(0.5, 1)* would be the center top of the bounding box.
- A *Transform* to transform *xy* to screen coordinates.
- A function with one of the following signatures:

```
def transform(renderer) -> Bbox
def transform(renderer) -> Transform
```

  where *renderer* is a *RendererBase* subclass.

  The result of the function is interpreted like the *Artist* and *Transform* cases above.

- A tuple *(xcoords, ycoords)* specifying separate coordinate systems for *x* and *y*. *xcoords* and *ycoords* must each be of one of the above described types.

See *Advanced Annotations* for more details.

textcoords

[str or *Artist* or *Transform* or callable or (float, float), default: value of *xycoords*] The coordinate system that *xytext* is given in.

All *xycoords* values are valid as well as the following strings:

Value	Description
'offset points'	Offset (in points) from the *xy* value
'offset pixels'	Offset (in pixels) from the *xy* value

arrowprops

[dict, optional] The properties used to draw a *FancyArrowPatch* arrow between the positions *xy* and *xytext*.

If *arrowprops* does not contain the key 'arrowstyle' the allowed keys are:

Key	Description
width	The width of the arrow in points
headwidth	The width of the base of the arrow head in points
headlength	The length of the arrow head in points
shrink	Fraction of total length to shrink from both ends
?	Any key to *matplotlib.patches.FancyArrowPatch*

If *arrowprops* contains the key 'arrowstyle' the above keys are forbidden. The allowed values of `'arrowstyle'` are:

Name	Attrs
`'-'`	None
`'->'`	head_length=0.4,head_width=0.2
`'-['`	widthB=1.0,lengthB=0.2,angleB=None
`'|-|'`	widthA=1.0,widthB=1.0
`'-|>'`	head_length=0.4,head_width=0.2
`'<-'`	head_length=0.4,head_width=0.2
`'<->'`	head_length=0.4,head_width=0.2
`'<|-'`	head_length=0.4,head_width=0.2
`'<|-|>'`	head_length=0.4,head_width=0.2
`'fancy'`	head_length=0.4,head_width=0.4,tail_width=0.4
`'simple'`	head_length=0.5,head_width=0.5,tail_width=0.2
`'wedge'`	tail_width=0.3,shrink_factor=0.5

Valid keys for *FancyArrowPatch* are:

Key	Description
arrowstyle	the arrow style
connectionstyle	the connection style
relpos	default is (0.5, 0.5)
patchA	default is bounding box of the text
patchB	default is None
shrinkA	default is 2 points
shrinkB	default is 2 points
mutation_scale	default is text size (in points)
mutation_aspect	default is 1.
?	any key for *matplotlib.patches.PathPatch*

Defaults to None, i.e. no arrow is drawn.

annotation_clip

[bool or None, default: None] Whether to draw the annotation when the annotation point *xy* is outside the axes area.

- If *True*, the annotation will only be drawn when *xy* is within the axes.
- If *False*, the annotation will always be drawn.
- If *None*, the annotation will only be drawn when *xy* is within the axes and *xycoords* is 'data'.

****kwargs**

Additional kwargs are passed to *Text*.

Returns

Annotation

See also:

Advanced Annotations

- *Annotations*

matplotlib.pyplot.arrow

`matplotlib.pyplot.arrow`(*x*, *y*, *dx*, *dy*, ***kwargs*)

Add an arrow to the axes.

This draws an arrow from `(x, y)` to `(x+dx, y+dy)`.

Parameters

x, y

[float] The x and y coordinates of the arrow base.

dx, dy

[float] The length of the arrow along x and y direction.

width: float, default: 0.001

Width of full arrow tail.

length_includes_head: bool, default: False

True if head is to be counted in calculating the length.

head_width: float or None, default: 3*width

Total width of the full arrow head.

head_length: float or None, default: 1.5*head_width

Length of arrow head.

shape: ['full', 'left', 'right'], default: 'full'

Draw the left-half, right-half, or full arrow.

overhang: float, default: 0

Fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

head_starts_at_zero: bool, default: False

If True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

****kwargs**

Patch properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None

Table 181 – continued from previous page

Property	Description
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

Returns

FancyArrow

The created *FancyArrow* object.

Notes

The resulting arrow is affected by the axes aspect ratio and limits. This may produce an arrow whose head is not square with its stem. To create an arrow whose head is square with its stem, use *annotate()* for example:

```
>>> ax.annotate("", xy=(0.5, 0.5), xytext=(0, 0),
...             arrowprops=dict(arrowstyle="->"))
```

Examples using `matplotlib.pyplot.arrow`

- sphx_glr_gallery_text_labels_and_annotations_arrow_demo.py

matplotlib.pyplot.autoscale

matplotlib.pyplot.**autoscale**(*enable=True*, *axis='both'*, *tight=None*)

Autoscale the axis view to the data (toggle).

Convenience method for simple axis view autoscaling. It turns autoscaling on or off, and then, if autoscaling for either axis is on, it performs the autoscaling on the specified axis or axes.

Parameters

enable

[bool or None, default: True] True turns autoscaling on, False turns it off. None leaves the autoscaling state unchanged.

axis

[{'both', 'x', 'y'}, default: 'both'] Which axis to operate on.

tight

[bool or None, default: None] If True, first set the margins to zero. Then, this argument is forwarded to `autoscale_view` (regardless of its value); see the description of its behavior there.

Examples using `matplotlib.pyplot.autoscale`

matplotlib.pyplot.autumn

matplotlib.pyplot.**autumn**()

Set the colormap to "autumn".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.autumn`

matplotlib.pyplot.axes

matplotlib.pyplot.**axes**(*arg=None*, ***kwargs*)

Add an axes to the current figure and make it the current axes.

Call signatures:

```
plt.axes()
plt.axes(rect, projection=None, polar=False, **kwargs)
plt.axes(ax)
```

Parameters

arg

[None or 4-tuple] The exact behavior of this function depends on the type:

- *None*: A new full window axes is added using `subplot(111, **kwargs)`.
- 4-tuple of floats *rect* = `[left, bottom, width, height]`. A new axes is added with dimensions *rect* in normalized (0, 1) units using *add_axes* on the current figure.

projection

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the *Axes*. *str* is the name of a custom projection, see *projections*. The default None results in a 'rectilinear' projection.

polar

[bool, default: False] If True, equivalent to projection='polar'.

sharex, sharey

[*Axes*, optional] Share the x or y *axis* with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

label

[str] A label for the returned axes.

Returns

Axes, or a subclass of *Axes*

The returned axes class depends on the projection used. It is *Axes* if rectilinear projection is used and *projections.polar.PolarAxes* if polar projection is used.

Other Parameters

**kwargs

This method also takes the keyword arguments for the returned axes class. The keyword arguments for the rectilinear axes class *Axes* can be found in the following table but there might also be other keyword arguments if another projection is used, see the actual axes class.

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and r
alpha	float or None
anchor	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
animated	bool
aspect	{'auto'} or num
autoscale_on	bool
autoscalex_on	bool
autoscaley_on	bool
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	None, or a number
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
contains	unknown
facecolor or fc	color
figure	*Figure*
frame_on	bool
gid	str
in_layout	bool
label	object
navigate	bool
navigate_mode	unknown
path_effects	*AbstractPathEffect*
picker	None or bool or callable
position	[left, bottom, width, height] or *Bbox*
prop_cycle	unknown
rasterization_zorder	float or None
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
title	str
transform	*Transform*
url	str
visible	bool
xbound	unknown
xlabel	str
xlim	(bottom: float, top: float)
xmargin	float greater than -0.5
xscale	{"linear", "log", "symlog", "logit", ...}
xticklabels	unknown
xticks	unknown
ybound	unknown

Table 182 – continued from previous page

Property	Description
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	{"linear", "log", "symlog", "logit", ...}
yticklabels	unknown
yticks	unknown
zorder	float

See also:

Figure.add_axes

pyplot.subplot

Figure.add_subplot

Figure.subplots

pyplot.subplots

Notes

If the figure already has a axes with key (*args*, *kwargs*) then it will simply make that axes current and return it. This behavior is deprecated. Meanwhile, if you do not want this behavior (i.e., you want to force the creation of a new axes), you must use a unique set of args and kwargs. The axes *label* attribute has been exposed for this purpose: if you want two axes that are otherwise identical to be added to the figure, make sure you give them unique labels.

Examples

```
# Creating a new full window axes
plt.axes()

# Creating a new axes with specified dimensions and some kwargs
plt.axes((left, bottom, width, height), facecolor='w')
```

Examples using `matplotlib.pyplot.axes`

- sphx_glr_gallery_subplots_axes_and_figures_subplots_adjust.py
- sphx_glr_gallery_text_labels_and_annotations_arrow_simple_demo.py
- sphx_glr_gallery_text_labels_and_annotations_mathtext_examples.py
- sphx_glr_gallery_axes_grid1_make_room_for_ylabel_using_axesgrid.py
- sphx_glr_gallery_event_handling_lasso_demo.py
- sphx_glr_gallery_widgets_buttons.py
- sphx_glr_gallery_widgets_check_buttons.py
- sphx_glr_gallery_widgets_radio_buttons.py
- sphx_glr_gallery_widgets_slider_demo.py

matplotlib.pyplot.axhline

matplotlib.pyplot.**axhline**(*y=0*, *xmin=0*, *xmax=1*, ***kwargs*)

Add a horizontal line across the axis.

Parameters

y

[float, default: 0] y position in data coordinates of the horizontal line.

xmin

[float, default: 0] Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.

xmax

[float, default: 1] Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.

Returns

Line2D

Other Parameters

****kwargs**

Valid keyword arguments are *Line2D* properties, with the exception of 'transform':

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also:

hlines

Add horizontal lines in data coordinates.

axhspan

Add a horizontal span (rectangle) across the axis.

axline

Add a line with an arbitrary slope.

Examples

- draw a thick red hline at 'y' = 0 that spans the xrange:

```
>>> axhline(linewidth=4, color='r')
```

- draw a default hline at 'y' = 1 that spans the xrange:

```
>>> axhline(y=1)
```

- draw a default hline at 'y' = .5 that spans the middle half of the xrange:

```
>>> axhline(y=.5, xmin=0.25, xmax=0.75)
```

Examples using `matplotlib.pyplot.axhline`

- sphx_glr_gallery_text_labels_and_annotations_multiline.py
- sphx_glr_gallery_pyplots_axline.py
- sphx_glr_gallery_color_color_cycle_default.py
- sphx_glr_gallery_misc_zorder_demo.py

matplotlib.pyplot.axhspan

matplotlib.pyplot.**axhspan**(*ymin*, *ymax*, *xmin=0*, *xmax=1*, ***kwargs*)

Add a horizontal span (rectangle) across the axis.

The rectangle spans from *ymin* to *ymax* vertically, and, by default, the whole x-axis horizontally. The x-span can be set using *xmin* (default: 0) and *xmax* (default: 1) which are in axis units; e.g. `xmin = 0.5` always refers to the middle of the x-axis regardless of the limits set by *set_xlim*.

Parameters

ymin

[float] Lower y-coordinate of the span, in data units.

ymax

[float] Upper y-coordinate of the span, in data units.

xmin

[float, default: 0] Lower x-coordinate of the span, in x-axis (0-1) units.

xmax

[float, default: 1] Upper x-coordinate of the span, in x-axis (0-1) units.

Returns

Polygon

Horizontal span (rectangle) from (xmin, ymin) to (xmax, ymax).

Other Parameters

****kwargs**

[*Polygon* properties]

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*

zorder	float

See also:

axvspan

Add a vertical span across the axes.

Examples using `matplotlib.pyplot.axhspan`

- sphx_glr_gallery_subplots_axes_and_figures_axhspan_demo.py

matplotlib.pyplot.axis

matplotlib.pyplot.**axis**(**args*, *emit=True*, ***kwargs*)

Convenience method to get or set some axis properties.

Call signatures:

```
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])
xmin, xmax, ymin, ymax = axis(option)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

Parameters

xmin, xmax, ymin, ymax

[float, optional] The axis limits to be set. This can also be achieved using

```
ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
```

option

[bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

Value	Description
'on'	Turn on axis lines and labels. Same as `True`.
'off'	Turn off axis lines and labels. Same as `False`.
'equal'	Set equal scaling (i.e., make circles circular) by changing axis limits. This is the same as `ax.set_aspect('equal', adjustable='datalim')`. Explicit data limits may not be respected in this case.
'scaled'	Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as `ax.set_aspect('equal', adjustable='box', anchor='C')`. Additionally, further autoscaling will be disabled.
'tight'	Set limits just large enough to show all data, then disable further autoscaling.
'auto'	Automatic scaling (fill plot box with data).
'image'	'scaled' with axis limits equal to data limits.
'square'	Square plot; similar to 'scaled', but initially forcing `xmax-xmin == ymax-ymin`.

emit

[bool, default: True] Whether observers are notified of the axis limit change. This option is passed on to *set_xlim* and *set_ylim*.

Returns

xmin, xmax, ymin, ymax

[float] The axis limits.

See also:

matplotlib.axes.Axes.set_xlim

matplotlib.axes.Axes.set_ylim

- sphx_glr_gallery_shapes_and_collections_artist_reference.py
- *Pyplot tutorial*

matplotlib.pyplot.axline

matplotlib.pyplot.**axline**(*xy1*, *xy2=None*, *, *slope=None*, ***kwargs*)

Add an infinitely long straight line.

The line can be defined either by two points *xy1* and *xy2*, or by one point *xy1* and a *slope*.

This draws a straight line "on the screen", regardless of the x and y scales, and is thus also suitable for drawing exponential decays in semilog plots, power laws in loglog plots, etc. However, *slope* should only be used with linear scales; It has no clear meaning for all other scales, and thus the behavior is undefined. Please specify the line using the points *xy1*, *xy2* for non-linear scales.

Parameters

xy1, xy2

[(float, float)] Points for the line to pass through. Either *xy2* or *slope* has to be given.

slope

[float, optional] The slope of the line. Either *xy2* or *slope* has to be given.

Returns

Line2D

Other Parameters

****kwargs**

Valid kwargs are *Line2D* properties, with the exception of 'transform':

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}

Table 185 – continued from previous page

Property	Description
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*

See also:

axhline

for horizontal lines

axvline

for vertical lines

Examples

Draw a thick red line passing through (0, 0) and (1, 1):

```
>>> axline((0, 0), (1, 1), linewidth=4, color='r')
```

Examples using `matplotlib.pyplot.axline`

- sphx_glr_gallery_pyplots_axline.py

matplotlib.pyplot.axvline

`matplotlib.pyplot.axvline`(*x=0*, *ymin=0*, *ymax=1*, ***kwargs*)

Add a vertical line across the axes.

Parameters

x

[float, default: 0] x position in data coordinates of the vertical line.

ymin

[float, default: 0] Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

ymax

[float, default: 1] Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

Returns

Line2D

Other Parameters

****kwargs**

Valid keyword arguments are *Line2D* properties, with the exception of 'transform':

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool

Table 186 – continued from previous page

Property	Description
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also:

vlines

Add vertical lines in data coordinates.

axvspan

Add a vertical span (rectangle) across the axis.

axline

Add a line with an arbitrary slope.

Examples

- draw a thick red vline at $x = 0$ that spans the yrange:

```
>>> axvline(linewidth=4, color='r')
```

- draw a default vline at $x = 1$ that spans the yrange:

```
>>> axvline(x=1)
```

- draw a default vline at $x = .5$ that spans the middle half of the yrange:

```
>>> axvline(x=.5, ymin=0.25, ymax=0.75)
```

Examples using `matplotlib.pyplot.axvline`

- sphx_glr_gallery_pyplots_axline.py
- sphx_glr_gallery_color_color_cycle_default.py

matplotlib.pyplot.axvspan

`matplotlib.pyplot.`**`axvspan`**(*xmin*, *xmax*, *ymin=0*, *ymax=1*, ***kwargs*)

Add a vertical span (rectangle) across the axes.

The rectangle spans from *xmin* to *xmax* horizontally, and, by default, the whole y-axis vertically. The y-span can be set using *ymin* (default: 0) and *ymax* (default: 1) which are in axis units; e.g. `ymin = 0.5` always refers to the middle of the y-axis regardless of the limits set by *set_ylim*.

Parameters

xmin

[float] Lower x-coordinate of the span, in data units.

xmax

[float] Upper x-coordinate of the span, in data units.

ymin

[float, default: 0] Lower y-coordinate of the span, in y-axis units (0-1).

ymax

[float, default: 1] Upper y-coordinate of the span, in y-axis units (0-1).

Returns

Polygon

Vertical span (rectangle) from (xmin, ymin) to (xmax, ymax).

Other Parameters

****kwargs**

[*Polygon* properties]

%(Polygon)s

See also:

axhspan

Add a horizontal span across the axes.

Examples

Draw a vertical, green, translucent rectangle from x = 1.25 to x = 1.55 that spans the yrange of the axes.

```
>>> axvspan(1.25, 1.55, facecolor='g', alpha=0.5)
```

Examples using `matplotlib.pyplot.axvspan`

- sphx_glr_gallery_subplots_axes_and_figures_axhspan_demo.py

matplotlib.pyplot.bar

matplotlib.pyplot.**bar**(*x*, *height*, *width=0.8*, *bottom=None*, ***, *align='center'*, *data=None*, ***kwargs*)

Make a bar plot.

The bars are positioned at *x* with the given *align*ment. Their dimensions are given by *height* and *width*. The vertical baseline is *bottom* (default 0).

Many parameters can take either a single value applying to all bars or a sequence of values, one for each bar.

Parameters

x

[float or array-like] The x coordinates of the bars. See also *align* for the alignment of the bars to the coordinates.

height

[float or array-like] The height(s) of the bars.

width

[float or array-like, default: 0.8] The width(s) of the bars.

bottom

[float or array-like, default: 0] The y coordinate(s) of the bars bases.

align

[{'center', 'edge'}, default: 'center'] Alignment of the bars to the *x* coordinates:

- 'center': Center the base on the *x* positions.
- 'edge': Align the left edges of the bars with the *x* positions.

To align the bars on the right edge pass a negative *width* and `align='edge'`.

Returns

BarContainer

Container with all the bars and optionally errorbars.

Other Parameters

color

[color or list of color, optional] The colors of the bar faces.

edgecolor

[color or list of color, optional] The colors of the bar edges.

linewidth

[float or array-like, optional] Width of the bar edge(s). If 0, don't draw edges.

tick_label

[str or list of str, optional] The tick labels of the bars. Default: None (Use default numeric labels.)

xerr, yerr

[float or array-like of shape(N,) or shape(2, N), optional] If not *None*, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:

- scalar: symmetric +/- values for all bars
- shape(N,): symmetric +/- values for each bar
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- *None*: No errorbar. (Default)

See /gallery/statistics/errorbar_features for an example on the usage of `xerr` and `yerr`.

ecolor

[color or list of color, default: 'black'] The line color of the errorbars.

capsize

[float, default: `rcParams["errorbar.capsize"]` (default: `0.0`)] The length of the error bar caps in points.

error_kw

[dict, optional] Dictionary of kwargs to be passed to the *errorbar* method. Values of *ecolor* or *capsize* defined here take precedence over the independent kwargs.

log

[bool, default: False] If *True*, set the y-axis to be log scale.

****kwargs**

[*Rectangle* properties]

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown

See also:

barh

Plot a horizontal bar plot.

Notes

Stacked bars can be achieved by passing individual *bottom* values per bar. See /gallery/lines_bars_and_markers/bar_stacked.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.bar`

- sphx_glr_gallery_lines_bars_and_markers_barchart.py
- sphx_glr_gallery_statistics_barchart_demo.py
- sphx_glr_gallery_pie_and_polar_charts_nested_pie.py
- sphx_glr_gallery_pie_and_polar_charts_polar_bar.py
- sphx_glr_gallery_shapes_and_collections_hatch_demo.py
- sphx_glr_gallery_misc_table_demo.py
- *Pyplot tutorial*
- *Sample plots in Matplotlib*

matplotlib.pyplot.barbs

matplotlib.pyplot.**barbs**(**args*, *data=None*, ***kw*)

Plot a 2D field of barbs.

Call signature:

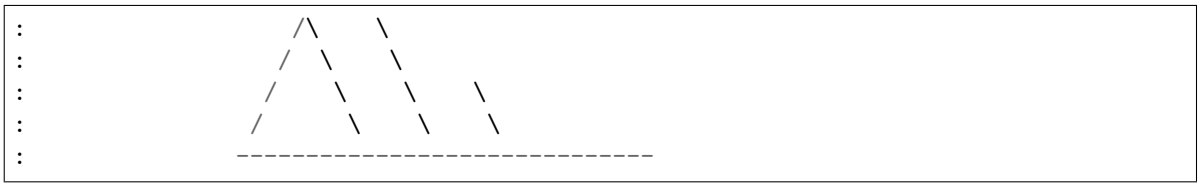
```
barbs([X, Y], U, V, [C], **kw)
```

Where X, Y define the barb locations, U, V define the barb directions, and C optionally sets the color.

All arguments may be 1D or 2D. U, V, C may be masked arrays, but masked X, Y are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by

the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as show schematically below:



The largest increment is given by a triangle (or "flag"). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

See also https://en.wikipedia.org/wiki/Wind_barb.

Parameters

X, Y

[1D or 2D array-like, optional] The x and y coordinates of the barb locations. See *pivot* for how the barbs are drawn to the x, y positions.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If *X* and *Y* are 1D but *U*, *V* are 2D, *X*, *Y* are expanded to 2D using `X, Y = np.meshgrid(X, Y)`. In this case `len(X)` and `len(Y)` must match the column and row dimensions of *U* and *V*.

U, V

[1D or 2D array-like] The x and y components of the barb shaft.

C

[1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *barbcolor* instead.

length

[float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

pivot

[{'tip', 'middle'} or float, default: 'tip'] The part of the arrow that is anchored to the *X*, *Y* grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

barbcolor

[color or color sequence] The color of all parts of the barb except for the flags. This parameter is analogous to the *edgecolor* parameter for polygons, which can be used instead. However this parameter will override facecolor.

flagcolor

[color or color sequence] The color of any flags on the barb. This parameter is analogous to the *facecolor* parameter for polygons, which can be used instead. However, this parameter will override facecolor. If this is not set (and *C* has not either) then *flagcolor* will be set to match *barbcolor* so that the barb has a uniform color. If *C* has been set, *flagcolor* has no effect.

sizes

[dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- 'spacing' - space between features (flags, full/half barbs)
- 'height' - height (distance from shaft to top) of a flag or full barb
- 'width' - width of a flag, twice the width of a full barb
- 'emptybarb' - radius of the circle used for low magnitudes

fill_empty

[bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

rounding

[bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.

barb_increments

[dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.

- 'half' - half barbs (Default is 5)
- 'full' - full barbs (Default is 10)
- 'flag' - flags (default is 50)

flip_barb

[bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).

A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as *U* and *V*.

Returns

barbs

[*Barbs*]

Other Parameters

****kwargs**

The barbs can further be customized using *PolyCollection* keyword arguments:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	ndarray
capstyle	{'butt', 'round', 'projecting'}
clim	(vmin: float, vmax: float)
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of rgba tuples
contains	unknown
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}

Table 188 – continued from previous page

Property	Description
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
norm	*Normalize* or None
offset_position	unknown
offsets	array-like (N, 2) or (2,)
path_effects	*AbstractPathEffect*
picker	None or bool or callable
pickradius	unknown
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.barbs`

- sphx_glr_gallery_images_contours_and_fields_barb_demo.py

matplotlib.pyplot.barh

matplotlib.pyplot.**barh**(*y*, *width*, *height=0.8*, *left=None*, *, *align='center'*, ***kwargs*)

Make a horizontal bar plot.

The bars are positioned at *y* with the given *align*ment. Their dimensions are given by *width* and *height*. The horizontal baseline is *left* (default 0).

Many parameters can take either a single value applying to all bars or a sequence of values, one for each bar.

Parameters

y

[float or array-like] The y coordinates of the bars. See also *align* for the alignment of the bars to the coordinates.

width

[float or array-like] The width(s) of the bars.

height

[float or array-like, default: 0.8] The heights of the bars.

left

[float or array-like, default: 0] The x coordinates of the left sides of the bars.

align

[{'center', 'edge'}, default: 'center'] Alignment of the base to the *y* coordinates*:

- 'center': Center the bars on the *y* positions.
- 'edge': Align the bottom edges of the bars with the *y* positions.

To align the bars on the top edge pass a negative *height* and `align='edge'`.

Returns

BarContainer

Container with all the bars and optionally errorbars.

Other Parameters

color

[color or list of color, optional] The colors of the bar faces.

edgecolor

[color or list of color, optional] The colors of the bar edges.

linewidth

[float or array-like, optional] Width of the bar edge(s). If 0, don't draw edges.

tick_label

[str or list of str, optional] The tick labels of the bars. Default: None (Use default numeric labels.)

xerr, yerr

[float or array-like of shape(N,) or shape(2, N), optional] If not `None`, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:

- scalar: symmetric +/- values for all bars
- shape(N,): symmetric +/- values for each bar
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- *None*: No errorbar. (default)

See /gallery/statistics/errorbar_features for an example on the usage of `xerr` and `yerr`.

ecolor

[color or list of color, default: 'black'] The line color of the errorbars.

capsize

[float, default: `rcParams["errorbar.capsize"]` (default: `0.0`)] The length of the error bar caps in points.

error_kw

[dict, optional] Dictionary of kwargs to be passed to the *errorbar* method. Values of *ecolor* or *capsize* defined here take precedence over the independent kwargs.

log

[bool, default: False] If `True`, set the x-axis to be log scale.

****kwargs**

[*Rectangle* properties]

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None

See also:

bar

Plot a vertical bar plot.

Notes

Stacked bars can be achieved by passing individual *left* values per bar. See /gallery/lines_bars_and_markers/horizontal_barchart_distribution .

Examples using `matplotlib.pyplot.barh`

- sphx_glr_gallery_lines_bars_and_markers_horizontal_barchart_distribution.py

matplotlib.pyplot.bone

`matplotlib.pyplot.bone()`
Set the colormap to "bone".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.bone`

matplotlib.pyplot.box

`matplotlib.pyplot.box(`*on=None*`)`
Turn the axes box on or off on the current axes.

Parameters

on

[bool or None] The new *Axes* box state. If `None`, toggle the state.

See also:

matplotlib.axes.Axes.set_frame_on()

matplotlib.axes.Axes.get_frame_on()

Examples using `matplotlib.pyplot.box`

matplotlib.pyplot.boxplot

matplotlib.pyplot.**boxplot**(*x*, *notch=None*, *sym=None*, *vert=None*, *whis=None*, *positions=None*, *widths=None*, *patch_artist=None*, *bootstrap=None*, *usermedians=None*, *conf_intervals=None*, *meanline=None*, *showmeans=None*, *showcaps=None*, *showbox=None*, *showfliers=None*, *boxprops=None*, *labels=None*, *flierprops=None*, *medianprops=None*, *meanprops=None*, *capprops=None*, *whiskerprops=None*, *manage_ticks=True*, *autorange=False*, *zorder=None*, ***, *data=None*)

Make a box and whisker plot.

Make a box and whisker plot for each column of *x* or each vector in sequence *x*. The box extends from the lower to upper quartile values of the data, with a line at the median. The whiskers extend from the box to show the range of the data. Flier points are those past the end of the whiskers.

Parameters

x

[Array or a sequence of vectors.] The input data.

notch

[bool, default: False] Whether to draw a noteched box plot (`True`), or a rectangular box plot (`False`). The notches represent the confidence interval (CI) around the median. The documentation for *bootstrap* describes how the locations of the notches are computed.

Note: In cases where the values of the CI are less than the lower quartile or greater than the upper quartile, the notches will extend beyond the box, giving it a distinctive "flipped" appearance. This is expected behavior and consistent with other statistical visualization packages.

---

sym

[str, optional] The default symbol for flier points. An empty string ('') hides the fliers. If `None`, then the fliers default to 'b+'. More control is provided by the *flierprops* parameter.

vert

[bool, default: True] If `True`, draws vertical boxes. If `False`, draw horizontal boxes.

whis

[float or (float, float), default: 1.5] The position of the whiskers.

If a float, the lower whisker is at the lowest datum above `Q1 - whis*(Q3-Q1)`, and the upper whisker at the highest datum below `Q3 + whis*(Q3-Q1)`, where Q1 and Q3 are the first and third quartiles. The default value of `whis = 1.5` corresponds to Tukey's original definition of boxplots.

If a pair of floats, they indicate the percentiles at which to draw the whiskers (e.g., (5, 95)). In particular, setting this to (0, 100) results in whiskers covering the whole range of the data. "range" is a deprecated synonym for (0, 100).

In the edge case where `Q1 == Q3`, *whis* is automatically set to (0, 100) (cover the whole range of the data) if *autorange* is True.

Beyond the whiskers, data are considered outliers and are plotted as individual points.

bootstrap

[int, optional] Specifies whether to bootstrap the confidence intervals around the median for notched boxplots. If *bootstrap* is None, no bootstrapping is performed, and notches are calculated using a Gaussian-based asymptotic approximation (see McGill, R., Tukey, J.W., and Larsen, W.A., 1978, and Kendall and Stuart, 1967). Otherwise, bootstrap specifies the number of times to bootstrap the median to determine its 95% confidence intervals. Values between 1000 and 10000 are recommended.

usermedians

[array-like, optional] A 1D array-like of length `len(x)`. Each entry that is not `None` forces the value of the median for the corresponding dataset. For entries that are `None`, the medians are computed by Matplotlib as normal.

conf_intervals

[array-like, optional] A 2D array-like of shape `(len(x), 2)`. Each entry that is not None forces the location of the corresponding notch (which is only drawn if *notch* is `True`). For entries that are `None`, the notches are computed by the method specified by the other parameters (e.g., *bootstrap*).

positions

[array-like, optional] Sets the positions of the boxes. The ticks and limits are automatically set to match the positions. Defaults to `range(1, N+1)` where N is the number of boxes to be drawn.

widths

[float or array-like] Sets the width of each box either with a scalar or a sequence. The default is 0.5, or `0.15*(distance between`

`extreme positions`), if that is smaller.

patch_artist

[bool, default: False] If `False` produces boxes with the Line2D artist. Otherwise, boxes and drawn with Patch artists.

labels

[sequence, optional] Labels for each dataset (one per dataset).

manage_ticks

[bool, default: True] If True, the tick locations and labels will be adjusted to match the boxplot positions.

autorange

[bool, default: False] When `True` and the data are distributed such that the 25th and 75th percentiles are equal, *whis* is set to (0, 100) such that the whisker ends are at the minimum and maximum of the data.

meanline

[bool, default: False] If `True` (and *showmeans* is `True`), will try to render the mean as a line spanning the full width of the box according to *meanprops* (see below). Not recommended if *shownotches* is also True. Otherwise, means will be shown as points.

zorder

[float, default: `Line2D.zorder = 2`] Sets the zorder of the boxplot.

Returns

dict

A dictionary mapping each component of the boxplot to a list of the *Line2D* instances created. That dictionary has the following keys (assuming vertical boxplots):

- `boxes`: the main body of the boxplot showing the quartiles and the median's confidence intervals if enabled.
- `medians`: horizontal lines at the median of each box.
- `whiskers`: the vertical lines extending to the most extreme, non-outlier data points.
- `caps`: the horizontal lines at the ends of the whiskers.
- `fliers`: points representing data that extend beyond the whiskers (fliers).
- `means`: points or lines representing the means.

Other Parameters

showcaps

[bool, default: True] Show the caps on the ends of whiskers.

showbox

[bool, default: True] Show the central box.

showfliers

[bool, default: True] Show the outliers beyond the caps.

showmeans

[bool, default: False] Show the arithmetic means.

capprops

[dict, default: None] The style of the caps.

boxprops

[dict, default: None] The style of the box.

whiskerprops

[dict, default: None] The style of the whiskers.

flierprops

[dict, default: None] The style of the fliers.

medianprops

[dict, default: None] The style of the median.

meanprops

[dict, default: None] The style of the mean.

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.boxplot`

- sphx_glr_gallery_pyplots_boxplot_demo_pyplot.py

matplotlib.pyplot.broken_barh

matplotlib.pyplot.**broken_barh**(*xranges*, *yrange*, *, *data=None*, ***kwargs*)

Plot a horizontal sequence of rectangles.

A rectangle is drawn for each element of *xranges*. All rectangles have the same vertical position and size defined by *yrange*.

This is a convenience function for instantiating a *BrokenBarHCollection*, adding it to the axes and autoscaling the view.

Parameters

xranges

[sequence of tuples (*xmin*, *xwidth*)] The x-positions and extends of the rectangles. For each tuple (*xmin*, *xwidth*) a rectangle is drawn from *xmin* to *xmin* + *xwidth*.

yrange

[(*ymin*, *yheight*)] The y-position and extend for all the rectangles.

Returns

BrokenBarHCollection

Other Parameters

****kwargs**

[*BrokenBarHCollection* properties] Each *kwarg* can be either a single argument applying to all rectangles, e.g.:

```
facecolors='black'
```

or a sequence of arguments over which is cycled, e.g.:

```
facecolors=('black', 'blue')
```

would create interleaving black and blue rectangles.

Supported keywords:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	ndarray
capstyle	{'butt', 'round', 'projecting'}
clim	(vmin: float, vmax: float)
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of rgba tuples
contains	unknown
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
norm	*Normalize* or None
offset_position	unknown
offsets	array-like (N, 2) or (2,)
path_effects	*AbstractPathEffect*
picker	None or bool or callable
pickradius	unknown
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.broken_barh`

matplotlib.pyplot.cla

`matplotlib.pyplot.cla()`
Clear the current axes.

Examples using `matplotlib.pyplot.cla`

- *Pyplot tutorial*

matplotlib.pyplot.clabel

`matplotlib.pyplot.clabel(`*CS*, *levels=None*, ***kwargs*`)`
Label a contour plot.

Adds labels to line contours in given *ContourSet*.

Parameters

CS

[*ContourSet* instance] Line contours to label.

levels

[array-like, optional] A list of level values, that should be labeled. The list must be a subset of `CS.levels`. If not given, all levels are labeled.

****kwargs**

All other parameters are documented in *clabel*.

Examples using `matplotlib.pyplot.clabel`

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

matplotlib.pyplot.clf

matplotlib.pyplot.**clf**()
Clear the current figure.

Examples using `matplotlib.pyplot.clf`

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

matplotlib.pyplot.clim

matplotlib.pyplot.**clim**(*vmin=None*, *vmax=None*)
Set the color limits of the current image.

If either *vmin* or *vmax* is None, the image min/max respectively will be used for color scaling.

If you want to set the clim of multiple images, use *set_clim* on every image, for example:

```
for im in gca().get_images():
    im.set_clim(0, 0.5)
```

Examples using `matplotlib.pyplot.clim`

matplotlib.pyplot.close

matplotlib.pyplot.**close**(*fig=None*)
Close a figure window.

Parameters

fig

[None or int or str or *Figure*] The figure to close. There are a number of ways to specify this:

- *None*: the current figure
- *Figure*: the given *Figure* instance
- `int`: a figure number

- `str`: a figure name
- 'all': all figures

Examples using `matplotlib.pyplot.close`

- sphx_glr_gallery_misc_multiprocess_sgskip.py

matplotlib.pyplot.cohere

`matplotlib.pyplot.cohere`(*x*, *y*, *NFFT=256*, *Fs=2*, *Fc=0*, *detrend=<function detrend_none at 0x7f5434697820>*, *window=<function window_hanning at 0x7f5434697160>*, *noverlap=0*, *pad_to=None*, *sides='default'*, *scale_by_freq=None*, ***, *data=None*, ***kwargs*)

Plot the coherence between *x* and *y*.

Plot the coherence between *x* and *y*. Coherence is the normalized cross spectral density:

$$C_{xy} = \frac{|P_{xy}|^2}{P_{xx}P_{yy}}$$

Parameters

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from

NFFT, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The *mlab* module defines *detrend_none*, *detrend_mean*, and *detrend_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend_none*. 'mean' calls *detrend_mean*. 'linear' calls *detrend_linear*.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int, default: 0 (no overlap)] The number of points of overlap between blocks.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

Cxy

[1-D array] The coherence vector.

freqs

[1-D array] The frequencies for the elements in *Cxy*.

Other Parameters

**kwargs

Keyword arguments control the *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool

Table 191 – continued from previous page

Property	Description
xdata	1D array
ydata	1D array
zorder	float

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

References

Bendat & Piersol -- Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

Examples using `matplotlib.pyplot.cohere`

matplotlib.pyplot.colorbar

matplotlib.pyplot.**colorbar**(*mappable=None*, *cax=None*, *ax=None*, ***kw*)

Add a colorbar to a plot.

Function signatures for the *pyplot* interface; all but the first are also method signatures for the *colorbar* method:

```
colorbar(**kwargs)
colorbar(mappable, **kwargs)
colorbar(mappable, cax=cax, **kwargs)
colorbar(mappable, ax=ax, **kwargs)
```

Parameters

mappable

The *matplotlib.cm.ScalarMappable* (i.e., *AxesImage*, *ContourSet*, etc.) described by this colorbar. This argument is mandatory for the *Figure.colorbar* method but optional for the *pyplot.colorbar* function, which sets the default to the current image.

Note that one can create a *ScalarMappable* "on-the-fly" to generate colorbars not attached to a previously drawn artist, e.g.

```
fig.colorbar(cm.ScalarMappable(norm=norm, cmap=cmap), ax=ax)
```

cax

[*Axes*, optional] Axes into which the colorbar will be drawn.

ax

[*Axes*, list of Axes, optional] Parent axes from which space for a new colorbar axes will be stolen. If a list of axes is given they will all be resized to make room for the colorbar axes.

use_gridspec

[bool, optional] If *cax* is `None`, a new *cax* is created as an instance of Axes. If *ax* is an instance of Subplot and *use_gridspec* is `True`, *cax* is created as an instance of Subplot using the *gridspec* module.

Returns

colorbar

[*Colorbar*] See also its base class, *ColorbarBase*.

Notes

Additional keyword arguments are of two kinds:

axes properties:

fraction

[float, default: 0.15] Fraction of original axes to use for colorbar.

shrink

[float, default: 1.0] Fraction by which to multiply the size of the colorbar.

aspect

[float, default: 20] Ratio of long to short dimensions.

pad

[float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

anchor

[(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

panchor

[(float, float), or *False*, optional] The anchor point of the colorbar parent axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

colorbar properties:

Property	Description
extend	{'neither', 'both', 'min', 'max'} If not 'neither', make pointed end(s) for out-of- range values. These are set for a given colormap using the colormap set_under and set_over methods.
extendfrac	{*None*, 'auto', length, lengths} If set to *None*, both the minimum and maximum triangular colorbar extensions with have a length of 5% of the interior colorbar length (this is the default setting). If set to 'auto', makes the triangular colorbar extensions the same lengths as the interior boxes (when *spacing* is set to 'uniform') or the same lengths as the respective adjacent interior boxes (when *spacing* is set to 'proportional'). If a scalar, indicates the length of both the minimum and maximum triangular colorbar extensions as a fraction of the interior colorbar length. A two-element sequence of fractions may also be given, indicating the lengths of the minimum and maximum colorbar extensions respectively as a fraction of the interior colorbar length.
extendrect	bool If *False* the minimum and maximum colorbar extensions will be triangular (the default). If *True* the extensions will be rectangular.
spacing	{'uniform', 'proportional'} Uniform spacing gives each discrete color the same space; proportional makes the space proportional to the data interval.
ticks	*None* or list of ticks or Locator If None, ticks are determined automatically from the input.
format	None or str or Formatter If None, *ScalarFormatter* is used. If a format string is given, e.g., '%.3f', that is used. An alternative *Formatter* may be given instead.
drawedges	bool Whether to draw lines at color boundaries.
label	str The label on the colorbar's long axis.

The following will probably be useful only in the context of indexed colors (that is, when the mappable has norm=NoNorm()), or other unusual circumstances.

Property	Description
boundaries	None or a sequence
values	None or a sequence which must be of length 1 less than the sequence of *boundaries*. For each region delimited by adjacent entries in *boundaries*, the color mapped to the corresponding value in values will be used.

If *mappable* is a *ContourSet*, its *extend* kwarg is included automatically.

The *shrink* kwarg provides a simple way to scale the colorbar with respect to the axes. Note that if *cax* is specified, it determines the size of the colorbar and *shrink* and *aspect* kwargs are ignored.

For more precise control, you can manually specify the positions of the axes objects in which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewers (svg and pdf) renders white gaps between segments of the colorbar. This is due to bugs in the viewers, not Matplotlib. As a workaround, the colorbar can be rendered with overlapping segments:

```
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However this has negative consequences in other circumstances, e.g. with semi-transparent images (alpha < 1) and colorbar extensions; therefore, this workaround is not used by default (see issue #1188).

matplotlib.pyplot.connect

matplotlib.pyplot.**connect**(*s*, *func*)

Bind function *func* to event *s*.

Parameters

s

[str] One of the following events ids:

- 'button_press_event'
- 'button_release_event'
- 'draw_event'
- 'key_press_event'
- 'key_release_event'
- 'motion_notify_event'
- 'pick_event'
- 'resize_event'
- 'scroll_event'
- 'figure_enter_event',
- 'figure_leave_event',
- 'axes_enter_event',

- 'axes_leave_event'
- 'close_event'.

func

[callable] The callback function to be executed, which must have the signature:

```
def func(event: Event) -> Any
```

For the location events (button and key press/release), if the mouse is over the axes, the `inaxes` attribute of the event will be set to the *Axes* the event occurs is over, and additionally, the variables `xdata` and `ydata` attributes will be set to the mouse location in data coordinates. See *KeyEvent* and *MouseEvent* for more info.

Returns

cid

A connection id that can be used with *FigureCanvasBase.mpl_disconnect*.

Examples

```
def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = canvas.mpl_connect('button_press_event', on_press)
```

Examples using `matplotlib.pyplot.connect`

- sphx_glr_gallery_event_handling_coords_demo.py

matplotlib.pyplot.contour

matplotlib.pyplot.**contour**(**args*, *data=None*, ***kwargs*)

Plot contours.

Call signature:

```
contour([X, Y,] Z, [levels], **kwargs)
```

contour and *contourf* draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

Parameters

X, Y

[array-like, optional] The coordinates of the values in *Z*.

X and *Y* must both be 2-D with the same shape as *Z* (e.g. created via `numpy.meshgrid`), or they must both be 1-D such that `len(X) == M` is the number of columns in *Z* and `len(Y) == N` is the number of rows in *Z*.

If not given, they are assumed to be integer indices, i.e. `X = range(M)`, `Y = range(N)`.

Z

[array-like(N, M)] The height values over which the contour is drawn.

levels

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use *MaxNLocator*, which tries to automatically choose no more than *n+1* "nice" contour levels between *vmin* and *vmax*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns

QuadContourSet

Other Parameters

corner_mask

[bool, default: `rcParams["contour.corner_mask"]` (default: `True`)] Enable/disable corner masking, which only has an effect if *Z* is a masked array. If `False`, any quad touching a masked point is masked out. If `True`, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.

colors

[color string or sequence of colors, optional] The colors of the levels, i.e. the lines for *contour* and the areas for *contourf*.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. `'red'` instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value *None*), the colormap specified by *cmap* will be used.

alpha

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] A *Colormap* instance or registered colormap name. The colormap maps the level values to colors.

If both *colors* and *cmap* are given, an error is raised.

norm

[*Normalize*, optional] If a colormap is used, the *Normalize* instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

vmin, vmax

[float, optional] If not *None*, either or both of these values will be supplied to the *Normalize* instance, overriding the default color scaling based on *levels*.

origin

[{*None*, 'upper', 'lower', 'image'}, default: None] Determines the orientation and exact position of *Z* by specifying the position of `Z[0, 0]`. This is only relevant, if *X*, *Y* are not given.

- *None*: `Z[0, 0]` is at X=0, Y=0 in the lower left corner.
- 'lower': `Z[0, 0]` is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': `Z[0, 0]` is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from `rcParams["image.origin"]` (default: `'upper'`).

extent

[(x0, x1, y0, y1), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of Z[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of Z[0, 0], and (*x1*, *y1*) is the position of Z[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to contour.

locator

[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `contourf`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

Note: An existing *QuadContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call `QuadContourSet.changed()` is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *QuadContourSet* because it internally calls `QuadContourSet.changed()`.

Example:

```
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
    colors=['#808080', '#A0A0A0', '#C0C0C0'], extend='both')
cs.cmap.set_over('red')
cs.cmap.set_under('blue')
cs.changed()
```

xunits, yunits

[registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

antialiased

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *True*. For line contours, it is taken from `rcParams["lines.antialiased"]` (default: `True`).

nchunk

[int >= 0, optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of *nchunk* by *nchunk* quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the *antialiased* flag and value of *alpha*.

linewidths

[float or array-like, default: `rcParams["contour.linewidth"]` (default: `None`)] *Only applies to* *`contour`*.

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to `rcParams["lines.linewidth"]` (default: `1.5`).

linestyles

[{*None*, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] *Only applies to* *`contour`*.

If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from `rcParams["contour.negative_linestyle"]` (default: `'dashed'`) setting.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

hatches

[List[str], optional] *Only applies to* *`contourf`*.

A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Notes

1. *contourf* differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to *contour*.
2. *contourf* fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

```
z1 < Z <= z2
```

   except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

Examples using `matplotlib.pyplot.contour`

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

matplotlib.pyplot.contourf

matplotlib.pyplot.**contourf**(**args*, *data=None*, ***kwargs*)

Plot contours.

Call signature:

```
contour([X, Y,] Z, [levels], **kwargs)
```

contour and *contourf* draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

Parameters

X, Y

[array-like, optional] The coordinates of the values in *Z*.

X and *Y* must both be 2-D with the same shape as *Z* (e.g. created via `numpy.meshgrid`), or they must both be 1-D such that `len(X) == M` is the number of columns in *Z* and `len(Y) == N` is the number of rows in *Z*.

If not given, they are assumed to be integer indices, i.e. `X = range(M)`, `Y = range(N)`.

Z

[array-like(N, M)] The height values over which the contour is drawn.

levels

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use *MaxNLocator*, which tries to automatically choose no more than *n+1* "nice" contour levels between *vmin* and *vmax*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns

QuadContourSet

Other Parameters

corner_mask

[bool, default: `rcParams["contour.corner_mask"]` (default: `True`)] Enable/disable corner masking, which only has an effect if *Z* is a masked array. If `False`, any quad touching a masked point is masked out. If `True`, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.

colors

[color string or sequence of colors, optional] The colors of the levels, i.e. the lines for *contour* and the areas for *contourf*.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. `'red'` instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value *None*), the colormap specified by *cmap* will be used.

alpha

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] A *Colormap* instance or registered colormap name. The colormap maps the level values to colors.

If both *colors* and *cmap* are given, an error is raised.

norm

[*Normalize*, optional] If a colormap is used, the *Normalize* instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

vmin, vmax

[float, optional] If not *None*, either or both of these values will be supplied to the *Normalize* instance, overriding the default color scaling based on *levels*.

origin

[{*None*, 'upper', 'lower', 'image'}, default: None] Determines the orientation and exact position of *Z* by specifying the position of `Z[0, 0]`. This is only relevant, if *X*, *Y* are not given.

- *None*: `Z[0, 0]` is at X=0, Y=0 in the lower left corner.
- 'lower': `Z[0, 0]` is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': `Z[0, 0]` is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from `rcParams["image.origin"]` (default: `'upper'`).

extent

[(x0, x1, y0, y1), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of Z[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of Z[0, 0], and (*x1*, *y1*) is the position of Z[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to contour.

locator

[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `contourf`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may

want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

Note: An existing *QuadContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call `QuadContourSet.changed()` is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *QuadContourSet* because it internally calls `QuadContourSet.changed()`.

Example:

```
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
    colors=['#808080', '#A0A0A0', '#C0C0C0'], extend='both')
cs.cmap.set_over('red')
cs.cmap.set_under('blue')
cs.changed()
```

xunits, yunits

[registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

antialiased

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *True*. For line contours, it is taken from `rcParams["lines.antialiased"]` (default: `True`).

nchunk

[int >= 0, optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of *nchunk* by *nchunk* quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the *antialiased* flag and value of *alpha*.

linewidths

[float or array-like, default: `rcParams["contour.linewidth"]` (default: `None`)] *Only applies to* *contour*.

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to `rcParams["lines.linewidth"]` (default: `1.5`).

linestyles

[{*None*, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] *Only applies to* *contour*.

If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from `rcParams["contour.negative_linestyle"]` (default: `'dashed'`) setting.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

hatches

[List[str], optional] *Only applies to* *contourf*.

A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Notes

1. *contourf* differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to *contour*.
2. *contourf* fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

```
z1 < Z <= z2
```

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

- sphx_glr_gallery_images_contours_and_fields_irregulardatagrid.py

- sphx_glr_gallery_images_contours_and_fields_pcolormesh_levels.py
- sphx_glr_gallery_images_contours_and_fields_triinterp_demo.py

matplotlib.pyplot.cool

matplotlib.pyplot.cool()
Set the colormap to "cool".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.cool`

matplotlib.pyplot.copper

matplotlib.pyplot.copper()
Set the colormap to "copper".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.copper`

matplotlib.pyplot.csd

matplotlib.pyplot.csd(*x*, *y*, *NFFT=None*, *Fs=None*, *Fc=None*, *detrend=None*, *window=None*, *noverlap=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*, *return_line=None*, ***, *data=None*, ***kwargs*)
Plot the cross-spectral density.

The cross spectral density P_{xy} by Welch's average periodogram method. The vectors *x* and *y* are divided into *NFFT* length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The product of the direct FFTs of *x* and *y* are averaged over each segment to compute P_{xy}, with a scaling to correct for power loss due to windowing.

If len(*x*) < *NFFT* or len(*y*) < *NFFT*, they will be zero padded to *NFFT*.

Parameters

x, y

[1-D arrays or sequences] Arrays or sequences containing the data.

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The *mlab* module defines *detrend_none*, *detrend_mean*, and *detrend_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend_none*. 'mean' calls *detrend_mean*. 'linear' calls *detrend_linear*.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int, default: 0 (no overlap)] The number of points of overlap between segments.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

return_line

[bool, default: False] Whether to include the line object plotted in the returned values.

Returns

Pxy

[1-D array] The values for the cross spectrum P_{xy} before scaling (complex valued).

freqs

[1-D array] The frequencies corresponding to the elements in *Pxy*.

line

[*Line2D*] The line created by this function. Only returned if *return_line* is True.

Other Parameters

****kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool

Table 192 – continued from previous page

Property	Description
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also:

psd

is equivalent to setting `y = x`.

Notes

For plotting, the power is plotted as $10\log_{10}(P_{xy})$ for decibels, though P_{xy} itself is returned.

References

Bendat & Piersol -- Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.csd`

matplotlib.pyplot.delaxes

matplotlib.pyplot.**delaxes**(*ax=None*)
Remove an *Axes* (defaulting to the current axes) from its figure.

Examples using `matplotlib.pyplot.delaxes`

matplotlib.pyplot.disconnect

matplotlib.pyplot.**disconnect**(*cid*)
Disconnect the callback with id *cid*.

Examples

```
cid = canvas.mpl_connect('button_press_event', on_press)
# ... later
canvas.mpl_disconnect(cid)
```

Examples using `matplotlib.pyplot.disconnect`

- sphx_glr_gallery_event_handling_coords_demo.py

matplotlib.pyplot.draw

matplotlib.pyplot.**draw**()

Redraw the current figure.

This is used to update a figure that has been altered, but not automatically redrawn. If interactive mode is on (via *ion()*), this should be only rarely needed, but there may be ways to modify the state of a figure without marking it as "stale". Please report these cases as bugs.

This is equivalent to calling `fig.canvas.draw_idle()`, where `fig` is the current figure.

Examples using `matplotlib.pyplot.draw`

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py
- sphx_glr_gallery_mplot3d_rotate_axes3d_sgskip.py

matplotlib.pyplot.draw_if_interactive

matplotlib.pyplot.**draw_if_interactive**()

Examples using `matplotlib.pyplot.draw_if_interactive`

matplotlib.pyplot.errorbar

matplotlib.pyplot.**errorbar**(*x*, *y*, *yerr=None*, *xerr=None*, *fmt=''*, *ecolor=None*, *elinewidth=None*, *capsize=None*, *barsabove=False*, *lolims=False*, *uplims=False*, *xlolims=False*, *xuplims=False*, *errorevery=1*, *capthick=None*, ***, *data=None*, ***kwargs*)

Plot y versus x as lines and/or markers with attached errorbars.

x, *y* define the data locations, *xerr*, *yerr* define the errorbar sizes. By default, this draws the data markers/lines as well the errorbars. Use fmt='none' to draw errorbars without any data markers.

Parameters

x, y

[float or array-like] The data positions.

xerr, yerr

[float or array-like, shape(N,) or shape(2, N), optional] The errorbar sizes:

- scalar: Symmetric +/- values for all data points.
- shape(N,): Symmetric +/-values for each data point.
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- *None*: No errorbar.

Note that all error arrays should have *positive* values.

See /gallery/statistics/errorbar_features for an example on the usage of `xerr` and `yerr`.

fmt

[str, default: ''] The format for the data points / data lines. See *plot* for details.

Use 'none' (case insensitive) to plot errorbars without any data markers.

ecolor

[color, default: None] The color of the errorbar lines. If None, use the color of the line connecting the markers.

elinewidth

[float, default: None] The linewidth of the errorbar lines. If None, the linewidth of the current style is used.

capsize

[float, default: `rcParams["errorbar.capsize"]` (default: `0.0`)] The length of the error bar caps in points.

capthick

[float, default: None] An alias to the keyword argument *markeredgewidth* (a.k.a. *mew*). This setting is a more sensible name for the property that controls the thickness of the error bar cap in points. For backwards compatibility, if *mew* or *markeredgewidth* are given, then they will over-ride *capthick*. This may change in future releases.

barsabove

[bool, default: False] If True, will plot the errorbars above the plot symbols. Default is below.

lolims, uplims, xlolims, xuplims

[bool, default: False] These arguments can be used to indicate that a value gives only upper/lower limits. In that case a caret symbol is used to indicate this. *lims*-arguments may be scalars, or array-likes of the same length as *xerr* and *yerr*. To use limits with inverted axes, *set_xlim* or *set_ylim* must be called before *errorbar()*. Note the tricky parameter names: setting e.g. *lolims* to True means that the y-value is a *lower* limit of the True value, so, only an *upward*-pointing arrow will be drawn!

errorevery

[int or (int, int), default: 1] draws error bars on a subset of the data. *errorevery* =N draws error bars on the points (x[::N], y[::N]). *errorevery* =(start, N) draws error bars on the points (x[start::N], y[start::N]). e.g. errorevery=(6, 3) adds error bars to the data at (x[6], x[9], x[12], x[15], ...). Used to avoid overlapping error bars when two series share x-axis values.

Returns

ErrorbarContainer

The container contains:

- plotline: *Line2D* instance of x, y plot markers and/or line.
- caplines: A tuple of *Line2D* instances of the error bar caps.
- barlinecols: A tuple of *LineCollection* with the horizontal and vertical error ranges.

Other Parameters

****kwargs**

All other keyword arguments are passed on to the *plot* call drawing the markers. For example, this code makes big red squares with thick green edges:

```
x, y, yerr = rand(3, 10)
errorbar(x, y, yerr, marker='s', mfc='red',
         mec='green', ms=20, mew=4)
```

where *mfc*, *mec*, *ms* and *mew* are aliases for the longer property names, *markerfacecolor*, *markeredgecolor*, *markersize* and *markeredgewidth*.

Valid kwargs for the marker properties are *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*, *xerr*, *yerr*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.errorbar`

- sphx_glr_gallery_lines_bars_and_markers_errorbar_limits_simple.py

matplotlib.pyplot.eventplot

matplotlib.pyplot.**eventplot**(*positions*, *orientation='horizontal'*, *lineoffsets=1*, *linelengths=1*, *linewidths=None*, *colors=None*, *linestyles='solid'*, ***, *data=None*, ***kwargs*)

Plot identical parallel lines at the given positions.

This type of plot is commonly used in neuroscience for representing neural events, where it is usually called a spike raster, dot raster, or raster plot.

However, it is useful in any situation where you wish to show the timing or position of multiple sets of discrete events, such as the arrival times of people to a business on each day of the month or the date of hurricanes each year of the last century.

Parameters

positions

[array-like or list of array-like] A 1D array-like defines the positions of one sequence of events.

Multiple groups of events may be passed as a list of array-likes. Each group can be styled independently by passing lists of values to *lineoffsets*, *linelengths*, *linewidths*, *colors* and *linestyles*.

Note that *positions* can be a 2D array, but in practice different event groups usually have different counts so that one will use a list of different-length arrays rather than a 2D array.

orientation

[{'horizontal', 'vertical'}, default: 'horizontal'] The direction of the event sequence:

- 'horizontal': the events are arranged horizontally. The indicator lines are vertical.
- 'vertical': the events are arranged vertically. The indicator lines are horizontal.

lineoffsets

[float or array-like, default: 1] The offset of the center of the lines from the origin, in the direction orthogonal to *orientation*.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

linelengths

[float or array-like, default: 1] The total height of the lines (i.e. the lines stretches from `lineoffset - linelength/2` to `lineoffset + linelength/2`).

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

linewidths

[float or array-like, default: `rcParams["lines.linewidth"]` (default: `1.5`)] The line width(s) of the event lines, in points.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

colors

[color or list of colors, default: `rcParams["lines.color"]` (default: `'C0'`)] The color(s) of the event lines.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

linestyles

[str or tuple or list of such values, default: 'solid'] Default is 'solid'. Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

```
(offset, onoffseq),
```

where *onoffseq* is an even length tuple of on and off ink in points.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

****kwargs**

Other keyword arguments are line collection properties. See *LineCollection* for a list of the valid properties.

Returns

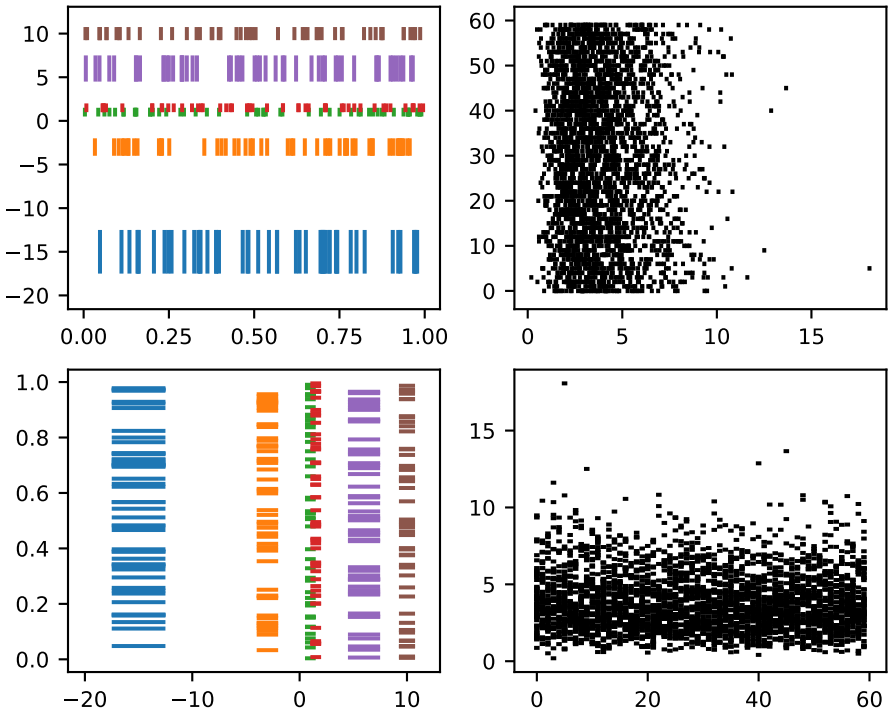
list of *EventCollection*

The *EventCollection* that were added.

Notes

For *linelengths*, *linewidths*, *colors*, and *linestyles*, if only a single value is given, that value is applied to all lines. If an array-like is given, it must have the same length as *positions*, and each value will be applied to the corresponding row of the array.

Examples



Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *positions*, *lineoffsets*, *linelengths*, *linewidths*, *colors*, *linestyles*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.eventplot`

matplotlib.pyplot.figimage

matplotlib.pyplot.**figimage**(*X*, *xo=0*, *yo=0*, *alpha=None*, *norm=None*, *cmap=None*, *vmin=None*, *vmax=None*, *origin=None*, *resize=False*, ***kwargs*)

Add a non-resampled image to the figure.

The image is attached to the lower or upper left corner depending on *origin*.

Parameters

X

The image data. This is an array of one of the following shapes:

- MxN: luminance (grayscale) values
- MxNx3: RGB values
- MxNx4: RGBA values

xo, yo

[int] The *x*/*y* image offset in pixels.

alpha

[None or float] The alpha blending value.

norm

[*matplotlib.colors.Normalize*] A *Normalize* instance to map the luminance to the interval [0, 1].

cmap

[str or *matplotlib.colors.Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] The colormap to use.

vmin, vmax

[float] If *norm* is not given, these values set the data limits for the colormap.

origin

[{'upper', 'lower'}, default: `rcParams["image.origin"]` (default: `'upper'`)] Indicates where the [0, 0] index of the array is in the upper left or lower left corner of the axes.

resize

[bool] If *True*, resize the figure to match the given image size.

Returns

matplotlib.image.FigureImage

Other Parameters

****kwargs**

Additional kwargs are *Artist* kwargs passed on to *FigureImage*.

Notes

figimage complements the axes image (*imshow*) which will be resampled to fit the current axes. If you want a resampled image to fill the entire figure, you can define an *Axes* with extent [0, 0, 1, 1].

Examples

```
f = plt.figure()
nx = int(f.get_figwidth() * f.dpi)
ny = int(f.get_figheight() * f.dpi)
data = np.random.random((ny, nx))
f.figimage(data)
plt.show()
```

Examples using `matplotlib.pyplot.figimage`

- sphx_glr_gallery_images_contours_and_fields_figimage_demo.py

matplotlib.pyplot.figlegend

matplotlib.pyplot.**figlegend**(**args*, ***kwargs*)

Place a legend on the figure.

To make a legend from existing artists on every axes:

```
figlegend()
```

To make a legend for a list of lines and labels:

```
figlegend(
    (line1, line2, line3),
    ('label1', 'label2', 'label3'),
    loc='upper right')
```

These can also be specified by keyword:

```
figlegend(
    handles=(line1, line2, line3),
    labels=('label1', 'label2', 'label3'),
    loc='upper right')
```

Parameters

handles

[list of *Artist*, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with *labels*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

labels

[list of str, optional] A list of labels to show next to the artists. Use this together with *handles*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

Returns

Legend

Other Parameters

loc

[str or pair of floats, default: `rcParams["legend.loc"]` (default: `'best'`) ('best' for axes, 'upper right' for figures)] The location of the legend.

The strings `'upper left'`, `'upper right'`, `'lower left'`, `'lower right'` place the legend at the corresponding corner of the axes/figure.

The strings `'upper center'`, `'lower center'`, `'center left'`, `'center right'` place the legend at the center of the corresponding edge of the axes/figure.

The string `'center'` places the legend at the center of the axes/figure.

The string `'best'` places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case *bbox_to_anchor* will be ignored).

For back-compatibility, `'center right'` (but no other location) can also be spelled `'right'`, and each "string" locations can also be given as a numeric value:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*. Defaults to `axes.bbox` (if called as a method to *Axes.legend*) or `figure.bbox` (if *Figure.legend*). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by *bbox_transform*, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox `(x, y, width, height)` that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple `(x, y)` places the corner of the legend specified by *loc* at x, y. For example, to put the legend's upper right-hand corner

in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

ncol

[int, default: 1] The number of columns that the legend has.

prop

[None or *matplotlib.font_manager.FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

labelcolor

[str or list] Sets the color of the text in the legend. Can be a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

numpoints

[int, default: `rcParams["legend.numpoints"]` (default: `1`)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).

scatterpoints

[int, default: `rcParams["legend.scatterpoints"]` (default: `1`)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).

scatteryoffsets

[iterable of floats, default: `[0.375, 0.5, 0.3125]`] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to `[0.5]`.

markerscale

[float, default: `rcParams["legend.markerscale"]` (default: `1.0`)] The relative size of legend markers compared with the originally drawn ones.

markerfirst

[bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

frameon

[bool, default: `rcParams["legend.frameon"]` (default: `True`)] Whether the legend should be drawn on a patch (frame).

fancybox

[bool, default: `rcParams["legend.fancybox"]` (default: `True`)] Whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend's background.

shadow

[bool, default: `rcParams["legend.shadow"]` (default: `False`)] Whether to draw a shadow behind the legend.

framealpha

[float, default: `rcParams["legend.framealpha"]` (default: `0.8`)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is `None`, the default value is ignored.

facecolor

["inherit" or color, default: `rcParams["legend.facecolor"]` (default: `'inherit'`)] The legend's background color. If `"inherit"`, use `rcParams["axes.facecolor"]` (default: `'white'`).

edgecolor

["inherit" or color, default: `rcParams["legend.edgecolor"]` (default: `'0.8'`)] The legend's background patch edge color. If `"inherit"`, use take `rcParams["axes.edgecolor"]` (default: `'black'`).

mode

[{"expand", None}] If *mode* is set to `"expand"` the legend will be horizontally expanded to fill the axes area (or *bbox_to_anchor* if defines the legend's size).

bbox_transform

[None or *matplotlib.transforms.Transform*] The transform for the bounding box (*bbox_to_anchor*). For a value of `None` (default) the Axes' `transAxes` transform will be used.

title

[str or None] The legend's title. Default is no title (`None`).

title_fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: `rcParams["legend.title_fontsize"]` (default: `None`)] The font size of the legend's title.

borderpad

[float, default: `rcParams["legend.borderpad"]` (default: `0.4`)] The fractional whitespace inside the legend border, in font-size units.

labelspacing

[float, default: `rcParams["legend.labelspacing"]` (default: `0.5`)] The vertical space between the legend entries, in font-size units.

handlelength

[float, default: `rcParams["legend.handlelength"]` (default: `2.0`)] The length of the legend handles, in font-size units.

handletextpad

[float, default: `rcParams["legend.handletextpad"]` (default: `0.8`)] The pad between the legend handle and text, in font-size units.

borderaxespad

[float, default: `rcParams["legend.borderaxespad"]` (default: `0.5`)] The pad between the axes and legend border, in font-size units.

columnspacing

[float, default: `rcParams["legend.columnspacing"]` (default: `2.0`)] The spacing between columns, in font-size units.

handler_map

[dict or None] The custom dictionary mapping instances or types to a legend handler. This *handler_map* updates the default handler map found at *matplotlib.legend.Legend.get_legend_handler_map*.

Notes

Some artists are not supported by this function. See *Legend guide* for details.

Examples using `matplotlib.pyplot.figlegend`

matplotlib.pyplot.fignum_exists

matplotlib.pyplot.**fignum_exists**(*num*)

Return whether the figure with the given id exists.

Examples using `matplotlib.pyplot.fignum_exists`

matplotlib.pyplot.figtext

matplotlib.pyplot.**figtext**(*x*, *y*, *s*, *fontdict=None*, ***kwargs*)

Add text to figure.

Parameters

x, y

[float] The position to place the text. By default, this is in figure coordinates, floats in [0, 1]. The coordinate system can be changed using the *transform* keyword.

s

[str] The text string.

fontdict

[dict, optional] A dictionary to override the default text properties. If not given, the defaults are determined by `rcParams["font.*"]`. Properties passed as *kwargs* override the corresponding ones given in *fontdict*.

Returns

Text

Other Parameters

****kwargs**

[*Text* properties] Other miscellaneous text parameters.

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array an
alpha	float or None
animated	bool
backgroundcolor	color

Tabl

Property	Description
bbox	dict with properties for *patches.FancyBboxPatch*
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
figure	*Figure*
fontfamily or family	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', '
fontproperties or font or font_properties	*font_manager.FontProperties* or `str` or `pathlib.Path`
fontsize or size	float or {'xx-small', 'x-small', 'small', 'medium', 'large',
fontstretch or stretch	{a numeric value in range 0-1000, 'ultra-condensed',
fontstyle or style	{'normal', 'italic', 'oblique'}
fontvariant or variant	{'normal', 'small-caps'}
fontweight or weight	{a numeric value in range 0-1000, 'ultralight', 'light',
gid	str
horizontalalignment or ha	{'center', 'right', 'left'}
in_layout	bool
label	object
linespacing	float (multiple of font size)
multialignment or ma	{'left', 'right', 'center'}
path_effects	*AbstractPathEffect*
picker	None or bool or callable
position	(float, float)
rasterized	bool or None
rotation	float or {'vertical', 'horizontal'}
rotation_mode	{None, 'default', 'anchor'}
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
text	object
transform	*Transform*
url	str
usetex	bool or None
verticalalignment or va	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
visible	bool
wrap	bool
x	float
y	float
zorder	float

Axes.text

pyplot.text

Examples using `matplotlib.pyplot.figtext`

- sphx_glr_gallery_text_labels_and_annotations_fonts_demo.py
- sphx_glr_gallery_text_labels_and_annotations_fonts_demo_kw.py

matplotlib.pyplot.figure

matplotlib.pyplot.**figure**(*num=None*, *figsize=None*, *dpi=None*, *facecolor=None*, *edgecolor=None*, *frameon=True*, *FigureClass=<class 'matplotlib.figure.Figure'>*, *clear=False*, ***kwargs*)

Create a new figure, or activate an existing figure.

Parameters

num

[int or str, optional] A unique identifier for the figure.

If a figure with that identifier already exists, this figure is made active and returned. An integer refers to the `Figure.number` attribute, a string refers to the figure label.

If there is no figure with the identifier or *num* is not given, a new figure is created, made active and returned. If *num* is an int, it will be used for the `Figure.number` attribute, otherwise, an auto-generated integer value is used (starting at 1 and incremented for each new figure). If *num* is a string, the figure label and the window title is set to this value.

figsize

[(float, float), default: `rcParams["figure.figsize"]` (default: `[6.4, 4.8]`)] Width, height in inches.

dpi

[float, default: `rcParams["figure.dpi"]` (default: `100.0`)] The resolution of the figure in dots-per-inch.

facecolor

[color, default: `rcParams["figure.facecolor"]` (default: `'white'`)] The background color.

edgecolor

[color, default: `rcParams["figure.edgecolor"]` (default: `'white'`)] The border color.

frameon

[bool, default: True] If False, suppress drawing the figure frame.

FigureClass

[subclass of *Figure*] Optionally use a custom *Figure* instance.

clear

[bool, default: False] If True and the figure already exists, then it is cleared.

tight_layout

[bool or dict, default: `rcParams["figure.autolayout"]` (default: `False`)] If `False` use *subplotpars*. If `True` adjust subplot parameters using *tight_layout* with default padding. When providing a dict containing the keys `pad`, `w_pad`, `h_pad`, and `rect`, the default *tight_layout* paddings will be overridden.

constrained_layout

[bool, default: `rcParams["figure.constrained_layout.use"]` (default: `False`)] If `True` use constrained layout to adjust positioning of plot elements. Like `tight_layout`, but designed to be more flexible. See *Constrained Layout Guide* for examples. (Note: does not work with `add_subplot` or *subplot2grid*.)

****kwargs : optional**

See *Figure* for other possible arguments.

Returns

Figure

The *Figure* instance returned will also be passed to new_figure_manager in the backends, which allows to hook custom *Figure* classes into the pyplot interface. Additional kwargs will be passed to the *Figure* init function.

Notes

If you are creating many figures, make sure you explicitly call *pyplot.close* on the figures you are not using, because this will enable pyplot to properly clean up the memory.

rcParams defines the default values, which can be modified in the matplotlibrc file.

Examples using `matplotlib.pyplot.figure`

- *Frame grabbing*
- sphx_glr_gallery_misc_hyperlinks_sgskip.py
- sphx_glr_gallery_mplot3d_rotate_axes3d_sgskip.py
- sphx_glr_gallery_mplot3d_wire3d_animation_sgskip.py
- sphx_glr_gallery_user_interfaces_svg_histogram_sgskip.py
- sphx_glr_gallery_user_interfaces_toolmanager_sgskip.py
- sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py

matplotlib.pyplot.fill

`matplotlib.pyplot.fill`(**args*, *data=None*, ***kwargs*)

Plot filled polygons.

Parameters

***args**

[sequence of x, y, [color]] Each polygon is defined by the lists of *x* and *y* positions of its nodes, optionally followed by a *color* specifier. See *matplotlib.colors* for supported color specifiers. The standard color cycle is used for polygons without a color specifier.

You can plot multiple polygons by providing multiple *x*, *y*, *[color]* groups.

For example, each of the following is legal:

```
ax.fill(x, y)                    # a polygon with default color
ax.fill(x, y, "b")               # a blue polygon
ax.fill(x, y, x2, y2)            # two polygons
ax.fill(x, y, "b", x2, y2, "r")  # a blue and a red polygon
```

data

[indexable object, optional] An object with labelled data. If given, provide the label names to plot in *x* and *y*, e.g.:

```
ax.fill("time", "signal",
        data={"time": [0, 1, 2], "signal": [0, 1, 0]})
```

Returns

list of *Polygon*

Other Parameters

****kwargs**

[*Polygon* properties]

Notes

Use *fill_between()* if you would like to fill the region between two curves.

Examples using `matplotlib.pyplot.fill`

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

matplotlib.pyplot.fill_between

`matplotlib.pyplot.`**`fill_between`**(*x*, *y1*, *y2=0*, *where=None*, *interpolate=False*, *step=None*, ***, *data=None*, ***kwargs*)

Fill the area between two horizontal curves.

The curves are defined by the points (*x*, *y1*) and (*x*, *y2*). This creates one or multiple polygons describing the filled area.

You may exclude some horizontal sections from filling using *where*.

By default, the edges connect the given points directly. Use *step* if the filling should be a step function, i.e. constant in between *x*.

Parameters

x

[array (length N)] The x coordinates of the nodes defining the curves.

y1

[array (length N) or scalar] The y coordinates of the nodes defining the first curve.

y2

[array (length N) or scalar, default: 0] The y coordinates of the nodes defining the second curve.

where

[array of bool (length N), optional] Define *where* to exclude some horizontal regions from being filled. The filled regions are defined by the coordinates `x[where]`. More precisely, fill between

`x[i]` and `x[i+1]` if `where[i] and where[i+1]`. Note that this definition implies that an isolated *True* value between two *False* values in *where* will not result in filling. Both sides of the *True* position remain unfilled due to the adjacent *False* values.

interpolate

[bool, default: False] This option is only relevant if *where* is used and the two curves are crossing each other.

Semantically, *where* is often used for *y1 > y2* or similar. By default, the nodes of the polygon defining the filled region will only be placed at the positions in the *x* array. Such a polygon cannot describe the above semantics close to the intersection. The x-sections containing the intersection are simply clipped.

Setting *interpolate* to *True* will calculate the actual intersection point and extend the filled region up to this point.

step

[{'pre', 'post', 'mid'}, optional] Define *step* if the filling should be a step function, i.e. constant in between *x*. The value determines where the step will occur:

- 'pre': The y value is continued constantly to the left from every *x* position, i.e. the interval `(x[i-1], x[i]]` has the value `y[i]`.
- 'post': The y value is continued constantly to the right from every *x* position, i.e. the interval `[x[i], x[i+1])` has the value `y[i]`.
- 'mid': Steps occur half-way between the *x* positions.

Returns

PolyCollection

A *PolyCollection* containing the plotted polygons.

Other Parameters

****kwargs**

All other keyword arguments are passed on to *PolyCollection*. They control the *Polygon* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools

Table 195 – continued from previous page

Property	Description
array	ndarray
capstyle	{'butt', 'round', 'projecting'}
clim	(vmin: float, vmax: float)
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of rgba tuples
contains	unknown
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
norm	*Normalize* or None
offset_position	unknown
offsets	array-like (N, 2) or (2,)
path_effects	*AbstractPathEffect*
picker	None or bool or callable
pickradius	unknown
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

See also:

fill_between

Fill between two sets of y-values.

fill_betweenx

Fill between two sets of x-values.

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y1*, *y2*, *where*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.fill_between`

- sphx_glr_gallery_lines_bars_and_markers_fill_between_demo.py
- sphx_glr_gallery_text_labels_and_annotations_mathtext_examples.py

matplotlib.pyplot.fill_betweenx

matplotlib.pyplot.**fill_betweenx**(*y*, *x1*, *x2=0*, *where=None*, *step=None*, *interpolate=False*, ***, *data=None*, ***kwargs*)

Fill the area between two vertical curves.

The curves are defined by the points (*y*, *x1*) and (*y*, *x2*). This creates one or multiple polygons describing the filled area.

You may exclude some vertical sections from filling using *where*.

By default, the edges connect the given points directly. Use *step* if the filling should be a step function, i.e. constant in between *y*.

Parameters

y

[array (length N)] The y coordinates of the nodes defining the curves.

x1

[array (length N) or scalar] The x coordinates of the nodes defining the first curve.

x2

[array (length N) or scalar, default: 0] The x coordinates of the nodes defining the second curve.

where

[array of bool (length N), optional] Define *where* to exclude some vertical regions from being filled. The filled regions are defined by the coordinates `y[where]`. More precisely, fill between `y[i]` and `y[i+1]` if `where[i] and where[i+1]`. Note that this definition implies that an isolated *True* value between two *False* values in *where* will not result in filling. Both sides of the *True* position remain unfilled due to the adjacent *False* values.

interpolate

[bool, default: False] This option is only relevant if *where* is used and the two curves are crossing each other.

Semantically, *where* is often used for *x1 > x2* or similar. By default, the nodes of the polygon defining the filled region will only be placed at the positions in the *y* array. Such a polygon cannot describe the above semantics close to the intersection. The y-sections containing the intersection are simply clipped.

Setting *interpolate* to *True* will calculate the actual intersection point and extend the filled region up to this point.

step

[{'pre', 'post', 'mid'}, optional] Define *step* if the filling should be a step function, i.e. constant in between *y*. The value determines where the step will occur:

- 'pre': The y value is continued constantly to the left from every *x* position, i.e. the interval `(x[i-1], x[i]]` has the value `y[i]`.
- 'post': The y value is continued constantly to the right from every *x* position, i.e. the interval `[x[i], x[i+1])` has the value `y[i]`.
- 'mid': Steps occur half-way between the *x* positions.

Returns

PolyCollection

A *PolyCollection* containing the plotted polygons.

Other Parameters

****kwargs**

All other keyword arguments are passed on to *PolyCollection*. They control the *Polygon* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	ndarray
capstyle	{'butt', 'round', 'projecting'}
clim	(vmin: float, vmax: float)
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of rgba tuples
contains	unknown
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool

See also:

fill_between

Fill between two sets of y-values.

fill_betweenx

Fill between two sets of x-values.

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *y*, *x1*, *x2*, *where*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.fill_betweenx`

matplotlib.pyplot.findobj

`matplotlib.pyplot.`**`findobj`**(*o=None*, *match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

Examples using `matplotlib.pyplot.findobj`

matplotlib.pyplot.flag

matplotlib.pyplot.**flag**()

Set the colormap to "flag".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.flag`

matplotlib.pyplot.gca

matplotlib.pyplot.**gca**(***kwargs*)

Get the current axes, creating one if necessary.

The following kwargs are supported for ensuring the returned axes adheres to the given projection etc., and for axes creation if the active axes does not exist:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and r
alpha	float or None
anchor	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
animated	bool
aspect	{'auto'} or num
autoscale_on	bool
autoscalex_on	bool
autoscaley_on	bool
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	None, or a number
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
contains	unknown
facecolor or fc	color
figure	*Figure*
frame_on	bool
gid	str
in_layout	bool
label	object
navigate	bool

Table 197 – continued from previous page

Property	Description
navigate_mode	unknown
path_effects	*AbstractPathEffect*
picker	None or bool or callable
position	[left, bottom, width, height] or *Bbox*
prop_cycle	unknown
rasterization_zorder	float or None
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
title	str
transform	*Transform*
url	str
visible	bool
xbound	unknown
xlabel	str
xlim	(bottom: float, top: float)
xmargin	float greater than -0.5
xscale	{"linear", "log", "symlog", "logit", ...}
xticklabels	unknown
xticks	unknown
ybound	unknown
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	{"linear", "log", "symlog", "logit", ...}
yticklabels	unknown
yticks	unknown
zorder	float

Examples using `matplotlib.pyplot.gca`

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

matplotlib.pyplot.gcf

matplotlib.pyplot.gcf()
Get the current figure.

If no current figure exists, a new one is created using *figure()*.

Examples using matplotlib.pyplot.gcf

- sphx_glr_gallery_text_labels_and_annotations_arrow_demo.py
- sphx_glr_gallery_event_handling_trifinder_event_demo.py
- sphx_glr_gallery_misc_agg_buffer.py
- *Tight Layout guide*

matplotlib.pyplot.gci

matplotlib.pyplot.gci()
Get the current colorable artist.

Specifically, returns the current *ScalarMappable* instance (Image created by *imshow* or *figimage*, *Collection* created by *pcolor* or *scatter*, etc.), or *None* if no such instance has been defined.

The current image is an attribute of the current axes, or the nearest earlier axes in the current figure that contains an image.

Notes

Historically, the only colorable artists were images; hence the name gci (get current image).

Examples using matplotlib.pyplot.gci

matplotlib.pyplot.get

matplotlib.pyplot.get(*obj*, **args*, ***kwargs*)
Return the value of an object's *property*, or print all of them.

Parameters

obj

[*Artist*] The queried artist; e.g., a *Line2D*, a *Text*, or an *Axes*.

property

[str or None, default: None] If *property* is 'somename', this function returns `obj.get_somename()`.

If is is None (or unset), it *prints* all gettable properties from *obj*. Many properties have aliases for shorter typing, e.g. 'lw' is an alias for 'linewidth'. In the output, aliases and full property names will be listed as:

property or alias = value

e.g.:

linewidth or lw = 2

Examples using `matplotlib.pyplot.get`

matplotlib.pyplot.get_current_fig_manager

matplotlib.pyplot.**get_current_fig_manager**()

Return the figure manager of the current figure.

The figure manager is a container for the actual backend-depended window that displays the figure on screen.

If if no current figure exists, a new one is created an its figure manager is returned.

Returns

FigureManagerBase **or backend-dependent subclass thereof**

Examples using `matplotlib.pyplot.get_current_fig_manager`

matplotlib.pyplot.get_figlabels

matplotlib.pyplot.**get_figlabels**()

Return a list of existing figure labels.

Examples using `matplotlib.pyplot.get_figlabels`

matplotlib.pyplot.get_fignums

`matplotlib.pyplot.get_fignums()`
Return a list of existing figure numbers.

Examples using `matplotlib.pyplot.get_fignums`

matplotlib.pyplot.get_plot_commands

`matplotlib.pyplot.get_plot_commands()`
Get a sorted list of all of the plotting commands.

Examples using `matplotlib.pyplot.get_plot_commands`

matplotlib.pyplot.getp

`matplotlib.pyplot.getp(obj, *args, **kwargs)`
Return the value of an object's *property*, or print all of them.

Parameters

obj

[*Artist*] The queried artist; e.g., a *Line2D*, a *Text*, or an *Axes*.

property

[str or None, default: None] If *property* is 'somename', this function returns `obj.get_somename()`.

If is is None (or unset), it *prints* all gettable properties from *obj*. Many properties have aliases for shorter typing, e.g. 'lw' is an alias for 'linewidth'. In the output, aliases and full property names will be listed as:

property or alias = value

e.g.:

linewidth or lw = 2

Examples using `matplotlib.pyplot.getp`

- sphx_glr_gallery_misc_set_and_get.py
- *Artist tutorial*

matplotlib.pyplot.ginput

```
matplotlib.pyplot.ginput(n=1, timeout=30, show_clicks=True,
                         mouse_add=<MouseButton.LEFT: 1>,
                         mouse_pop=<MouseButton.RIGHT: 3>,
                         mouse_stop=<MouseButton.MIDDLE: 2>)
```

Blocking call to interact with a figure.

Wait until the user clicks *n* times on the figure, and return the coordinates of each click in a list.

There are three possible interactions:

- Add a point.
- Remove the most recently added point.
- Stop the interaction and return the points added so far.

The actions are assigned to mouse buttons via the arguments *mouse_add*, *mouse_pop* and *mouse_stop*.

Parameters

n

[int, default: 1] Number of mouse clicks to accumulate. If negative, accumulate clicks until the input is terminated manually.

timeout

[float, default: 30 seconds] Number of seconds to wait before timing out. If zero or negative will never timeout.

show_clicks

[bool, default: True] If True, show a red cross at the location of each click.

mouse_add

[*MouseButton* or None, default: *MouseButton.LEFT*] Mouse button used to add points.

mouse_pop

[*MouseButton* or None, default: *MouseButton.RIGHT*] Mouse button used to remove the most recently added point.

mouse_stop

[*MouseButton* or None, default: *MouseButton.MIDDLE*] Mouse button used to stop input.

Returns

list of tuples

A list of the clicked (x, y) coordinates.

Notes

The keyboard can also be used to select points in case your mouse does not have one or more of the buttons. The delete and backspace keys act like right clicking (i.e., remove last point), the enter key terminates input and any other key (not already used by the window manager) selects a point.

Examples using `matplotlib.pyplot.ginput`

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

matplotlib.pyplot.gray

matplotlib.pyplot.**gray**()
Set the colormap to "gray".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.gray`

matplotlib.pyplot.grid

matplotlib.pyplot.**grid**(*b=None*, *which='major'*, *axis='both'*, ***kwargs*)
Configure the grid lines.

Parameters

b

[bool or None, optional] Whether to show the grid lines. If any *kwargs* are supplied, it is assumed you want the grid on and *b* will be set to True.

If *b* is *None* and there are no *kwargs*, this toggles the visibility of the lines.

which

[{'major', 'minor', 'both'}, optional] The grid lines to apply the changes on.

axis

[{'both', 'x', 'y'}, optional] The axis to apply the changes on.

****kwargs**

[*Line2D* properties] Define the line properties of the grid, e.g.:

```
grid(color='r', linestyle='-', linewidth=2)
```

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)

Table 198 – continued from previous page

Property	Description
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

Notes

The axis is drawn as a unit, so the effective zorder for drawing the grid is determined by the zorder of each axis, not by the zorder of the *Line2D* objects comprising the grid. Therefore, to set grid zorder, use *set_axisbelow* or, for more control, call the *set_zorder* method of each axis.

matplotlib.pyplot.hexbin

matplotlib.pyplot.**hexbin**(*x*, *y*, *C=None*, *gridsize=100*, *bins=None*, *xscale='linear'*, *yscale='linear'*, *extent=None*, *cmap=None*, *norm=None*, *vmin=None*, *vmax=None*, *alpha=None*, *linewidths=None*, *edgecolors='face'*, *reduce_C_function=<function mean at 0x7f5439899310>*, *mincnt=None*, *marginals=False*, ***, *data=None*, ***kwargs*)

Make a 2D hexagonal binning plot of points *x*, *y*.

If *C* is *None*, the value of the hexagon is determined by the number of points in the hexagon. Otherwise, *C* specifies values at the coordinate (x[i], y[i]). For each hexagon, these values are reduced using *reduce_C_function*.

Parameters

x, y

[array-like] The data positions. *x* and *y* must be of the same length.

C

[array-like, optional] If given, these values are accumulated in the bins. Otherwise, every point has a value of 1. Must be of the same length as *x* and *y*.

gridsize

[int or (int, int), default: 100] If a single int, the number of hexagons in the *x*-direction. The number of hexagons in the *y*-direction is chosen such that the hexagons are approximately regular.

Alternatively, if a tuple (*nx*, *ny*), the number of hexagons in the *x*-direction and the *y*-direction.

bins

['log' or int or sequence, default: None] Discretization of the hexagon values.

- If *None*, no binning is applied; the color of each hexagon directly corresponds to its count value.
- If 'log', use a logarithmic scale for the color map. Internally, $log_{10}(i+1)$ is used to determine the hexagon color. This is equivalent to `norm=LogNorm()`.
- If an integer, divide the counts in the specified number of bins, and color the hexagons accordingly.

- If a sequence of values, the values of the lower bound of the bins to be used.

xscale

[{'linear', 'log'}, default: 'linear'] Use a linear or log10 scale on the horizontal axis.

yscale

[{'linear', 'log'}, default: 'linear'] Use a linear or log10 scale on the vertical axis.

mincnt

[int > 0, default: *None*] If not *None*, only display cells with more than *mincnt* number of points in the cell.

marginals

[bool, default: *False*] If marginals is *True*, plot the marginal density as colormapped rectangles along the bottom of the x-axis and left of the y-axis.

extent

[float, default: *None*] The limits of the bins. The default assigns the limits based on *gridsize*, *x*, *y*, *xscale* and *yscale*.

If *xscale* or *yscale* is set to 'log', the limits are expected to be the exponent for a power of 10. E.g. for x-limits of 1 and 50 in 'linear' scale and y-limits of 10 and 1000 in 'log' scale, enter (1, 50, 1, 3).

Order of scalars is (left, right, bottom, top).

Returns

PolyCollection

A *PolyCollection* defining the hexagonal bins.

- *PolyCollection.get_offsets* contains a Mx2 array containing the x, y positions of the M hexagon centers.
- *PolyCollection.get_array* contains the values of the M hexagons.

If *marginals* is *True*, horizontal bar and vertical bar (both PolyCollections) will be attached to the return collection as attributes *hbar* and *vbar*.

Other Parameters

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] The Colormap instance or registered colormap name used to map the bin values to colors.

norm

[*Normalize*, optional] The Normalize instance scales the bin values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

vmin, vmax

[float, default: None] The colorbar range. If *None*, suitable min/max values are automatically chosen by the *Normalize* instance (defaults to the respective min/max values of the bins in case of the default linear scaling). It is deprecated to use *vmin*/*vmax* when *norm* is given.

alpha

[float between 0 and 1, optional] The alpha blending value, between 0 (transparent) and 1 (opaque).

linewidths

[float, default: *None*] If *None*, defaults to 1.0.

edgecolors

[{'face', 'none', *None*} or color, default: 'face'] The color of the hexagon edges. Possible values are:

- 'face': Draw the edges in the same color as the fill color.
- 'none': No edges are drawn. This can sometimes lead to unsightly unpainted pixels between the hexagons.
- *None*: Draw outlines in the default color.
- An explicit color.

reduce_C_function

[callable, default: `numpy.mean`] The function to aggregate *C* within the bins. It is ignored if *C* is not given. This must have the signature:

```
def reduce_C_function(C: array) -> float
```

Commonly used functions are:

- `numpy.mean`: average of the points
- `numpy.sum`: integral of the point values
- `numpy.max`: value taken from the largest point

****kwargs**

[*PolyCollection* properties] All other keyword arguments are passed on to *PolyCollection*:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	ndarray
capstyle	{'butt', 'round', 'projecting'}
clim	(vmin: float, vmax: float)
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of rgba tuples
contains	unknown
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
norm	*Normalize* or None
offset_position	unknown
offsets	array-like (N, 2) or (2,)
path_effects	*AbstractPathEffect*
picker	None or bool or callable
pickradius	unknown
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.hexbin`

matplotlib.pyplot.hist

matplotlib.pyplot.**hist**(*x*, *bins=None*, *range=None*, *density=False*, *weights=None*, *cumulative=False*, *bottom=None*, *histtype='bar'*, *align='mid'*, *orientation='vertical'*, *rwidth=None*, *log=False*, *color=None*, *label=None*, *stacked=False*, ***, *data=None*, ***kwargs*)

Plot a histogram.

Compute and draw the histogram of *x*. The return value is a tuple (*n*, *bins*, *patches*) or ([*n0*, *n1*, ...], *bins*, [*patches0*, *patches1*, ...]) if the input contains multiple data. See the documentation of the *weights* parameter to draw a histogram of already-binned data.

Multiple data can be provided via *x* as a list of datasets of potentially different length ([*x0*, *x1*, ...]), or as a 2-D ndarray in which each column is a dataset. Note that the ndarray form is transposed relative to the list form.

Masked arrays are not supported.

The *bins*, *range*, *weights*, and *density* parameters behave as in `numpy.histogram`.

Parameters

x

[(n,) array or sequence of (n,) arrays] Input values, this takes either a single array or a sequence of arrays which are not required to be of the same length.

bins

[int or sequence or str, default: `rcParams["hist.bins"]` (default: `10`)] If *bins* is an integer, it defines the number of equal-width bins in the range.

If *bins* is a sequence, it defines the bin edges, including the left edge of the first bin and the right edge of the last bin; in this case, bins may be unequally spaced. All but the last (righthand-most) bin is half-open. In other words, if *bins* is:

```
[1, 2, 3, 4]
```

then the first bin is `[1, 2)` (including 1, but excluding 2) and the second `[2, 3)`. The last bin, however, is `[3, 4]`, which *includes* 4.

If *bins* is a string, it is one of the binning strategies supported by `numpy.histogram_bin_edges`: 'auto', 'fd', 'doane', 'scott', 'stone', 'rice', 'sturges', or 'sqrt'.

range

[tuple or None, default: None] The lower and upper range of the bins. Lower and upper outliers are ignored. If not provided, *range* is `(x.min(), x.max())`. Range has no effect if *bins* is a sequence.

If *bins* is a sequence or *range* is specified, autoscaling is based on the specified bin range instead of the range of x.

density

[bool, default: False] If `True`, draw and return a probability density: each bin will display the bin's raw count divided by the total number of counts *and the bin width* (`density = counts / (sum(counts) * np.diff(bins))`), so that the area under the histogram integrates to 1 (`np.sum(density * np.diff(bins)) == 1`).

If *stacked* is also `True`, the sum of the histograms is normalized to 1.

weights

[(n,) array-like or None, default: None] An array of weights, of the same shape as *x*. Each value in *x* only contributes its associated weight towards the bin count (instead of 1). If *density* is `True`, the weights are normalized, so that the integral of the density over the range remains 1.

This parameter can be used to draw a histogram of data that has already been binned, e.g. using `numpy.histogram` (by treating each bin as a single point with a weight equal to its count)

```
counts, bins = np.histogram(data)
plt.hist(bins[:-1], bins, weights=counts)
```

(or you may alternatively use *bar()*).

cumulative

[bool or -1, default: False] If `True`, then a histogram is computed where each bin gives the counts in that bin plus all bins for smaller values. The last bin gives the total number of datapoints.

If *density* is also `True` then the histogram is normalized such that the last bin equals 1.

If *cumulative* is a number less than 0 (e.g., -1), the direction of accumulation is reversed. In this case, if *density* is also `True`, then the histogram is normalized such that the first bin equals 1.

bottom

[array-like, scalar, or None, default: None] Location of the bottom of each bin, ie. bins are drawn from `bottom` to `bottom + hist(x, bins)` If a scalar, the bottom of each bin is shifted by the same amount. If an array, each bin is shifted independently and the length of bottom must match the number of bins. If None, defaults to 0.

histtype

[{'bar', 'barstacked', 'step', 'stepfilled'}, default: 'bar'] The type of histogram to draw.

- 'bar' is a traditional bar-type histogram. If multiple data are given the bars are arranged side by side.
- 'barstacked' is a bar-type histogram where multiple data are stacked on top of each other.
- 'step' generates a lineplot that is by default unfilled.
- 'stepfilled' generates a lineplot that is by default filled.

align

[{'left', 'mid', 'right'}, default: 'mid'] The horizontal alignment of the histogram bars.

- 'left': bars are centered on the left bin edges.
- 'mid': bars are centered between the bin edges.
- 'right': bars are centered on the right bin edges.

orientation

[{'vertical', 'horizontal'}, default: 'vertical'] If 'horizontal', *barh* will be used for bar-type histograms and the *bottom* kwarg will be the left edges.

rwidth

[float or None, default: None] The relative width of the bars as a fraction of the bin width. If `None`, automatically compute the width.

Ignored if *histtype* is 'step' or 'stepfilled'.

log

[bool, default: False] If `True`, the histogram axis will be set to a log scale. If *log* is `True` and *x* is a 1D array, empty bins will be filtered out and only the non-empty `(n, bins, patches)` will be returned.

color

[color or array-like of colors or None, default: None] Color or sequence of colors, one per dataset. Default (`None`) uses the standard line color sequence.

label

[str or None, default: None] String, or sequence of strings to match multiple datasets. Bar charts yield multiple patches per dataset, but only the first gets the label, so that *legend* will work as expected.

stacked

[bool, default: False] If `True`, multiple data are stacked on top of each other If `False` multiple data are arranged side by side if histtype is 'bar' or on top of each other if histtype is 'step'

Returns

n

[array or list of arrays] The values of the histogram bins. See *density* and *weights* for a description of the possible semantics. If input *x* is an array, then this is an array of length *nbins*. If input is a sequence of arrays `[data1, data2, ...]`, then this is a list of arrays with the values of the histograms for each of the arrays in the same order. The dtype of the array *n* (or of its element arrays) will always be float even if no weighting or normalization is used.

bins

[array] The edges of the bins. Length nbins + 1 (nbins left edges and right edge of last bin). Always a single array even when multiple data sets are passed in.

patches

[*BarContainer* or list of a single *Polygon* or list of such objects] Container of individual artists used to create the histogram or list of such containers if there are multiple input datasets.

Other Parameters

****kwargs**

Patch properties

See also:

hist2d

2D histograms

Notes

For large numbers of bins (>1000), 'step' and 'stepfilled' can be significantly faster than 'bar' and 'barstacked'.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *weights*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.hist`

- sphx_glr_gallery_user_interfaces_svg_histogram_sgskip.py

matplotlib.pyplot.hist2d

matplotlib.pyplot.**hist2d**(*x*, *y*, *bins=10*, *range=None*, *density=False*, *weights=None*, *cmin=None*, *cmax=None*, *, *data=None*, ***kwargs*)

Make a 2D histogram plot.

Parameters

x, y

[array-like, shape (n,)] Input values

bins

[None or int or [int, int] or array-like or [array, array]] The bin specification:

- If int, the number of bins for the two dimensions (nx=ny=bins).
- If `[int, int]`, the number of bins in each dimension (nx, ny = bins).
- If array-like, the bin edges for the two dimensions (x_edges=y_edges=bins).
- If `[array, array]`, the bin edges in each dimension (x_edges, y_edges = bins).

The default value is 10.

range

[array-like shape(2, 2), optional] The leftmost and rightmost edges of the bins along each dimension (if not specified explicitly in the bins parameters): `[[xmin, xmax], [ymin, ymax]]`. All values outside of this range will be considered outliers and not tallied in the histogram.

density

[bool, default: False] Normalize histogram. See the documentation for the *density* parameter of *hist* for more details.

weights

[array-like, shape (n,), optional] An array of values w_i weighing each sample (x_i, y_i).

cmin, cmax

[float, default: None] All bins that has count less than *cmin* or more than *cmax* will not be displayed (set to NaN before passing to imshow) and these count values in the return value count histogram will also be set to nan upon return.

Returns

h

[2D array] The bi-dimensional histogram of samples x and y. Values in x are histogrammed along the first dimension and values in y are histogrammed along the second dimension.

xedges

[1D array] The bin edges along the x axis.

yedges

[1D array] The bin edges along the y axis.

image

[*QuadMesh*]

Other Parameters

cmap

[Colormap or str, optional] A *colors.Colormap* instance. If not set, use rc settings.

norm

[Normalize, optional] A *colors.Normalize* instance is used to scale luminance data to `[0, 1]`. If not set, defaults to *colors.Normalize()*.

vmin/vmax

[None or scalar, optional] Arguments passed to the *Normalize* instance.

alpha

[`0 <= scalar <= 1` or `None`, optional] The alpha blending value.

****kwargs**

Additional parameters are passed along to the *pcolormesh* method and *QuadMesh* constructor.

See also:

hist

1D histogram plotting

Notes

- Currently `hist2d` calculates its own axis limits, and any limits previously set are ignored.
- Rendering the histogram with a logarithmic color scale is accomplished by passing a *colors.LogNorm* instance to the *norm* keyword argument. Likewise, power-law normalization (similar in effect to gamma correction) can be accomplished with *colors.PowerNorm*.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*, *weights*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.hist2d`

- sphx_glr_gallery_scales_power_norm.py

matplotlib.pyplot.hlines

`matplotlib.pyplot.`**`hlines`**(*y*, *xmin*, *xmax*, *colors=None*, *linestyles='solid'*, *label=''*, ***, *data=None*, ***kwargs*)

Plot horizontal lines at each *y* from *xmin* to *xmax*.

Parameters

y

[float or array-like] y-indexes where to plot the lines.

xmin, xmax

[float or array-like] Respective beginning and end of each line. If scalars are provided, all lines will have same length.

colors

[list of colors, default: `rcParams["lines.color"]` (default: `'C0'`)]

linestyles

[{'solid', 'dashed', 'dashdot', 'dotted'}, optional]

label

[str, default: '']

Returns

LineCollection

Other Parameters

****kwargs**

[*LineCollection* properties.]

See also:

vlines

vertical lines

axhline

horizontal line across the axes

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *y*, *xmin*, *xmax*, *colors*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.hlines`

matplotlib.pyplot.hot

matplotlib.pyplot.**hot**()
Set the colormap to "hot".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.hot`

matplotlib.pyplot.hsv

matplotlib.pyplot.**hsv**()
Set the colormap to "hsv".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.hsv`

matplotlib.pyplot.imread

matplotlib.pyplot.**imread**(*fname*, *format=None*)
Read an image from a file into an array.

Parameters

fname

[str or file-like] The image file to read: a filename, a URL or a file-like object opened in read-binary mode.

format

[str, optional] The image file format assumed for reading the data. If not given, the format is deduced from the filename. If nothing can be deduced, PNG is tried.

Returns

`numpy.array`

The image data. The returned array has shape

- (M, N) for grayscale images.
- (M, N, 3) for RGB images.
- (M, N, 4) for RGBA images.

Examples using `matplotlib.pyplot.imread`

- sphx_glr_gallery_images_contours_and_fields_image_clip_path.py
- sphx_glr_gallery_images_contours_and_fields_image_demo.py
- sphx_glr_gallery_images_contours_and_fields_watermark_image.py
- sphx_glr_gallery_text_labels_and_annotations_demo_annotation_box.py
- sphx_glr_gallery_text_labels_and_annotations_demo_text_path.py
- sphx_glr_gallery_misc_demo_ribbon_box.py

matplotlib.pyplot.imsave

`matplotlib.pyplot.`**`imsave`**(*fname*, *arr*, ***kwargs*)

Save an array as an image file.

Parameters

fname

[str or path-like or file-like] A path or a file-like object to store the image in. If *format* is not set, then the output format is inferred from the extension of *fname*, if any, and from `rcParams["savefig.format"]` (default: `'png'`) otherwise. If *format* is set, it determines the output format.

arr

[array-like] The image data. The shape can be one of MxN (luminance), MxNx3 (RGB) or MxNx4 (RGBA).

vmin, vmax

[float, optional] *vmin* and *vmax* set the color scaling for the image by fixing the values that map to the colormap color limits. If either *vmin* or *vmax* is None, that limit is determined from the *arr* min/max value.

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] A Colormap instance or registered colormap name. The colormap maps scalar data to colors. It is ignored for RGB(A) data.

format

[str, optional] The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under *fname*.

origin

[{'upper', 'lower'}, default: `rcParams["image.origin"]` (default: `'upper'`)] Indicates whether the `(0, 0)` index of the array is in the upper left or lower left corner of the axes.

dpi

[float] The DPI to store in the metadata of the file. This does not affect the resolution of the output image. Depending on file format, this may be rounded to the nearest integer.

metadata

[dict, optional] Metadata in the image file. The supported keys depend on the output format, see the documentation of the respective backends for more information.

pil_kwargs

[dict, optional] Keyword arguments passed to `PIL.Image.Image.save`. If the 'pnginfo' key is present, it completely overrides *metadata*, including the default 'Software' key.

Examples using `matplotlib.pyplot.imsave`

matplotlib.pyplot.imshow

matplotlib.pyplot.**imshow**(*X*, *cmap=None*, *norm=None*, *aspect=None*, *interpolation=None*, *alpha=None*, *vmin=None*, *vmax=None*, *origin=None*, *extent=None*, ***, *filternorm=True*, *filterrad=4.0*, *resample=None*, *url=None*, *data=None*, ***kwargs*)

Display data as an image, i.e., on a 2D regular raster.

The input may either be actual RGB(A) data, or 2D scalar data, which will be rendered as a pseudocolor image. For displaying a grayscale image set up the color mapping using the parameters `cmap='gray', vmin=0, vmax=255`.

The number of pixels used to render an image is set by the axes size and the *dpi* of the figure. This can lead to aliasing artifacts when the image is resampled because the displayed image size will usually not match the size of *X* (see /gallery/images_contours_and_fields/image_antialiasing). The resampling can be controlled via the *interpolation* parameter and/or `rcParams["image.interpolation"]` (default: `'antialiased'`).

Parameters

X

[array-like or PIL image] The image data. Supported array shapes are:

- (M, N): an image with scalar data. The values are mapped to colors using normalization and a colormap. See parameters *norm*, *cmap*, *vmin*, *vmax*.
- (M, N, 3): an image with RGB values (0-1 float or 0-255 int).
- (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

The first two dimensions (M, N) define the rows and columns of the image.

Out-of-range RGB(A) values are clipped.

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors. This parameter is ignored for RGB(A) data.

norm

[*Normalize*, optional] The *Normalize* instance used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling mapping the lowest value to 0 and the highest to 1 is used. This parameter is ignored for RGB(A) data.

aspect

[{'equal', 'auto'} or float, default: `rcParams["image.aspect"]` (default: `'equal'`)] The aspect ratio of the axes. This parameter is particularly relevant for images since it determines whether data pixels are square.

This parameter is a shortcut for explicitly calling *Axes.set_aspect*. See there for further details.

- 'equal': Ensures an aspect ratio of 1. Pixels will be square (unless pixel sizes are explicitly made non-square in data coordinates using *extent*).
- 'auto': The axes is kept fixed and the aspect is adjusted so that the data fit in the axes. In general, this will result in non-square pixels.

interpolation

[str, default: `rcParams["image.interpolation"]` (default: `'antialiased'`)] The interpolation method used.

Supported values are 'none', 'antialiased', 'nearest', 'bilinear', 'bicubic', 'spline16', 'spline36', 'hanning', 'hamming', 'hermite', 'kaiser', 'quadric', 'catrom', 'gaussian', 'bessel', 'mitchell', 'sinc', 'lanczos'.

If *interpolation* is 'none', then no interpolation is performed on the Agg, ps, pdf and svg backends. Other backends will fall back to 'nearest'. Note that most SVG renderers perform interpolation at rendering and that the default interpolation method they implement may differ.

If *interpolation* is the default 'antialiased', then 'nearest' interpolation is used if the image is upsampled by more than a factor of three (i.e. the number of display pixels is at least three times the size of the data array). If the upsampling rate is smaller than 3, or the image is downsampled, then 'hanning' interpolation is used to act as an anti-aliasing filter, unless the image happens to be upsampled by exactly a factor of two or one.

See /gallery/images_contours_and_fields/interpolation_methods for an overview of the supported interpolation methods, and /gallery/images_contours_and_fields/image_antialiasing for a discussion of image antialiasing.

Some interpolation methods require an additional radius parameter, which can be set by *filterrad*. Additionally, the antigrain image resize filter is controlled by the parameter *filternorm*.

alpha

[float or array-like, optional] The alpha blending value, between 0 (transparent) and 1 (opaque). If *alpha* is an array, the alpha blending values are applied pixel by pixel, and *alpha* must have the same shape as *X*.

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the

supplied data. It is deprecated to use *vmin*/*vmax* when *norm* is given.

origin

[{'upper', 'lower'}, default: `rcParams["image.origin"]` (default: `'upper'`)] Place the [0, 0] index of the array in the upper left or lower left corner of the axes. The convention (the default) 'upper' is typically used for matrices and images.

Note that the vertical axes points upward for 'lower' but downward for 'upper'.

See the *origin and extent in imshow* tutorial for examples and a more detailed description.

extent

[floats (left, right, bottom, top), optional] The bounding box in data coordinates that the image will fill. The image is stretched individually along x and y to fill the box.

The default extent is determined by the following conditions. Pixels have unit size in data coordinates. Their centers are on integer coordinates, and their center coordinates range from 0 to columns-1 horizontally and from 0 to rows-1 vertically.

Note that the direction of the vertical axis and thus the default values for top and bottom depend on *origin*:

- For `origin == 'upper'` the default is `(-0.5, numcols-0.5, numrows-0.5, -0.5)`.
- For `origin == 'lower'` the default is `(-0.5, numcols-0.5, -0.5, numrows-0.5)`.

See the *origin and extent in imshow* tutorial for examples and a more detailed description.

filternorm

[bool, default: True] A parameter for the antigrain image resize filter (see the antigrain documentation). If *filternorm* is set, the filter normalizes integer values and corrects the rounding errors. It doesn't do anything with the source floating point values, it corrects only integers according to the rule of 1.0 which means that any sum of pixel weights must be equal to 1.0. So, the filter function must produce a graph of the proper shape.

filterrad

[float > 0, default: 4.0] The filter radius for filters that have a radius parameter, i.e. when interpolation is one of: 'sinc', 'lanczos' or 'blackman'.

resample

[bool, default: `rcParams["image.resample"]` (default: `True`)] When *True*, use a full resampling method. When *False*, only resample when the output image is larger than the input image.

url

[str, optional] Set the url of the created *AxesImage*. See *Artist.set_url*.

Returns

AxesImage

Other Parameters

****kwargs**

[*Artist* properties] These parameters are passed on to the constructor of the *AxesImage* artist.

See also:

matshow

Plot a matrix or an array as an image.

Notes

Unless *extent* is used, pixel centers will be located at integer coordinates. In other words: the origin will coincide with the center of pixel (0, 0).

There are two common representations for RGB images with an alpha channel:

- Straight (unassociated) alpha: R, G, and B channels represent the color of the pixel, disregarding its opacity.
- Premultiplied (associated) alpha: R, G, and B channels represent the color of the pixel, adjusted for its opacity by multiplication.

imshow expects RGB images adopting the straight (unassociated) alpha representation.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.imshow`

- sphx_glr_gallery_misc_hyperlinks_sgskip.py

matplotlib.pyplot.inferno

matplotlib.pyplot.**inferno**()
Set the colormap to "inferno".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.inferno`

matplotlib.pyplot.install_repl_displayhook

matplotlib.pyplot.**install_repl_displayhook**()
Install a repl display hook so that any stale figure are automatically redrawn when control is returned to the repl.

This works both with IPython and with vanilla python shells.

Examples using `matplotlib.pyplot.install_repl_displayhook`

matplotlib.pyplot.ioff

matplotlib.pyplot.**ioff**()
Turn the interactive mode off.

See also:

ion
enable interactive mode

isinteractive
query current state

show
show windows (and maybe block)

pause

show windows, run GUI event loop, and block for a time

Examples using `matplotlib.pyplot.ioff`

matplotlib.pyplot.ion

`matplotlib.pyplot.ion()`

Turn the interactive mode on.

See also:

ioff

disable interactive mode

isinteractive

query current state

show

show windows (and maybe block)

pause

show windows, run GUI event loop, and block for a time

Examples using `matplotlib.pyplot.ion`

- *Usage Guide*

matplotlib.pyplot.isinteractive

`matplotlib.pyplot.isinteractive()`

Return if pyplot is in "interactive mode" or not.

If in interactive mode then:

- newly created figures will be shown immediately
- figures will automatically redraw on change
- *pyplot.show* will not block by default

If not in interactive mode then:

- newly created figures and changes to figures will not be reflected until explicitly asked to be
- *pyplot.show* will block by default

See also:

ion

enable interactive mode

ioff

disable interactive mode

show

show windows (and maybe block)

pause

show windows, run GUI event loop, and block for a time

Examples using `matplotlib.pyplot.isinteractive`

matplotlib.pyplot.jet

matplotlib.pyplot.**jet**()

Set the colormap to "jet".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.jet`

matplotlib.pyplot.legend

matplotlib.pyplot.**legend**(**args*, ***kwargs*)

Place a legend on the axes.

Call signatures:

```
legend()
legend(labels)
legend(handles, labels)
```

The call signatures correspond to three different ways how to use this method.

1. Automatic detection of elements to be shown in the legend

The elements to be added to the legend are automatically determined, when you do not pass in any extra arguments.

In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the *set_label()* method on the artist:

```
line, = ax.plot([1, 2, 3], label='Inline label')
ax.legend()
```

or:

```
line, = ax.plot([1, 2, 3])
line.set_label('Label via method')
ax.legend()
```

Specific lines can be excluded from the automatic legend element selection by defining a label starting with an underscore. This is default for all artists, so calling *Axes.legend* without any arguments and without setting the labels manually will result in no legend being drawn.

2. Labeling existing plot elements

To make a legend for lines which already exist on the axes (via plot for instance), simply call this function with an iterable of strings, one for each legend item. For example:

```
ax.plot([1, 2, 3])
ax.legend(['A simple line'])
```

Note: This way of using is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

3. Explicitly defining the elements in the legend

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```
legend((line1, line2, line3), ('label1', 'label2', 'label3'))
```

Parameters

handles

[sequence of *Artist*, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with *labels*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

labels

[list of str, optional] A list of labels to show next to the artists. Use this together with *handles*, if you need full control on what

is shown in the legend and the automatic mechanism described above is not sufficient.

Returns

Legend

Other Parameters

loc

[str or pair of floats, default: `rcParams["legend.loc"]` (default: `'best'`) ('best' for axes, 'upper right' for figures)] The location of the legend.

The strings `'upper left'`, `'upper right'`, `'lower left'`, `'lower right'` place the legend at the corresponding corner of the axes/figure.

The strings `'upper center'`, `'lower center'`, `'center left'`, `'center right'` place the legend at the center of the corresponding edge of the axes/figure.

The string `'center'` places the legend at the center of the axes/figure.

The string `'best'` places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case *bbox_to_anchor* will be ignored).

For back-compatibility, `'center right'` (but no other location) can also be spelled `'right'`, and each "string" locations can also be given as a numeric value:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*. Defaults to `axes.bbox` (if called as a method to *Axes.legend*) or `figure.bbox` (if *Figure.legend*). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by *bbox_transform*, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox `(x, y, width, height)` that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple `(x, y)` places the corner of the legend specified by *loc* at x, y. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

ncol

[int, default: 1] The number of columns that the legend has.

prop

[None or *matplotlib.font_manager.FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

labelcolor

[str or list] Sets the color of the text in the legend. Can be a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

numpoints

[int, default: `rcParams["legend.numpoints"]` (default: `1`)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).

scatterpoints

[int, default: `rcParams["legend.scatterpoints"]` (default: `1`)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).

scatteryoffsets

[iterable of floats, default: `[0.375, 0.5, 0.3125]`] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to `[0.5]`.

markerscale

[float, default: `rcParams["legend.markerscale"]` (default: `1.0`)] The relative size of legend markers compared with the originally drawn ones.

markerfirst

[bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

frameon

[bool, default: `rcParams["legend.frameon"]` (default: `True`)] Whether the legend should be drawn on a patch (frame).

fancybox

[bool, default: `rcParams["legend.fancybox"]` (default: `True`)] Whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend's background.

shadow

[bool, default: `rcParams["legend.shadow"]` (default: `False`)] Whether to draw a shadow behind the legend.

framealpha

[float, default: `rcParams["legend.framealpha"]` (default: `0.8`)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is `None`, the default value is ignored.

facecolor

["inherit" or color, default: `rcParams["legend.facecolor"]` (default: `'inherit'`)] The legend's background color. If `"inherit"`, use `rcParams["axes.facecolor"]` (default: `'white'`).

edgecolor

["inherit" or color, default: `rcParams["legend.edgecolor"]` (default: `'0.8'`)] The legend's background patch edge color. If `"inherit"`, use take `rcParams["axes.edgecolor"]` (default: `'black'`).

mode

[{"expand", None}] If *mode* is set to `"expand"` the legend will be horizontally expanded to fill the axes area (or *bbox_to_anchor* if defines the legend's size).

bbox_transform

[None or *matplotlib.transforms.Transform*] The transform for the bounding box (*bbox_to_anchor*). For a value of `None` (default) the Axes' `transAxes` transform will be used.

title

[str or None] The legend's title. Default is no title (`None`).

title_fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: `rcParams["legend.title_fontsize"]` (default: `None`)] The font size of the legend's title.

borderpad

[float, default: `rcParams["legend.borderpad"]` (default: `0.4`)] The fractional whitespace inside the legend border, in font-size units.

labelspacing

[float, default: `rcParams["legend.labelspacing"]` (default: `0.5`)] The vertical space between the legend entries, in font-size units.

handlelength

[float, default: `rcParams["legend.handlelength"]` (default: `2.0`)]
The length of the legend handles, in font-size units.

handletextpad

[float, default: `rcParams["legend.handletextpad"]` (default: `0.8`)]
The pad between the legend handle and text, in font-size units.

borderaxespad

[float, default: `rcParams["legend.borderaxespad"]` (default: `0.5`)]
The pad between the axes and legend border, in font-size units.

columnspacing

[float, default: `rcParams["legend.columnspacing"]` (default: `2.0`)]
The spacing between columns, in font-size units.

handler_map

[dict or None] The custom dictionary mapping instances or types to a legend handler. This *handler_map* updates the default handler map found at *matplotlib.legend.Legend.get_legend_handler_map*.

Notes

Some artists are not supported by this function. See *Legend guide* for details.

Examples

Examples using `matplotlib.pyplot.legend`

- sphx_glr_gallery_user_interfaces_svg_histogram_sgskip.py
- sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py

matplotlib.pyplot.locator_params

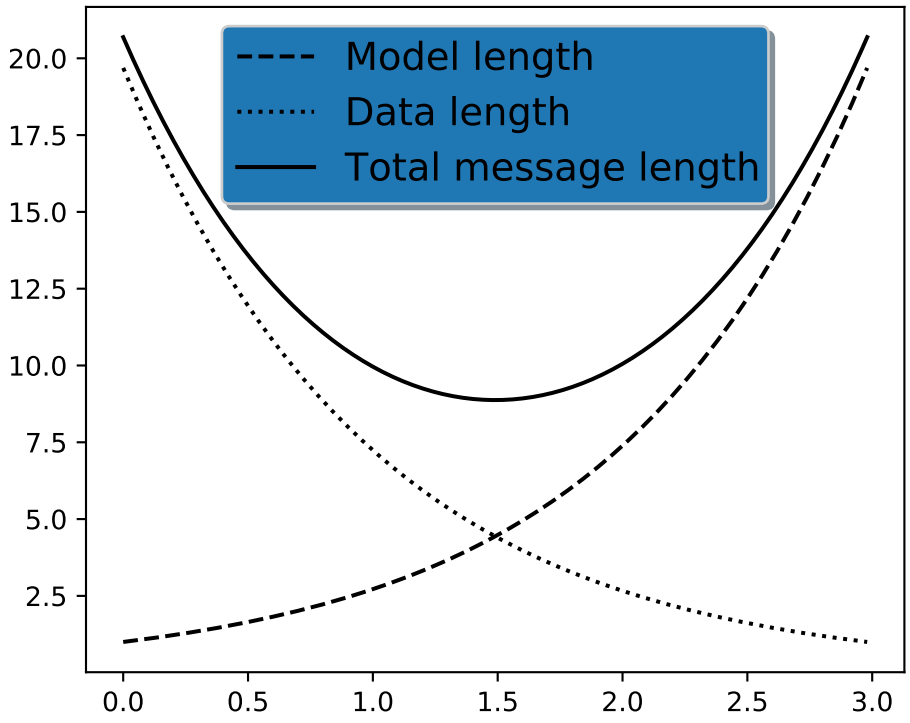
`matplotlib.pyplot.locator_params`(*axis='both'*, *tight=None*, ***kwargs*)
Control behavior of major tick locators.

Because the locator is involved in autoscaling, *autoscale_view* is called automatically after the parameters are changed.

Parameters

axis

[{'both', 'x', 'y'}, default: 'both'] The axis on which to operate.



tight

[bool or None, optional] Parameter passed to *autoscale_view*. Default is None, for no change.

Other Parameters

****kwargs**

Remaining keyword arguments are passed to directly to the `set_params()` method of the locator. Supported keywords depend on the type of the locator. See for example *set_params* for the *ticker.MaxNLocator* used by default for linear axes.

Examples

When plotting small subplots, one might want to reduce the maximum number of ticks and use tight bounds, for example:

```
ax.locator_params(tight=True, nbins=4)
```

Examples using `matplotlib.pyplot.locator_params`

matplotlib.pyplot.loglog

matplotlib.pyplot.**loglog**(**args*, ***kwargs*)

Make a plot with log scaling on both the x and y axis.

Call signatures:

```
loglog([x], y, [fmt], data=None, **kwargs)
loglog([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around *plot* which additionally changes both the x-axis and the y-axis to log scaling. All of the concepts and parameters of plot can be used here as well.

The additional parameters *base*, *subs* and *nonpositive* control the x/y-axis properties. They are just forwarded to *Axes.set_xscale* and *Axes.set_yscale*. To use different properties on the x-axis and the y-axis, use e.g. `ax.set_xscale("log", base=10); ax.set_yscale("log", base=2)`.

Parameters

base

[float, default: 10] Base of the logarithm.

subs

[sequence, optional] The location of the minor ticks. If *None*, reasonable locations are automatically chosen depending on the number of decades in the plot. See *Axes.set_xscale*/*Axes.set_yscale* for details.

nonpositive

[{'mask', 'clip'}, default: 'mask'] Non-positive values can be masked as invalid, or clipped to a very small positive number.

Returns

lines

A list of *Line2D* objects representing the plotted data.

Other Parameters

****kwargs**

All parameters supported by *plot*.

Examples using `matplotlib.pyplot.loglog`

- *Sample plots in Matplotlib*

matplotlib.pyplot.magma

matplotlib.pyplot.**magma**()

Set the colormap to "magma".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.magma`

matplotlib.pyplot.magnitude_spectrum

matplotlib.pyplot.**magnitude_spectrum**(*x*, *Fs=None*, *Fc=None*, *window=None*, *pad_to=None*, *sides=None*, *scale=None*, ***, *data=None*, ***kwargs*)

Plot the magnitude spectrum.

Compute the magnitude spectrum of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data.

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a

function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

scale

[{'default', 'linear', 'dB'}] The scaling of the values in the *spec*. 'linear' is no scaling. 'dB' returns the values in dB scale, i.e., the dB amplitude (20 * log10). 'default' is 'linear'.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

spectrum

[1-D array] The values for the magnitude spectrum before scaling (real valued).

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

line

[*Line2D*] The line created by this function.

Other Parameters

****kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also:

psd

Plots the power spectral density.

angle_spectrum

Plots the angles of the corresponding frequencies.

phase_spectrum

Plots the phase (unwrapped angle) of the corresponding frequencies.

specgram

Can plot the magnitude spectrum of segments within the signal in a colormap.

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.magnitude_spectrum`

matplotlib.pyplot.margins

matplotlib.pyplot.**margins**(**margins*, *x=None*, *y=None*, *tight=True*)

Set or retrieve autoscaling margins.

The padding added to each limit of the axes is the *margin* times the data interval. All input parameters must be floats within the range [0, 1]. Passing both positional and keyword arguments is invalid and will raise a TypeError. If no arguments (positional or otherwise) are provided, the current margins will remain in place and simply be returned.

Specifying any margin changes only the autoscaling; for example, if *xmargin* is not None, then *xmargin* times the X data interval will be added to each end of that interval before it is used in autoscaling.

Parameters

***margins**

[float, optional] If a single positional argument is provided, it specifies both margins of the x-axis and y-axis limits. If two positional arguments are provided, they will be interpreted as *xmargin*, *ymargin*. If setting the margin on a single axis is desired, use the keyword arguments described below.

x, y

[float, optional] Specific margin values for the x-axis and y-axis, respectively. These cannot be used with positional arguments, but can be used individually to alter on e.g., only the y-axis.

tight

[bool or None, default: True] The *tight* parameter is passed to `autoscale_view()`, which is executed after a margin is changed; the default here is *True*, on the assumption that when margins are specified, no additional padding to match tick marks is usually desired. Set *tight* to *None* will preserve the previous setting.

Returns

xmargin, ymargin

[float]

Notes

If a previously used Axes method such as *pcolor()* has set `use_sticky_edges` to `True`, only the limits not set by the "sticky artists" will be modified. To force all of the margins to be set, set `use_sticky_edges` to `False` before calling *margins()*.

Examples using `matplotlib.pyplot.margins`

- sphx_glr_gallery_subplots_axes_and_figures_axes_margins.py
- sphx_glr_gallery_ticks_and_spines_ticklabels_rotation.py

matplotlib.pyplot.matshow

`matplotlib.pyplot.`**`matshow`**(*A*, *fignum=None*, ***kwargs*)

Display an array as a matrix in a new figure window.

The origin is set at the upper left hand corner and rows (first dimension of the array) are displayed horizontally. The aspect ratio of the figure window is that of the array, unless this would make an excessively short or narrow figure.

Tick labels for the xaxis are placed on top.

Parameters

A

[array-like(M, N)] The matrix to be displayed.

fignum

[None or int or False] If *None*, create a new figure window with automatic numbering.

If a nonzero integer, draw into the figure with the given number (create it if it does not exist).

If 0, use the current axes (or create one if it does not exist).

Note: Because of how *Axes.matshow* tries to set the figure aspect ratio to be the one of the array, strange things may happen if you reuse an existing figure.

Returns

AxesImage

Other Parameters

****kwargs**

[*imshow* arguments]

Examples using `matplotlib.pyplot.matshow`

- sphx_glr_gallery_images_contours_and_fields_matshow.py

matplotlib.pyplot.minorticks_off

matplotlib.pyplot.**minorticks_off**()
Remove minor ticks from the axes.

Examples using `matplotlib.pyplot.minorticks_off`

matplotlib.pyplot.minorticks_on

matplotlib.pyplot.**minorticks_on**()
Display minor ticks on the axes.

Displaying minor ticks may reduce performance; you may turn them off using *minorticks_off()* if drawing speed is a problem.

Examples using `matplotlib.pyplot.minorticks_on`

matplotlib.pyplot.new_figure_manager

matplotlib.pyplot.**new_figure_manager**(*num*, **args*, ***kwargs*)
Create a new figure manager instance.

Examples using `matplotlib.pyplot.new_figure_manager`

matplotlib.pyplot.nipy_spectral

matplotlib.pyplot.**nipy_spectral**()
Set the colormap to "nipy_spectral".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.nipy_spectral`

matplotlib.pyplot.pause

matplotlib.pyplot.**pause**(*interval*)
Run the GUI event loop for *interval* seconds.

If there is an active figure, it will be updated and displayed before the pause, and the GUI event loop (if any) will run during the pause.

This can be used for crude animation. For more complex animation use *matplotlib.animation*.

If there is no active figure, sleep for *interval* seconds instead.

See also:

matplotlib.animation

Complex animation

show

show figures and optional block forever

Examples using `matplotlib.pyplot.pause`

- sphx_glr_gallery_mplot3d_rotate_axes3d_sgskip.py
- sphx_glr_gallery_mplot3d_wire3d_animation_sgskip.py

matplotlib.pyplot.pcolor

matplotlib.pyplot.**pcolor**(**args*, *shading=None*, *alpha=None*, *norm=None*, *cmap=None*, *vmin=None*, *vmax=None*, *data=None*, ***kwargs*)

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```
pcolor([X, Y,] C, **kwargs)
```

X and *Y* can be used to specify the corners of the quadrilaterals.

Hint: `pcolor()` can be very slow for large arrays. In most cases you should use the similar but much faster *`pcolormesh`* instead. See *Differences between pcolor() and pcolormesh()* for a discussion of the differences.

Parameters

C

[array-like] A scalar 2-D array. The values will be color-mapped.

X, Y

[array-like, optional] The coordinates of the corners of quadrilaterals of a pcolormesh:

```
(X[i+1, j], Y[i+1, j])       (X[i+1, j+1], Y[i+1, j+1])
                      +------+
                      |      |
                      +------+
   (X[i, j], Y[i, j])       (X[i, j+1], Y[i, j+1])
```

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the *Notes* section below.

If `shading='flat'` the dimensions of *X* and *Y* should be one greater than those of *C*, and the quadrilateral is colored due to the value at `C[i, j]`. If *X*, *Y* and *C* have equal dimensions, a warning will be raised and the last row and column of *C* will be ignored.

If `shading='nearest'`, the dimensions of *X* and *Y* should be the same as those of *C* (if not, a ValueError will be raised). The color `C[i, j]` will be centered on `(X[i, j], Y[i, j])`.

If *X* and/or *Y* are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2-D arrays, making a rectangular grid.

shading

[{'flat', 'nearest', 'auto'}, optional] The fill style for the quadrilateral; defaults to 'flat' or `rcParams["pcolor.shading"]` (default: `'flat'`). Possible values:

- 'flat': A solid color is used for each quad. The color of the quad (i, j), (i+1, j), (i, j+1), (i+1, j+1) is given by `C[i, j]`. The dimensions of *X* and *Y* should be one greater than those of *C*; if they are the same as *C*, then a deprecation warning is raised, and the last row and column of *C* are dropped.
- 'nearest': Each grid point will have a color centered on it, extending halfway between the adjacent grid centers. The dimensions of *X* and *Y* must be the same as *C*.
- 'auto': Choose 'flat' if dimensions of *X* and *Y* are one larger than *C*. Choose 'nearest' if dimensions are the same.

See /gallery/images_contours_and_fields/pcolormesh_grids for more description.

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] A Colormap instance or registered colormap name. The colormap maps the *C* values to colors.

norm

[*Normalize*, optional] The Normalize instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

vmin, vmax

[float, default: None] The colorbar range. If *None*, suitable min/max values are automatically chosen by the *Normalize* instance (defaults to the respective min/max values of *C* in case of the default linear scaling). It is deprecated to use *vmin*/*vmax* when *norm* is given.

edgecolors

[{'none', None, 'face', color, color sequence}, optional] The color of the edges. Defaults to 'none'. Possible values:

- 'none' or '': No edge.
- *None*: `rcParams["patch.edgecolor"]` (default: `'black'`) will be used. Note that currently `rcParams["patch.force_edgecolor"]` (default: `False`) has to be True for this to work.
- 'face': Use the adjacent face color.
- A color or sequence of colors will set the edge color.

The singular form *edgecolor* works as an alias.

alpha

[float, default: None] The alpha blending value of the face color, between 0 (transparent) and 1 (opaque). Note: The edgecolor is currently not affected by this.

snap

[bool, default: False] Whether to snap the mesh to pixel boundaries.

Returns

matplotlib.collections.Collection

Other Parameters

antialiaseds

[bool, default: False] The default *antialiaseds* is False if the default *edgecolors*="none" is used. This eliminates artificial lines at patch boundaries, and works regardless of the value of alpha. If *edgecolors* is not "none", then the default *antialiaseds* is taken from `rcParams["patch.antialiased"]` (default: `True`). Stroking the edges may be preferred if *alpha* is 1, but will cause artifacts otherwise.

****kwargs**

Additionally, the following arguments are allowed. They are passed along to the *PolyCollection* constructor:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	ndarray
capstyle	{'butt', 'round', 'projecting'}
clim	(vmin: float, vmax: float)
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of rgba tuples
contains	unknown
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
norm	*Normalize* or None
offset_position	unknown
offsets	array-like (N, 2) or (2,)
path_effects	*AbstractPathEffect*
picker	None or bool or callable
pickradius	unknown
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

See also:

pcolormesh

for an explanation of the differences between pcolor and pcolormesh.

imshow

If X and Y are each equidistant, *imshow* can be a faster alternative.

Notes

Masked arrays

X, Y and C may be masked arrays. If either `C[i, j]`, or one of the vertices surrounding `C[i, j]` (X or Y at `[i, j]`, `[i+1, j]`, `[i, j+1]`, `[i+1, j+1]`) is masked, nothing is plotted.

Grid orientation

The grid orientation follows the standard matrix convention: An array C with shape (nrows, ncolumns) is plotted with the column number as X and the row number as Y.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.pcolor`

- sphx_glr_gallery_images_contours_and_fields_pcolor_demo.py
- sphx_glr_gallery_subplots_axes_and_figures_axes_margins.py

matplotlib.pyplot.pcolormesh

matplotlib.pyplot.**pcolormesh**(**args*, *alpha=None*, *norm=None*, *cmap=None*, *vmin=None*, *vmax=None*, *shading=None*, *antialiased=False*, *data=None*, ***kwargs*)

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```
pcolormesh([X, Y,] C, **kwargs)
```

X and Y can be used to specify the corners of the quadrilaterals.

Hint: *pcolormesh* is similar to *pcolor*. It is much faster and preferred in most cases. For a detailed discussion on the differences see *Differences between*

pcolor() and pcolormesh().

Parameters

C

[array-like] A scalar 2-D array. The values will be color-mapped.

X, Y

[array-like, optional] The coordinates of the corners of quadrilaterals of a pcolormesh:

```
(X[i+1, j], Y[i+1, j])       (X[i+1, j+1], Y[i+1, j+1])
                      +-----+
                      |     |
                      +-----+
   (X[i, j], Y[i, j])       (X[i, j+1], Y[i, j+1])
```

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the *Notes* section below.

If `shading='flat'` the dimensions of *X* and *Y* should be one greater than those of *C*, and the quadrilateral is colored due to the value at `C[i, j]`. If *X*, *Y* and *C* have equal dimensions, a warning will be raised and the last row and column of *C* will be ignored.

If `shading='nearest'` or `'gouraud'`, the dimensions of *X* and *Y* should be the same as those of *C* (if not, a ValueError will be raised). For `'nearest'` the color `C[i, j]` is centered on `(X[i, j], Y[i, j])`. For `'gouraud'`, a smooth interpolation is caried out between the quadrilateral corners.

If *X* and/or *Y* are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2-D arrays, making a rectangular grid.

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] A Colormap instance or registered colormap name. The colormap maps the *C* values to colors.

norm

[*Normalize*, optional] The Normalize instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

vmin, vmax

[float, default: None] The colorbar range. If *None*, suitable min/max values are automatically chosen by the *Normalize* instance (defaults to the respective min/max values of *C* in case of the default linear scaling). It is deprecated to use *vmin*/*vmax* when *norm* is given.

edgecolors

[{'none', None, 'face', color, color sequence}, optional] The color of the edges. Defaults to 'none'. Possible values:

- 'none' or '': No edge.
- *None*: `rcParams["patch.edgecolor"]` (default: `'black'`) will be used. Note that currently `rcParams["patch.force_edgecolor"]` (default: `False`) has to be True for this to work.
- 'face': Use the adjacent face color.
- A color or sequence of colors will set the edge color.

The singular form *edgecolor* works as an alias.

alpha

[float, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

shading

[{'flat', 'nearest', 'gouraud', 'auto'}, optional] The fill style for the quadrilateral; defaults to 'flat' or `rcParams["pcolor.shading"]` (default: `'flat'`). Possible values:

- 'flat': A solid color is used for each quad. The color of the quad (i, j), (i+1, j), (i, j+1), (i+1, j+1) is given by `C[i, j]`. The dimensions of *X* and *Y* should be one greater than those of *C*; if they are the same as *C*, then a deprecation warning is raised, and the last row and column of *C* are dropped.
- 'nearest': Each grid point will have a color centered on it, extending halfway between the adjacent grid centers. The dimensions of *X* and *Y* must be the same as *C*.
- 'gouraud': Each quad will be Gouraud shaded: The color of the corners (i', j') are given by `C[i', j']`. The color values of the area in between is interpolated from the corner values. The dimensions of *X* and *Y* must be the same as *C*. When Gouraud shading is used, *edgecolors* is ignored.
- 'auto': Choose 'flat' if dimensions of *X* and *Y* are one larger than *C*. Choose 'nearest' if dimensions are the same.

See /gallery/images_contours_and_fields/pcolormesh_grids for more description.

snap

[bool, default: False] Whether to snap the mesh to pixel boundaries.

Returns

matplotlib.collections.QuadMesh

Other Parameters

****kwargs**

Additionally, the following arguments are allowed. They are passed along to the *QuadMesh* constructor:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	ndarray
capstyle	{'butt', 'round', 'projecting'}
clim	(vmin: float, vmax: float)
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of rgba tuples
contains	unknown
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
norm	*Normalize* or None
offset_position	unknown
offsets	array-like (N, 2) or (2,)
path_effects	*AbstractPathEffect*
picker	None or bool or callable
pickradius	unknown

Table 202 – continued from previous page

Property	Description
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

See also:

pcolor

An alternative implementation with slightly different features. For a detailed discussion on the differences see *Differences between pcolor() and pcolormesh()*.

imshow

If X and Y are each equidistant, *imshow* can be a faster alternative.

Notes

Masked arrays

C may be a masked array. If `C[i, j]` is masked, the corresponding quadrilateral will be transparent. Masking of X and Y is not supported. Use *pcolor* if you need this functionality.

Grid orientation

The grid orientation follows the standard matrix convention: An array C with shape (nrows, ncolumns) is plotted with the column number as X and the row number as Y.

Differences between pcolor() and pcolormesh()

Both methods are used to create a pseudocolor plot of a 2-D array using quadrilaterals.

The main difference lies in the created object and internal data handling: While *pcolor* returns a *PolyCollection*, *pcolormesh* returns a *QuadMesh*. The latter is more specialized for the given purpose and thus is faster. It should almost always be preferred.

There is also a slight difference in the handling of masked arrays. Both *pcolor* and *pcolormesh* support masked arrays for C. However, only *pcolor* supports masked arrays for X and Y. The reason lies in the internal handling of the

masked values. *pcolor* leaves out the respective polygons from the PolyCollection. *pcolormesh* sets the facecolor of the masked elements to transparent. You can see the difference when using edgecolors. While all edges are drawn irrespective of masking in a QuadMesh, the edge between two adjacent masked quadrilaterals in *pcolor* is not drawn as the corresponding polygons do not exist in the PolyCollection.

Another difference is the support of Gouraud shading in *pcolormesh*, which is not available with *pcolor*.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.pcolormesh`

- sphx_glr_gallery_images_contours_and_fields_pcolor_demo.py
- sphx_glr_gallery_images_contours_and_fields_pcolormesh_grids.py
- sphx_glr_gallery_images_contours_and_fields_pcolormesh_levels.py
- sphx_glr_gallery_images_contours_and_fields_quadmesh_demo.py
- *Sample plots in Matplotlib*

matplotlib.pyplot.phase_spectrum

matplotlib.pyplot.**phase_spectrum**(*x*, *Fs=None*, *Fc=None*, *window=None*, *pad_to=None*, *sides=None*, ***, *data=None*, ***kwargs*)

Plot the phase spectrum.

Compute the phase spectrum (unwrapped angle spectrum) of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

spectrum

[1-D array] The values for the phase spectrum in radians (real valued).

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

line

[*Line2D*] The line created by this function.

Other Parameters

****kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array

Table 203 – continued from previous page

Property	Description
zorder	float

See also:

magnitude_spectrum

Plots the magnitudes of the corresponding frequencies.

angle_spectrum

Plots the wrapped version of this function.

specgram

Can plot the phase spectrum of segments within the signal in a colormap.

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.phase_spectrum`

matplotlib.pyplot.pie

`matplotlib.pyplot.pie`(*x*, *explode=None*, *labels=None*, *colors=None*, *autopct=None*, *pctdistance=0.6*, *shadow=False*, *labeldistance=1.1*, *startangle=0*, *radius=1*, *counterclock=True*, *wedgeprops=None*, *textprops=None*, *center=0, 0*, *frame=False*, *rotatelabels=False*, ***, *normalize=None*, *data=None*)

Plot a pie chart.

Make a pie chart of array *x*. The fractional area of each wedge is given by `x/sum(x)`. If `sum(x) < 1`, then the values of *x* give the fractional area directly and the array will not be normalized. The resulting pie will have an empty wedge of size `1 - sum(x)`.

The wedges are plotted counterclockwise, by default starting from the x-axis.

Parameters

x

[1D array-like] The wedge sizes.

explode

[array-like, default: None] If not *None*, is a `len(x)` array which specifies the fraction of the radius with which to offset each wedge.

labels

[list, default: None] A sequence of strings providing the labels for each wedge

colors

[array-like, default: None] A sequence of colors through which the pie chart will cycle. If *None*, will use the colors in the currently active cycle.

autopct

[None or str or callable, default: None] If not *None*, is a string or function used to label the wedges with their numeric value. The label will be placed inside the wedge. If it is a format string, the label will be `fmt % pct`. If it is a function, it will be called.

pctdistance

[float, default: 0.6] The ratio between the center of each pie slice and the start of the text generated by *autopct*. Ignored if *autopct* is *None*.

shadow

[bool, default: False] Draw a shadow beneath the pie.

normalize: None or bool, default: None

When *True*, always make a full pie by normalizing x so that `sum(x) == 1`. *False* makes a partial pie if `sum(x) <= 1` and raises a `ValueError` for `sum(x) > 1`.

When *None*, defaults to *True* if `sum(x) >= 1` and *False* if `sum(x) < 1`.

Please note that the previous default value of *None* is now deprecated, and the default will change to *True* in the next release. Please pass `normalize=False` explicitly if you want to draw a partial pie.

labeldistance

[float or None, default: 1.1] The radial distance at which the pie labels are drawn. If set to `None`, label are not drawn, but are stored for use in `legend()`

startangle

[float, default: 0 degrees] The angle by which the start of the pie is rotated, counterclockwise from the x-axis.

radius

[float, default: 1] The radius of the pie.

counterclock

[bool, default: True] Specify fractions direction, clockwise or counterclockwise.

wedgeprops

[dict, default: None] Dict of arguments passed to the wedge objects making the pie. For example, you can pass in `wedgeprops = {'linewidth': 3}` to set the width of the wedge border lines equal to 3. For more details, look at the doc/arguments of the wedge object. By default `clip_on=False`.

textprops

[dict, default: None] Dict of arguments to pass to the text objects.

center

[(float, float), default: (0, 0)] The coordinates of the center of the chart.

frame

[bool, default: False] Plot axes frame with the chart if true.

rotatelabels

[bool, default: False] Rotate each label to the angle of the corresponding slice if true.

Returns

patches

[list] A sequence of *matplotlib.patches.Wedge* instances

texts

[list] A list of the label *Text* instances.

autotexts

[list] A list of *Text* instances for the numeric labels. This will only be returned if the parameter *autopct* is not *None*.

Notes

The pie chart will probably look best if the figure and axes are square, or the Axes aspect is equal. This method sets the aspect ratio of the axis to "equal". The axes aspect ratio can be controlled with *Axes.set_aspect*.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *explode*, *labels*, *colors*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.pie`

- sphx_glr_gallery_pie_and_polar_charts_pie_demo2.py
- sphx_glr_gallery_pie_and_polar_charts_nested_pie.py
- sphx_glr_gallery_pie_and_polar_charts_pie_and_donut_labels.py
- *Sample plots in Matplotlib*

matplotlib.pyplot.pink

matplotlib.pyplot.**pink**()
Set the colormap to "pink".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.pink`

matplotlib.pyplot.plasma

matplotlib.pyplot.**plasma**()
Set the colormap to "plasma".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.plasma`

matplotlib.pyplot.plot

matplotlib.pyplot.plot(**args*, *scalex=True*, *scaley=True*, *data=None*, ***kwargs*)

Plot y versus x as lines and/or markers.

Call signatures:

```
plot([x], y, [fmt], *, data=None, **kwargs)
plot([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

The coordinates of the points or line nodes are given by *x*, *y*.

The optional parameter *fmt* is a convenient way for defining basic formatting like color, marker and linestyle. It's a shortcut string notation described in the *Notes* section below.

```
>>> plot(x, y)        # plot x and y using default line style and color
>>> plot(x, y, 'bo')  # plot x and y using blue circle markers
>>> plot(y)           # plot y using x as index array 0..N-1
>>> plot(y, 'r+')     # ditto, but with red plusses
```

You can use *Line2D* properties as keyword arguments for more control on the appearance. Line properties and *fmt* can be mixed. The following two calls yield identical results:

```
>>> plot(x, y, 'go--', linewidth=2, markersize=12)
>>> plot(x, y, color='green', marker='o', linestyle='dashed',
...      linewidth=2, markersize=12)
```

When conflicting with *fmt*, keyword arguments take precedence.

Plotting labelled data

There's a convenient way for plotting objects with labelled data (i.e. data that can be accessed by index `obj['y']`). Instead of giving the data in *x* and *y*, you can provide the object in the *data* parameter and just give the labels for *x* and *y*:

```
>>> plot('xlabel', 'ylabel', data=obj)
```

All indexable objects are supported. This could e.g. be a `dict`, a `pandas.DataFrame` or a structured numpy array.

Plotting multiple sets of data

There are various ways to plot multiple sets of data.

- The most straight forward way is just to call *plot* multiple times. Example:

```
>>> plot(x1, y1, 'bo')
>>> plot(x2, y2, 'go')
```

- Alternatively, if your data is already a 2d array, you can pass it directly to *x*, *y*. A separate data set will be drawn for every column.

  Example: an array `a` where the first column represents the *x* values and the other columns are the *y* columns:

```
>>> plot(a[0], a[1:])
```

- The third way is to specify multiple sets of *[x]*, *y*, *[fmt]* groups:

```
>>> plot(x1, y1, 'g^', x2, y2, 'g-')
```

  In this case, any additional keyword argument applies to all datasets. Also this syntax cannot be combined with the *data* parameter.

By default, each line is assigned a different style specified by a 'style cycle'. The *fmt* and line property parameters are only necessary if you want explicit deviations from these defaults. Alternatively, you can also change the style cycle using `rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`).

Parameters

x, y

[array-like or scalar] The horizontal / vertical coordinates of the data points. *x* values are optional and default to `range(len(y))`.

Commonly, these parameters are 1D arrays.

They can also be scalars, or two-dimensional (in that case, the columns represent separate data sets).

These arguments cannot be passed as keywords.

fmt

[str, optional] A format string, e.g. 'ro' for red circles. See the *Notes* section for a full description of the format strings.

Format strings are just an abbreviation for quickly setting basic line properties. All of these and more can also be controlled by keyword arguments.

This argument cannot be passed as keyword.

data

[indexable object, optional] An object with labelled data. If given, provide the label names to plot in *x* and *y*.

Note: Technically there's a slight ambiguity in calls where the second label is a valid *fmt*. `plot('n', 'o', data=obj)` could be

`plt(x, y)` or `plt(y, fmt)`. In such cases, the former interpretation is chosen, but a warning is issued. You may suppress the warning by adding an empty format string `plot('n', 'o', '', data=obj)`.

Returns

list of *Line2D*

A list of lines representing the plotted data.

Other Parameters

scalex, scaley

[bool, default: True] These parameters determine if the view limits are adapted to the data limits. The values are passed on to `autoscale_view`.

****kwargs**

[*Line2D* properties, optional] *kwargs* are used to specify properties like a line label (for auto legends), linewidth, antialiasing, marker face color. Example:

```
>>> plot([1, 2, 3], [1, 2, 3], 'go-', label='line 1', linewidth=2)
>>> plot([1, 2, 3], [1, 4, 9], 'rs', label='line 2')
```

If you make multiple lines with one plot call, the kwargs apply to all those lines.

Here is a list of available *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd

Table 204 – continued from previous page

Property	Description
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also:

scatter

XY scatter plot with markers of varying size and/or color (sometimes also called bubble chart).

Notes

Format Strings

A format string consists of a part for color, marker and line:

```
fmt = '[marker][line][color]'
```

Each of them is optional. If not provided, the value from the style cycle is used. Exception: If `line` is given, but no `marker`, the data will be a line without markers.

Other combinations such as `[color][marker][line]` are also supported, but note that their parsing may be ambiguous.

Markers

character	description
`'.'`	point marker
`','`	pixel marker
`'o'`	circle marker
`'v'`	triangle_down marker
`'^'`	triangle_up marker
`'<'`	triangle_left marker
`'>'`	triangle_right marker
`'1'`	tri_down marker
`'2'`	tri_up marker
`'3'`	tri_left marker
`'4'`	tri_right marker
`'s'`	square marker
`'p'`	pentagon marker
`'*'`	star marker
`'h'`	hexagon1 marker
`'H'`	hexagon2 marker
`'+'`	plus marker
`'x'`	x marker
`'D'`	diamond marker
`'d'`	thin_diamond marker
`'|'`	vline marker
`'_'`	hline marker

Line Styles

character	description
`'-'`	solid line style
`'--'`	dashed line style
`'-.'`	dash-dot line style
`':'`	dotted line style

Example format strings:

```
'b'    # blue markers with default shape
'or'   # red circles
'-g'   # green solid line
'--'   # dashed line with default color
'^k:'  # black triangle_up markers connected by a dotted line
```

Colors

The supported color abbreviations are the single letter codes

character	color
'b'	blue
'g'	green
'r'	red
'c'	cyan
'm'	magenta
'y'	yellow
'k'	black
'w'	white

and the 'CN' colors that index into the default property cycle.

If the color is the only part of the format string, you can additionally use any *matplotlib.colors* spec, e.g. full names ('green') or hex strings ('#008000').

Examples using matplotlib.pyplot.plot

- *Frame grabbing*
- sphx_glr_gallery_misc_print_stdout_sgskip.py
- sphx_glr_gallery_user_interfaces_toolmanager_sgskip.py
- sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py

matplotlib.pyplot.plot_date

matplotlib.pyplot.**plot_date**(*x*, *y*, *fmt='o'*, *tz=None*, *xdate=True*, *ydate=False*, ***, *data=None*, ***kwargs*)

Plot data that contains dates.

Similar to *plot*, this plots *y* vs. *x* as lines or markers. However, the axis labels are formatted as dates depending on *xdate* and *ydate*.

Parameters

x, y

[array-like] The coordinates of the data points. If *xdate* or *ydate* is *True*, the respective values *x* or *y* are interpreted as *Matplotlib dates*.

fmt

[str, optional] The plot format string. For details, see the corresponding parameter in *plot*.

tz

[timezone string or `datetime.tzinfo`, default: `rcParams["timezone"]` (default: `'UTC'`)] The time zone to use in labeling dates.

xdate

[bool, default: True] If *True*, the *x*-axis will be interpreted as Matplotlib dates.

ydate

[bool, default: False] If *True*, the *y*-axis will be interpreted as Matplotlib dates.

Returns

lines

A list of *Line2D* objects representing the plotted data.

Other Parameters

****kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}

Table 205 – continued from previous page

Property	Description
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also:

matplotlib.dates

Helper functions on dates.

matplotlib.dates.date2num

Convert dates to num.

matplotlib.dates.num2date

Convert num to dates.

matplotlib.dates.drange

Create an equally spaced sequence of dates.

Notes

If you are using custom date tickers and formatters, it may be necessary to set the formatters/locators after the call to *plot_date*. *plot_date* will set the default tick locator to *AutoDateLocator* (if the tick locator is not already set to a *DateLocator* instance) and the default tick formatter to *AutoDateFormatter* (if the tick formatter is not already set to a *DateFormatter* instance).

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.plot_date`

- sphx_glr_gallery_ticks_and_spines_date_demo_rrule.py

matplotlib.pyplot.polar

matplotlib.pyplot.**polar**(**args*, ***kwargs*)

Make a polar plot.

call signature:

```
polar(theta, r, **kwargs)
```

Multiple *theta*, *r* arguments are supported, with format strings, as in *plot*.

Examples using `matplotlib.pyplot.polar`

- sphx_glr_gallery_misc_transoffset.py
- *Sample plots in Matplotlib*

matplotlib.pyplot.prism

matplotlib.pyplot.**prism**()

Set the colormap to "prism".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.prism`

matplotlib.pyplot.psd

matplotlib.pyplot.**psd**(*x*, *NFFT=None*, *Fs=None*, *Fc=None*, *detrend=None*, *window=None*, *noverlap=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*, *return_line=None*, ***, *data=None*, ***kwargs*)

Plot the power spectral density.

The power spectral density P_{xx} by Welch's average periodogram method. The vector *x* is divided into *NFFT* length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The $|\mathrm{fft}(i)|^2$ of each segment i are averaged to compute P_{xx}, with a scaling to correct for power loss due to windowing.

If len(*x*) < *NFFT*, it will be zero padded to *NFFT*.

Parameters

x

[1-D array or sequence] Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-

sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The *mlab* module defines *detrend_none*, *detrend_mean*, and *detrend_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend_none*. 'mean' calls *detrend_mean*. 'linear' calls *detrend_linear*.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int, default: 0 (no overlap)] The number of points of overlap between segments.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

return_line

[bool, default: False] Whether to include the line object plotted in the returned values.

Returns

Pxx

[1-D array] The values for the power spectrum P_{xx} before scaling (real valued).

freqs

[1-D array] The frequencies corresponding to the elements in *Pxx*.

line

[*Line2D*] The line created by this function. Only returned if *return_line* is True.

Other Parameters

**kwargs

Keyword arguments control the *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float

Table 206 – continued from previous page

Property	Description
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also:

specgram

Differs in the default overlap; in not returning the mean of the segment periodograms; in returning the times of the segments; and in plotting a colormap instead of a line.

magnitude_spectrum

Plots the magnitude spectrum.

csd

Plots the spectral density between two signals.

Notes

For plotting, the power is plotted as $10\log_{10}(P_{xx})$ for decibels, though *Pxx* itself is returned.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.psd`

- sphx_glr_gallery_lines_bars_and_markers_psd_demo.py

matplotlib.pyplot.quiver

matplotlib.pyplot.**quiver**(**args*, *data=None*, ***kw*)

Plot a 2D field of arrows.

Call signature:

```
quiver([X, Y], U, V, [C], **kw)
```

X, *Y* define the arrow locations, *U*, *V* define the arrow directions, and *C* optionally sets the color.

Arrow size

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the *scale* and *scale_units* parameters.

Arrow shape

The defaults give a slightly swept-back arrow; to make the head a triangle, make *headaxislength* the same as *headlength*. To make the arrow more pointed, reduce *headwidth* or increase *headlength* and *headaxislength*. To make the head smaller relative to the shaft, scale down all the head parameters. You will probably do best to leave minshaft alone.

Arrow outline

linewidths and *edgecolors* can be used to customize the arrow outlines.

Parameters

X, Y

[1D or 2D array-like, optional] The x and y coordinates of the arrow locations.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If *X* and *Y* are 1D but *U*, *V* are 2D, *X*, *Y* are expanded to 2D using `X, Y = np.meshgrid(X, Y)`. In this case `len(X)` and `len(Y)` must match the column and row dimensions of *U* and *V*.

U, V

[1D or 2D array-like] The x and y direction components of the arrow vectors.

They must have the same number of elements, matching the number of arrow locations. *U* and *V* may be masked. Only locations unmasked in *U*, *V*, and *C* will be drawn.

C

[1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *color* instead. The size of *C* must match the number of arrow locations.

units

[{'width', 'height', 'dots', 'inches', 'x', 'y' 'xy'}, default: 'width'] The arrow dimensions (except for *length*) are measured in multiples of this unit.

The following values are supported:

- 'width', 'height': The width or height of the axis.
- 'dots', 'inches': Pixels or inches based on the figure dpi.
- 'x', 'y', 'xy': *X*, *Y* or $\sqrt{X^2 + Y^2}$ in data units.

The arrows scale differently depending on the units. For 'x' or 'y', the arrows get larger as one zooms in; for other units, the arrow size is independent of the zoom state. For 'width or 'height', the arrow size increases with the width and height of the axes, respectively, when the window is resized; for 'dots' or 'inches', resizing does not change the arrows.

angles

[{'uv', 'xy'} or array-like, default: 'uv'] Method for determining the angle of the arrows.

- 'uv': The arrow axis aspect ratio is 1 so that if $U == V$ the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).

  Use this if the arrows symbolize a quantity that is not based on X, Y data coordinates.

- 'xy': Arrows point from (x, y) to (x+u, y+v). Use this for plotting a gradient field, for example.

- Alternatively, arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.

  In this case U, V is only used to determine the length of the arrows.

Note: inverting a data axis will correspondingly invert the arrows only with `angles='xy'`.

scale

[float, optional] Number of data units per arrow length unit, e.g., m/s per plot width; a smaller scale parameter makes the arrow longer. Default is *None*.

If *None*, a simple autoscaling algorithm is used, based on the average vector length and the number of vectors. The arrow length unit is given by the *scale_units* parameter.

scale_units

[{'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, optional] If the *scale* kwarg is *None*, the arrow length unit. Default is *None*.

e.g. *scale_units* is 'inches', *scale* is 2.0, and `(u, v) = (1, 0)`, then the vector will be 0.5 inches long.

If *scale_units* is 'width' or 'height', then the vector will be half the width/height of the axes.

If *scale_units* is 'x' then the vector will be 0.5 x-axis units. To plot vectors in the x-y plane, with u and v having the same units as x and y, use `angles='xy', scale_units='xy', scale=1`.

width

[float, optional] Shaft width in arrow units; default depends on choice of units, above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

headwidth

[float, default: 3] Head width as multiple of shaft width.

headlength

[float, default: 5] Head length as multiple of shaft width.

headaxislength

[float, default: 4.5] Head length at shaft intersection.

minshaft

[float, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

minlength

[float, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

pivot

[{'tail', 'mid', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is anchored to the *X*, *Y* grid. The arrow rotates about this point.

'mid' is a synonym for 'middle'.

color

[color or color sequence, optional] Explicit color(s) for the arrows. If *C* has been set, *color* has no effect.

This is a synonym for the *PolyCollection* *facecolor* parameter.

Other Parameters

****kwargs**

[*PolyCollection* properties, optional] All other keyword arguments are passed on to *PolyCollection*:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	ndarray
capstyle	{'butt', 'round', 'projecting'}
clim	(vmin: float, vmax: float)
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None

Table 207 – continued from previous page

Property	Description
color	color or list of rgba tuples
contains	unknown
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
norm	*Normalize* or None
offset_position	unknown
offsets	array-like (N, 2) or (2,)
path_effects	*AbstractPathEffect*
picker	None or bool or callable
pickradius	unknown
rasterized	bool or None

zorder	float

See also:

Axes.quiverkey

Add a key to a quiver plot.

Examples using `matplotlib.pyplot.quiver`

- sphx_glr_gallery_images_contours_and_fields_quiver_demo.py
- sphx_glr_gallery_images_contours_and_fields_quiver_simple_demo.py
- sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py
- *Sample plots in Matplotlib*

matplotlib.pyplot.quiverkey

matplotlib.pyplot.**quiverkey**(*Q*, *X*, *Y*, *U*, *label*, ***kw*)

Add a key to a quiver plot.

The positioning of the key depends on *X*, *Y*, *coordinates*, and *labelpos*. If *labelpos* is 'N' or 'S', *X*, *Y* give the position of the middle of the key arrow. If *labelpos* is 'E', *X*, *Y* positions the head, and if *labelpos* is 'W', *X*, *Y* positions the tail; in either of these two cases, *X*, *Y* is somewhere in the middle of the arrow+label key object.

Parameters

Q

[*matplotlib.quiver.Quiver*] A *Quiver* object as returned by a call to *quiver()*.

X, Y

[float] The location of the key.

U

[float] The length of the key.

label

[str] The key label (e.g., length and units of the key).

angle

[float, default: 0] The angle of the key arrow, in degrees anti-clockwise from the x-axis.

coordinates

[{'axes', 'figure', 'data', 'inches'}, default: 'axes'] Coordinate system and units for *X*, *Y*: 'axes' and 'figure' are normalized coordinate systems with (0, 0) in the lower left and (1, 1) in the upper right; 'data' are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); 'inches' is position in the figure in inches, with (0, 0) at the lower left corner.

color

[color] Overrides face and edge colors from *Q*.

labelpos

[{'N', 'S', 'E', 'W'}] Position the label above, below, to the right, to the left of the arrow, respectively.

labelsep

[float, default: 0.1] Distance in inches between the arrow and the label.

labelcolor

[color, default: `rcParams["text.color"]` (default: `'black'`)] Label color.

fontproperties

[dict, optional] A dictionary with keyword arguments accepted by the *FontProperties* initializer: *family*, *style*, *variant*, *size*, *weight*.

****kwargs**

Any additional keyword arguments are used to override vector properties taken from *Q*.

Examples using `matplotlib.pyplot.quiverkey`

- sphx_glr_gallery_images_contours_and_fields_quiver_demo.py
- sphx_glr_gallery_images_contours_and_fields_quiver_simple_demo.py

matplotlib.pyplot.rc

matplotlib.pyplot.**rc**(*group*, ***kwargs*)

Set the current *rcParams*. *group* is the grouping for the rc, e.g., for `lines.linewidth` the group is `lines`, for `axes.facecolor`, the group is `axes`, and so on. Group may also be a list or tuple of group names, e.g., (*xtick*, *ytick*). *kwargs* is a dictionary attribute name/value pairs, e.g.,:

```
rc('lines', linewidth=2, color='r')
```

sets the current *rcParams* and is equivalent to:

```
rcParams['lines.linewidth'] = 2
rcParams['lines.color'] = 'r'
```

The following aliases are available to save typing for interactive users:

Alias	Property
'lw'	'linewidth'
'ls'	'linestyle'
'c'	'color'
'fc'	'facecolor'
'ec'	'edgecolor'
'mew'	'markeredgewidth'
'aa'	'antialiased'

Thus you could abbreviate the above call as:

```
rc('lines', lw=2, c='r')
```

Note you can use python's kwargs dictionary facility to store dictionaries of default parameters. e.g., you can customize the font rc as follows:

```
font = {'family' : 'monospace',
        'weight' : 'bold',
        'size'   : 'larger'}
rc('font', **font)  # pass in the font dict as kwargs
```

This enables you to easily switch between several configurations. Use `matplotlib.style.use('default')` or *rcdefaults()* to restore the default *rcParams* after changes.

Notes

Similar functionality is available by using the normal dict interface, i.e. `rcParams.update({"lines.linewidth": 2, ...})` (but `rcParams.update` does not support abbreviations or grouping).

Examples using `matplotlib.pyplot.rc`

- *Styling with cycler*

matplotlib.pyplot.rc_context

`matplotlib.pyplot.rc_context`(*rc=None*, *fname=None*)

Return a context manager for temporarily changing rcParams.

Parameters

rc

[dict] The rcParams to temporarily set.

fname

[str or path-like] A file with Matplotlib rc settings. If both *fname* and *rc* are given, settings from *rc* take precedence.

See also:

The matplotlibrc file

Examples

Passing explicit values via a dict:

```
with mpl.rc_context({'interactive': False}):
    fig, ax = plt.subplots()
    ax.plot(range(3), range(3))
    fig.savefig('example.png')
    plt.close(fig)
```

Loading settings from a file:

```
with mpl.rc_context(fname='print.rc'):
    plt.plot(x, y)  # uses 'print.rc'
```

Examples using `matplotlib.pyplot.rc_context`

- sphx_glr_gallery_text_labels_and_annotations_usetex_baseline_test.py
- sphx_glr_gallery_misc_logos2.py
- sphx_glr_gallery_ticks_and_spines_auto_ticks.py

matplotlib.pyplot.rcdefaults

matplotlib.pyplot.**rcdefaults**()

Restore the *rcParams* from Matplotlib's internal default style.

Style-blacklisted *rcParams* (defined in `matplotlib.style.core.STYLE_BLACKLIST`) are not updated.

See also:

matplotlib.rc_file_defaults

Restore the *rcParams* from the rc file originally loaded by Matplotlib.

matplotlib.style.use

Use a specific style file. Call `style.use('default')` to restore the default style.

Examples using `matplotlib.pyplot.rcdefaults`

- sphx_glr_gallery_lines_bars_and_markers_barh.py
- sphx_glr_gallery_misc_customize_rc.py

matplotlib.pyplot.rgrids

matplotlib.pyplot.**rgrids**(*radii=None*, *labels=None*, *angle=None*, *fmt=None*, ***kwargs*)

Get or set the radial gridlines on the current polar plot.

Call signatures:

```
lines, labels = rgrids()
lines, labels = rgrids(radii, labels=None, angle=22.5, fmt=None, **kwargs)
```

When called with no arguments, *rgrids* simply returns the tuple (*lines*, *labels*). When called with arguments, the labels will appear at the specified radial distances and angle.

Parameters

radii

[tuple with floats] The radii for the radial gridlines

labels

[tuple with strings or None] The labels to use at each radial gridline. The *matplotlib.ticker.ScalarFormatter* will be used if None.

angle

[float] The angular position of the radius labels in degrees.

fmt

[str or None] Format string used in *matplotlib.ticker.FormatStrFormatter*. For example '%f'.

Returns

lines

[list of *lines.Line2D*] The radial gridlines.

labels

[list of *text.Text*] The tick labels.

Other Parameters

****kwargs**

kwargs are optional *Text* properties for the labels.

See also:

pyplot.thetagrids

projections.polar.PolarAxes.set_rgrids

Axis.get_gridlines

Axis.get_ticklabels

Examples

```
# set the locations of the radial gridlines
lines, labels = rgrids( (0.25, 0.5, 1.0) )

# set the locations and labels of the radial gridlines
lines, labels = rgrids( (0.25, 0.5, 1.0), ('Tom', 'Dick', 'Harry' ))
```

Examples using `matplotlib.pyplot.rgrids`

matplotlib.pyplot.savefig

matplotlib.pyplot.**savefig**(**args*, ***kwargs*)

Save the current figure.

Call signature:

```
savefig(fname, dpi=None, facecolor='w', edgecolor='w',
        orientation='portrait', papertype=None, format=None,
        transparent=False, bbox_inches=None, pad_inches=0.1,
        frameon=None, metadata=None)
```

The available output formats depend on the backend being used.

Parameters

fname

[str or path-like or file-like] A path, or a Python file-like object, or possibly some backend-dependent object such as *matplotlib.backends.backend_pdf.PdfPages*.

If *format* is set, it determines the output format, and the file is saved as *fname*. Note that *fname* is used verbatim, and there is no attempt to make the extension, if any, of *fname* match *format*, and no extension is appended.

If *format* is not set, then the format is inferred from the extension of *fname*, if there is one. If *format* is not set and *fname* has no extension, then the file is saved with `rcParams["savefig.format"]` (default: `'png'`) and the appropriate extension is appended to *fname*.

Other Parameters

dpi

[float or 'figure', default: `rcParams["savefig.dpi"]` (default: `'figure'`)] The resolution in dots per inch. If 'figure', use the figure's dpi value.

quality

[int, default: `rcParams["savefig.jpeg_quality"]` (default: `95`)] Applicable only if *format* is 'jpg' or 'jpeg', ignored otherwise.

The image quality, on a scale from 1 (worst) to 95 (best). Values above 95 should be avoided; 100 disables portions of the JPEG compression algorithm, and results in large files with hardly any gain in image quality.

This parameter is deprecated.

optimize

[bool, default: False] Applicable only if *format* is 'jpg' or 'jpeg', ignored otherwise.

Whether the encoder should make an extra pass over the image in order to select optimal encoder settings.

This parameter is deprecated.

progressive

[bool, default: False] Applicable only if *format* is 'jpg' or 'jpeg', ignored otherwise.

Whether the image should be stored as a progressive JPEG file.

This parameter is deprecated.

facecolor

[color or 'auto', default: `rcParams["savefig.facecolor"]` (default: `'auto'`)] The facecolor of the figure. If 'auto', use the current figure facecolor.

edgecolor

[color or 'auto', default: `rcParams["savefig.edgecolor"]` (default: `'auto'`)] The edgecolor of the figure. If 'auto', use the current figure edgecolor.

orientation

[{'landscape', 'portrait'}] Currently only supported by the postscript backend.

papertype

[str] One of 'letter', 'legal', 'executive', 'ledger', 'a0' through 'a10', 'b0' through 'b10'. Only supported for postscript output.

format

[str] The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under *fname*.

transparent

[bool] If *True*, the axes patches will all be transparent; the figure patch will also be transparent unless facecolor and/or edgecolor are specified via kwargs. This is useful, for example, for displaying a plot on top of a colored background on a web page. The transparency of these patches will be restored to their original values upon exit of this function.

bbox_inches

[str or *Bbox*, default: `rcParams["savefig.bbox"]` (default: `None`)] Bounding box in inches: only the given portion of the figure is saved. If 'tight', try to figure out the tight bbox of the figure.

pad_inches

[float, default: `rcParams["savefig.pad_inches"]` (default: `0.1`)] Amount of padding around the figure when bbox_inches is 'tight'.

bbox_extra_artists

[list of *Artist*, optional] A list of extra artists that will be considered when the tight bbox is calculated.

backend

[str, optional] Use a non-default backend to render the file, e.g. to render a png file with the "cairo" backend rather than the default "agg", or a pdf file with the "pgf" backend rather than the default "pdf". Note that the default backend is normally sufficient. See *The builtin backends* for a list of valid backends for each file format. Custom backends can be referenced as "module://...".

metadata

[dict, optional] Key/value pairs to store in the image metadata. The supported keys and defaults depend on the image format and backend:

- 'png' with Agg backend: See the parameter `metadata` of *print_png*.
- 'pdf' with pdf backend: See the parameter `metadata` of *PdfPages*.
- 'svg' with svg backend: See the parameter `metadata` of *print_svg*.
- 'eps' and 'ps' with PS backend: Only 'Creator' is supported.

pil_kwargs

[dict, optional] Additional keyword arguments that are passed to `PIL.Image.Image.save` when saving the figure.

Examples using `matplotlib.pyplot.savefig`

- sphx_glr_gallery_misc_print_stdout_sgskip.py
- sphx_glr_gallery_user_interfaces_svg_histogram_sgskip.py
- sphx_glr_gallery_user_interfaces_svg_tooltip_sgskip.py
- sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py

matplotlib.pyplot.sca

`matplotlib.pyplot.`**sca**(*ax*)

Set the current Axes to *ax* and the current Figure to the parent of *ax*.

Examples using `matplotlib.pyplot.sca`

matplotlib.pyplot.scatter

`matplotlib.pyplot.`**scatter**(*x*, *y*, *s=None*, *c=None*, *marker=None*, *cmap=None*, *norm=None*, *vmin=None*, *vmax=None*, *alpha=None*, *linewidths=None*, *verts=<deprecated parameter>*, *edgecolors=None*, ***, *plotnonfinite=False*, *data=None*, ***kwargs*)

A scatter plot of *y* vs. *x* with varying marker size and/or color.

Parameters

x, y

[float or array-like, shape (n,)] The data positions.

s

[float or array-like, shape (n,), optional] The marker size in points**2. Default is `rcParams['lines.markersize'] ** 2`.

c

[array-like or list of colors or color, optional] The marker colors. Possible values:

- A scalar or sequence of n numbers to be mapped to colors using *cmap* and *norm*.
- A 2-D array in which the rows are RGB or RGBA.
- A sequence of colors of length n.
- A single color format string.

Note that *c* should not be a single numeric RGB or RGBA sequence because that is indistinguishable from an array of values to be colormapped. If you want to specify the same RGB or RGBA value for all points, use a 2-D array with a single row. Otherwise, value- matching will have precedence in case of a size matching with *x* and *y*.

If you wish to specify a single color for all points prefer the *color* keyword argument.

Defaults to `None`. In that case the marker color is determined by the value of *color*, *facecolor* or *facecolors*. In case those are not specified or `None`, the marker color is determined by the next color of the `Axes`' current "shape and fill" color cycle. This cycle defaults to `rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`).

marker

[*MarkerStyle*, default: `rcParams["scatter.marker"]` (default: `'o'`)] The marker style. *marker* can be either an instance of the class or the text shorthand for a particular marker. See *matplotlib.markers* for more information about marker styles.

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] A *Colormap* instance or registered colormap name. *cmap* is only used if *c* is an array of floats.

norm

[*Normalize*, default: None] If *c* is an array of floats, *norm* is used to scale the color data, *c*, in the range 0 to 1, in order to map into the colormap *cmap*. If *None*, use the default *colors.Normalize*.

vmin, vmax

[float, default: None] *vmin* and *vmax* are used in conjunction with the default norm to map the color array *c* to the colormap *cmap*. If None, the respective min and max of the color array is used. It is deprecated to use *vmin*/*vmax* when *norm* is given.

alpha

[float, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

linewidths

[float or array-like, default: `rcParams["lines.linewidth"]` (default: `1.5`)] The linewidth of the marker edges. Note: The default *edgecolors* is 'face'. You may want to change this as well.

edgecolors

[{'face', 'none', *None*} or color or sequence of color, default: `rcParams["scatter.edgecolors"]` (default: `'face'`)] The edge color of the marker. Possible values:

- 'face': The edge color will always be the same as the face color.
- 'none': No patch boundary will be drawn.
- A color or sequence of colors.

For non-filled markers, the *edgecolors* kwarg is ignored and forced to 'face' internally.

plotnonfinite

[bool, default: False] Set to plot points with nonfinite *c*, in conjunction with *set_bad*.

Returns

PathCollection

Other Parameters

****kwargs**

[*Collection* properties]

See also:

plot

To plot scatter plots when markers are identical in size and color.

Notes

- The *plot* function will be faster for scatterplots where markers don't vary in size or color.
- Any or all of *x*, *y*, *s*, and *c* may be masked arrays, in which case all masks will be combined and only unmasked points will be plotted.
- Fundamentally, scatter works with 1-D arrays; *x*, *y*, *s*, and *c* may be input as N-D arrays, but within scatter they will be flattened. The exception is *c*, which will be flattened only if its size matches the size of *x* and *y*.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*, *s*, *linewidths*, *edgecolors*, *c*, *facecolor*, *facecolors*, *color*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.scatter`

- sphx_glr_gallery_misc_hyperlinks_sgskip.py

matplotlib.pyplot.sci

`matplotlib.pyplot.sci`(*im*)

Set the current image.

This image will be the target of colormap functions like *viridis*, and other functions such as *clim*. The current image is an attribute of the current axes.

Examples using `matplotlib.pyplot.sci`

- sphx_glr_gallery_shapes_and_collections_line_collection.py

matplotlib.pyplot.semilogx

matplotlib.pyplot.**semilogx**(**args*, ***kwargs*)

Make a plot with log scaling on the x axis.

Call signatures:

```
semilogx([x], y, [fmt], data=None, **kwargs)
semilogx([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around *plot* which additionally changes the x-axis to log scaling. All of the concepts and parameters of plot can be used here as well.

The additional parameters *base*, *subs*, and *nonpositive* control the x-axis properties. They are just forwarded to *Axes.set_xscale*.

Parameters

base

[float, default: 10] Base of the x logarithm.

subs

[array-like, optional] The location of the minor xticks. If *None*, reasonable locations are automatically chosen depending on the number of decades in the plot. See *Axes.set_xscale* for details.

nonposition

[{'mask', 'clip'}, default: 'mask'] Non-positive values in x can be masked as invalid, or clipped to a very small positive number.

Returns

lines

A list of *Line2D* objects representing the plotted data.

Other Parameters

****kwargs**

All parameters supported by *plot*.

Examples using `matplotlib.pyplot.semilogx`

- *Sample plots in Matplotlib*

matplotlib.pyplot.semilogy

matplotlib.pyplot.**semilogy**(**args*, ***kwargs*)

Make a plot with log scaling on the y axis.

Call signatures:

```
semilogy([x], y, [fmt], data=None, **kwargs)
semilogy([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around *plot* which additionally changes the y-axis to log scaling. All of the concepts and parameters of plot can be used here as well.

The additional parameters *base*, *subs*, and *nonpositive* control the y-axis properties. They are just forwarded to *Axes.set_yscale*.

Parameters

base

[float, default: 10] Base of the y logarithm.

subs

[array-like, optional] The location of the minor yticks. If *None*, reasonable locations are automatically chosen depending on the number of decades in the plot. See *Axes.set_yscale* for details.

nonposition

[{'mask', 'clip'}, default: 'mask'] Non-positive values in y can be masked as invalid, or clipped to a very small positive number.

Returns

lines

A list of *Line2D* objects representing the plotted data.

Other Parameters

****kwargs**

All parameters supported by *plot*.

Examples using `matplotlib.pyplot.semilogy`

- *Sample plots in Matplotlib*

matplotlib.pyplot.set_cmap

matplotlib.pyplot.**set_cmap**(*cmap*)

Set the default colormap, and applies it to the current image if any.

Parameters

cmap

[*Colormap* or str] A colormap instance or the name of a registered colormap.

See also:

colormaps

matplotlib.cm.register_cmap

matplotlib.cm.get_cmap

Examples using `matplotlib.pyplot.set_cmap`

matplotlib.pyplot.setp

matplotlib.pyplot.**setp**(*obj*, **args*, ***kwargs*)

Set a property on an artist object.

matplotlib supports the use of *setp()* ("set property") and *getp()* to set and get object properties, as well as to do introspection on the object. For example, to set the linestyle of a line to be dashed, you can do:

```
>>> line, = plot([1, 2, 3])
>>> setp(line, linestyle='--')
```

If you want to know the valid types of arguments, you can provide the name of the property you want to set without a value:

```
>>> setp(line, 'linestyle')
    linestyle: {'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
```

If you want to see all the properties that can be set, and their possible values, you can do:

```
>>> setp(line)
    ... long output listing omitted
```

By default *setp* prints to sys.stdout, but this can be modified using the *file* keyword-only argument:

```
>>> with fopen('output.log') as f:
>>>     setp(line, file=f)
```

setp() operates on a single instance or a iterable of instances. If you are in query mode introspecting the possible values, only the first instance in the sequence is used. When actually setting values, all the instances will be set. e.g., suppose you have a list of two lines, the following will make both lines thicker and red:

```
>>> x = arange(0, 1, 0.01)
>>> y1 = sin(2*pi*x)
>>> y2 = sin(4*pi*x)
>>> lines = plot(x, y1, x, y2)
>>> setp(lines, linewidth=2, color='r')
```

setp() works with the MATLAB style string/value pairs or with python kwargs. For example, the following are equivalent:

```
>>> setp(lines, 'linewidth', 2, 'color', 'r')  # MATLAB style
>>> setp(lines, linewidth=2, color='r')        # python style
```

Examples using matplotlib.pyplot.setp

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

matplotlib.pyplot.show

matplotlib.pyplot.**show**(*, *block=None*)

Display all open figures.

In non-interactive mode, *block* defaults to True. All figures will display and show will not return until all windows are closed. If there are no figures, return immediately.

In interactive mode *block* defaults to False. This will ensure that all of the figures are shown and this function immediately returns.

Parameters

block

[bool, optional] If True block and run the GUI main loop until all windows are closed.

If `False` ensure that all windows are displayed and return immediately. In this case, you are responsible for ensuring that the event loop is running to have responsive figures.

See also:

ion

enable interactive mode

ioff

disable interactive mode

Examples using `matplotlib.pyplot.show`

- sphx_glr_gallery_text_labels_and_annotations_font_family_rc_sgskip.py

- sphx_glr_gallery_widgets_lasso_selector_demo_sgskip.py

matplotlib.pyplot.specgram

matplotlib.pyplot.**specgram**(*x*, *NFFT=None*, *Fs=None*, *Fc=None*, *detrend=None*, *window=None*, *noverlap=None*, *cmap=None*, *xextent=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*, *mode=None*, *scale=None*, *vmin=None*, *vmax=None*, ***, *data=None*, ***kwargs*)

Plot a spectrogram.

Compute and plot a spectrogram of data in *x*. Data are split into *NFFT* length segments and the spectrum of each section is computed. The windowing function *window* is applied to each segment, and the amount of overlap of each segment is specified with *noverlap*. The spectrogram is plotted as a colormap (using imshow).

Parameters

x

[1-D array or sequence] Array or sequence containing the data.

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The *mlab* module defines *detrend_none*, *detrend_mean*, and *detrend_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend_none*. 'mean' calls *detrend_mean*. 'linear' calls *detrend_linear*.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

mode

[{'default', 'psd', 'magnitude', 'angle', 'phase'}] What sort of spectrum to use. Default is 'psd', which takes the power spectral density. 'magnitude' returns the magnitude spectrum. 'angle' returns the phase spectrum without unwrapping. 'phase' returns the phase spectrum with unwrapping.

noverlap

[int] The number of points of overlap between blocks. The default value is 128.

scale

[{'default', 'linear', 'dB'}] The scaling of the values in the *spec*. 'linear' is no scaling. 'dB' returns the values in dB scale. When *mode* is 'psd', this is dB power (10 * log10). Otherwise this is dB amplitude (20 * log10). 'default' is 'dB' if *mode* is 'psd' or 'magnitude' and 'linear' otherwise. This must be 'linear' if *mode* is 'angle' or 'phase'.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

cmap

[*Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)]

xextent

[*None* or (xmin, xmax)] The image extent along the x-axis. The default sets *xmin* to the left border of the first bin (*spectrum* column) and *xmax* to the right border of the last bin. Note that for *noverlap>0* the width of the bins is smaller than those of the segments.

****kwargs**

Additional keyword arguments are passed on to *imshow* which makes the specgram image.

Returns

spectrum

[2-D array] Columns are the periodograms of successive segments.

freqs

[1-D array] The frequencies corresponding to the rows in *spectrum*.

t

[1-D array] The times corresponding to midpoints of segments (i.e., the columns in *spectrum*).

im

[*AxesImage*] The image created by imshow containing the spectrogram.

See also:

psd

Differs in the default overlap; in returning the mean of the segment periodograms; in not returning times; and in generating a line plot instead of colormap.

magnitude_spectrum

A single spectrum, similar to having a single segment when *mode* is 'magnitude'. Plots a line instead of a colormap.

angle_spectrum

A single spectrum, similar to having a single segment when *mode* is 'angle'. Plots a line instead of a colormap.

phase_spectrum

A single spectrum, similar to having a single segment when *mode* is 'phase'. Plots a line instead of a colormap.

Notes

The parameters *detrend* and *scale_by_freq* do only apply when *mode* is set to 'psd'.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.specgram`

- sphx_glr_gallery_images_contours_and_fields_specgram_demo.py
- *Sample plots in Matplotlib*

matplotlib.pyplot.spring

matplotlib.pyplot.**spring**()

Set the colormap to "spring".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.spring`

matplotlib.pyplot.spy

matplotlib.pyplot.**spy**(*Z*, *precision=0*, *marker=None*, *markersize=None*, *aspect='equal'*, *origin='upper'*, ***kwargs*)

Plot the sparsity pattern of a 2D array.

This visualizes the non-zero values of the array.

Two plotting styles are available: image and marker. Both are available for full arrays, but only the marker style works for `scipy.sparse.spmatrix` instances.

Image style

If *marker* and *markersize* are *None*, *imshow* is used. Any extra remaining keyword arguments are passed to this method.

Marker style

If *Z* is a `scipy.sparse.spmatrix` or *marker* or *markersize* are *None*, a *Line2D* object will be returned with the value of marker determining the marker type, and any remaining keyword arguments passed to *plot*.

Parameters

Z

[array-like (M, N)] The array to be plotted.

precision

[float or 'present', default: 0] If *precision* is 0, any non-zero value will be plotted. Otherwise, values of $|Z| > precision$ will be plotted.

For `scipy.sparse.spmatrix` instances, you can also pass 'present'. In this case any value present in the array will be plotted, even if it is identically zero.

aspect

[{'equal', 'auto', None} or float, default: 'equal'] The aspect ratio of the axes. This parameter is particularly relevant for images since it determines whether data pixels are square.

This parameter is a shortcut for explicitly calling *Axes.set_aspect*. See there for further details.

- 'equal': Ensures an aspect ratio of 1. Pixels will be square.
- 'auto': The axes is kept fixed and the aspect is adjusted so that the data fit in the axes. In general, this will result in non-square pixels.
- *None*: Use `rcParams["image.aspect"]` (default: `'equal'`).

origin

[{'upper', 'lower'}, default: `rcParams["image.origin"]` (default: `'upper'`)] Place the [0, 0] index of the array in the upper left or lower left corner of the axes. The convention 'upper' is typically used for matrices and images.

Returns

AxesImage **or** *Line2D*

The return type depends on the plotting style (see above).

Other Parameters

****kwargs**

The supported additional parameters depend on the plotting style.

For the image style, you can pass the following additional parameters of *imshow*:

- *cmap*
- *alpha*
- *url*

- any *Artist* properties (passed on to the *AxesImage*)

For the marker style, you can pass any *Line2D* property except for *linestyle*:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array

Table 208 – continued from previous page

Property	Description
ydata	1D array
zorder	float

Examples using `matplotlib.pyplot.spy`

- sphx_glr_gallery_images_contours_and_fields_spy_demos.py

matplotlib.pyplot.stackplot

matplotlib.pyplot.**stackplot**(*x*, **args*, *labels=()*, *colors=None*, *baseline='zero'*, *data=None*, ***kwargs*)

Draw a stacked area plot.

Parameters

x

[1d array of dimension N]

y

[2d array (dimension MxN), or sequence of 1d arrays (each dimension 1xN)] The data is assumed to be unstacked. Each of the following calls is legal:

```
stackplot(x, y)               # where y is MxN
stackplot(x, y1, y2, y3, y4)  # where y1, y2, y3, y4, are all 1xNm
```

baseline

[{'zero', 'sym', 'wiggle', 'weighted_wiggle'}] Method used to calculate the baseline:

- `'zero'`: Constant zero baseline, i.e. a simple stacked plot.
- `'sym'`: Symmetric around zero and is sometimes called 'ThemeRiver'.
- `'wiggle'`: Minimizes the sum of the squared slopes.
- `'weighted_wiggle'`: Does the same but weights to account for size of each layer. It is also called 'Streamgraph'-layout. More details can be found at http://leebyron.com/streamgraph/.

labels

[Length N sequence of strings] Labels to assign to each data series.

colors

[Length N sequence of colors] A list or tuple of colors. These will be cycled through and used to colour the stacked areas.

****kwargs**

All other keyword arguments are passed to *Axes.fill_between*.

Returns

list of *PolyCollection*

A list of *PolyCollection* instances, one for each element in the stacked area plot.

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.stackplot`

matplotlib.pyplot.stem

`matplotlib.pyplot.stem`(**args*, *linefmt=None*, *markerfmt=None*, *basefmt=None*, *bottom=0*, *label=None*, *use_line_collection=True*, *data=None*)

Create a stem plot.

A stem plot plots vertical lines at each *x* location from the baseline to *y*, and places a marker there.

Call signature:

```
stem([x,] y, linefmt=None, markerfmt=None, basefmt=None)
```

The x-positions are optional. The formats may be provided either as positional or as keyword-arguments.

Parameters

x

[array-like, optional] The x-positions of the stems. Default: (0, 1, ..., len(y) - 1).

y

[array-like] The y-values of the stem heads.

linefmt

[str, optional] A string defining the properties of the vertical lines. Usually, this will be a color or a color and a linestyle:

Character	Line Style
`'-'`	solid line
`'--'`	dashed line
`'-.'`	dash-dot line
`':'`	dotted line

Default: 'C0-', i.e. solid line with the first color of the color cycle.

Note: While it is technically possible to specify valid formats other than color or color and linestyle (e.g. 'rx' or '-.'), this is beyond the intention of the method and will most likely not result in a reasonable plot.

markerfmt

[str, optional] A string defining the properties of the markers at the stem heads. Default: 'C0o', i.e. filled circles with the first color of the color cycle.

basefmt

[str, default: 'C3-' ('C2-' in classic mode)] A format string defining the properties of the baseline.

bottom

[float, default: 0] The y-position of the baseline.

label

[str, default: None] The label to use for the stems in legends.

use_line_collection

[bool, default: True] If `True`, store and plot the stem lines as a *LineCollection* instead of individual lines, which significantly increases performance. If `False`, defaults to the old behavior of using a list of *Line2D* objects. This parameter may be deprecated in the future.

Returns

StemContainer

The container may be treated like a tuple (*markerline*, *stemlines*, *baseline*)

Notes

See also:

The MATLAB function stem which inspired this method.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.stem`

- sphx_glr_gallery_lines_bars_and_markers_stem_plot.py

matplotlib.pyplot.step

matplotlib.pyplot.**step**(*x*, *y*, **args*, *where='pre'*, *data=None*, ***kwargs*)

Make a step plot.

Call signatures:

```
step(x, y, [fmt], *, data=None, where='pre', **kwargs)
step(x, y, [fmt], x2, y2, [fmt2], ..., *, where='pre', **kwargs)
```

This is just a thin wrapper around *plot* which changes some formatting options. Most of the concepts and parameters of plot can be used here as well.

Parameters

x

[array-like] 1-D sequence of x positions. It is assumed, but not checked, that it is uniformly increasing.

y

[array-like] 1-D sequence of y levels.

fmt

[str, optional] A format string, e.g. 'g' for a green line. See *plot* for a more detailed description.

Note: While full format strings are accepted, it is recommended to only specify the color. Line styles are currently ignored (use the keyword argument *linestyle* instead). Markers are accepted and plotted on the given positions, however, this is a rarely needed feature for step plots.

data

[indexable object, optional] An object with labelled data. If given, provide the label names to plot in *x* and *y*.

where

[{'pre', 'post', 'mid'}, default: 'pre'] Define where the steps should be placed:

- 'pre': The y value is continued constantly to the left from every *x* position, i.e. the interval `(x[i-1], x[i]]` has the value `y[i]`.
- 'post': The y value is continued constantly to the right from every *x* position, i.e. the interval `[x[i], x[i+1])` has the value `y[i]`.
- 'mid': Steps occur half-way between the *x* positions.

Returns

lines

A list of *Line2D* objects representing the plotted data.

Other Parameters

****kwargs**

Additional parameters are the same as those for *plot*.

Notes

Examples using `matplotlib.pyplot.step`

- sphx_glr_gallery_lines_bars_and_markers_step_demo.py

matplotlib.pyplot.streamplot

matplotlib.pyplot.**streamplot**(*x*, *y*, *u*, *v*, *density=1*, *linewidth=None*, *color=None*, *cmap=None*, *norm=None*, *arrowsize=1*, *arrowstyle='-|>'*, *minlength=0.1*, *transform=None*, *zorder=None*, *start_points=None*, *maxlength=4.0*, *integration_direction='both'*, ***, *data=None*)

Draw streamlines of a vector flow.

Parameters

x, y

[1D arrays] An evenly spaced grid.

u, v

[2D arrays] *x* and *y*-velocities. The number of rows and columns must match the length of *y* and *x*, respectively.

density

[float or (float, float)] Controls the closeness of streamlines. When `density = 1`, the domain is divided into a 30x30 grid. *density* linearly scales this grid. Each cell in the grid can have, at most, one traversing streamline. For different densities in each direction, use a tuple (density_x, density_y).

linewidth

[float or 2D array] The width of the stream lines. With a 2D array the line width can be varied across the grid. The array must have the same shape as *u* and *v*.

color

[color or 2D array] The streamline color. If given an array, its values are converted to colors using *cmap* and *norm*. The array must have the same shape as *u* and *v*.

cmap

[*Colormap*] Colormap used to plot streamlines and arrows. This is only used if *color* is an array.

norm

[*Normalize*] Normalize object used to scale luminance data to 0, 1. If `None`, stretch (min, max) to (0, 1). This is only used if *color* is an array.

arrowsize

[float] Scaling factor for the arrow size.

arrowstyle

[str] Arrow style specification. See *FancyArrowPatch*.

minlength

[float] Minimum length of streamline in axes coordinates.

start_points

[Nx2 array] Coordinates of starting points for the streamlines in data coordinates (the same coordinates as the *x* and *y* arrays).

zorder

[int] The zorder of the stream lines and arrows. Artists with lower zorder values are drawn first.

maxlength

[float] Maximum length of streamline in axes coordinates.

integration_direction

[{'forward', 'backward', 'both'}, default: 'both'] Integrate the streamline in forward, backward or both directions.

Returns

StreamplotSet

Container object with attributes

- `lines`: *LineCollection* of streamlines
- `arrows`: *PatchCollection* containing *FancyArrowPatch* objects representing the arrows half-way along stream lines.

This container will probably change in the future to allow changes to the colormap, alpha, etc. for both lines and arrows, but these changes should be backward compatible.

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*, *u*, *v*, *start_points*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.streamplot`

- sphx_glr_gallery_images_contours_and_fields_plot_streamplot.py
- *Sample plots in Matplotlib*

matplotlib.pyplot.subplot

matplotlib.pyplot.**subplot**(**args*, ***kwargs*)

Add a subplot to the current figure.

Wrapper of *Figure.add_subplot* with a difference in behavior explained in the notes section.

Call signatures:

```
subplot(nrows, ncols, index, **kwargs)
subplot(pos, **kwargs)
subplot(**kwargs)
subplot(ax)
```

Parameters

***args**

[int, (int, int, *index*), or *SubplotSpec*, default: (1, 1, 1)] The position of the subplot described by one of

- Three integers (*nrows*, *ncols*, *index*). The subplot will take the *index* position on a grid with *nrows* rows and *ncols* columns. *index* starts at 1 in the upper left corner and increases to the right. *index* can also be a two-tuple specifying the (*first*, *last*) indices (1-based, and including *last*) of the subplot, e.g., `fig.add_subplot(3, 1, (1, 2))` makes a subplot that spans the upper 2/3 of the figure.
- A 3-digit integer. The digits are interpreted as if given separately as three single-digit integers, i.e. `fig.add_subplot(235)` is the same as `fig.add_subplot(2, 3, 5)`. Note that this can only be used if there are no more than 9 subplots.
- A *SubplotSpec*.

projection

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the subplot (*Axes*). *str* is the name of a custom projection, see *projections*. The default None results in a 'rectilinear' projection.

polar

[bool, default: False] If True, equivalent to projection='polar'.

sharex, sharey

[*Axes*, optional] Share the x or y *axis* with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

label

[str] A label for the returned axes.

Returns

axes.SubplotBase, **or another subclass of** *Axes*

The axes of the subplot. The returned axes base class depends on the projection used. It is *Axes* if rectilinear projection is used and *projections.polar.PolarAxes* if polar projection is used. The returned axes is then a subplot subclass of the base class.

Other Parameters

****kwargs**

This method also takes the keyword arguments for the returned axes base class; except for the *figure* argument. The keyword arguments for the rectilinear base class *Axes* can be found in the following table but there might also be other keyword arguments if another projection is used.

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and re
alpha	float or None
anchor	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
animated	bool
aspect	{'auto'} or num
autoscale_on	bool
autoscalex_on	bool
autoscaley_on	bool
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	None, or a number
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None

Table 209 – continued from previous page

Property	Description
contains	unknown
facecolor or fc	color
figure	*Figure*
frame_on	bool
gid	str
in_layout	bool
label	object
navigate	bool
navigate_mode	unknown
path_effects	*AbstractPathEffect*
picker	None or bool or callable
position	[left, bottom, width, height] or *Bbox*
prop_cycle	unknown
rasterization_zorder	float or None
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None

xlim	(bottom: float, top: float)
xmargin	float greater than -0.5
xscale	{"linear", "log", "symlog", "logit", ...}
xticklabels	unknown
xticks	unknown
ybound	unknown
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	{"linear", "log", "symlog", "logit", ...}
yticklabels	unknown
yticks	unknown
zorder	float

See also:

Figure.add_subplot

pyplot.subplots

pyplot.axes

Figure.subplots

Notes

Creating a subplot will delete any pre-existing subplot that overlaps with it beyond sharing a boundary:

```
import matplotlib.pyplot as plt
# plot a line, implicitly creating a subplot(111)
plt.plot([1, 2, 3])
# now create a subplot which represents the top plot of a grid
# with 2 rows and 1 column. Since this subplot will overlap the
# first, the plot (and its axes) previously created, will be removed
plt.subplot(211)
```

If you do not want this behavior, use the *Figure.add_subplot* method or the *pyplot.axes* function instead.

If the figure already has a subplot with key (*args*, *kwargs*) then it will simply make that subplot current and return it. This behavior is deprecated. Meanwhile, if you do not want this behavior (i.e., you want to force the creation of a new subplot), you must use a unique set of args and kwargs. The axes *label* attribute has been exposed for this purpose: if you want two subplots that are otherwise identical to be added to the figure, make sure you give them unique labels.

In rare circumstances, *add_subplot* may be called with a single argument, a subplot axes instance already created in the present figure but not in the figure's list of axes.

Examples

```
plt.subplot(221)

# equivalent but more general
ax1=plt.subplot(2, 2, 1)

# add a subplot with no frame
ax2=plt.subplot(222, frameon=False)

# add a polar subplot
plt.subplot(223, projection='polar')

# add a red subplot that shares the x-axis with ax1
plt.subplot(224, sharex=ax1, facecolor='red')

# delete ax2 from the figure
plt.delaxes(ax2)

# add ax2 to the figure again
plt.subplot(ax2)
```

matplotlib.pyplot.subplot2grid

matplotlib.pyplot.**subplot2grid**(*shape*, *loc*, *rowspan=1*, *colspan=1*, *fig=None*, ***kwargs*)

Create a subplot at a specific location inside a regular grid.

Parameters

shape

[(int, int)] Number of rows and of columns of the grid in which to place axis.

loc

[(int, int)] Row number and column number of the axis location within the grid.

rowspan

[int, default: 1] Number of rows for the axis to span to the right.

colspan

[int, default: 1] Number of columns for the axis to span downwards.

fig

[*Figure*, optional] Figure to place the subplot in. Defaults to the current figure.

****kwargs**

Additional keyword arguments are handed to *add_subplot*.

Returns

axes.SubplotBase, **or another subclass of** *Axes*

The axes of the subplot. The returned axes base class depends on the projection used. It is *Axes* if rectilinear projection is used and *projections.polar.PolarAxes* if polar projection is used. The returned axes is then a subplot subclass of the base class.

Notes

The following call

```
ax = subplot2grid((nrows, ncols), (row, col), rowspan, colspan)
```

is identical to

```
fig = gcf()
gs = fig.add_gridspec(nrows, ncols)
ax = fig.add_subplot(gs[row:row+rowspan, col:col+colspan])
```

Examples using `matplotlib.pyplot.subplot2grid`

- *Tight Layout guide*

matplotlib.pyplot.subplot_mosaic

matplotlib.pyplot.**subplot_mosaic**(*layout*, ***, *subplot_kw=None*, *gridspec_kw=None*, *empty_sentinel='.'*, ***fig_kw*)

Build a layout of Axes based on ASCII art or nested lists.

This is a helper function to build complex GridSpec layouts visually.

Note: This API is provisional and may be revised in the future based on early user feedback.

Parameters

layout

[list of list of {hashable or nested} or str] A visual layout of how you want your Axes to be arranged labeled as strings. For example

```
x = [['A panel', 'A panel', 'edge'],
     ['C panel', '.',       'edge']]
```

Produces 4 axes:

- 'A panel' which is 1 row high and spans the first two columns
- 'edge' which is 2 rows high and is on the right edge
- 'C panel' which in 1 row and 1 column wide in the bottom left
- a blank space 1 row and 1 column wide in the bottom center

Any of the entries in the layout can be a list of lists of the same form to create nested layouts.

If input is a str, then it must be of the form

```
'''
AAE
C.E
'''
```

where each character is a column and each line is a row. This only allows only single character Axes labels and does not allow nesting but is very terse.

subplot_kw

[dict, optional] Dictionary with keywords passed to the *Figure.add_subplot* call used to create each subplot.

gridspec_kw

[dict, optional] Dictionary with keywords passed to the *GridSpec* constructor used to create the grid the subplots are placed on.

empty_sentinel

[object, optional] Entry in the layout to mean "leave this space empty". Defaults to `'.'`. Note, if *layout* is a string, it is processed via `inspect.cleandoc` to remove leading white space, which may interfere with using white-space as the empty sentinel.

****fig_kw**

All additional keyword arguments are passed to the *pyplot.figure* call.

Returns

fig

[*Figure*] The new figure

dict[label, Axes]

A dictionary mapping the labels to the Axes objects.

Examples using `matplotlib.pyplot.subplot_mosaic`

matplotlib.pyplot.subplot_tool

`matplotlib.pyplot.subplot_tool`(*targetfig=None*)

Launch a subplot tool window for a figure.

A *matplotlib.widgets.SubplotTool* instance is returned.

Examples using `matplotlib.pyplot.subplot_tool`

- sphx_glr_gallery_subplots_axes_and_figures_subplot_toolbar.py

matplotlib.pyplot.subplots

`matplotlib.pyplot.subplots`(*nrows=1*, *ncols=1*, ***, *sharex=False*, *sharey=False*, *squeeze=True*, *subplot_kw=None*, *gridspec_kw=None*, ***fig_kw*)

Create a figure and a set of subplots.

This utility wrapper makes it convenient to create common layouts of subplots, including the enclosing figure object, in a single call.

Parameters

nrows, ncols

[int, default: 1] Number of rows/columns of the subplot grid.

sharex, sharey

[bool or {'none', 'all', 'row', 'col'}, default: False] Controls sharing of properties among x (*sharex*) or y (*sharey*) axes:

- True or 'all': x- or y-axis will be shared among all subplots.
- False or 'none': each subplot x- or y-axis will be independent.
- 'row': each subplot row will share an x- or y-axis.
- 'col': each subplot column will share an x- or y-axis.

When subplots have a shared x-axis along a column, only the x tick labels of the bottom subplot are created. Similarly, when subplots have a shared y-axis along a row, only the y tick labels of the first column subplot are created. To later turn other subplots' ticklabels on, use *tick_params*.

squeeze

[bool, default: True]

- If True, extra dimensions are squeezed out from the returned array of *Axes*:
  - if only one subplot is constructed (nrows=ncols=1), the resulting single Axes object is returned as a scalar.
  - for Nx1 or 1xM subplots, the returned object is a 1D numpy object array of Axes objects.
  - for NxM, subplots with N>1 and M>1 are returned as a 2D array.
- If False, no squeezing at all is done: the returned Axes object is always a 2D array containing Axes instances, even if it ends up being 1x1.

subplot_kw

[dict, optional] Dict with keywords passed to the *add_subplot* call used to create each subplot.

gridspec_kw

[dict, optional] Dict with keywords passed to the *GridSpec* constructor used to create the grid the subplots are placed on.

****fig_kw**

All additional keyword arguments are passed to the *pyplot.figure* call.

Returns

fig

[*Figure*]

ax

[*axes.Axes* or array of Axes] *ax* can be either a single *Axes* object or an array of Axes objects if more than one subplot was created. The dimensions of the resulting array can be controlled with the squeeze keyword, see above.

Typical idioms for handling the return value are:

```
# using the variable ax for single a Axes
fig, ax = plt.subplots()

# using the variable axs for multiple Axes
fig, axs = plt.subplots(2, 2)

# using tuple unpacking for multiple Axes
fig, (ax1, ax2) = plt.subplot(1, 2)
fig, ((ax1, ax2), (ax3, ax4)) = plt.subplot(2, 2)
```

The names `ax` and pluralized `axs` are preferred over `axes` because for the latter it's not clear if it refers to a single *Axes* instance or a collection of these.

pyplot.figure

pyplot.subplot

pyplot.axes

Figure.subplots

Figure.add_subplot

Examples

```
# First create some toy data:
x = np.linspace(0, 2*np.pi, 400)
y = np.sin(x**2)

# Create just a figure and only one subplot
fig, ax = plt.subplots()
ax.plot(x, y)
ax.set_title('Simple plot')

# Create two subplots and unpack the output array immediately
f, (ax1, ax2) = plt.subplots(1, 2, sharey=True)
ax1.plot(x, y)
ax1.set_title('Sharing Y axis')
ax2.scatter(x, y)

# Create four polar axes and access them through the returned array
fig, axs = plt.subplots(2, 2, subplot_kw=dict(polar=True))
axs[0, 0].plot(x, y)
axs[1, 1].scatter(x, y)

# Share a X axis with each column of subplots
plt.subplots(2, 2, sharex='col')

# Share a Y axis with each row of subplots
plt.subplots(2, 2, sharey='row')

# Share both X and Y axes with all subplots
plt.subplots(2, 2, sharex='all', sharey='all')

# Note that this is the same as
plt.subplots(2, 2, sharex=True, sharey=True)

# Create figure number 10 with a single subplot
```

(continues on next page)

(continued from previous page)

```
# and clears it if it already exists.
fig, ax = plt.subplots(num=10, clear=True)
```

matplotlib.pyplot.subplots_adjust

matplotlib.pyplot.**subplots_adjust**(*left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*, *hspace=None*)

Adjust the subplot layout parameters.

Unset parameters are left unmodified; initial values are given by `rcParams["figure.subplot.[name]"]`.

Parameters

left

[float, optional] The position of the left edge of the subplots, as a fraction of the figure width.

right

[float, optional] The position of the right edge of the subplots, as a fraction of the figure width.

bottom

[float, optional] The position of the bottom edge of the subplots, as a fraction of the figure height.

top

[float, optional] The position of the top edge of the subplots, as a fraction of the figure height.

wspace

[float, optional] The width of the padding between subplots, as a fraction of the average axes width.

hspace

[float, optional] The height of the padding between subplots, as a fraction of the average axes height.

matplotlib.pyplot.summer

matplotlib.pyplot.**summer**()

Set the colormap to "summer".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.summer`

matplotlib.pyplot.suptitle

matplotlib.pyplot.**suptitle**(*t*, ***kwargs*)

Add a centered title to the figure.

Parameters

t

[str] The title text.

x

[float, default 0.5] The x location of the text in figure coordinates.

y

[float, default 0.98] The y location of the text in figure coordinates.

horizontalalignment, ha

[{'center', 'left', right'}, default: 'center'] The horizontal alignment of the text relative to (*x*, *y*).

verticalalignment, va

[{'top', 'center', 'bottom', 'baseline'}, default: 'top'] The vertical alignment of the text relative to (*x*, *y*).

fontsize, size

[default: `rcParams["figure.titlesize"]` (default: `'large'`)] The font size of the text. See *Text.set_size* for possible values.

fontweight, weight

[default: `rcParams["figure.titleweight"]` (default: `'normal'`)] The font weight of the text. See *Text.set_weight* for possible values.

Returns

text

The *Text* instance of the title.

Other Parameters

fontproperties

[None or dict, optional] A dict of font properties. If *fontproperties* is given the default values for font size and weight are taken from the *FontProperties* defaults. `rcParams["figure.titlesize"]` (default: `'large'`) and `rcParams["figure.titleweight"]` (default: `'normal'`) are ignored in this case.

****kwargs**

Additional kwargs are *matplotlib.text.Text* properties.

Examples

```
>>> fig.suptitle('This is the figure title', fontsize=12)
```

Examples using `matplotlib.pyplot.suptitle`

- sphx_glr_gallery_subplots_axes_and_figures_gridspec_nested.py
- *Pyplot tutorial*

matplotlib.pyplot.switch_backend

matplotlib.pyplot.**switch_backend**(*newbackend*)

Close all open figures and set the Matplotlib backend.

The argument is case-insensitive. Switching to an interactive backend is possible only if no event loop for another interactive backend has started. Switching to and from non-interactive backends is always possible.

Parameters

newbackend

[str] The name of the backend to use.

Examples using `matplotlib.pyplot.switch_backend`

matplotlib.pyplot.table

matplotlib.pyplot.**table**(*cellText=None*, *cellColours=None*, *cellLoc='right'*, *colWidths=None*, *rowLabels=None*, *rowColours=None*, *rowLoc='left'*, *colLabels=None*, *colColours=None*, *colLoc='center'*, *loc='bottom'*, *bbox=None*, *edges='closed'*, ***kwargs*)

Add a table to an *Axes*.

At least one of *cellText* or *cellColours* must be specified. These parameters must be 2D lists, in which the outer lists define the rows and the inner list define the column values per row. Each row must have the same number of elements.

The table can optionally have row and column headers, which are configured using *rowLabels*, *rowColours*, *rowLoc* and *colLabels*, *colColours*, *colLoc* respectively.

For finer grained control over tables, use the *Table* class and add it to the axes with *Axes.add_table*.

Parameters

cellText

[2D list of str, optional] The texts to place into the table cells.

Note: Line breaks in the strings are currently not accounted for and will result in the text exceeding the cell boundaries.

cellColours

[2D list of colors, optional] The background colors of the cells.

cellLoc

[{'left', 'center', 'right'}, default: 'right'] The alignment of the text within the cells.

colWidths

[list of float, optional] The column widths in units of the axes. If not given, all columns will have a width of *1 / ncols*.

rowLabels

[list of str, optional] The text of the row header cells.

rowColours

[list of colors, optional] The colors of the row header cells.

rowLoc

[{'left', 'center', 'right'}, default: 'left'] The text alignment of the row header cells.

colLabels

[list of str, optional] The text of the column header cells.

colColours

[list of colors, optional] The colors of the column header cells.

colLoc

[{'left', 'center', 'right'}, default: 'left'] The text alignment of the column header cells.

loc

[str, optional] The position of the cell with respect to *ax*. This must be one of the *codes*.

bbox

[*Bbox*, optional] A bounding box to draw the table into. If this is not *None*, this overrides *loc*.

edges

[substring of 'BRTL' or {'open', 'closed', 'horizontal', 'vertical'}]
The cell edges to be drawn with a line. See also *visible_edges*.

Returns

Table

The created table.

Other Parameters

**kwargs

Table properties.

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
alpha	float or None
animated	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
contains	unknown
figure	*Figure*
fontsize	float
gid	str
in_layout	bool
label	object
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

Examples using `matplotlib.pyplot.table`

- sphx_glr_gallery_misc_table_demo.py
- *Sample plots in Matplotlib*

matplotlib.pyplot.text

`matplotlib.pyplot.text`(*x*, *y*, *s*, *fontdict=None*, ***kwargs*)

Add text to the axes.

Add the text *s* to the axes at location *x*, *y* in data coordinates.

Parameters

x, y

[float] The position to place the text. By default, this is in data coordinates. The coordinate system can be changed using the *transform* parameter.

s

[str] The text.

fontdict

[dict, default: None] A dictionary to override the default text properties. If fontdict is None, the defaults are determined by *rcParams*.

Returns

Text

The created *Text* instance.

Other Parameters

****kwargs**

[*Text* properties.] Other miscellaneous text parameters.

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array an
alpha	float or None
animated	bool
backgroundcolor	color
bbox	dict with properties for *patches.FancyBboxPatch*
clip_box	*Bbox*

Tabl

Property	Description
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
figure	*Figure*
fontfamily or family	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', '
fontproperties or font or font_properties	*font_manager.FontProperties* or `str` or `pathlib.Path`
fontsize or size	float or {'xx-small', 'x-small', 'small', 'medium', 'large',
fontstretch or stretch	{a numeric value in range 0-1000, 'ultra-condensed',
fontstyle or style	{'normal', 'italic', 'oblique'}
fontvariant or variant	{'normal', 'small-caps'}
fontweight or weight	{a numeric value in range 0-1000, 'ultralight', 'light',
gid	str
horizontalalignment or ha	{'center', 'right', 'left'}
in_layout	bool
label	object
linespacing	float (multiple of font size)
multialignment or ma	{'left', 'right', 'center'}
path_effects	*AbstractPathEffect*
picker	None or bool or callable
position	(float, float)
rasterized	bool or None
rotation	float or {'vertical', 'horizontal'}
rotation_mode	{None, 'default', 'anchor'}
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
text	object
transform	*Transform*
url	str
usetex	bool or None
verticalalignment or va	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
visible	bool
wrap	bool
x	float
y	float
zorder	float

Examples

Individual keyword arguments can be used to override any given parameter:

```
>>> text(x, y, s, fontsize=12)
```

The default transform specifies that text is in data coords, alternatively, you can specify text in axis coords ((0, 0) is lower-left and (1, 1) is upper-right). The example below places text in the center of the axes:

```
>>> text(0.5, 0.5, 'matplotlib', horizontalalignment='center',
...      verticalalignment='center', transform=ax.transAxes)
```

You can put a rectangular box around the text instance (e.g., to set a background color) by using the keyword *bbox*. *bbox* is a dictionary of *Rectangle* properties. For example:

```
>>> text(x, y, s, bbox=dict(facecolor='red', alpha=0.5))
```

matplotlib.pyplot.thetagrids

matplotlib.pyplot.**thetagrids**(*angles=None*, *labels=None*, *fmt=None*, ***kwargs*)

Get or set the theta gridlines on the current polar plot.

Call signatures:

```
lines, labels = thetagrids()
lines, labels = thetagrids(angles, labels=None, fmt=None, **kwargs)
```

When called with no arguments, *thetagrids* simply returns the tuple (*lines*, *labels*). When called with arguments, the labels will appear at the specified angles.

Parameters

angles

[tuple with floats, degrees] The angles of the theta gridlines.

labels

[tuple with strings or None] The labels to use at each radial gridline. The *projections.polar.ThetaFormatter* will be used if None.

fmt

[str or None] Format string used in *matplotlib.ticker.FormatStrFormatter*. For example '%f'. Note that the angle in radians will be used.

Returns

lines

[list of *lines.Line2D*] The theta gridlines.

labels

[list of *text.Text*] The tick labels.

Other Parameters

****kwargs**

kwargs are optional *Text* properties for the labels.

See also:

pyplot.rgrids

projections.polar.PolarAxes.set_thetagrids

Axis.get_gridlines

Axis.get_ticklabels

Examples

```
# set the locations of the angular gridlines
lines, labels = thetagrids(range(45, 360, 90))

# set the locations and labels of the angular gridlines
lines, labels = thetagrids(range(45, 360, 90), ('NE', 'NW', 'SW', 'SE'))
```

Examples using `matplotlib.pyplot.thetagrids`

matplotlib.pyplot.tick_params

matplotlib.pyplot.**tick_params**(*axis='both', **kwargs*)

Change the appearance of ticks, tick labels, and gridlines.

Tick properties that are not explicitly set using the keyword arguments remain unchanged unless *reset* is True.

Parameters

axis

[{'x', 'y', 'both'}, default: 'both'] The axis to which the parameters are applied.

which

[{'major', 'minor', 'both'}, default: 'major'] The group of ticks to which the parameters are applied.

reset

[bool, default: False] Whether to reset the ticks to defaults before updating them.

Other Parameters

direction

[{'in', 'out', 'inout'}] Puts ticks inside the axes, outside the axes, or both.

length

[float] Tick length in points.

width

[float] Tick width in points.

color

[color] Tick color.

pad

[float] Distance in points between tick and label.

labelsize

[float or str] Tick label font size in points or as a string (e.g., 'large').

labelcolor

[color] Tick label color.

colors

[color] Tick color and label color.

zorder

[float] Tick and label zorder.

bottom, top, left, right

[bool] Whether to draw the respective ticks.

labelbottom, labeltop, labelleft, labelright

[bool] Whether to draw the respective tick labels.

labelrotation

[float] Tick label rotation

grid_color

[color] Gridline color.

grid_alpha

[float] Transparency of gridlines: 0 (transparent) to 1 (opaque).

grid_linewidth

[float] Width of gridlines in points.

grid_linestyle

[str] Any valid *Line2D* line style spec.

Examples

```
ax.tick_params(direction='out', length=6, width=2, colors='r',
               grid_color='r', grid_alpha=0.5)
```

This will make all major ticks be red, pointing out of the box, and with dimensions 6 points by 2 points. Tick labels will also be red. Gridlines will be red and translucent.

Examples using `matplotlib.pyplot.tick_params`

matplotlib.pyplot.ticklabel_format

matplotlib.pyplot.**ticklabel_format**(*, *axis='both'*, *style=''*, *scilimits=None*, *useOffset=None*, *useLocale=None*, *useMathText=None*)

Configure the *ScalarFormatter* used by default for linear axes.

If a parameter is not set, the corresponding property of the formatter is left unchanged.

Parameters

axis

[{'x', 'y', 'both'}, default: 'both'] The axes to configure. Only major ticks are affected.

style

[{'sci', 'scientific', 'plain'}] Whether to use scientific notation. The formatter default is to use scientific notation.

scilimits

[pair of ints (m, n)] Scientific notation is used only for numbers outside the range 10^m to 10^n (and only if the formatter is configured to use scientific notation at all). Use (0, 0) to include all numbers. Use (m, m) where m != 0 to fix the order of magnitude to 10^m. The formatter default is `rcParams["axes.formatter.limits"]` (default: `[-5, 6]`).

useOffset

[bool or float] If True, the offset is calculated as needed. If False, no offset is used. If a numeric value, it sets the offset. The formatter default is `rcParams["axes.formatter.useoffset"]` (default: `True`).

useLocale

[bool] Whether to format the number using the current locale or using the C (English) locale. This affects e.g. the decimal separator. The formatter default is `rcParams["axes.formatter.use_locale"]` (default: `False`).

useMathText

[bool] Render the offset and scientific notation in mathtext. The formatter default is `rcParams["axes.formatter.use_mathtext"]` (default: `False`).

Raises

AttributeError

If the current formatter is not a *ScalarFormatter*.

Examples using `matplotlib.pyplot.ticklabel_format`

matplotlib.pyplot.tight_layout

`matplotlib.pyplot.`**`tight_layout`**(*, *pad=1.08*, *h_pad=None*, *w_pad=None*, *rect=None*)

Adjust the padding between and around subplots.

Parameters

pad

[float, default: 1.08] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

h_pad, w_pad

[float, default: *pad*] Padding (height/width) between edges of adjacent subplots, as a fraction of the font size.

rect

[tuple (left, bottom, right, top), default: (0, 0, 1, 1)] A rectangle in normalized figure coordinates into which the whole subplots area (including labels) will fit.

Examples using `matplotlib.pyplot.tight_layout`

- sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py

matplotlib.pyplot.title

matplotlib.pyplot.**title**(*label*, *fontdict=None*, *loc=None*, *pad=None*, ***, *y=None*, ***kwargs*)

Set a title for the axes.

Set one of the three available axes titles. The available titles are positioned above the axes in the center, flush with the left edge, and flush with the right edge.

Parameters

label

[str] Text to use for the title

fontdict

[dict] A dictionary controlling the appearance of the title text, the default *fontdict* is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'color': rcParams['axes.titlecolor'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

loc

[{'center', 'left', 'right'}, default: `rcParams["axes.titlelocation"]` (default: `'center'`)] Which title to set.

y

[float, default: `rcParams["axes.titley"]` (default: `None`)] Vertical axes loation for the title (1.0 is the top). If None (the default), y is determined automatically to avoid decorators on the axes.

pad

[float, default: `rcParams["axes.titlepad"]` (default: `6.0`)] The offset of the title from the top of the axes, in points.

Returns

Text

The matplotlib text instance representing the title

Other Parameters

****kwargs**

[*Text* properties] Other keyword arguments are text properties, see *Text* for a list of valid text properties.

Examples using `matplotlib.pyplot.title`

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py
- sphx_glr_gallery_user_interfaces_svg_histogram_sgskip.py

matplotlib.pyplot.tricontour

`matplotlib.pyplot.tricontour`(**args*, ***kwargs*)

Draw contour lines on an unstructured triangular grid.

The triangulation can be specified in one of two ways; either

```
tricontour(triangulation, ...)
```

where *triangulation* is a *Triangulation* object, or

```
tricontour(x, y, ...)
tricontour(x, y, triangles, ...)
tricontour(x, y, triangles=triangles, ...)
tricontour(x, y, mask=mask, ...)
tricontour(x, y, triangles, mask=mask, ...)
```

in which case a *Triangulation* object will be created. See that class' docstring for an explanation of these cases.

The remaining arguments may be:

```
tricontour(..., Z)
```

where *Z* is the array of values to contour, one per point in the triangulation. The level values are chosen automatically.

```
tricontour(..., Z, levels)
```

contour up to *levels+1* automatically chosen contour levels (*levels* intervals).

```
tricontour(..., Z, levels)
```

draw contour lines at the values specified in sequence *levels*, which must be in increasing order.

```
tricontour(Z, **kwargs)
```

Use keyword arguments to control colors, linewidth, origin, cmap ... see below for more details.

Parameters

triangulation

[*Triangulation*, optional] The unstructured triangular grid.

If specified, then *x*, *y*, *triangles*, and *mask* are not accepted.

x, y

[array-like, optional] The coordinates of the values in *Z*.

triangles

[int array-like of shape (ntri, 3), optional] For each triangle, the indices of the three points that make up the triangle, ordered in an anticlockwise manner. If not specified, the Delaunay triangulation is calculated.

mask

[bool array-like of shape (ntri), optional] Which triangles are masked out.

Z

[array-like(N, M)] The height values over which the contour is drawn.

levels

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use *MaxNLocator*, which tries to automatically choose no more than *n+1* "nice" contour levels between *vmin* and *vmax*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns

TriContourSet

Other Parameters

colors

[color string or sequence of colors, optional] The colors of the levels, i.e., the contour lines.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. `'red'` instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value *None*), the colormap specified by *cmap* will be used.

alpha

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] A *Colormap* instance or registered colormap name. The colormap maps the level values to colors.

If both *colors* and *cmap* are given, an error is raised.

norm

[*Normalize*, optional] If a colormap is used, the *Normalize* instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

origin

[{*None*, 'upper', 'lower', 'image'}, default: None] Determines the orientation and exact position of *Z* by specifying the position of `Z[0, 0]`. This is only relevant, if *X*, *Y* are not given.

- *None*: `Z[0, 0]` is at X=0, Y=0 in the lower left corner.
- 'lower': `Z[0, 0]` is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': `Z[0, 0]` is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from `rcParams["image.origin"]` (default: `'upper'`).

extent

[(x0, x1, y0, y1), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of Z[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of Z[0, 0], and (*x1*, *y1*) is the position of Z[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to contour.

locator

[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `tricontour`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

Note: An existing *TriContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call to *ContourSet.changed()* is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *TriContourSet* because it internally calls *ContourSet.changed()*.

---

xunits, yunits

[registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

linewidths

[float or array-like, default: `rcParams["contour.linewidth"]` (default: `None`)] The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to `rcParams["lines.linewidth"]` (default: `1.5`).

linestyles

[{*None*, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their

linestyle from `rcParams["contour.negative_linestyle"]` (default: `'dashed'`) setting.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

Examples using `matplotlib.pyplot.tricontour`

- sphx_glr_gallery_images_contours_and_fields_irregulardatagrid.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_delaunay.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_user.py
- sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py

matplotlib.pyplot.tricontourf

matplotlib.pyplot.**tricontourf**(**args*, ***kwargs*)

Draw contour regions on an unstructured triangular grid.

The triangulation can be specified in one of two ways; either

```
tricontourf(triangulation, ...)
```

where *triangulation* is a *Triangulation* object, or

```
tricontourf(x, y, ...)
tricontourf(x, y, triangles, ...)
tricontourf(x, y, triangles=triangles, ...)
tricontourf(x, y, mask=mask, ...)
tricontourf(x, y, triangles, mask=mask, ...)
```

in which case a *Triangulation* object will be created. See that class' docstring for an explanation of these cases.

The remaining arguments may be:

```
tricontourf(..., Z)
```

where *Z* is the array of values to contour, one per point in the triangulation. The level values are chosen automatically.

```
tricontourf(..., Z, levels)
```

contour up to *levels+1* automatically chosen contour levels (*levels* intervals).

```
tricontourf(..., Z, levels)
```

draw contour regions at the values specified in sequence *levels*, which must be in increasing order.

```
tricontourf(Z, **kwargs)
```

Use keyword arguments to control colors, linewidth, origin, cmap ... see below for more details.

Parameters

triangulation

[*Triangulation*, optional] The unstructured triangular grid.

If specified, then *x*, *y*, *triangles*, and *mask* are not accepted.

x, y

[array-like, optional] The coordinates of the values in *Z*.

triangles

[int array-like of shape (ntri, 3), optional] For each triangle, the indices of the three points that make up the triangle, ordered in an anticlockwise manner. If not specified, the Delaunay triangulation is calculated.

mask

[bool array-like of shape (ntri), optional] Which triangles are masked out.

Z

[array-like(N, M)] The height values over which the contour is drawn.

levels

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use *MaxNLocator*, which tries to automatically choose no more than *n+1* "nice" contour levels between *vmin* and *vmax*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns

TriContourSet

Other Parameters

colors

[color string or sequence of colors, optional] The colors of the levels, i.e., the contour regions.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. `'red'` instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value *None*), the colormap specified by *cmap* will be used.

alpha

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] A *Colormap* instance or registered colormap name. The colormap maps the level values to colors.

If both *colors* and *cmap* are given, an error is raised.

norm

[*Normalize*, optional] If a colormap is used, the *Normalize* instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

origin

[{*None*, 'upper', 'lower', 'image'}, default: None] Determines the orientation and exact position of *Z* by specifying the position of `Z[0, 0]`. This is only relevant, if *X*, *Y* are not given.

- *None*: `Z[0, 0]` is at X=0, Y=0 in the lower left corner.
- 'lower': `Z[0, 0]` is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': `Z[0, 0]` is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from `rcParams["image.origin"]` (default: `'upper'`).

extent

[(x0, x1, y0, y1), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of Z[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of Z[0, 0], and (*x1*, *y1*) is the position of Z[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to contour.

locator

[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `tricontourf`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

Note: An existing *TriContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call to *ContourSet.changed()* is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *TriContourSet* because it internally calls *ContourSet.changed()*.

---

xunits, yunits

[registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

antialiased

[bool, default: True] Whether to use antialiasing.

Notes

tricontourf fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

```
z1 < Z <= z2
```

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

Examples using `matplotlib.pyplot.tricontourf`

- sphx_glr_gallery_images_contours_and_fields_irregulardatagrid.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_demo.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_delaunay.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_user.py
- sphx_glr_gallery_images_contours_and_fields_triinterp_demo.py

matplotlib.pyplot.tripcolor

matplotlib.pyplot.**tripcolor**(**args*, *alpha=1.0*, *norm=None*, *cmap=None*, *vmin=None*, *vmax=None*, *shading='flat'*, *facecolors=None*, ***kwargs*)

Create a pseudocolor plot of an unstructured triangular grid.

The triangulation can be specified in one of two ways; either:

```
tripcolor(triangulation, ...)
```

where triangulation is a *Triangulation* object, or

```
tripcolor(x, y, ...)
tripcolor(x, y, triangles, ...)
tripcolor(x, y, triangles=triangles, ...)
tripcolor(x, y, mask=mask, ...)
tripcolor(x, y, triangles, mask=mask, ...)
```

in which case a Triangulation object will be created. See *Triangulation* for a explanation of these possibilities.

The next argument must be *C*, the array of color values, either one per point in the triangulation if color values are defined at points, or one per triangle in the triangulation if color values are defined at triangles. If there are the same number of points and triangles in the triangulation it is assumed that color values are defined at points; to force the use of color values at triangles use the kwarg `facecolors=C` instead of just `C`.

shading may be 'flat' (the default) or 'gouraud'. If *shading* is 'flat' and C values are defined at points, the color values used for each triangle are from the mean C of the triangle's three points. If *shading* is 'gouraud' then color values must be defined at points.

The remaining kwargs are the same as for *pcolor*.

Examples using `matplotlib.pyplot.tripcolor`

- sphx_glr_gallery_images_contours_and_fields_tripcolor_demo.py

matplotlib.pyplot.triplot

matplotlib.pyplot.**triplot**(**args*, ***kwargs*)

Draw a unstructured triangular grid as lines and/or markers.

The triangulation to plot can be specified in one of two ways; either:

```
triplot(triangulation, ...)
```

where triangulation is a *Triangulation* object, or

```
triplot(x, y, ...)
triplot(x, y, triangles, ...)
triplot(x, y, triangles=triangles, ...)
triplot(x, y, mask=mask, ...)
triplot(x, y, triangles, mask=mask, ...)
```

in which case a Triangulation object will be created. See *Triangulation* for a explanation of these possibilities.

The remaining args and kwargs are the same as for *plot*.

Returns

lines

[*Line2D*] The drawn triangles edges.

markers

[*Line2D*] The drawn marker nodes.

Examples using `matplotlib.pyplot.triplot`

- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_delaunay.py
- sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py
- sphx_glr_gallery_images_contours_and_fields_triinterp_demo.py
- sphx_glr_gallery_images_contours_and_fields_triplot_demo.py
- sphx_glr_gallery_event_handling_trifinder_event_demo.py

matplotlib.pyplot.twinx

matplotlib.pyplot.**twinx**(*ax=None*)

Make and return a second axes that shares the *x*-axis. The new axes will overlay *ax* (or the current axes if *ax* is *None*), and its ticks will be on the right.

Examples

/gallery/subplots_axes_and_figures/two_scales

Examples using `matplotlib.pyplot.twinx`

matplotlib.pyplot.twiny

matplotlib.pyplot.**twiny**(*ax=None*)

Make and return a second axes that shares the *y*-axis. The new axes will overlay *ax* (or the current axes if *ax* is *None*), and its ticks will be on the top.

Examples

/gallery/subplots_axes_and_figures/two_scales

Examples using `matplotlib.pyplot.twiny`

matplotlib.pyplot.uninstall_repl_displayhook

matplotlib.pyplot.**uninstall_repl_displayhook**()

Uninstall the matplotlib display hook.

> **Warning:** Need IPython >= 2 for this to work. For IPython < 2 will raise a `NotImplementedError`

> **Warning:** If you are using vanilla python and have installed another display hook this will reset `sys.displayhook` to what ever function was there when matplotlib installed it's displayhook, possibly discarding your changes.

Examples using `matplotlib.pyplot.uninstall_repl_displayhook`

matplotlib.pyplot.violinplot

`matplotlib.pyplot.violinplot`(*dataset*, *positions=None*, *vert=True*, *widths=0.5*, *showmeans=False*, *showextrema=True*, *showmedians=False*, *quantiles=None*, *points=100*, *bw_method=None*, *, *data=None*)

Make a violin plot.

Make a violin plot for each column of *dataset* or each vector in sequence *dataset*. Each filled area extends to represent the entire data range, with optional lines at the mean, the median, the minimum, the maximum, and user-specified quantiles.

Parameters

dataset

[Array or a sequence of vectors.] The input data.

positions

[array-like, default: [1, 2, ..., n]] Sets the positions of the violins. The ticks and limits are automatically set to match the positions.

vert

[bool, default: True.] If true, creates a vertical violin plot. Otherwise, creates a horizontal violin plot.

widths

[array-like, default: 0.5] Either a scalar or a vector that sets the maximal width of each violin. The default is 0.5, which uses about half of the available horizontal space.

showmeans

[bool, default: False] If `True`, will toggle rendering of the means.

showextrema

[bool, default: True] If `True`, will toggle rendering of the extrema.

showmedians

[bool, default: False] If `True`, will toggle rendering of the medians.

quantiles

[array-like, default: None] If not None, set a list of floats in interval [0, 1] for each violin, which stands for the quantiles that will be rendered for that violin.

points

[int, default: 100] Defines the number of points to evaluate each of the gaussian kernel density estimations at.

bw_method

[str, scalar or callable, optional] The method used to calculate the estimator bandwidth. This can be 'scott', 'silverman', a scalar constant or a callable. If a scalar, this will be used directly as `kde.factor`. If a callable, it should take a `GaussianKDE` instance as its only parameter and return a scalar. If None (default), 'scott' is used.

Returns

dict

A dictionary mapping each component of the violinplot to a list of the corresponding collection instances created. The dictionary has the following keys:

- `bodies`: A list of the *PolyCollection* instances containing the filled area of each violin.
- `cmeans`: A *LineCollection* instance that marks the mean values of each of the violin's distribution.
- `cmins`: A *LineCollection* instance that marks the bottom of each violin's distribution.
- `cmaxes`: A *LineCollection* instance that marks the top of each violin's distribution.
- `cbars`: A *LineCollection* instance that marks the centers of each violin's distribution.
- `cmedians`: A *LineCollection* instance that marks the median values of each of the violin's distribution.
- `cquantiles`: A *LineCollection* instance created to identify the quantile values of each of the violin's distribution.

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *dataset*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.violinplot`

matplotlib.pyplot.viridis

matplotlib.pyplot.**viridis**()

Set the colormap to "viridis".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.viridis`

matplotlib.pyplot.vlines

matplotlib.pyplot.**vlines**(*x*, *ymin*, *ymax*, *colors=None*, *linestyles='solid'*, *label=''*, ***, *data=None*, ***kwargs*)

Plot vertical lines.

Plot vertical lines at each *x* from *ymin* to *ymax*.

Parameters

x

[float or array-like] x-indexes where to plot the lines.

ymin, ymax

[float or array-like] Respective beginning and end of each line. If scalars are provided, all lines will have same length.

colors

[list of colors, default: `rcParams["lines.color"]` (default: `'C0'`)]

linestyles

[{'solid', 'dashed', 'dashdot', 'dotted'}, optional]

label

[str, default: '']

Returns

LineCollection

Other Parameters

****kwargs**

[*LineCollection* properties.]

See also:

hlines

horizontal lines

axvline

vertical line across the axes

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *ymin*, *ymax*, *colors*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.vlines`

matplotlib.pyplot.waitforbuttonpress

matplotlib.pyplot.**waitforbuttonpress**(*timeout=-1*)

Blocking call to interact with the figure.

Wait for user input and return True if a key was pressed, False if a mouse button was pressed and None if no input was given within *timeout* seconds. Negative values deactivate *timeout*.

Examples using `matplotlib.pyplot.waitforbuttonpress`

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

matplotlib.pyplot.winter

matplotlib.pyplot.**winter**()

Set the colormap to "winter".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.winter`

matplotlib.pyplot.xcorr

matplotlib.pyplot.**xcorr**(*x*, *y*, *normed=True*, *detrend=<function detrend_none at 0x7f5434697820>*, *usevlines=True*, *maxlags=10*, ***, *data=None*, ***kwargs*)

Plot the cross correlation between *x* and *y*.

The correlation with lag k is defined as $\sum_n x[n+k] \cdot y^*[n]$, where y^* is the complex conjugate of y.

Parameters

x, y

[array-like of length n]

detrend

[callable, default: *mlab.detrend_none* (no detrending)] A detrending function applied to *x* and *y*. It must have the signature

```
detrend(x: np.ndarray) -> np.ndarray
```

normed

[bool, default: True] If `True`, input vectors are normalised to unit length.

usevlines

[bool, default: True] Determines the plot style.

If `True`, vertical lines are plotted from 0 to the xcorr value using *Axes.vlines*. Additionally, a horizontal line is plotted at y=0 using *Axes.axhline*.

If `False`, markers are plotted at the xcorr values using *Axes.plot*.

maxlags

[int, default: 10] Number of lags to show. If None, will return all `2 * len(x) - 1` lags.

Returns

lags

[array (length `2*maxlags+1`)] The lag vector.

c

[array (length `2*maxlags+1`)] The auto correlation vector.

line

[*LineCollection* or *Line2D*] *Artist* added to the axes of the correlation:

- *LineCollection* if *usevlines* is True.
- *Line2D* if *usevlines* is False.

b

[*Line2D* or None] Horizontal line at 0 if *usevlines* is True None *usevlines* is False.

Other Parameters

linestyle

[*Line2D* property, optional] The linestyle for plotting the data points. Only used if *usevlines* is `False`.

marker

[str, default: 'o'] The marker for plotting the data points. Only used if *usevlines* is `False`.

****kwargs**

Additional parameters are passed to *Axes.vlines* and *Axes.axhline* if *usevlines* is `True`; otherwise they are passed to *Axes.plot*.

Notes

The cross correlation is performed with `numpy.correlate` with `mode = "full"`.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.xcorr`

- sphx_glr_gallery_lines_bars_and_markers_xcorr_acorr_demo.py

matplotlib.pyplot.xkcd

`matplotlib.pyplot.`**xkcd**(*scale=1*, *length=100*, *randomness=2*)

Turn on xkcd sketch-style drawing mode. This will only have effect on things drawn after this function is called.

For best results, the "Humor Sans" font should be installed: it is not included with Matplotlib.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line.

length

[float, optional] The length of the wiggle along the line.

randomness

[float, optional] The scale factor by which the length is shrunken or expanded.

Notes

This function works by a number of rcParams, so it will probably override others you have set before.

If you want the effects of this function to be temporary, it can be used as a context manager, for example:

```
with plt.xkcd():
    # This figure will be in XKCD-style
    fig1 = plt.figure()
    # ...

# This figure will be in regular style
fig2 = plt.figure()
```

Examples using `matplotlib.pyplot.xkcd`

- sphx_glr_gallery_showcase_xkcd.py

matplotlib.pyplot.xlabel

matplotlib.pyplot.**xlabel**(*xlabel*, *fontdict=None*, *labelpad=None*, ***, *loc=None*, ***kwargs*)

Set the label for the x-axis.

Parameters

xlabel

[str] The label text.

labelpad

[float, default: None] Spacing in points from the axes bounding box including ticks and tick labels.

loc

[{'left', 'center', 'right'}, default: `rcParams["xaxis.labellocation"]` (default: `'center'`)] The label position. This is a high-level alternative for passing parameters *x* and *horizontalalignment*.

Other Parameters

****kwargs**

[*Text* properties] *Text* properties control the appearance of the label.

See also:

text

Documents the properties supported by *Text*.

Examples using `matplotlib.pyplot.xlabel`

- sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py

matplotlib.pyplot.xlim

matplotlib.pyplot.**xlim**(**args*, ***kwargs*)

Get or set the x limits of the current axes.

Call signatures:

```
left, right = xlim()  # return the current xlim
xlim((left, right))   # set the xlim to left, right
xlim(left, right)     # set the xlim to left, right
```

If you do not specify args, you can pass *left* or *right* as kwargs, i.e.:

```
xlim(right=3)  # adjust the right leaving left unchanged
xlim(left=1)  # adjust the left leaving right unchanged
```

Setting limits turns autoscaling off for the x-axis.

Returns

left, right

A tuple of the new x-axis limits.

Notes

Calling this function with no arguments (e.g. `xlim()`) is the pyplot equivalent of calling *get_xlim* on the current axes. Calling this function with arguments is the pyplot equivalent of calling *set_xlim* on the current axes. All arguments are passed though.

Examples using `matplotlib.pyplot.xlim`

- *Frame grabbing*
- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

matplotlib.pyplot.xscale

`matplotlib.pyplot.`**`xscale`**`(`*value*, ***kwargs*`)`

Set the x-axis scale.

Parameters

value

[{"linear", "log", "symlog", "logit", ...}] The axis scale type to apply.

****kwargs**

Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- *matplotlib.scale.LinearScale*
- *matplotlib.scale.LogScale*
- *matplotlib.scale.SymmetricalLogScale*
- *matplotlib.scale.LogitScale*

Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using *matplotlib.scale.register_scale*. These scales can then also be used here.

Examples using `matplotlib.pyplot.xscale`

- sphx_glr_gallery_scales_symlog_demo.py

matplotlib.pyplot.xticks

matplotlib.pyplot.**xticks**(*ticks=None*, *labels=None*, ***kwargs*)

Get or set the current tick locations and labels of the x-axis.

Pass no arguments to return the current values without modifying them.

Parameters

ticks

[array-like, optional] The list of xtick locations. Passing an empty list removes all xticks.

labels

[array-like, optional] The labels to place at the given *ticks* locations. This argument can only be passed if *ticks* is passed as well.

****kwargs**

Text properties can be used to control the appearance of the labels.

Returns

locs

The list of xtick locations.

labels

The list of xlabel *Text* objects.

Notes

Calling this function with no arguments (e.g. `xticks()`) is the pyplot equivalent of calling *get_xticks* and *get_xticklabels* on the current axes. Calling this function with arguments is the pyplot equivalent of calling *set_xticks* and *set_xticklabels* on the current axes.

Examples

```
>>> locs, labels = xticks()  # Get the current locations and labels.
>>> xticks(np.arange(0, 1, step=0.2))  # Set label locations.
>>> xticks(np.arange(3), ['Tom', 'Dick', 'Sue'])  # Set text labels.
>>> xticks([0, 1, 2], ['January', 'February', 'March'],
...        rotation=20)  # Set text labels and properties.
>>> xticks([])  # Disable xticks.
```

Examples using `matplotlib.pyplot.xticks`

- sphx_glr_gallery_subplots_axes_and_figures_secondary_axis.py
- sphx_glr_gallery_text_labels_and_annotations_arrow_demo.py
- sphx_glr_gallery_text_labels_and_annotations_multiline.py
- sphx_glr_gallery_axes_grid1_demo_colorbar_of_inset_axes.py
- sphx_glr_gallery_misc_table_demo.py
- sphx_glr_gallery_ticks_and_spines_ticklabels_rotation.py

matplotlib.pyplot.ylabel

`matplotlib.pyplot.ylabel`(*ylabel*, *fontdict=None*, *labelpad=None*, *, *loc=None*, ***kwargs*)

Set the label for the y-axis.

Parameters

ylabel

[str] The label text.

labelpad

[float, default: None] Spacing in points from the axes bounding box including ticks and tick labels.

loc

[{'bottom', 'center', 'top'}, default: `rcParams["yaxis.labellocation"]` (default: `'center'`)] The label position. This is a high-level alternative for passing parameters *y* and *horizontalalignment*.

Other Parameters

****kwargs**

[*Text* properties] *Text* properties control the appearance of the label.

See also:

text

Documents the properties supported by *Text*.

Examples using `matplotlib.pyplot.ylabel`

- sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py

matplotlib.pyplot.ylim

`matplotlib.pyplot.ylim`(**args*, ***kwargs*)

Get or set the y-limits of the current axes.

Call signatures:

```
bottom, top = ylim()  # return the current ylim
ylim((bottom, top))   # set the ylim to bottom, top
ylim(bottom, top)     # set the ylim to bottom, top
```

If you do not specify args, you can alternatively pass *bottom* or *top* as kwargs, i.e.:

```
ylim(top=3)  # adjust the top leaving bottom unchanged
ylim(bottom=1)  # adjust the bottom leaving top unchanged
```

Setting limits turns autoscaling off for the y-axis.

Returns

bottom, top

A tuple of the new y-axis limits.

Notes

Calling this function with no arguments (e.g. `ylim()`) is the pyplot equivalent of calling *get_ylim* on the current axes. Calling this function with arguments is the pyplot equivalent of calling *set_ylim* on the current axes. All arguments are passed though.

Examples using `matplotlib.pyplot.ylim`

- *Frame grabbing*
- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

matplotlib.pyplot.yscale

`matplotlib.pyplot.yscale(`*value*, ***kwargs*`)`

Set the y-axis scale.

Parameters

value

[{"linear", "log", "symlog", "logit", ...}] The axis scale type to apply.

****kwargs**

Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- *matplotlib.scale.LinearScale*
- *matplotlib.scale.LogScale*
- *matplotlib.scale.SymmetricalLogScale*
- *matplotlib.scale.LogitScale*

Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using *matplotlib.scale.register_scale*. These scales can then also be used here.

Examples using `matplotlib.pyplot.yscale`

- sphx_glr_gallery_scales_symlog_demo.py
- *Pyplot tutorial*

matplotlib.pyplot.yticks

matplotlib.pyplot.**yticks**(*ticks=None*, *labels=None*, ***kwargs*)

Get or set the current tick locations and labels of the y-axis.

Pass no arguments to return the current values without modifying them.

Parameters

ticks

[array-like, optional] The list of ytick locations. Passing an empty list removes all yticks.

labels

[array-like, optional] The labels to place at the given *ticks* locations. This argument can only be passed if *ticks* is passed as well.

****kwargs**

Text properties can be used to control the appearance of the labels.

Returns

locs

The list of ytick locations.

labels

The list of ylabel *Text* objects.

Notes

Calling this function with no arguments (e.g. `yticks()`) is the pyplot equivalent of calling *get_yticks* and *get_yticklabels* on the current axes. Calling this function with arguments is the pyplot equivalent of calling *set_yticks* and *set_yticklabels* on the current axes.

Examples

```
>>> locs, labels = yticks()  # Get the current locations and labels.
>>> yticks(np.arange(0, 1, step=0.2))  # Set label locations.
>>> yticks(np.arange(3), ['Tom', 'Dick', 'Sue'])  # Set text labels.
>>> yticks([0, 1, 2], ['January', 'February', 'March'],
...        rotation=45)  # Set text labels and properties.
>>> yticks([])  # Disable yticks.
```

Examples using `matplotlib.pyplot.yticks`

- sphx_glr_gallery_text_labels_and_annotations_arrow_demo.py
- sphx_glr_gallery_axes_grid1_demo_colorbar_of_inset_axes.py
- sphx_glr_gallery_misc_table_demo.py

`matplotlib.pyplot.plotting()`

Function	Description
acorr	Plot the autocorrelation of *x*.
angle_spectrum	Plot the angle spectrum.
annotate	Annotate the point *xy* with text *text*.
arrow	Add an arrow to the axes.
autoscale	Autoscale the axis view to the data (toggle).
axes	Add an axes to the current figure and make it the current axes.
axhline	Add a horizontal line across the axis.
axhspan	Add a horizontal span (rectangle) across the axis.
axis	Convenience method to get or set some axis properties.
axline	Add an infinitely long straight line.
axvline	Add a vertical line across the axes.
axvspan	Add a vertical span (rectangle) across the axes.
bar	Make a bar plot.
barbs	Plot a 2D field of barbs.
barh	Make a horizontal bar plot.
box	Turn the axes box on or off on the current axes.
boxplot	Make a box and whisker plot.
broken_barh	Plot a horizontal sequence of rectangles.
cla	Clear the current axes.
clabel	Label a contour plot.
clf	Clear the current figure.
clim	Set the color limits of the current image.
close	Close a figure window.
cohere	Plot the coherence between *x* and *y*.
colorbar	Add a colorbar to a plot.

Table 211 – continued from previous page

Function	Description
contour	Plot contours.
contourf	Plot contours.
csd	Plot the cross-spectral density.
delaxes	Remove an *Axes* (defaulting to the current axes) from its figure.
draw	Redraw the current figure.
draw_if_interactive	
errorbar	Plot y versus x as lines and/or markers with attached errorbars.
eventplot	Plot identical parallel lines at the given positions.
figimage	Add a non-resampled image to the figure.
figlegend	Place a legend on the figure.
fignum_exists	Return whether the figure with the given id exists.
figtext	Add text to figure.
figure	Create a new figure, or activate an existing figure.
fill	Plot filled polygons.
fill_between	Fill the area between two horizontal curves.
fill_betweenx	Fill the area between two vertical curves.
findobj	Find artist objects.
gca	Get the current axes, creating one if necessary.
gcf	Get the current figure.
gci	Get the current colorable artist.
get	Return the value of an object's *property*, or print all of them.
get_figlabels	Return a list of existing figure labels.
get_fignums	Return a list of existing figure numbers.
getp	Return the value of an object's *property*, or print all of them.
grid	Configure the grid lines.
hexbin	Make a 2D hexagonal binning plot of points *x*, *y*.
hist	Plot a histogram.
hist2d	Make a 2D histogram plot.
hlines	Plot horizontal lines at each *y* from *xmin* to *xmax*.
imread	Read an image from a file into an array.
imsave	Save an array as an image file.
imshow	Display data as an image, i.e., on a 2D regular raster.
install_repl_displayhook	Install a repl display hook so that any stale figure are automatically
ioff	Turn the interactive mode off.
ion	Turn the interactive mode on.
isinteractive	Return if pyplot is in "interactive mode" or not.
legend	Place a legend on the axes.
locator_params	Control behavior of major tick locators.
loglog	Make a plot with log scaling on both the x and y axis.
magnitude_spectrum	Plot the magnitude spectrum.
margins	Set or retrieve autoscaling margins.
matshow	Display an array as a matrix in a new figure window.
minorticks_off	Remove minor ticks from the axes.

Table 211 – continued from previous page

Function	Description
minorticks_on	Display minor ticks on the axes.
new_figure_manager	Create a new figure manager instance.
pause	Run the GUI event loop for *interval* seconds.
pcolor	Create a pseudocolor plot with a non-regular rectangular grid.
pcolormesh	Create a pseudocolor plot with a non-regular rectangular grid.
phase_spectrum	Plot the phase spectrum.
pie	Plot a pie chart.
plot	Plot y versus x as lines and/or markers.
plot_date	Plot data that contains dates.
polar	Make a polar plot.
psd	Plot the power spectral density.
quiver	Plot a 2D field of arrows.
quiverkey	Add a key to a quiver plot.
rc	Set the current *rcParams*.
rc_context	Return a context manager for temporarily changing rcParams.
rcdefaults	Restore the *rcParams* from Matplotlib's internal default style.
rgrids	Get or set the radial gridlines on the current polar plot.
savefig	Save the current figure.
sca	Set the current Axes to *ax* and the current Figure to the parent of *a*
scatter	A scatter plot of *y* vs.
sci	Set the current image.
semilogx	Make a plot with log scaling on the x axis.
semilogy	Make a plot with log scaling on the y axis.
set_cmap	Set the default colormap, and applies it to the current image if any.
setp	Set a property on an artist object.
show	Display all open figures.
specgram	Plot a spectrogram.
spy	Plot the sparsity pattern of a 2D array.
stackplot	Draw a stacked area plot.
stem	Create a stem plot.
step	Make a step plot.
streamplot	Draw streamlines of a vector flow.
subplot	Add a subplot to the current figure.
subplot2grid	Create a subplot at a specific location inside a regular grid.
subplot_mosaic	Build a layout of Axes based on ASCII art or nested lists.
subplot_tool	Launch a subplot tool window for a figure.
subplots	Create a figure and a set of subplots.
subplots_adjust	Adjust the subplot layout parameters.
suptitle	Add a centered title to the figure.
switch_backend	Close all open figures and set the Matplotlib backend.
table	Add a table to an *Axes*.
text	Add text to the axes.
thetagrids	Get or set the theta gridlines on the current polar plot.

Table 211 – continued from previous page

Function	Description
tick_params	Change the appearance of ticks, tick labels, and gridlines.
ticklabel_format	Configure the *ScalarFormatter* used by default for linear axes.
tight_layout	Adjust the padding between and around subplots.
title	Set a title for the axes.
tricontour	Draw contour lines on an unstructured triangular grid.
tricontourf	Draw contour regions on an unstructured triangular grid.
tripcolor	Create a pseudocolor plot of an unstructured triangular grid.
triplot	Draw a unstructured triangular grid as lines and/or markers.
twinx	Make and return a second axes that shares the *x*-axis.
twiny	Make and return a second axes that shares the *y*-axis.
uninstall_repl_displayhook	Uninstall the matplotlib display hook.
violinplot	Make a violin plot.
vlines	Plot vertical lines.
xcorr	Plot the cross correlation between *x* and *y*.
xkcd	Turn on xkcd sketch-style drawing mode.
xlabel	Set the label for the x-axis.
xlim	Get or set the x limits of the current axes.
xscale	Set the x-axis scale.
xticks	Get or set the current tick locations and labels of the x-axis.
ylabel	Set the label for the y-axis.
ylim	Get or set the y-limits of the current axes.
yscale	Set the y-axis scale.
yticks	Get or set the current tick locations and labels of the y-axis.

18.38.2 Colors in Matplotlib

There are many colormaps you can use to map data onto color values. Below we list several ways in which color can be utilized in Matplotlib.

For a more in-depth look at colormaps, see the *Choosing Colormaps in Matplotlib* tutorial.

matplotlib.pyplot.**colormaps**()

Matplotlib provides a number of colormaps, and others can be added using *register_cmap()*. This function documents the built-in colormaps, and will also return a list of all registered colormaps if called.

You can set the colormap for an image, pcolor, scatter, etc, using a keyword argument:

```
imshow(X, cmap=cm.hot)
```

or using the *set_cmap()* function:

```
imshow(X)
pyplot.set_cmap('hot')
pyplot.set_cmap('jet')
```

In interactive mode, *set_cmap()* will update the colormap post-hoc, allowing you to see which one works best for your data.

All built-in colormaps can be reversed by appending `_r`: For instance, `gray_r` is the reverse of `gray`.

There are several common color schemes used in visualization:

Sequential schemes

for unipolar data that progresses from low to high

Diverging schemes

for bipolar data that emphasizes positive or negative deviations from a central value

Cyclic schemes

for plotting values that wrap around at the endpoints, such as phase angle, wind direction, or time of day

Qualitative schemes

for nominal data that has no inherent ordering, where color is used only to distinguish categories

Matplotlib ships with 4 perceptually uniform color maps which are the recommended color maps for sequential data:

Colormap	Description
inferno	perceptually uniform shades of black-red-yellow
magma	perceptually uniform shades of black-red-white
plasma	perceptually uniform shades of blue-red-yellow
viridis	perceptually uniform shades of blue-green-yellow

The following colormaps are based on the ColorBrewer color specifications and designs developed by Cynthia Brewer:

ColorBrewer Diverging (luminance is highest at the midpoint, and decreases towards differently-colored endpoints):

Colormap	Description
BrBG	brown, white, blue-green
PiYG	pink, white, yellow-green
PRGn	purple, white, green
PuOr	orange, white, purple
RdBu	red, white, blue
RdGy	red, white, gray
RdYlBu	red, yellow, blue
RdYlGn	red, yellow, green
Spectral	red, orange, yellow, green, blue

ColorBrewer Sequential (luminance decreases monotonically):

Colormap	Description
Blues	white to dark blue
BuGn	white, light blue, dark green
BuPu	white, light blue, dark purple
GnBu	white, light green, dark blue
Greens	white to dark green
Greys	white to black (not linear)
Oranges	white, orange, dark brown
OrRd	white, orange, dark red
PuBu	white, light purple, dark blue
PuBuGn	white, light purple, dark green
PuRd	white, light purple, dark red
Purples	white to dark purple
RdPu	white, pink, dark purple
Reds	white to dark red
YlGn	light yellow, dark green
YlGnBu	light yellow, light green, dark blue
YlOrBr	light yellow, orange, dark brown
YlOrRd	light yellow, orange, dark red

ColorBrewer Qualitative:

(For plotting nominal data, *ListedColormap* is used, not *LinearSegmentedColormap*. Different sets of colors are recommended for different numbers of categories.)

- Accent
- Dark2
- Paired
- Pastel1
- Pastel2
- Set1

- Set2
- Set3

A set of colormaps derived from those of the same name provided with Matlab are also included:

Colormap	Description
autumn	sequential linearly-increasing shades of red-orange-yellow
bone	sequential increasing black-white color map with a tinge of blue, to emulate X-ray film
cool	linearly-decreasing shades of cyan-magenta
copper	sequential increasing shades of black-copper
flag	repetitive red-white-blue-black pattern (not cyclic at endpoints)
gray	sequential linearly-increasing black-to-white grayscale
hot	sequential black-red-yellow-white, to emulate blackbody radiation from an object at increasing temperatures
jet	a spectral map with dark endpoints, blue-cyan-yellow-red; based on a fluid-jet simulation by NCSA[1]
pink	sequential increasing pastel black-pink-white, meant for sepia tone colorization of photographs
prism	repetitive red-yellow-green-blue-purple-...-green pattern (not cyclic at endpoints)
spring	linearly-increasing shades of magenta-yellow
summer	sequential linearly-increasing shades of green-yellow
winter	linearly-increasing shades of blue-green

A set of palettes from the Yorick scientific visualisation package, an evolution of the GIST package, both by David H. Munro are included:

[1] Rainbow colormaps, `jet` in particular, are considered a poor choice for scientific visualization by many researchers: Rainbow Color Map (Still) Considered Harmful

Colormap	Description
gist_earth	mapmaker's colors from dark blue deep ocean to green lowlands to brown highlands to white mountains
gist_heat	sequential increasing black-red-orange-white, to emulate blackbody radiation from an iron bar as it grows hotter
gist_ncar	pseudo-spectral black-blue-green-yellow-red-purple-white colormap from National Center for Atmospheric Research[2]
gist_rainbow	runs through the colors in spectral order from red to violet at full saturation (like *hsv* but not cyclic)
gist_stern	"Stern special" color table from Interactive Data Language software

A set of cyclic color maps:

Colormap	Description
hsv	red-yellow-green-cyan-blue-magenta-red, formed by changing the hue component in the HSV color space
twilight	perceptually uniform shades of white-blue-black-red-white
twilight_shifted	perceptually uniform shades of black-blue-white-red-black

Other miscellaneous schemes:

[2] Resembles "BkBlAqGrYeOrReViWh200" from NCAR Command Language. See Color Table Gallery

Colormap	Description
afmhot	sequential black-orange-yellow-white blackbody spectrum, commonly used in atomic force microscopy
brg	blue-red-green
bwr	diverging blue-white-red
coolwarm	diverging blue-gray-red, meant to avoid issues with 3D shading, color blindness, and ordering of colors[3]
CMRmap	"Default colormaps on color images often reproduce to confusing grayscale images. The proposed colormap maintains an aesthetically pleasing color image that automatically reproduces to a monotonic grayscale with discrete, quantifiable saturation levels."[4]
cubehelix	Unlike most other color schemes cubehelix was designed by D.A. Green to be monotonically increasing in terms of perceived brightness. Also, when printed on a black and white postscript printer, the scheme results in a greyscale with monotonically increasing brightness. This color scheme is named cubehelix because the (r, g, b) values produced can be visualised as a squashed helix around the diagonal in the (r, g, b) color cube.
gnuplot	gnuplot's traditional pm3d scheme (black-blue-red-yellow)
gnuplot2	sequential color printable as gray (black-blue-violet-yellow-white)
ocean	green-blue-white
rainbow	spectral purple-blue-green-yellow-orange-red colormap with diverging luminance
seismic	diverging blue-white-red
nipy_spectral	black-purple-blue-green-yellow-red-white spectrum, originally from the Neuroimaging in Python project
terrain	mapmaker's colors, blue-green-yellow-brown-white, originally from IGOR Pro
turbo	Spectral map (purple-blue-green-yellow-orange-red) with a bright center and darker endpoints. A smoother alternative to jet.

The following colormaps are redundant and may be removed in future versions. It's recommended to use the names in the descriptions instead, which produce identical output:

[3] See Diverging Color Maps for Scientific Visualization by Kenneth Moreland.
[4] See A Color Map for Effective Black-and-White Rendering of Color-Scale Images by Carey Rappaport

Colormap	Description
gist_gray	identical to *gray*
gist_yarg	identical to *gray_r*
binary	identical to *gray_r*

18.39 matplotlib.projections

class matplotlib.projections.**ProjectionRegistry**

Bases: object

A mapping of registered projection names to projection classes.

get_projection_class(*self*, *name*)

Get a projection class from its *name*.

get_projection_names(*self*)

Return the names of all projections currently registered.

register(*self*, **projections*)

Register a new set of projections.

matplotlib.projections.**get_projection_class**(*projection=None*)

Get a projection class from its name.

If *projection* is None, a standard rectilinear projection is returned.

matplotlib.projections.**get_projection_names**()

Return the names of all projections currently registered.

matplotlib.projections.**register_projection**(*cls*)

18.40 matplotlib.projections.polar

class matplotlib.projections.polar.**InvertedPolarTransform**(*axis=None*, *use_rmin=True*, *_apply_theta_transforms=True*)

Bases: *matplotlib.transforms.Transform*

The inverse of the polar transform, mapping Cartesian coordinate space *x* and *y* back to *theta* and *r*.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

has_inverse = True

input_dims = 2

inverted(*self*)
Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

output_dims = 2

transform_non_affine(*self*, *xy*)
Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as NumPy array of length *input_dims* or shape (N x *input_dims*).

Returns

array

The output values as NumPy array of length *input_dims* or shape (N x *output_dims*), depending on the input.

class matplotlib.projections.polar.PolarAffine(*scale_transform*, *limits*)
Bases: *matplotlib.transforms.Affine2DBase*

The affine part of the polar projection. Scales the output so that maximum radius rests on the edge of the axes circle.

limits is the view limit of the data. The only part of its bounds that is used is the y limits (for the radius limits). The theta range is handled by the non-affine transform.

get_matrix(*self*)
Get the matrix for the affine part of this transform.

class matplotlib.projections.polar.PolarAxes(**args*, *theta_offset=0*, *theta_direction=1*, *rlabel_position=22.5*, ***kwargs*)
Bases: matplotlib.axes._axes.Axes

A polar graph projection, where the input dimensions are *theta*, *r*.

Theta starts pointing east and goes anti-clockwise.

Build an axes in a figure.

Parameters

fig

[*Figure*] The axes is build in the *Figure* *fig*.

rect

[[left, bottom, width, height]] The axes is build in the rectangle *rect*. *rect* is in *Figure* coordinates.

sharex, sharey

[*Axes*, optional] The x or y *axis* is shared with the x or y axis in the input *Axes*.

frameon

[bool, default: True] Whether the axes frame is visible.

box_aspect

[None, or a number, optional] Sets the aspect of the axes box. See *set_box_aspect* for details.

****kwargs**

Other optional keyword arguments:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and r
alpha	float or None
anchor	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
animated	bool
aspect	{'auto'} or num
autoscale_on	bool
autoscalex_on	bool
autoscaley_on	bool
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	None, or a number
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
contains	unknown
facecolor or fc	color
figure	*Figure*

Table 212 – continued from previous page

Property	Description
frame_on	bool
gid	str
in_layout	bool
label	object
navigate	bool
navigate_mode	unknown
path_effects	*AbstractPathEffect*
picker	None or bool or callable
position	[left, bottom, width, height] or *Bbox*
prop_cycle	unknown
rasterization_zorder	float or None
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
title	str
transform	*Transform*
url	str
visible	bool
xbound	unknown
xlabel	str
xlim	(bottom: float, top: float)
xmargin	float greater than -0.5
xscale	{"linear", "log", "symlog", "logit", ...}
xticklabels	unknown
xticks	unknown
ybound	unknown
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	{"linear", "log", "symlog", "logit", ...}
yticklabels	unknown
yticks	unknown
zorder	float

Returns

Axes

The new *Axes* object.

class InvertedPolarTransform(*axis=None*, *use_rmin=True*, *_apply_theta_transforms=True*)

Bases: *matplotlib.transforms.Transform*

The inverse of the polar transform, mapping Cartesian coordinate space *x*

and *y* back to *theta* and *r*.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

`has_inverse = True`

`input_dims = 2`

`inverted`(*self*)

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`output_dims = 2`

`transform_non_affine`(*self*, *xy*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as NumPy array of length *input_dims* or shape (N x *input_dims*).

Returns

array

The output values as NumPy array of length *input_dims* or shape (N x *output_dims*), depending on the input.

`class PolarAffine`(*scale_transform*, *limits*)

Bases: *matplotlib.transforms.Affine2DBase*

The affine part of the polar projection. Scales the output so that maximum radius rests on the edge of the axes circle.

limits is the view limit of the data. The only part of its bounds that is used is the y limits (for the radius limits). The theta range is handled by the non-affine transform.

`get_matrix`(*self*)
Get the matrix for the affine part of this transform.

`class PolarTransform`(*axis=None*, *use_rmin=True*, *_apply_theta_transforms=True*)
Bases: *matplotlib.transforms.Transform*

The base polar transform. This handles projection *theta* and *r* into Cartesian coordinate space *x* and *y*, but does not perform the ultimate affine transformation into the correct position.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

`has_inverse = True`

`input_dims = 2`

`inverted`(*self*)
Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`output_dims = 2`

`transform_non_affine`(*self*, *tr*)
Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as NumPy array of length *input_dims* or shape (N x *input_dims*).

Returns

array

The output values as NumPy array of length *input_dims* or shape (N x *output_dims*), depending on the input.

transform_path_non_affine(*self*, *path*)
Apply the non-affine part of this transform to *Path* *path*, returning a new *Path*.

transform_path(path) is equivalent to transform_path_affine(transform_path_non_affine

class RadialLocator(*base*, *axes=None*)
Bases: *matplotlib.ticker.Locator*

Used to locate radius ticks.

Ensures that all ticks are strictly positive. For all other tasks, it delegates to the base *Locator* (which may be different depending on the scale of the *r*-axis.

autoscale(*self*)
[*Deprecated*]

Notes

Deprecated since version 3.2:

nonsingular(*self*, *vmin*, *vmax*)
Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with `(v0, v1)` set to the data limits on the axes if the axes contains any data, or `(-inf, +inf)` if not.

- If `v0 == v1` (possibly up to some floating point slop), this method returns an expanded interval around this value.
- If `(v0, v1) == (-inf, +inf)`, this method returns appropriate default view limits.
- Otherwise, `(v0, v1)` is returned without modification.

pan(*self*, *numsteps*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

refresh(*self*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`view_limits`(*self*, *vmin*, *vmax*)
Select a scale for the range from vmin to vmax.

Subclasses should override this method to change locator behaviour.

`zoom`(*self*, *direction*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`class ThetaFormatter`
Bases: *matplotlib.ticker.Formatter*

Used to format the *theta* tick labels. Converts the native unit of radians into degrees and adds a degree symbol.

`class ThetaLocator`(*base*)
Bases: *matplotlib.ticker.Locator*

Used to locate theta ticks.

This will work the same as the base locator except in the case that the view spans the entire circle. In such cases, the previously used default locations of every 45 degrees are returned.

`autoscale`(*self*)
[*Deprecated*]

Notes

Deprecated since version 3.2:

`pan`(*self*, *numsteps*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`refresh`(*self*)
[*Deprecated*] Refresh internal information based on current limits.

Notes

Deprecated since version 3.3.

`set_axis`(*self*, *axis*)

`view_limits`(*self*, *vmin*, *vmax*)
Select a scale for the range from vmin to vmax.

Subclasses should override this method to change locator behaviour.

`zoom`(*self*, *direction*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`can_pan`(*self*)
Return *True* if this axes supports the pan/zoom button functionality.

For polar axes, this is slightly misleading. Both panning and zooming are performed by the same button. Panning is performed in azimuth while zooming is done along the radial.

`can_zoom`(*self*)
Return *True* if this axes supports the zoom box button functionality.

Polar axes do not support zoom boxes.

`cla`(*self*)
Clear the current axes.

`drag_pan`(*self*, *button*, *key*, *x*, *y*)
Called when the mouse moves during a pan operation.

Parameters

button

[*MouseButton*] The pressed mouse button.

key

[str or None] The pressed key, if any.

x, y

[float] The mouse coordinates in display coords.

Notes

This is intended to be overridden by new projection types.

`draw`(*self*, *renderer*, **args*, ***kwargs*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`end_pan`(*self*)
Called when a pan operation completes (when the mouse button is up.)

Notes

This is intended to be overridden by new projection types.

`format_coord`(*self*, *theta*, *r*)
Return a format string formatting the *x*, *y* coordinates.

`get_data_ratio`(*self*)
Return the aspect ratio of the data itself. For a polar plot, this should always be 1.0

`get_rlabel_position`(*self*)

Returns

float

The theta position of the radius labels in degrees.

`get_rmax`(*self*)

Returns

float

Outer radial limit.

`get_rmin`(*self*)

Returns

float

The inner radial limit.

`get_rorigin`(*self*)

Returns

float

`get_rsign`(*self*)

`get_theta_direction`(*self*)
Get the direction in which theta increases.

-1:

Theta increases in the clockwise direction

1:

Theta increases in the counterclockwise direction

`get_theta_offset`(*self*)
Get the offset for the location of 0 in radians.

`get_thetamax`(*self*)
Return the maximum theta limit in degrees.

`get_thetamin`(*self*)
Get the minimum theta limit in degrees.

`get_xaxis_text1_transform`(*self*, *pad*)

Returns

transform

[Transform] The transform used for drawing x-axis labels, which will add *pad_points* of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis corrdinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

`get_xaxis_text2_transform`(*self*, *pad*)

Returns

transform

[Transform] The transform used for drawing secondary x-axis labels, which will add *pad_points* of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis corrdinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

`get_xaxis_transform`(*self*, *which='grid'*)

Get the transformation used for drawing x-axis labels, ticks and gridlines. The x-direction is in data coordinates and the y-direction is in axis coordinates.

Note: This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

`get_yaxis_text1_transform`(*self*, *pad*)

Returns

transform

[Transform] The transform used for drawing y-axis labels, which will add *pad_points* of padding (in points) between the

axes and the label. The x-direction is in axis coordinates and the y-direction is in data corrdinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

`get_yaxis_text2_transform`(*self*, *pad*)

Returns

transform

[Transform] The transform used for drawing secondart y-axis labels, which will add *pad_points* of padding (in points) between the axes and the label. The x-direction is in axis coordinates and the y-direction is in data corrdinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

`get_yaxis_transform`(*self*, *which='grid'*)

Get the transformation used for drawing y-axis labels, ticks and gridlines. The x-direction is in axis coordinates and the y-direction is in data coordinates.

Note: This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

name = 'polar'

set_rgrids(*self*, *radii*, *labels=None*, *angle=None*, *fmt=None*, ***kwargs*)

Set the radial gridlines on a polar plot.

Parameters

radii

[tuple with floats] The radii for the radial gridlines

labels

[tuple with strings or None] The labels to use at each radial gridline. The *matplotlib.ticker.ScalarFormatter* will be used if None.

angle

[float] The angular position of the radius labels in degrees.

fmt

[str or None] Format string used in *matplotlib.ticker.FormatStrFormatter*. For example '%f'.

Returns

lines

[list of *lines.Line2D*] The radial gridlines.

labels

[list of *text.Text*] The tick labels.

Other Parameters

****kwargs**

kwargs are optional *Text* properties for the labels.

See also:

PolarAxes.set_thetagrids

Axis.get_gridlines

Axis.get_ticklabels

set_rlabel_position(*self*, *value*)
Update the theta position of the radius labels.

Parameters

value

[number] The angular position of the radius labels in degrees.

set_rlim(*self*, *bottom=None*, *top=None*, *emit=True*, *auto=False*, ***kwargs*)
See *set_ylim*.

set_rmax(*self*, *rmax*)
Set the outer radial limit.

Parameters

rmax

[float]

set_rmin(*self*, *rmin*)
Set the inner radial limit.

Parameters

rmin

[float]

set_rorigin(*self*, *rorigin*)
Update the radial origin.

Parameters

rorigin

[float]

set_rscale(*self*, **args*, ***kwargs*)

set_rticks(*self*, **args*, ***kwargs*)

set_theta_direction(*self*, *direction*)
Set the direction in which theta increases.

clockwise, -1:

Theta increases in the clockwise direction

counterclockwise, anticlockwise, 1:

Theta increases in the counterclockwise direction

set_theta_offset(*self*, *offset*)
Set the offset for the location of 0 in radians.

`set_theta_zero_location`(*self*, *loc*, *offset=0.0*)
Set the location of theta's zero.

This simply calls *set_theta_offset* with the correct value in radians.

Parameters

loc

[str] May be one of "N", "NW", "W", "SW", "S", "SE", "E", or "NE".

offset

[float, default: 0] An offset in degrees to apply from the specified *loc*. **Note:** this offset is *always* applied counter-clockwise regardless of the direction setting.

`set_thetagrids`(*self*, *angles*, *labels=None*, *fmt=None*, ***kwargs*)
Set the theta gridlines in a polar plot.

Parameters

angles

[tuple with floats, degrees] The angles of the theta gridlines.

labels

[tuple with strings or None] The labels to use at each theta gridline. The *projections.polar.ThetaFormatter* will be used if None.

fmt

[str or None] Format string used in *matplotlib.ticker.FormatStrFormatter*. For example '%f'. Note that the angle that is used is in radians.

Returns

lines

[list of *lines.Line2D*] The theta gridlines.

labels

[list of *text.Text*] The tick labels.

Other Parameters

****kwargs**

kwargs are optional *Text* properties for the labels.

See also:

PolarAxes.set_rgrids

Axis.get_gridlines

Axis.get_ticklabels

`set_thetalim`(*self*, **args*, ***kwargs*)
Set the minimum and maximum theta values.

Can take the following signatures:

- `set_thetalim(minval, maxval)`: Set the limits in radians.
- `set_thetalim(thetamin=minval, thetamax=maxval)`: Set the limits in degrees.

where minval and maxval are the minimum and maximum limits. Values are wrapped in to the range $[0, 2\pi]$ (in radians), so for example it is possible to do `set_thetalim(-np.pi / 2, np.pi / 2)` to have an axes symmetric around 0. A ValueError is raised if the absolute angle difference is larger than 2π.

`set_thetamax`(*self*, *thetamax*)
Set the maximum theta limit in degrees.

`set_thetamin`(*self*, *thetamin*)
Set the minimum theta limit in degrees.

`set_xscale`(*self*, *scale*, **args*, ***kwargs*)
Set the x-axis scale.

Parameters

value

[{"linear", "log", "symlog", "logit", ...}] The axis scale type to apply.

****kwargs**

Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- *matplotlib.scale.LinearScale*
- *matplotlib.scale.LogScale*
- *matplotlib.scale.SymmetricalLogScale*
- *matplotlib.scale.LogitScale*

Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using *matplotlib.scale.register_scale*. These scales can then also be used here.

`set_ylim`(*self*, *bottom=None*, *top=None*, *emit=True*, *auto=False*, *, *ymin=None*, *ymax=None*)

Set the data limits for the radial axis.

Parameters

bottom

[float, optional] The bottom limit (default: None, which leaves the bottom limit unchanged). The bottom and top ylims may be passed as the tuple (*bottom*, *top*) as the first positional argument (or as the *bottom* keyword argument).

top

[float, optional] The top limit (default: None, which leaves the top limit unchanged).

emit

[bool, default: True] Whether to notify observers of limit change.

auto

[bool or None, default: False] Whether to turn on autoscaling of the y-axis. True turns on, False turns off, None leaves unchanged.

ymin, ymax

[float, optional] These arguments are deprecated and will be removed in a future version. They are equivalent to *bottom* and *top* respectively, and it is an error to pass both *ymin* and *bottom* or *ymax* and *top*.

Returns

bottom, top

[(float, float)] The new y-axis limits in data coordinates.

`set_yscale`(*self*, **args*, ***kwargs*)

Set the y-axis scale.

Parameters

value

[{"linear", "log", "symlog", "logit", ...}] The axis scale type to apply.

****kwargs**

Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- *matplotlib.scale.LinearScale*
- *matplotlib.scale.LogScale*
- *matplotlib.scale.SymmetricalLogScale*
- *matplotlib.scale.LogitScale*

Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using *matplotlib.scale.register_scale*. These scales can then also be used here.

`start_pan`(*self*, *x*, *y*, *button*)
Called when a pan operation has started.

Parameters

x, y

[float] The mouse coordinates in display coords.

button

[*MouseButton*] The pressed mouse button.

Notes

This is intended to be overridden by new projection types.

`class matplotlib.projections.polar.PolarTransform`(*axis=None*, *use_rmin=True*, *_apply_theta_transforms=True*)

Bases: *matplotlib.transforms.Transform*

The base polar transform. This handles projection *theta* and *r* into Cartesian coordinate space *x* and *y*, but does not perform the ultimate affine transformation into the correct position.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

`has_inverse = True`

`input_dims = 2`

`inverted`(*self*)
Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`output_dims = 2`

`transform_non_affine`(*self*, *tr*)
Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as NumPy array of length *input_dims* or shape (N x *input_dims*).

Returns

array

The output values as NumPy array of length *input_dims* or shape (N x *output_dims*), depending on the input.

`transform_path_non_affine`(*self*, *path*)
Apply the non-affine part of this transform to *Path* *path*, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(va`

`class matplotlib.projections.polar.RadialAxis`(**args*, ***kwargs*)
Bases: *matplotlib.axis.YAxis*

A radial Axis.

This overrides certain properties of a *YAxis* to provide special-casing for a radial axis.

Parameters

axes

[*matplotlib.axes.Axes*] The *Axes* to which the created Axis belongs.

pickradius

[float] The acceptance radius for containment tests. See also *Axis.contains*.

`axis_name = 'radius'`
Read-only name identifying the axis.

`cla`(*self*)
Clear this axis.

`class matplotlib.projections.polar.RadialLocator`(*base*, *axes=None*)
Bases: *matplotlib.ticker.Locator*

Used to locate radius ticks.

Ensures that all ticks are strictly positive. For all other tasks, it delegates to the base *Locator* (which may be different depending on the scale of the *r*-axis.

`autoscale`(*self*)
[*Deprecated*]

Notes

Deprecated since version 3.2:

`nonsingular`(*self*, *vmin*, *vmax*)
Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with `(v0, v1)` set to the data limits on the axes if the axes contains any data, or `(-inf, +inf)` if not.

- If `v0 == v1` (possibly up to some floating point slop), this method returns an expanded interval around this value.
- If `(v0, v1) == (-inf, +inf)`, this method returns appropriate default view limits.
- Otherwise, `(v0, v1)` is returned without modification.

`pan`(*self*, *numsteps*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`refresh`(*self*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`view_limits`(*self*, *vmin*, *vmax*)
Select a scale for the range from vmin to vmax.

Subclasses should override this method to change locator behaviour.

`zoom`(*self*, *direction*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`class matplotlib.projections.polar.RadialTick`(**args*, ***kwargs*)
Bases: *matplotlib.axis.YTick*

A radial-axis tick.

This subclass of *YTick* provides radial ticks with some small modification to their re-positioning such that ticks are rotated based on axes limits. This results in ticks that are correctly perpendicular to the spine. Labels are also rotated to be perpendicular to the spine, when 'auto' rotation is enabled.

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

`update_position`(*self*, *loc*)
Set the location of tick in data coords with scalar *loc*.

`class matplotlib.projections.polar.ThetaAxis`(**args*, ***kwargs*)
Bases: *matplotlib.axis.XAxis*

A theta Axis.

This overrides certain properties of an *XAxis* to provide special-casing for an angular axis.

Parameters

axes

[*matplotlib.axes.Axes*] The *Axes* to which the created Axis belongs.

pickradius

[float] The acceptance radius for containment tests. See also *Axis.contains*.

`axis_name = 'theta'`
Read-only name identifying the axis.

`cla`(*self*)
Clear this axis.

`class matplotlib.projections.polar.ThetaFormatter`
Bases: *matplotlib.ticker.Formatter*

Used to format the *theta* tick labels. Converts the native unit of radians into degrees and adds a degree symbol.

`class matplotlib.projections.polar.ThetaLocator`(*base*)
Bases: *matplotlib.ticker.Locator*

Used to locate theta ticks.

This will work the same as the base locator except in the case that the view spans the entire circle. In such cases, the previously used default locations of every 45 degrees are returned.

`autoscale`(*self*)
[*Deprecated*]

Notes

Deprecated since version 3.2:

`pan`(*self*, *numsteps*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`refresh`(*self*)
[*Deprecated*] Refresh internal information based on current limits.

Notes

Deprecated since version 3.3.

`set_axis`(*self*, *axis*)

`view_limits`(*self*, *vmin*, *vmax*)
Select a scale for the range from vmin to vmax.

Subclasses should override this method to change locator behaviour.

`zoom`(*self*, *direction*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`class matplotlib.projections.polar.ThetaTick`(*axes*, **args*, ***kwargs*)
Bases: *matplotlib.axis.XTick*

A theta-axis tick.

This subclass of *XTick* provides angular ticks with some small modification to their re-positioning such that ticks are rotated based on tick location. This results in ticks that are correctly perpendicular to the arc spine.

When 'auto' rotation is enabled, labels are also rotated to be parallel to the spine. The label padding is also applied here since it's not possible to use a generic axes transform to produce tick-specific padding.

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

`update_position`(*self*, *loc*)
Set the location of tick in data coords with scalar *loc*.

18.41 matplotlib.quiver

Support for plotting vector fields.

Presently this contains Quiver and Barb. Quiver plots an arrow in the direction of the vector, with the size of the arrow related to the magnitude of the vector.

Barbs are like quiver in that they point along a vector, but the magnitude of the vector is given schematically by the presence of barbs or flags on the barb.

This will also become a home for things such as standard deviation ellipses, which can and will be derived very easily from the Quiver code.

18.41.1 Classes

Quiver(ax, *args[, scale, headwidth, ...])	Specialized PolyCollection for arrows.
QuiverKey(Q, X, Y, U, label, *[, angle, ...])	Labelled arrow for use as a quiver plot scale key.
Barbs(ax, *args[, pivot, length, barbcolor, ...])	Specialized PolyCollection for barbs.

matplotlib.quiver.Quiver

class matplotlib.quiver.**Quiver**(*ax*, **args*, *scale=None*, *headwidth=3*, *headlength=5*, *headaxislength=4.5*, *minshaft=1*, *minlength=1*, *units='width'*, *scale_units=None*, *angles='uv'*, *width=None*, *color='k'*, *pivot='tail'*, ***kw*)

Bases: *matplotlib.collections.PolyCollection*

Specialized PolyCollection for arrows.

The only API method is set_UVC(), which can be used to change the size, orientation, and color of the arrows; their locations are fixed when the class is instantiated. Possibly this method will be useful in animations.

Much of the work in this class is done in the draw() method so that as much information as possible is available about the plot. In subsequent draw() calls, recalculation is limited to things that might have changed, so there should be no performance penalty from putting the calculations in the draw() method.

Plot a 2D field of arrows.

Call signature:

```
quiver([X, Y], U, V, [C], **kw)
```

X, *Y* define the arrow locations, *U*, *V* define the arrow directions, and *C* optionally sets the color.

Arrow size

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the *scale* and *scale_units* parameters.

Arrow shape

The defaults give a slightly swept-back arrow; to make the head a triangle, make *headaxislength* the same as *headlength*. To make the arrow more pointed, reduce *headwidth* or increase *headlength* and *headaxislength*. To make the head smaller relative to the shaft, scale down all the head parameters. You will probably do best to leave minshaft alone.

Arrow outline

linewidths and *edgecolors* can be used to customize the arrow outlines.

Parameters

X, Y

[1D or 2D array-like, optional] The x and y coordinates of the arrow locations.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If *X* and *Y* are 1D but *U*, *V* are 2D, *X*, *Y* are expanded to 2D using `X, Y = np.meshgrid(X, Y)`. In this case `len(X)` and `len(Y)` must match the column and row dimensions of *U* and *V*.

U, V

[1D or 2D array-like] The x and y direction components of the arrow vectors.

They must have the same number of elements, matching the number of arrow locations. *U* and *V* may be masked. Only locations unmasked in *U*, *V*, and *C* will be drawn.

C

[1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *color* instead. The size of *C* must match the number of arrow locations.

units

[{'width', 'height', 'dots', 'inches', 'x', 'y' 'xy'}, default: 'width'] The arrow dimensions (except for *length*) are measured in multiples of this unit.

The following values are supported:

- 'width', 'height': The width or height of the axis.
- 'dots', 'inches': Pixels or inches based on the figure dpi.
- 'x', 'y', 'xy': *X*, *Y* or $\sqrt{X^2 + Y^2}$ in data units.

The arrows scale differently depending on the units. For 'x' or 'y', the arrows get larger as one zooms in; for other units, the arrow size is independent of the zoom state. For 'width or 'height', the arrow size increases with the width and height of the axes, respectively, when the window is resized; for 'dots' or 'inches', resizing does not change the arrows.

angles

[{'uv', 'xy'} or array-like, default: 'uv'] Method for determining the angle of the arrows.

- 'uv': The arrow axis aspect ratio is 1 so that if $U == V$ the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).

  Use this if the arrows symbolize a quantity that is not based on X, Y data coordinates.

- 'xy': Arrows point from (x, y) to (x+u, y+v). Use this for plotting a gradient field, for example.

- Alternatively, arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.

  In this case U, V is only used to determine the length of the arrows.

Note: inverting a data axis will correspondingly invert the arrows only with `angles='xy'`.

scale

[float, optional] Number of data units per arrow length unit, e.g., m/s per plot width; a smaller scale parameter makes the arrow longer. Default is *None*.

If *None*, a simple autoscaling algorithm is used, based on the average vector length and the number of vectors. The arrow length unit is given by the *scale_units* parameter.

scale_units

[{'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, optional] If the *scale* kwarg is *None*, the arrow length unit. Default is *None*.

e.g. *scale_units* is 'inches', *scale* is 2.0, and `(u, v) = (1, 0)`, then the vector will be 0.5 inches long.

If *scale_units* is 'width' or 'height', then the vector will be half the width/height of the axes.

If *scale_units* is 'x' then the vector will be 0.5 x-axis units. To plot vectors in the x-y plane, with u and v having the same units as x and y, use `angles='xy', scale_units='xy', scale=1`.

width

[float, optional] Shaft width in arrow units; default depends on choice of units, above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

headwidth

[float, default: 3] Head width as multiple of shaft width.

headlength

[float, default: 5] Head length as multiple of shaft width.

headaxislength

[float, default: 4.5] Head length at shaft intersection.

minshaft

[float, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

minlength

[float, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

pivot

[{'tail', 'mid', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is anchored to the *X*, *Y* grid. The arrow rotates about this point.

'mid' is a synonym for 'middle'.

color

[color or color sequence, optional] Explicit color(s) for the arrows. If *C* has been set, *color* has no effect.

This is a synonym for the *PolyCollection* *facecolor* parameter.

Other Parameters

****kwargs**

[*PolyCollection* properties, optional] All other keyword arguments are passed on to *PolyCollection*:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	ndarray
capstyle	{'butt', 'round', 'projecting'}
clim	(vmin: float, vmax: float)
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None

Table 214 – continued from previous page

Property	Description
cmap	*Colormap* or str or None
color	color or list of rgba tuples
contains	unknown
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
norm	*Normalize* or None
offset_position	unknown
offsets	array-like (N, 2) or (2,)
path_effects	*AbstractPathEffect*
picker	None or bool or callable
pickradius	unknown
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

See also:

Axes.quiverkey

Add a key to a quiver plot.

`__init__`(*self*, *ax*, **args*, *scale=None*, *headwidth=3*, *headlength=5*, *headaxislength=4.5*, *minshaft=1*, *minlength=1*, *units='width'*, *scale_units=None*, *angles='uv'*, *width=None*, *color='k'*, *pivot='tail'*, ***kw*)

The constructor takes one required argument, an Axes instance, followed by the args and kwargs described by the following pyplot interface documentation:

Plot a 2D field of arrows.

Call signature:

```
quiver([X, Y], U, V, [C], **kw)
```

X, *Y* define the arrow locations, *U*, *V* define the arrow directions, and *C* optionally sets the color.

Arrow size

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the *scale* and *scale_units* parameters.

Arrow shape

The defaults give a slightly swept-back arrow; to make the head a triangle, make *headaxislength* the same as *headlength*. To make the arrow more pointed, reduce *headwidth* or increase *headlength* and *headaxislength*. To make the head smaller relative to the shaft, scale down all the head parameters. You will probably do best to leave minshaft alone.

Arrow outline

linewidths and *edgecolors* can be used to customize the arrow outlines.

Parameters

X, Y

[1D or 2D array-like, optional] The x and y coordinates of the arrow locations.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If *X* and *Y* are 1D but *U*, *V* are 2D, *X*, *Y* are expanded to 2D using `X, Y = np.meshgrid(X, Y)`. In this case `len(X)` and `len(Y)` must match the column and row dimensions of *U* and *V*.

U, V

[1D or 2D array-like] The x and y direction components of the arrow vectors.

They must have the same number of elements, matching the number of arrow locations. *U* and *V* may be masked. Only locations unmasked in *U*, *V*, and *C* will be drawn.

C

[1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *color* instead. The size of *C* must match the number of arrow locations.

units

[{'width', 'height', 'dots', 'inches', 'x', 'y' 'xy'}, default: 'width'] The arrow dimensions (except for *length*) are measured in multiples of this unit.

The following values are supported:

- 'width', 'height': The width or height of the axis.
- 'dots', 'inches': Pixels or inches based on the figure dpi.
- 'x', 'y', 'xy': X, Y or $\sqrt{X^2 + Y^2}$ in data units.

The arrows scale differently depending on the units. For 'x' or 'y', the arrows get larger as one zooms in; for other units, the arrow size is independent of the zoom state. For 'width or 'height', the arrow size increases with the width and height of the axes, respectively, when the window is resized; for 'dots' or 'inches', resizing does not change the arrows.

angles

[{'uv', 'xy'} or array-like, default: 'uv'] Method for determining the angle of the arrows.

- 'uv': The arrow axis aspect ratio is 1 so that if $U == V$ the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).

  Use this if the arrows symbolize a quantity that is not based on X, Y data coordinates.

- 'xy': Arrows point from (x, y) to (x+u, y+v). Use this for plotting a gradient field, for example.

- Alternatively, arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.

  In this case U, V is only used to determine the length of the arrows.

Note: inverting a data axis will correspondingly invert the arrows only with `angles='xy'`.

scale

[float, optional] Number of data units per arrow length unit, e.g., m/s per plot width; a smaller scale parameter makes the arrow longer. Default is *None*.

If *None*, a simple autoscaling algorithm is used, based on the average vector length and the number of vectors. The arrow length unit is given by the *scale_units* parameter.

scale_units

[{'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, optional] If the *scale* kwarg is *None*, the arrow length unit. Default is *None*.

e.g. *scale_units* is 'inches', *scale* is 2.0, and `(u, v) = (1, 0)`, then the vector will be 0.5 inches long.

If *scale_units* is 'width' or 'height', then the vector will be half the width/height of the axes.

If *scale_units* is 'x' then the vector will be 0.5 x-axis units. To plot vectors in the x-y plane, with u and v having the same units as x and y, use `angles='xy', scale_units='xy', scale=1`.

width

[float, optional] Shaft width in arrow units; default depends on choice of units, above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

headwidth

[float, default: 3] Head width as multiple of shaft width.

headlength

[float, default: 5] Head length as multiple of shaft width.

headaxislength

[float, default: 4.5] Head length at shaft intersection.

minshaft

[float, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

minlength

[float, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

pivot

[{'tail', 'mid', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is anchored to the *X*, *Y* grid. The arrow rotates about this point.

'mid' is a synonym for 'middle'.

color

[color or color sequence, optional] Explicit color(s) for the arrows. If *C* has been set, *color* has no effect.

This is a synonym for the *PolyCollection* *facecolor* parameter.

Other Parameters

**kwargs

[*PolyCollection* properties, optional] All other keyword arguments are passed on to *PolyCollection*:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	ndarray
capstyle	{'butt', 'round', 'projecting'}
clim	(vmin: float, vmax: float)
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of rgba tuples
contains	unknown
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
norm	*Normalize* or None
offset_position	unknown
offsets	array-like (N, 2) or (2,)
path_effects	*AbstractPathEffect*
picker	None or bool or callable
pickradius	unknown
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

See also:

Axes.quiverkey

Add a key to a quiver plot.

__module__ = 'matplotlib.quiver'

ax(*self*)

[*Deprecated*]

Notes

Deprecated since version 3.3:

draw(*self*, *renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_datalim(*self*, *transData*)

quiver_doc = "\nPlot a 2D field of arrows.\n\nCall signature::\n\n quiver([X, Y], U, V, [C

remove(*self*)

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

set_UVC(*self*, *U*, *V*, *C=None*)

Examples using `matplotlib.quiver.Quiver`

- sphx_glr_gallery_images_contours_and_fields_quiver_demo.py
- sphx_glr_gallery_images_contours_and_fields_quiver_simple_demo.py

matplotlib.quiver.QuiverKey

`class matplotlib.quiver.QuiverKey(`*Q*, *X*, *Y*, *U*, *label*, ***, *angle=0*, *coordinates='axes'*, *color=None*, *labelsep=0.1*, *labelpos='N'*, *labelcolor=None*, *fontproperties=None*, ***kw*`)`

Bases: *matplotlib.artist.Artist*

Labelled arrow for use as a quiver plot scale key.

Add a key to a quiver plot.

The positioning of the key depends on *X*, *Y*, *coordinates*, and *labelpos*. If *labelpos* is 'N' or 'S', *X*, *Y* give the position of the middle of the key arrow. If *labelpos* is 'E', *X*, *Y* positions the head, and if *labelpos* is 'W', *X*, *Y* positions the tail; in either of these two cases, *X*, *Y* is somewhere in the middle of the arrow+label key object.

Parameters

Q

[*matplotlib.quiver.Quiver*] A *Quiver* object as returned by a call to *quiver()*.

X, Y

[float] The location of the key.

U

[float] The length of the key.

label

[str] The key label (e.g., length and units of the key).

angle

[float, default: 0] The angle of the key arrow, in degrees anticlockwise from the x-axis.

coordinates

[{'axes', 'figure', 'data', 'inches'}, default: 'axes'] Coordinate system and units for *X*, *Y*: 'axes' and 'figure' are normalized coordinate systems with (0, 0) in the lower left and (1, 1) in the upper right; 'data' are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); 'inches' is position in the figure in inches, with (0, 0) at the lower left corner.

color

[color] Overrides face and edge colors from *Q*.

labelpos

[{'N', 'S', 'E', 'W'}] Position the label above, below, to the right, to the left of the arrow, respectively.

labelsep

[float, default: 0.1] Distance in inches between the arrow and the label.

labelcolor

[color, default: `rcParams["text.color"]` (default: `'black'`)] Label color.

fontproperties

[dict, optional] A dictionary with keyword arguments accepted by the *FontProperties* initializer: *family*, *style*, *variant*, *size*, *weight*.

****kwargs**

Any additional keyword arguments are used to override vector properties taken from *Q*.

`__init__`(*self*, *Q*, *X*, *Y*, *U*, *label*, *, *angle=0*, *coordinates='axes'*, *color=None*, *labelsep=0.1*, *labelpos='N'*, *labelcolor=None*, *fontproperties=None*, ***kw*)

Add a key to a quiver plot.

The positioning of the key depends on *X*, *Y*, *coordinates*, and *labelpos*. If *labelpos* is 'N' or 'S', *X*, *Y* give the position of the middle of the key arrow. If *labelpos* is 'E', *X*, *Y* positions the head, and if *labelpos* is 'W', *X*, *Y* positions the tail; in either of these two cases, *X*, *Y* is somewhere in the middle of the arrow+label key object.

Parameters

Q

[*matplotlib.quiver.Quiver*] A *Quiver* object as returned by a call to *quiver()*.

X, Y

[float] The location of the key.

U

[float] The length of the key.

label

[str] The key label (e.g., length and units of the key).

angle

[float, default: 0] The angle of the key arrow, in degrees anti-clockwise from the x-axis.

coordinates

[{'axes', 'figure', 'data', 'inches'}, default: 'axes'] Coordinate system and units for *X*, *Y*: 'axes' and 'figure' are normalized coordinate systems with (0, 0) in the lower left and (1, 1) in the upper right; 'data' are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); 'inches' is position in the figure in inches, with (0, 0) at the lower left corner.

color

[color] Overrides face and edge colors from *Q*.

labelpos

[{'N', 'S', 'E', 'W'}] Position the label above, below, to the right, to the left of the arrow, respectively.

labelsep

[float, default: 0.1] Distance in inches between the arrow and the label.

labelcolor

[color, default: `rcParams["text.color"]` (default: `'black'`)] Label color.

fontproperties

[dict, optional] A dictionary with keyword arguments accepted by the *FontProperties* initializer: *family*, *style*, *variant*, *size*, *weight*.

****kwargs**

Any additional keyword arguments are used to override vector properties taken from *Q*.

`__module__ = 'matplotlib.quiver'`

`contains`(*self*, *mouseevent*)

Test whether the artist contains the mouse event.

Parameters

mouseevent

[*matplotlib.backend_bases.MouseEvent*]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`halign = {'E': 'left', 'N': 'center', 'S': 'center', 'W': 'right'}`

`pivot = {'E': 'tip', 'N': 'middle', 'S': 'middle', 'W': 'tail'}`

`property quiverkey_doc`

`remove`(*self*)
Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

`set_figure`(*self*, *fig*)
Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

```
valign = {'E': 'center', 'N': 'bottom', 'S': 'top', 'W': 'center'}
```

Examples using `matplotlib.quiver.QuiverKey`

- sphx_glr_gallery_images_contours_and_fields_quiver_demo.py

matplotlib.quiver.Barbs

class matplotlib.quiver.**Barbs**(*ax*, **args*, *pivot='tip'*, *length=7*, *barbcolor=None*, *flagcolor=None*, *sizes=None*, *fill_empty=False*, *barb_increments=None*, *rounding=True*, *flip_barb=False*, ***kw*)

Bases: *matplotlib.collections.PolyCollection*

Specialized PolyCollection for barbs.

The only API method is *set_UVC()*, which can be used to change the size, orientation, and color of the arrows. Locations are changed using the *set_offsets()* collection method. Possibly this method will be useful in animations.

There is one internal function `_find_tails()` which finds exactly what should be put on the barb given the vector magnitude. From there `_make_barbs()` is used to find the vertices of the polygon to represent the barb based on this information.

Plot a 2D field of barbs.

Call signature:

```
barbs([X, Y], U, V, [C], **kw)
```

Where X, Y define the barb locations, U, V define the barb directions, and C optionally sets the color.

All arguments may be 1D or 2D. U, V, C may be masked arrays, but masked X, Y are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as show schematically below:

```
:                  /\    \
:                 /  \    \
:                /    \    \    \
:               /      \    \    \
:              ------------------------------
```

The largest increment is given by a triangle (or "flag"). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

See also https://en.wikipedia.org/wiki/Wind_barb.

Parameters

X, Y

[1D or 2D array-like, optional] The x and y coordinates of the barb locations. See *pivot* for how the barbs are drawn to the x, y positions.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If *X* and *Y* are 1D but *U*, *V* are 2D, *X*, *Y* are expanded to 2D using `X, Y = np.meshgrid(X, Y)`. In this case `len(X)` and `len(Y)` must match the column and row dimensions of *U* and *V*.

U, V

[1D or 2D array-like] The x and y components of the barb shaft.

C

[1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *barbcolor* instead.

length

[float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

pivot

[{'tip', 'middle'} or float, default: 'tip'] The part of the arrow that is anchored to the *X*, *Y* grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

barbcolor

[color or color sequence] The color of all parts of the barb except for the flags. This parameter is analogous to the *edgecolor* parameter for polygons, which can be used instead. However this parameter will override facecolor.

flagcolor

[color or color sequence] The color of any flags on the barb. This parameter is analogous to the *facecolor* parameter for polygons, which can be used instead. However, this parameter will override facecolor. If this is not set (and *C* has not either) then *flagcolor* will be set to match *barbcolor* so that the barb has a uniform color. If *C* has been set, *flagcolor* has no effect.

sizes

[dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- 'spacing' - space between features (flags, full/half barbs)
- 'height' - height (distance from shaft to top) of a flag or full barb
- 'width' - width of a flag, twice the width of a full barb
- 'emptybarb' - radius of the circle used for low magnitudes

fill_empty

[bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

rounding

[bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.

barb_increments

[dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.

- 'half' - half barbs (Default is 5)
- 'full' - full barbs (Default is 10)
- 'flag' - flags (default is 50)

flip_barb

[bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).

A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as *U* and *V*.

Returns

barbs

[*Barbs*]

Other Parameters

**kwargs

The barbs can further be customized using *PolyCollection* keyword arguments:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	ndarray
capstyle	{'butt', 'round', 'projecting'}
clim	(vmin: float, vmax: float)
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of rgba tuples
contains	unknown
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
norm	*Normalize* or None
offset_position	unknown
offsets	array-like (N, 2) or (2,)
path_effects	*AbstractPathEffect*
picker	None or bool or callable
pickradius	unknown

Table 216 – continued from previous page

Property	Description
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

`__init__`(*self*, *ax*, **args*, *pivot='tip'*, *length=7*, *barbcolor=None*, *flagcolor=None*, *sizes=None*, *fill_empty=False*, *barb_increments=None*, *rounding=True*, *flip_barb=False*, ***kw*)

The constructor takes one required argument, an Axes instance, followed by the args and kwargs described by the following pyplot interface documentation:

Plot a 2D field of barbs.

Call signature:

```
barbs([X, Y], U, V, [C], **kw)
```

Where *X*, *Y* define the barb locations, *U*, *V* define the barb directions, and *C* optionally sets the color.

All arguments may be 1D or 2D. *U*, *V*, *C* may be masked arrays, but masked *X*, *Y* are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as show schematically below:

```
:                    /\    \
:                   /  \    \
:                  /    \    \    \
:                 /      \    \    \
:                ------------------------------
```

The largest increment is given by a triangle (or "flag"). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

See also https://en.wikipedia.org/wiki/Wind_barb.

Parameters

X, Y

[1D or 2D array-like, optional] The x and y coordinates of the barb locations. See *pivot* for how the barbs are drawn to the x, y positions.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If *X* and *Y* are 1D but *U*, *V* are 2D, *X*, *Y* are expanded to 2D using `X, Y = np.meshgrid(X, Y)`. In this case `len(X)` and `len(Y)` must match the column and row dimensions of *U* and *V*.

U, V

[1D or 2D array-like] The x and y components of the barb shaft.

C

[1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *barbcolor* instead.

length

[float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

pivot

[{'tip', 'middle'} or float, default: 'tip'] The part of the arrow that is anchored to the *X*, *Y* grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

barbcolor

[color or color sequence] The color of all parts of the barb except for the flags. This parameter is analogous to the *edgecolor* parameter for polygons, which can be used instead. However this parameter will override facecolor.

flagcolor

[color or color sequence] The color of any flags on the barb. This parameter is analogous to the *facecolor* parameter for polygons, which can be used instead. However, this parameter will override facecolor. If this is not set (and *C* has not either) then *flagcolor* will be set to match *barbcolor* so that the barb has a uniform color. If *C* has been set, *flagcolor* has no effect.

sizes

[dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- 'spacing' - space between features (flags, full/half barbs)
- 'height' - height (distance from shaft to top) of a flag or full barb
- 'width' - width of a flag, twice the width of a full barb
- 'emptybarb' - radius of the circle used for low magnitudes

fill_empty

[bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

rounding

[bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.

barb_increments

[dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.

- 'half' - half barbs (Default is 5)
- 'full' - full barbs (Default is 10)
- 'flag' - flags (default is 50)

flip_barb

[bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).

A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as *U* and *V*.

Returns

barbs

[*Barbs*]

Other Parameters

**kwargs

The barbs can further be customized using *PolyCollection* keyword arguments:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools

__module__ = 'matplotlib.quiver'

barbs_doc = '\nPlot a 2D field of barbs.\n\nCall signature::\n\n barbs([X, Y], U, V, [C],

set_UVC(*self*, *U*, *V*, *C=None*)

set_offsets(*self*, *xy*)

Set the offsets for the barb polygons. This saves the offsets passed in and masks them as appropriate for the existing U/V data.

Parameters

xy

[sequence of pairs of floats]

Examples using `matplotlib.quiver.Barbs`

18.42 matplotlib.rcsetup

The rcsetup module contains the validation code for customization using Matplotlib's rc settings.

Each rc setting is assigned a function used to validate any attempted changes to that setting. The validation functions are defined in the rcsetup module, and are used to construct the rcParams global object which stores the settings and is referenced throughout Matplotlib.

The default values of the rc settings are set in the default matplotlibrc file. Any additions or deletions to the parameter set listed here should also be propagated to the `matplotlibrc.template` in Matplotlib's root source directory.

class matplotlib.rcsetup.**ValidateInStrings**(*key*, *valid*, *ignorecase=False*, *, *_deprecated_since=None*)

Bases: `object`

valid is a list of legal strings.

matplotlib.rcsetup.**cycler**(**args*, ***kwargs*)

Create a `Cycler` object much like `cycler.cycler()`, but includes input validation.

Call signatures:

```
cycler(cycler)
cycler(label=values[, label2=values2[, ...]])
cycler(label, values)
```

Form 1 copies a given `Cycler` object.

Form 2 creates a `Cycler` which cycles over one or more properties simultaneously. If multiple properties are given, their value lists must have the same length.

Form 3 creates a `Cycler` for a single property. This form exists for compatibility with the original cycler. Its use is discouraged in favor of the kwarg form, i.e. `cycler(label=values)`.

Parameters

cycler

[Cycler] Copy constructor for Cycler.

label

[str] The property key. Must be a valid *Artist* property. For example, 'color' or 'linestyle'. Aliases are allowed, such as 'c' for 'color' and 'lw' for 'linewidth'.

values

[iterable] Finite-length iterable of the property values. These values are validated and will raise a ValueError if invalid.

Returns

Cycler

A new `Cycler` for the given properties.

Examples

Creating a cycler for a single property:

```
>>> c = cycler(color=['red', 'green', 'blue'])
```

Creating a cycler for simultaneously cycling over multiple properties (e.g. red circle, green plus, blue cross):

```
>>> c = cycler(color=['red', 'green', 'blue'],
...            marker=['o', '+', 'x'])
```

matplotlib.rcsetup.**update_savefig_format**(*value*)

[*Deprecated*]

Notes

Deprecated since version 3.2:

matplotlib.rcsetup.**validate_animation_writer_path**(*p*)
[*Deprecated*]

Notes

Deprecated since version 3.2:

matplotlib.rcsetup.**validate_any**(*s*)

matplotlib.rcsetup.**validate_anylist**(*s*)

matplotlib.rcsetup.**validate_aspect**(*s*)

matplotlib.rcsetup.**validate_axisbelow**(*s*)

matplotlib.rcsetup.**validate_backend**(*s*)

matplotlib.rcsetup.**validate_bbox**(*s*)

matplotlib.rcsetup.**validate_bool**(*b*)
Convert b to `bool` or raise.

matplotlib.rcsetup.**validate_bool_maybe_none**(*b*)
[*Deprecated*] Convert b to `bool` or raise, passing through *None*.

Notes

Deprecated since version 3.3.

matplotlib.rcsetup.**validate_capstyle**(*s*)

matplotlib.rcsetup.**validate_capstylelist**(*s*)

matplotlib.rcsetup.**validate_color**(*s*)
Return a valid color arg.

matplotlib.rcsetup.**validate_color_for_prop_cycle**(*s*)

matplotlib.rcsetup.**validate_color_or_auto**(*s*)

matplotlib.rcsetup.**validate_color_or_inherit**(*s*)
Return a valid color arg.

matplotlib.rcsetup.**validate_colorlist**(*s*)
return a list of colorspecs

matplotlib.rcsetup.**validate_cycler**(*s*)
Return a Cycler object from a string repr or the object itself.

matplotlib.rcsetup.**validate_dashlist**(*s*)
return a list of floats

matplotlib.rcsetup.**validate_dpi**(*s*)
Confirm s is string 'figure' or convert s to float or raise.

matplotlib.rcsetup.**validate_fillstylelist**(*s*)

matplotlib.rcsetup.**validate_float**(*s*)

matplotlib.rcsetup.**validate_float_or_None**(*s*)

matplotlib.rcsetup.**validate_floatlist**(*s*)
return a list of floats

matplotlib.rcsetup.**validate_joinstyle**(*s*)

matplotlib.rcsetup.**validate_joinstylelist**(*s*)

matplotlib.rcsetup.**validate_markevery**(*s*)
Validate the markevery property of a Line2D object.

Parameters

s

[None, int, float, slice, length-2 tuple of ints,] length-2 tuple of floats, list of ints

Returns

None, int, float, slice, length-2 tuple of ints,

length-2 tuple of floats, list of ints

matplotlib.rcsetup.**validate_markeverylist**(*s*)

Validate the markevery property of a Line2D object.

Parameters

s

[None, int, float, slice, length-2 tuple of ints,] length-2 tuple of floats, list of ints

Returns

None, int, float, slice, length-2 tuple of ints,

length-2 tuple of floats, list of ints

matplotlib.rcsetup.**validate_movie_writer**(*s*)

[*Deprecated*]

Notes

Deprecated since version 3.3:

matplotlib.rcsetup.**validate_nseq_float**(*n*)

[*Deprecated*]

Notes

Deprecated since version 3.3:

matplotlib.rcsetup.**validate_nseq_int**(*n*)

[*Deprecated*]

Notes

Deprecated since version 3.3:

matplotlib.rcsetup.**validate_path_exists**(*s*)
[*Deprecated*] If s is a path, return s, else False

Notes

Deprecated since version 3.2.

matplotlib.rcsetup.**validate_ps_distiller**(*s*)

matplotlib.rcsetup.**validate_sketch**(*s*)

matplotlib.rcsetup.**validate_string**(*s*)

matplotlib.rcsetup.**validate_string_or_None**(*s*)

matplotlib.rcsetup.**validate_stringlist**(*s*)
return a list of strings

matplotlib.rcsetup.**validate_webagg_address**(*s*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

matplotlib.rcsetup.**validate_whiskers**(*s*)

18.43 matplotlib.sankey

Module for creating Sankey diagrams using Matplotlib.

class matplotlib.sankey.**Sankey**(*ax=None*, *scale=1.0*, *unit=''*, *format='%G'*, *gap=0.25*, *radius=0.1*, *shoulder=0.03*, *offset=0.15*, *head_angle=100*, *margin=0.4*, *tolerance=1e-06*, ***kwargs*)

Bases: `object`

Sankey diagram.

Sankey diagrams are a specific type of flow diagram, in which the width of the arrows is shown proportionally to the flow quantity. They are typically used to visualize energy or material or cost transfers between processes. Wikipedia (6/1/2011)

Create a new Sankey instance.

The optional arguments listed below are applied to all subdiagrams so that there is consistent alignment and formatting.

In order to draw a complex Sankey diagram, create an instance of *Sankey* by calling it without any kwargs:

```
sankey = Sankey()
```

Then add simple Sankey sub-diagrams:

```
sankey.add() # 1
sankey.add() # 2
#...
sankey.add() # n
```

Finally, create the full diagram:

```
sankey.finish()
```

Or, instead, simply daisy-chain those calls:

```
Sankey().add().add...  .add().finish()
```

Other Parameters

ax

[*Axes*] Axes onto which the data should be plotted. If *ax* isn't provided, new Axes will be created.

scale

[float] Scaling factor for the flows. *scale* sizes the width of the paths in order to maintain proper layout. The same scale is applied to all subdiagrams. The value should be chosen such that the product of the scale and the sum of the inputs is approximately 1.0 (and the product of the scale and the sum of the outputs is approximately -1.0).

unit

[str] The physical unit associated with the flow quantities. If *unit* is None, then none of the quantities are labeled.

format

[str] A Python number formatting string to be used in labeling the flow as a quantity (i.e., a number times a unit, where the unit is given).

gap

[float] Space between paths that break in/break away to/from the top or bottom.

radius

[float] Inner radius of the vertical paths.

shoulder

[float] Size of the shoulders of output arrows.

offset

[float] Text offset (from the dip or tip of the arrow).

head_angle

[float] Angle, in degrees, of the arrow heads (and negative of the angle of the tails).

margin

[float] Minimum space between Sankey outlines and the edge of the plot area.

tolerance

[float] Acceptable maximum of the magnitude of the sum of flows. The magnitude of the sum of connected flows cannot be greater than *tolerance*.

****kwargs**

Any additional keyword arguments will be passed to *add()*, which will create the first subdiagram.

See also:

Sankey.add

Sankey.finish

Examples

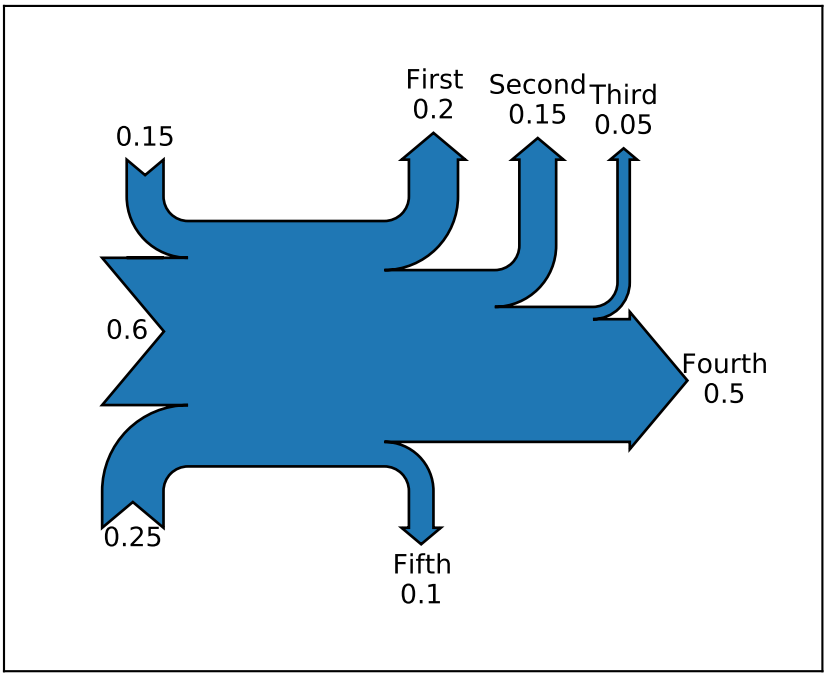
add(*self*, *patchlabel=''*, *flows=None*, *orientations=None*, *labels=''*, *trunklength=1.0*, *pathlengths=0.25*, *prior=None*, *connect=0, 0*, *rotation=0*, ***kwargs*)

Add a simple Sankey diagram with flows at the same hierarchical level.

Parameters

patchlabel

The default settings produce a diagram like this.



[str] Label to be placed at the center of the diagram. Note that *label* (not *patchlabel*) can be passed as keyword argument to create an entry in the legend.

flows

[list of float] Array of flow values. By convention, inputs are positive and outputs are negative.

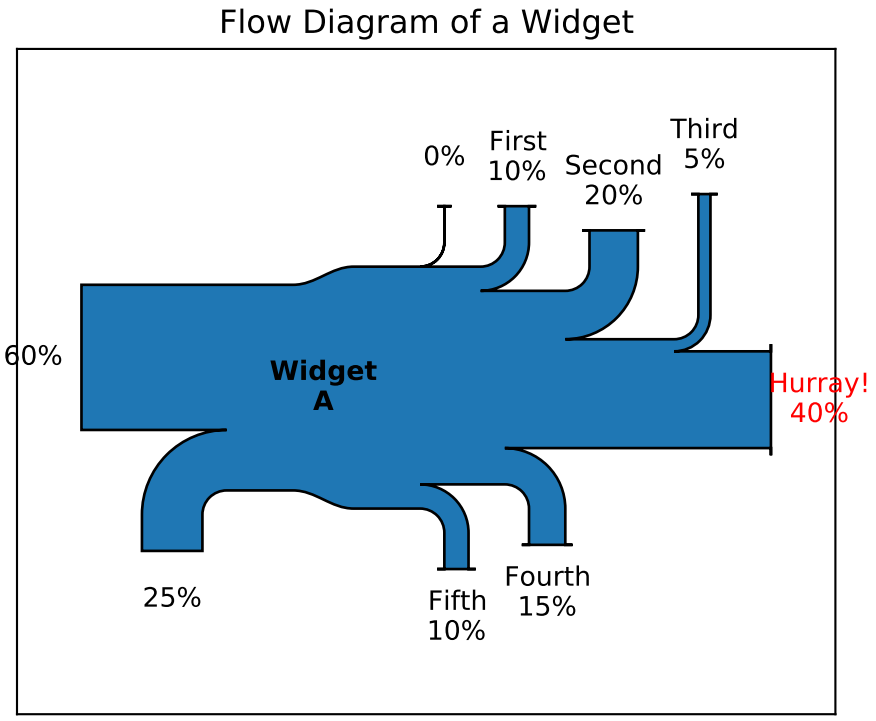
Flows are placed along the top of the diagram from the inside out in order of their index within *flows*. They are placed along the sides of the diagram from the top down and along the bottom from the outside in.

If the sum of the inputs and outputs is nonzero, the discrepancy will appear as a cubic Bezier curve along the top and bottom edges of the trunk.

orientations

[list of {-1, 0, 1}] List of orientations of the flows (or a single orientation to be used for all flows). Valid values are 0 (inputs from the left, outputs to the right), 1 (from and to the top) or -1 (from and to the bottom).

labels



[list of (str or None)] List of labels for the flows (or a single label to be used for all flows). Each label may be *None* (no label), or a labeling string. If an entry is a (possibly empty) string, then the quantity for the corresponding flow will be shown below the string. However, if the *unit* of the main diagram is None, then quantities are never shown, regardless of the value of this argument.

trunklength

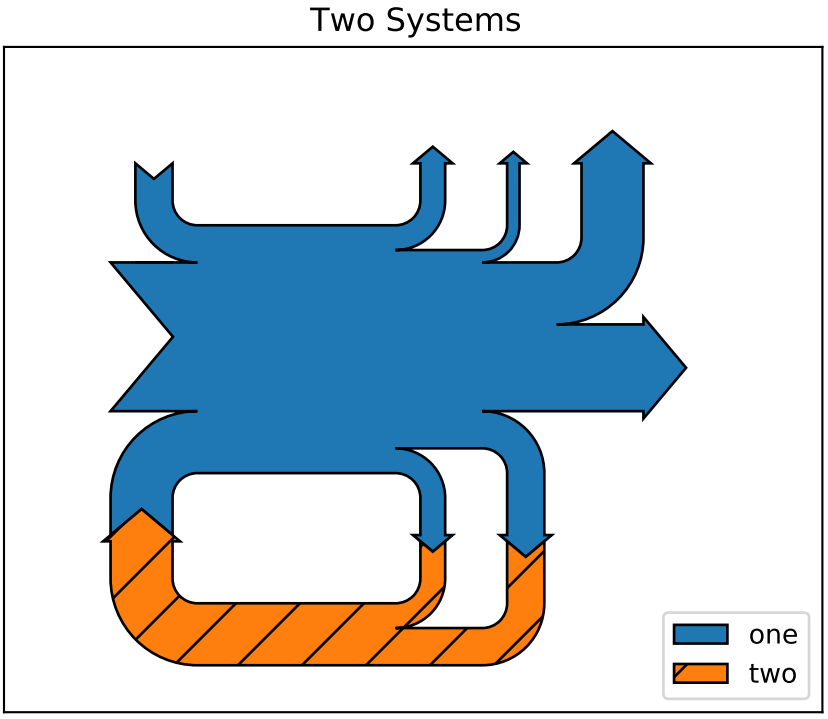
[float] Length between the bases of the input and output groups (in data-space units).

pathlengths

[list of float] List of lengths of the vertical arrows before break-in or after break-away. If a single value is given, then it will be applied to the first (inside) paths on the top and bottom, and the length of all other arrows will be justified accordingly. The *pathlengths* are not applied to the horizontal inputs and outputs.

prior

[int] Index of the prior diagram to which this diagram should



be connected.

connect

[(int, int)] A (prior, this) tuple indexing the flow of the prior diagram and the flow of this diagram which should be connected. If this is the first diagram or *prior* is *None*, *connect* will be ignored.

rotation

[float] Angle of rotation of the diagram in degrees. The interpretation of the *orientations* argument will be rotated accordingly (e.g., if *rotation* == 90, an *orientations* entry of 1 means to/from the left). *rotation* is ignored if this diagram is connected to an existing one (using *prior* and *connect*).

Returns

Sankey

The current *Sankey* instance.

Other Parameters

****kwargs**

Additional keyword arguments set *matplotlib.patches.PathPatch* properties, listed below. For example, one may want to use `fill=False` or `label="A legend entry"`.

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

See also:

Sankey.finish

`finish`(*self*)

Adjust the axes and return a list of information about the Sankey subdiagram(s).

Return value is a list of subdiagrams represented with the following fields:

Field	Description
patch	Sankey outline (an instance of *PathPatch*)
flows	values of the flows (positive for input, negative for output)
angles	list of angles of the arrows [deg/90] For example, if the diagram has not been rotated, an input to the top side will have an angle of 3 (DOWN), and an output from the top side will have an angle of 1 (UP). If a flow has been skipped (because its magnitude is less than *tolerance*), then its angle will be *None*.
tips	array in which each row is an [x, y] pair indicating the positions of the tips (or "dips") of the flow paths If the magnitude of a flow is less the *tolerance* for the instance of *Sankey*, the flow is skipped and its tip will be at the center of the diagram.
text	*Text* instance for the label of the diagram
texts	list of *Text* instances for the labels of flows

Sankey.add

18.44 matplotlib.scale

Scales define the distribution of data values on an axis, e.g. a log scaling.

They are attached to an *Axis* and hold a *Transform*, which is responsible for the actual data transformation.

See also *axes.Axes.set_xscale* and the scales examples in the documentation.

class matplotlib.scale.**FuncScale**(*axis*, *functions*)

Bases: *matplotlib.scale.ScaleBase*

Provide an arbitrary scale with user-supplied function for the axis.

Parameters

axis

[*Axis*] The axis for the scale.

functions

[(callable, callable)] two-tuple of the forward and inverse functions for the scale. The forward function must be monotonic.

Both functions must have the signature:

```
def forward(values: array-like) -> array-like
```

`get_transform`(*self*)
Return the *FuncTransform* associated with this scale.

`name = 'function'`

`set_default_locators_and_formatters`(*self*, *axis*)
Set the locators and formatters of *axis* to instances suitable for this scale.

`class matplotlib.scale.FuncScaleLog`(*axis*, *functions*, *base=10*)
Bases: *matplotlib.scale.LogScale*

Provide an arbitrary scale with user-supplied function for the axis and then put on a logarithmic axes.

Parameters

axis

[*matplotlib.axis.Axis*] The axis for the scale.

functions

[(callable, callable)] two-tuple of the forward and inverse functions for the scale. The forward function must be monotonic.

Both functions must have the signature:

```
def forward(values: array-like) -> array-like
```

base

[float, default: 10] Logarithmic base of the scale.

`property base`

`get_transform`(*self*)
Return the *Transform* associated with this scale.

`name = 'functionlog'`

`class matplotlib.scale.FuncTransform`(*forward*, *inverse*)
Bases: *matplotlib.transforms.Transform*

A simple transform that takes and arbitrary function for the forward and inverse transform.

Parameters

forward

[callable] The forward function for the transform. This function must have an inverse and, for best behavior, be monotonic. It must have the signature:

```
def forward(values: array-like) -> array-like
```

inverse

[callable] The inverse of the forward function. Signature as `forward`.

`has_inverse = True`

`input_dims = 1`

`inverted`(*self*)

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`is_separable = True`

`output_dims = 1`

`transform_non_affine`(*self*, *values*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as NumPy array of length *input_dims* or shape (N x *input_dims*).

Returns

array

The output values as NumPy array of length *input_dims* or shape (N x *output_dims*), depending on the input.

`class matplotlib.scale.InvertedLogTransform`(*base*)

Bases: *matplotlib.transforms.Transform*

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

has_inverse = True

input_dims = 1

inverted(*self*)

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

is_separable = True

output_dims = 1

transform_non_affine(*self*, *a*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as NumPy array of length *input_dims* or shape (N x *input_dims*).

Returns

array

The output values as NumPy array of length *input_dims* or shape (N x *output_dims*), depending on the input.

class matplotlib.scale.InvertedSymmetricalLogTransform(*base*, *linthresh*, *linscale*)

Bases: *matplotlib.transforms.Transform*

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

has_inverse = True

input_dims = 1

`inverted`(*self*)
Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`is_separable = True`

`output_dims = 1`

`transform_non_affine`(*self*, *a*)
Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as NumPy array of length *input_dims* or shape (N x *input_dims*).

Returns

array

The output values as NumPy array of length *input_dims* or shape (N x *output_dims*), depending on the input.

`class matplotlib.scale.LinearScale`(*axis*, ***kwargs*)
Bases: *matplotlib.scale.ScaleBase*

The default linear scale.

`get_transform`(*self*)
Return the transform for linear scaling, which is just the *IdentityTransform*.

`name = 'linear'`

`set_default_locators_and_formatters`(*self*, *axis*)
Set the locators and formatters of *axis* to instances suitable for this scale.

`class matplotlib.scale.LogScale`(*axis*, ***kwargs*)
Bases: *matplotlib.scale.ScaleBase*

A standard logarithmic scale. Care is taken to only plot positive values.

Parameters

axis

[*Axis*] The axis for the scale.

base

[float, default: 10] The base of the logarithm.

nonpositive

[{'clip', 'mask'}, default: 'clip'] Determines the behavior for non-positive values. They can either be masked as invalid, or clipped to a very small positive number.

subs

[sequence of int, default: None] Where to place the subticks between each major tick. For example, in a log10 scale, `[2, 3, 4, 5, 6, 7, 8, 9]` will place 8 logarithmically spaced minor ticks between each major tick.

property InvertedLogTransform

property LogTransform

property base

get_transform(*self*)
Return the *LogTransform* associated with this scale.

limit_range_for_scale(*self*, *vmin*, *vmax*, *minpos*)
Limit the domain to positive values.

name = 'log'

set_default_locators_and_formatters(*self*, *axis*)
Set the locators and formatters of *axis* to instances suitable for this scale.

class matplotlib.scale.LogTransform(**kwargs)
Bases: *matplotlib.transforms.Transform*

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

has_inverse = True

input_dims = 1

inverted(*self*)
Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

is_separable = True

output_dims = 1

transform_non_affine(*self*, *a*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as NumPy array of length *input_dims* or shape (N x *input_dims*).

Returns

array

The output values as NumPy array of length *input_dims* or shape (N x *output_dims*), depending on the input.

class matplotlib.scale.LogisticTransform(***kwargs*)

Bases: *matplotlib.transforms.Transform*

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

has_inverse = True

input_dims = 1

inverted(*self*)

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

is_separable = True

output_dims = 1

transform_non_affine(*self*, *a*)

logistic transform (base 10)

class matplotlib.scale.LogitScale(**kwargs)

Bases: *matplotlib.scale.ScaleBase*

Logit scale for data between zero and one, both excluded.

This scale is similar to a log scale close to zero and to one, and almost linear around 0.5. It maps the interval]0, 1[onto]-infty, +infty[.

Parameters

axis

[*matplotlib.axis.Axis*] Currently unused.

nonpositive

[{'mask', 'clip'}] Determines the behavior for values beyond the open interval]0, 1[. They can either be masked as invalid, or clipped to a number very close to 0 or 1.

use_overline

[bool, default: False] Indicate the usage of survival notation (overline{x}) in place of standard notation (1-x) for probability close to one.

one_half

[str, default: r"frac{1}{2}"] The string used for ticks formatter to represent 1/2.

get_transform(*self*)

Return the *LogitTransform* associated with this scale.

limit_range_for_scale(*self*, *vmin*, *vmax*, *minpos*)

Limit the domain to values between 0 and 1 (excluded).

name = 'logit'

set_default_locators_and_formatters(*self*, *axis*)

Set the locators and formatters of *axis* to instances suitable for this scale.

class matplotlib.scale.LogitTransform(**kwargs)

Bases: *matplotlib.transforms.Transform*

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

has_inverse = True

input_dims = 1

`inverted`(*self*)
Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`is_separable = True`

`output_dims = 1`

`transform_non_affine`(*self*, *a*)
logit transform (base 10), masked or clipped

`class matplotlib.scale.ScaleBase`(*axis*, ***kwargs*)
Bases: `object`

The base class for all scales.

Scales are separable transformations, working on a single dimension.

Any subclasses will want to override:

- `name`
- *get_transform()*
- *set_default_locators_and_formatters()*

And optionally:

- *limit_range_for_scale()*

Construct a new scale.

Notes

The following note is for scale implementors.

For back-compatibility reasons, scales take an *Axis* object as first argument. However, this argument should not be used: a single scale object should be usable by multiple *Axis*es at the same time.

`get_transform`(*self*)
Return the *Transform* object associated with this scale.

`limit_range_for_scale`(*self*, *vmin*, *vmax*, *minpos*)
Return the range *vmin*, *vmax*, restricted to the domain supported by this scale (if any).

minpos should be the minimum positive value in the data. This is used by log scales to determine a minimum value.

`set_default_locators_and_formatters`(*self*, *axis*)
Set the locators and formatters of *axis* to instances suitable for this scale.

class matplotlib.scale.SymmetricalLogScale(*axis*, ***kwargs*)

Bases: *matplotlib.scale.ScaleBase*

The symmetrical logarithmic scale is logarithmic in both the positive and negative directions from the origin.

Since the values close to zero tend toward infinity, there is a need to have a range around zero that is linear. The parameter *linthresh* allows the user to specify the size of this range (-*linthresh*, *linthresh*).

Parameters

base

[float, default: 10] The base of the logarithm.

linthresh

[float, default: 2] Defines the range `(-x, x)`, within which the plot is linear. This avoids having the plot go to infinity around zero.

subs

[sequence of int] Where to place the subticks between each major tick. For example, in a log10 scale: `[2, 3, 4, 5, 6, 7, 8, 9]` will place 8 logarithmically spaced minor ticks between each major tick.

linscale

[float, optional] This allows the linear range `(-linthresh, linthresh)` to be stretched relative to the logarithmic range. Its value is the number of decades to use for each half of the linear range. For example, when *linscale* == 1.0 (the default), the space used for the positive and negative halves of the linear range will be equal to one decade in the logarithmic range.

Construct a new scale.

Notes

The following note is for scale implementors.

For back-compatibility reasons, scales take an *Axis* object as first argument. However, this argument should not be used: a single scale object should be usable by multiple *Axis*es at the same time.

property InvertedSymmetricalLogTransform

property SymmetricalLogTransform

property base

`get_transform`(*self*)
Return the *SymmetricalLogTransform* associated with this scale.

`property linscale`

`property linthresh`

`name = 'symlog'`

`set_default_locators_and_formatters`(*self*, *axis*)
Set the locators and formatters of *axis* to instances suitable for this scale.

`class matplotlib.scale.SymmetricalLogTransform`(*base*, *linthresh*, *linscale*)
Bases: *matplotlib.transforms.Transform*

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

`has_inverse = True`

`input_dims = 1`

`inverted`(*self*)
Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`is_separable = True`

`output_dims = 1`

`transform_non_affine`(*self*, *a*)
Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as NumPy array of length *input_dims* or shape (N x *input_dims*).

Returns

array

The output values as NumPy array of length *input_dims* or shape (N x *output_dims*), depending on the input.

matplotlib.scale.**get_scale_names**()
Return the names of the available scales.

matplotlib.scale.**register_scale**(*scale_class*)
Register a new kind of scale.

Parameters

scale_class

[subclass of *ScaleBase*] The scale to register.

matplotlib.scale.**scale_factory**(*scale*, *axis*, ***kwargs*)
Return a scale class by name.

Parameters

scale

[{'function', 'functionlog', 'linear', 'log', 'logit', 'symlog'}]

axis

[*matplotlib.axis.Axis*]

18.45 matplotlib.sphinxext.plot_directive

18.45.1 A directive for including a Matplotlib plot in a Sphinx document

By default, in HTML output, `plot` will include a .png file with a link to a high-res .png and .pdf. In LaTeX output, it will include a .pdf.

The source code for the plot may be included in one of three ways:

1. **A path to a source file** as the argument to the directive:

```
.. plot:: path/to/plot.py
```

When a path to a source file is given, the content of the directive may optionally contain a caption for the plot:

```
.. plot:: path/to/plot.py

   The plot's caption.
```

Additionally, one may specify the name of a function to call (with no arguments) immediately after importing the module:

```
.. plot:: path/to/plot.py plot_function1
```

2. Included as **inline content** to the directive:

```
.. plot::

   import matplotlib.pyplot as plt
   import matplotlib.image as mpimg
   import numpy as np
   img = mpimg.imread('_static/stinkbug.png')
   imgplot = plt.imshow(img)
```

3. Using **doctest** syntax:

```
.. plot::

   A plotting example:
   >>> import matplotlib.pyplot as plt
   >>> plt.plot([1, 2, 3], [4, 5, 6])
```

Options

The `plot` directive supports the following options:

format

[{'python', 'doctest'}] The format of the input.

include-source

[bool] Whether to display the source code. The default can be changed using the `plot_include_source` variable in `conf.py`.

encoding

[str] If this source file is in a non-UTF8 or non-ASCII encoding, the encoding must be specified using the `:encoding:` option. The encoding will not be inferred using the `-*- coding -*-` metacomment.

context

[bool or str] If provided, the code will be run in the context of all previous plot directives for which the `:context:` option was specified. This only applies to inline code plot directives, not those run from files. If the `:context: reset` option is specified, the context is reset for this and future plots, and previous figures are closed prior to running the code. `:context: close-figs` keeps the context but closes previous figures before running the code.

nofigs

[bool] If specified, the code block will be run, but no figures will be inserted. This is usually useful with the `:context:` option.

Additionally, this directive supports all of the options of the `image` directive, except for *target* (since plot will add its own target). These include *alt*, *height*, *width*, *scale*, *align* and *class*.

Configuration options

The plot directive has the following configuration options:

plot_include_source

Default value for the include-source option

plot_html_show_source_link

Whether to show a link to the source in HTML.

plot_pre_code

Code that should be executed before each plot. If not specified or None it will default to a string containing:

```
import numpy as np
from matplotlib import pyplot as plt
```

plot_basedir

Base directory, to which `plot::` file names are relative to. (If None or empty, file names are relative to the directory where the file containing the directive is.)

plot_formats

File formats to generate. List of tuples or strings:

```
[(suffix, dpi), suffix, ...]
```

that determine the file format and the DPI. For entries whose DPI was omitted, sensible defaults are chosen. When passing from the command line through sphinx_build the list should be passed as suffix:dpi,suffix:dpi, ...

plot_html_show_formats

Whether to show links to the files in HTML.

plot_rcparams

A dictionary containing any non-standard rcParams that should be applied before each plot.

plot_apply_rcparams

By default, rcParams are applied when `:context:` option is not used in a plot directive. This configuration option overrides this behavior and applies rcParams before each plot.

plot_working_directory

By default, the working directory will be changed to the directory of the example, so the code can get at its data files, if any. Also its path will be added to `sys.path` so it can import any helper modules sitting beside it. This configuration option can be used to specify a central directory (also added to `sys.path`) where data files and helper modules for all code are located.

plot_template

Provide a customized template for preparing restructured text.

`class matplotlib.sphinxext.plot_directive.PlotDirective(`*name*, *arguments*, *options*, *content*, *lineno*, *content_offset*, *block_text*, *state*, *state_machine*`)`

The `.. plot::` directive, as documented in the module's docstring.

`run(`*self*`)`

Run the plot directive.

`exception matplotlib.sphinxext.plot_directive.PlotError`

`matplotlib.sphinxext.plot_directive.mark_plot_labels(`*app*, *document*`)`

To make plots referenceable, we need to move the reference from the "htmlonly" (or "latexonly") node to the actual figure node itself.

`matplotlib.sphinxext.plot_directive.out_of_date(`*original*, *derived*`)`

Return whether *derived* is out-of-date relative to *original*, both of which are full file paths.

`matplotlib.sphinxext.plot_directive.render_figures(`*code*, *code_path*, *output_dir*, *output_base*, *context*, *function_name*, *config*, *context_reset=False*, *close_figs=False*`)`

Run a pyplot script and save the images in *output_dir*.

Save the images under *output_dir* with file names derived from *output_base*

`matplotlib.sphinxext.plot_directive.run_code(`*code*, *code_path*, *ns=None*, *function_name=None*`)`

Import a Python module from a path, and run the function given by name, if function_name is not None.

`matplotlib.sphinxext.plot_directive.split_code_at_show(`*text*`)`

Split code at plt.show().

`matplotlib.sphinxext.plot_directive.unescape_doctest(`*text*`)`

Extract code from a piece of text, which contains either Python code or doctests.

18.46 matplotlib.spines

class matplotlib.spines.**Spine**(*axes*, *spine_type*, *path*, ***kwargs*)

Bases: *matplotlib.patches.Patch*

An axis spine -- the line noting the data area boundaries.

Spines are the lines connecting the axis tick marks and noting the boundaries of the data area. They can be placed at arbitrary positions. See *set_position* for more information.

The default position is `('outward', 0)`.

Spines are subclasses of *Patch*, and inherit much of their behavior.

Spines draw a line, a circle, or an arc depending if *set_patch_line*, *set_patch_circle*, or *set_patch_arc* has been called. Line-like is the default.

Parameters

axes

[*Axes*] The *Axes* instance containing the spine.

spine_type

[str] The spine type.

path

[*Path*] The *Path* instance used to draw the spine.

Other Parameters

****kwargs**

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None

Table 219 – continued from previous page

Property	Description
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

classmethod arc_spine(*axes*, *spine_type*, *center*, *radius*, *theta1*, *theta2*, ***kwargs*)

Create and return an arc *Spine*.

classmethod circular_spine(*axes*, *center*, *radius*, ***kwargs*)

Create and return a circular *Spine*.

cla(*self*)

Clear the current spine.

draw(*self*, *renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`get_bounds`(*self*)
Get the bounds of the spine.

`get_patch_transform`(*self*)
Return the *Transform* instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

`get_path`(*self*)
Return the path of this patch.

`get_position`(*self*)
Return the spine position.

`get_smart_bounds`(*self*)
[*Deprecated*] Return whether the spine has smart bounds.

Notes

Deprecated since version 3.2.

`get_spine_transform`(*self*)
Return the spine transform.

`get_window_extent`(*self*, *renderer=None*)
Return the window extent of the spines in display space, including padding for ticks (but not their labels)

See also:

matplotlib.axes.Axes.get_tightbbox

matplotlib.axes.Axes.get_window_extent

`classmethod linear_spine`(*axes*, *spine_type*, ***kwargs*)
Create and return a linear *Spine*.

`register_axis`(*self*, *axis*)
Register an axis.

An axis should be registered with its corresponding spine from the Axes instance. This allows the spine to clear any axis properties when needed.

`set_bounds`(*self*, *low=None*, *high=None*)
Set the spine bounds.

Parameters

low

[float or None, optional] The lower spine bound. Passing *None* leaves the limit unchanged.

The bounds may also be passed as the tuple (*low*, *high*) as the first positional argument.

high

[float or None, optional] The higher spine bound. Passing *None* leaves the limit unchanged.

`set_color`(*self*, *c*)
Set the edgecolor.

Parameters

c

[color]

Notes

This method does not modify the facecolor (which defaults to "none"), unlike the *Patch.set_color* method defined in the parent class. Use *Patch.set_facecolor* to set the facecolor.

`set_patch_arc`(*self*, *center*, *radius*, *theta1*, *theta2*)
Set the spine to be arc-like.

`set_patch_circle`(*self*, *center*, *radius*)
Set the spine to be circular.

`set_patch_line`(*self*)
Set the spine to be linear.

`set_position`(*self*, *position*)
Set the position of the spine.

Spine position is specified by a 2 tuple of (position type, amount). The position types are:

- 'outward': place the spine out from the data area by the specified number of points. (Negative values place the spine inwards.)
- 'axes': place the spine at the specified Axes coordinate (0 to 1).
- 'data': place the spine at the specified data coordinate.

Additionally, shorthand notations define a special positions:

- 'center' -> ('axes', 0.5)

- 'zero' -> ('data', 0.0)

`set_smart_bounds`(*self*, *value*)
[*Deprecated*] Set the spine and associated axis to have smart bounds.

Notes

Deprecated since version 3.2.

18.47 matplotlib.style

Styles are predefined sets of *rcParams* that define the visual appearance of a plot.

Customizing Matplotlib with style sheets and rcParams describes the mechanism and usage of styles.

The /gallery/style_sheets/style_sheets_reference gives an overview of the builtin styles.

`matplotlib.style.context`(*style*, *after_reset=False*)
Context manager for using style settings temporarily.

Parameters

style

[str, dict, Path or list] A style specification. Valid options are:

str	The name of a style or a path/URL to a style file. For a list of available style names, see `style.available`.
dict	Dictionary with valid key/value pairs for *matplotlib.rcParams*.
Path	A path-like object which is a path to a style file.
list	A list of style specifiers (str, Path or dict) applied from first to last in the list.

after_reset

[bool] If True, apply style after resetting settings to their defaults; otherwise, apply style on top of the current settings.

`matplotlib.style.reload_library`()
Reload the style library.

`matplotlib.style.use`(*style*)
Use Matplotlib style settings from a style specification.

The style name of 'default' is reserved for reverting back to the default style settings.

Note: This updates the *rcParams* with the settings from the style. *rcParams* not defined in the style are kept.

Parameters

style

[str, dict, Path or list] A style specification. Valid options are:

str	The name of a style or a path/URL to a style file. For a list of available style names, see `style.available`.
dict	Dictionary with valid key/value pairs for *matplotlib.rcParams*.
Path	A path-like object which is a path to a style file.
list	A list of style specifiers (str, Path or dict) applied from first to last in the list.

`matplotlib.style.library`
A dict mapping from style name to *RcParams* defining that style.

This is meant to be read-only. Use *reload_library* to update.

`matplotlib.style.available`
List of the names of the available styles.

This is meant to be read-only. Use *reload_library* to update.

18.48 matplotlib.table

Tables drawing.

Use the factory function *table* to create a ready-made table from texts. If you need more control, use the *Table* class and its methods.

The table consists of a grid of cells, which are indexed by (row, column). The cell (0, 0) is positioned at the top left.

Thanks to John Gill for providing the class and table.

`class matplotlib.table.Cell(`*xy*, *width*, *height*, *edgecolor='k'*, *facecolor='w'*, *fill=True*, *text=''*, *loc=None*, *fontproperties=None*, *, *visible_edges='closed'*`)`
Bases: *matplotlib.patches.Rectangle*

A cell is a *Rectangle* with some associated *Text*.

As a user, you'll most likely not creates cells yourself. Instead, you should use either the *table* factory function or *Table.add_cell*.

Parameters

xy

[2-tuple] The position of the bottom left corner of the cell.

width

[float] The cell width.

height

[float] The cell height.

edgecolor

[color] The color of the cell border.

facecolor

[color] The cell facecolor.

fill

[bool] Whether the cell background is filled.

text

[str] The cell text.

loc

[{'left', 'center', 'right'}, default: 'right'] The alignment of the text within the cell.

fontproperties

[dict] A dict defining the font properties of the text. Supported keys and values are the keyword arguments accepted by *FontProperties*.

visible_edges

[str, default: 'closed'] The cell edges to be drawn with a line: a substring of 'BRTL' (bottom, right, top, left), or one of 'open' (no edges drawn), 'closed' (all edges drawn), 'horizontal' (bottom and top), 'vertical' (right and left).

`PAD = 0.1`
Padding between text and rectangle.

`auto_set_font_size`(*self*, *renderer*)
Shrink font size until the text fits into the cell width.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`get_fontsize`(*self*)
Return the cell fontsize.

`get_path`(*self*)
Return a *Path* for the *visible_edges*.

`get_required_width`(*self*, *renderer*)
Return the minimal required width for the cell.

`get_text`(*self*)
Return the cell *Text* instance.

`get_text_bounds`(*self*, *renderer*)
Return the text bounds as *(x, y, width, height)* in table coordinates.

`set_figure`(*self*, *fig*)
Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

`set_fontsize`(*self*, *size*)
Set the text fontsize.

`set_text_props`(*self*, ***kwargs*)
Update the text properties.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array an
alpha	float or None
animated	bool
backgroundcolor	color
bbox	dict with properties for *patches.FancyBboxPatch*
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None

Tabl

Property	Description
color or c	color
contains	unknown
figure	*Figure*
fontfamily or family	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', '
fontproperties or font or font_properties	*font_manager.FontProperties* or `str` or `pathlib.Path`
fontsize or size	float or {'xx-small', 'x-small', 'small', 'medium', 'large',
fontstretch or stretch	{a numeric value in range 0-1000, 'ultra-condensed',
fontstyle or style	{'normal', 'italic', 'oblique'}
fontvariant or variant	{'normal', 'small-caps'}
fontweight or weight	{a numeric value in range 0-1000, 'ultralight', 'light',
gid	str
horizontalalignment or ha	{'center', 'right', 'left'}
in_layout	bool
label	object
linespacing	float (multiple of font size)
multialignment or ma	{'left', 'right', 'center'}
path_effects	*AbstractPathEffect*
picker	None or bool or callable
position	(float, float)
rasterized	bool or None
rotation	float or {'vertical', 'horizontal'}
rotation_mode	{None, 'default', 'anchor'}
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
text	object
transform	*Transform*
url	str
usetex	bool or None
verticalalignment or va	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
visible	bool
wrap	bool
x	float
y	float
zorder	float

`set_transform`(*self*, *trans*)

Set the artist transform.

Parameters

t

[*Transform*]

property visible_edges
The cell edges to be drawn with a line.

Reading this property returns a substring of 'BRTL' (bottom, right, top, left').

When setting this property, you can use a substring of 'BRTL' or one of {'open', 'closed', 'horizontal', 'vertical'}.

matplotlib.table.CustomCell
alias of *matplotlib.table.Cell*

class matplotlib.table.Table(*ax*, *loc=None*, *bbox=None*, ***kwargs*)
Bases: *matplotlib.artist.Artist*

A table of cells.

The table consists of a grid of cells, which are indexed by (row, column).

For a simple table, you'll have a full grid of cells with indices from (0, 0) to (num_rows-1, num_cols-1), in which the cell (0, 0) is positioned at the top left. However, you can also add cells with negative indices. You don't have to add a cell to every grid position, so you can create tables that have holes.

Note: You'll usually not create an empty table from scratch. Instead use *table* to create a table from data.

Parameters

ax

[*matplotlib.axes.Axes*] The *Axes* to plot the table into.

loc

[str] The position of the cell with respect to *ax*. This must be one of the *codes*.

bbox

[*Bbox* or None] A bounding box to draw the table into. If this is not *None*, this overrides *loc*.

Other Parameters

****kwargs**

Artist properties.

AXESPAD = 0.02
The border between the Axes and the table edge in Axes units.

FONTSIZE = 10

add_cell(*self*, *row*, *col*, **args*, ***kwargs*)
Create a cell and add it to the table.

Parameters

row

[int] Row index.

col

[int] Column index.

***args, ****kwargs**

All other parameters are passed on to *Cell*.

Returns

Cell

The created cell.

`auto_set_column_width`(*self*, *col*)
Automatically set the widths of given columns to optimal sizes.

Parameters

col

[int or sequence of ints] The indices of the columns to autoscale.

`auto_set_font_size`(*self*, *value=True*)
Automatically set font size.

`codes = {'best': 0, 'bottom': 17, 'bottom left': 12, 'bottom right': 13, 'center': 9, 'c`
Possible values where to place the table relative to the Axes.

`contains`(*self*, *mouseevent*)
Test whether the artist contains the mouse event.

Parameters

mouseevent

[*matplotlib.backend_bases.MouseEvent*]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`property edges`
The default value of *visible_edges* for newly added cells using *add_cell*.

Notes

This setting does currently only affect newly created cells using *add_cell*.

To change existing cells, you have to set their edges explicitly:

```
for c in tab.get_celld().values():
    c.visible_edges = 'horizontal'
```

`get_celld`(*self*)
Return a dict of cells in the table mapping *(row, column)* to *Cell*s.

Notes

You can also directly index into the Table object to access individual cells:

```
cell = table[row, col]
```

`get_children`(*self*)
Return the Artists contained by the table.

`get_window_extent`(*self*, *renderer*)
Return the bounding box of the table in window coords.

`scale`(*self*, *xscale*, *yscale*)
Scale column widths by *xscale* and row heights by *yscale*.

`set_fontsize`(*self*, *size*)
Set the font size, in points, of the cell text.

Parameters

size

[float]

Notes

As long as auto font size has not been disabled, the value will be clipped such that the text fits horizontally into the cell.

You can disable this behavior using *auto_set_font_size*.

```
>>> the_table.auto_set_font_size(False)
>>> the_table.set_fontsize(20)
```

However, there is no automatic scaling of the row height so that the text may exceed the cell boundary.

matplotlib.table.**table**(*ax*, *cellText=None*, *cellColours=None*, *cellLoc='right'*, *colWidths=None*, *rowLabels=None*, *rowColours=None*, *rowLoc='left'*, *colLabels=None*, *colColours=None*, *colLoc='center'*, *loc='bottom'*, *bbox=None*, *edges='closed'*, ***kwargs*)

Add a table to an *Axes*.

At least one of *cellText* or *cellColours* must be specified. These parameters must be 2D lists, in which the outer lists define the rows and the inner list define the column values per row. Each row must have the same number of elements.

The table can optionally have row and column headers, which are configured using *rowLabels*, *rowColours*, *rowLoc* and *colLabels*, *colColours*, *colLoc* respectively.

For finer grained control over tables, use the *Table* class and add it to the axes with *Axes.add_table*.

Parameters

cellText

[2D list of str, optional] The texts to place into the table cells.

Note: Line breaks in the strings are currently not accounted for and will result in the text exceeding the cell boundaries.

cellColours

[2D list of colors, optional] The background colors of the cells.

cellLoc

[{'left', 'center', 'right'}, default: 'right'] The alignment of the text within the cells.

colWidths

[list of float, optional] The column widths in units of the axes. If not given, all columns will have a width of *1 / ncols*.

rowLabels

[list of str, optional] The text of the row header cells.

rowColours

[list of colors, optional] The colors of the row header cells.

rowLoc

[{'left', 'center', 'right'}, default: 'left'] The text alignment of the row header cells.

colLabels

[list of str, optional] The text of the column header cells.

colColours

[list of colors, optional] The colors of the column header cells.

colLoc

[{'left', 'center', 'right'}, default: 'left'] The text alignment of the column header cells.

loc

[str, optional] The position of the cell with respect to *ax*. This must be one of the *codes*.

bbox

[*Bbox*, optional] A bounding box to draw the table into. If this is not *None*, this overrides *loc*.

edges

[substring of 'BRTL' or {'open', 'closed', 'horizontal', 'vertical'}] The cell edges to be drawn with a line. See also *visible_edges*.

Returns

Table

The created table.

Other Parameters

****kwargs**

Table properties.

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
alpha	float or None
animated	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
contains	unknown
figure	*Figure*
fontsize	float
gid	str
in_layout	bool
label	object
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

18.49 matplotlib.testing

18.49.1 matplotlib.testing

Helper functions for testing.

matplotlib.testing.**is_called_from_pytest**()

[*Deprecated*] Whether we are in a pytest run.

Notes

Deprecated since version 3.2.

matplotlib.testing.**set_font_settings_for_testing**()

matplotlib.testing.**set_reproducibility_for_testing**()

matplotlib.testing.**setup**()

18.49.2 matplotlib.testing.compare

Utilities for comparing image results.

matplotlib.testing.compare.**comparable_formats**()

Return the list of file formats that *compare_images* can compare on this system.

Returns

list of str

E.g. `['png', 'pdf', 'svg', 'eps']`.

matplotlib.testing.compare.**compare_images**(*expected*, *actual*, *tol*, *in_decorator=False*)

Compare two "image" files checking differences within a tolerance.

The two given filenames may point to files which are convertible to PNG via the `converter` dictionary. The underlying RMS is calculated with the `calculate_rms` function.

Parameters

expected

[str] The filename of the expected image.

actual

[str] The filename of the actual image.

tol

[float] The tolerance (a color value difference, where 255 is the maximal difference). The test fails if the average pixel difference is greater than this value.

in_decorator

[bool] Determines the output format. If called from image_comparison decorator, this should be True. (default=False)

Returns

None or dict or str

Return *None* if the images are equal within the given tolerance.

If the images differ, the return value depends on *in_decorator*. If *in_decorator* is true, a dict with the following entries is returned:

- *rms*: The RMS of the image difference.
- *expected*: The filename of the expected image.
- *actual*: The filename of the actual image.

- *diff_image*: The filename of the difference image.
- *tol*: The comparison tolerance.

Otherwise, a human-readable multi-line string representation of this information is returned.

Examples

```
img1 = "./baseline/plot.png"
img2 = "./output/plot.png"
compare_images(img1, img2, 0.001)
```

18.49.3 matplotlib.testing.decorators

class matplotlib.testing.decorators.**CleanupTestCase**(*methodName='runTest'*)

Bases: unittest.case.TestCase

A wrapper for unittest.TestCase that includes cleanup operations.

Create an instance of the class that will use the named test method when executed. Raises a ValueError if the instance does not have a method with the specified name.

classmethod setUpClass()

Hook method for setting up class fixture before running tests in the class.

classmethod tearDownClass()

Hook method for deconstructing the class fixture after running all tests in the class.

matplotlib.testing.decorators.**check_figures_equal**(**, extensions='png', 'pdf', 'svg', tol=0*)

Decorator for test cases that generate and compare two figures.

The decorated function must take two keyword arguments, *fig_test* and *fig_ref*, and draw the test and reference images on them. After the function returns, the figures are saved and compared.

This decorator should be preferred over *image_comparison* when possible in order to keep the size of the test suite from ballooning.

Parameters

extensions

[list, default: ["png", "pdf", "svg"]] The extensions to test.

tol

[float] The RMS threshold above which the test is considered failed.

Examples

Check that calling *Axes.plot* with a single argument plots it against `[0, 1, 2, ...]`:

```
@check_figures_equal()
def test_plot(fig_test, fig_ref):
    fig_test.subplots().plot([1, 3, 5])
    fig_ref.subplots().plot([0, 1, 2], [1, 3, 5])
```

matplotlib.testing.decorators.**check_freetype_version**(*ver*)

matplotlib.testing.decorators.**cleanup**(*style=None*)

A decorator to ensure that any global state is reset before running a test.

Parameters

style

[str, dict, or list, optional] The style(s) to apply. Defaults to `["classic", "_classic_test_patch"]`.

matplotlib.testing.decorators.**image_comparison**(*baseline_images*, *extensions=None*, *tol=0*, *freetype_version=None*, *remove_text=False*, *savefig_kwarg=None*, *style='classic'*, *'_classic_test_patch'*)

Compare images generated by the test with those specified in *baseline_images*, which must correspond, else an `ImageComparisonFailure` exception will be raised.

Parameters

baseline_images

[list or None] A list of strings specifying the names of the images generated by calls to *Figure.savefig*.

If *None*, the test function must use the `baseline_images` fixture, either as a parameter or with `pytest.mark.usefixtures`. This value is only allowed when using pytest.

extensions

[None or list of str] The list of extensions to test, e.g. `['png', 'pdf']`.

If *None*, defaults to all supported extensions: png, pdf, and svg.

When testing a single extension, it can be directly included in the names passed to *baseline_images*. In that case, *extensions* must not be set.

In order to keep the size of the test suite from ballooning, we only include the `svg` or `pdf` outputs if the test is explicitly exercising a feature dependent on that backend (see also the *check_figures_equal* decorator for that purpose).

tol

[float, default: 0] The RMS threshold above which the test is considered failed.

Due to expected small differences in floating-point calculations, on 32-bit systems an additional 0.06 is added to this threshold.

freetype_version

[str or tuple] The expected freetype version or range of versions for this test to pass.

remove_text

[bool] Remove the title and tick text from the figure before comparison. This is useful to make the baseline images independent of variations in text rendering between different versions of FreeType.

This does not remove other, more deliberate, text, such as legends and annotations.

savefig_kwarg

[dict] Optional arguments that are passed to the savefig method.

style

[str, dict, or list] The optional style(s) to apply to the image test. The test itself can also apply additional styles if desired. Defaults to `["classic", "_classic_test_patch"]`.

matplotlib.testing.decorators.**remove_ticks_and_titles**(*figure*)

18.49.4 matplotlib.testing.exceptions

exception matplotlib.testing.exceptions.**ImageComparisonFailure**

Bases: AssertionError

Raise this exception to mark a test as a comparison between two images.

18.50 matplotlib.text

Classes for including text in a figure.

class matplotlib.text.**Annotation**(*text*, *xy*, *xytext=None*, *xycoords='data'*, *textcoords=None*, *arrowprops=None*, *annotation_clip=None*, ***kwargs*)

Bases: *matplotlib.text.Text*, matplotlib.text._AnnotationBase

An *Annotation* is a *Text* that can refer to a specific position *xy*. Optionally an arrow pointing from the text to *xy* can be drawn.

Attributes

xy

The annotated position.

xycoords

The coordinate system for *xy*.

arrow_patch

A *FancyArrowPatch* to point from *xytext* to *xy*.

Annotate the point *xy* with text *text*.

In the simplest form, the text is placed at *xy*.

Optionally, the text can be displayed in another position *xytext*. An arrow pointing from the text to the annotated point *xy* can then be added by defining *arrowprops*.

Parameters

text

[str] The text of the annotation. *s* is a deprecated synonym for this parameter.

xy

[(float, float)] The point *(x, y)* to annotate. The coordinate system is determined by *xycoords*.

xytext

[(float, float), default: *xy*] The position *(x, y)* to place the text at. The coordinate system is determined by *textcoords*.

xycoords

[str or *Artist* or *Transform* or callable or (float, float), default: 'data'] The coordinate system that *xy* is given in. The following types of values are supported:

- One of the following strings:

Value	Description
'figure points'	Points from the lower left of the figure
'figure pixels'	Pixels from the lower left of the figure
'figure fraction'	Fraction of figure from lower left
'axes points'	Points from lower left corner of axes
'axes pixels'	Pixels from lower left corner of axes
'axes fraction'	Fraction of axes from lower left
'data'	Use the coordinate system of the object being annotated (default)
'polar'	*(theta, r)* if not native 'data' coordinates

- An *Artist*: *xy* is interpreted as a fraction of the artist's *Bbox*. E.g. *(0, 0)* would be the lower left corner of the bounding box and *(0.5, 1)* would be the center top of the bounding box.
- A *Transform* to transform *xy* to screen coordinates.
- A function with one of the following signatures:

```
def transform(renderer) -> Bbox
def transform(renderer) -> Transform
```

  where *renderer* is a *RendererBase* subclass.

  The result of the function is interpreted like the *Artist* and *Transform* cases above.

- A tuple *(xcoords, ycoords)* specifying separate coordinate systems for *x* and *y*. *xcoords* and *ycoords* must each be of one of the above described types.

See *Advanced Annotations* for more details.

textcoords

[str or *Artist* or *Transform* or callable or (float, float), default: value of *xycoords*] The coordinate system that *xytext* is given in.

All *xycoords* values are valid as well as the following strings:

Value	Description
'offset points'	Offset (in points) from the *xy* value
'offset pixels'	Offset (in pixels) from the *xy* value

arrowprops

[dict, optional] The properties used to draw a *FancyArrowPatch* arrow between the positions *xy* and *xytext*.

If *arrowprops* does not contain the key 'arrowstyle' the allowed keys are:

Key	Description
width	The width of the arrow in points
headwidth	The width of the base of the arrow head in points
headlength	The length of the arrow head in points
shrink	Fraction of total length to shrink from both ends
?	Any key to *matplotlib.patches.FancyArrowPatch*

If *arrowprops* contains the key 'arrowstyle' the above keys are forbidden. The allowed values of `'arrowstyle'` are:

Name	Attrs
`'-'`	None
`'->'`	head_length=0.4,head_width=0.2
`'-['`	widthB=1.0,lengthB=0.2,angleB=None
`'|-|'`	widthA=1.0,widthB=1.0
`'-|>'`	head_length=0.4,head_width=0.2
`'<-'`	head_length=0.4,head_width=0.2
`'<->'`	head_length=0.4,head_width=0.2
`'<|-'`	head_length=0.4,head_width=0.2
`'<|-|>'`	head_length=0.4,head_width=0.2
`'fancy'`	head_length=0.4,head_width=0.4,tail_width=0.4
`'simple'`	head_length=0.5,head_width=0.5,tail_width=0.2
`'wedge'`	tail_width=0.3,shrink_factor=0.5

Valid keys for *FancyArrowPatch* are:

Key	Description
arrowstyle	the arrow style
connectionstyle	the connection style
relpos	default is (0.5, 0.5)
patchA	default is bounding box of the text
patchB	default is None
shrinkA	default is 2 points
shrinkB	default is 2 points
mutation_scale	default is text size (in points)
mutation_aspect	default is 1.
?	any key for *matplotlib.patches.PathPatch*

Defaults to None, i.e. no arrow is drawn.

annotation_clip

[bool or None, default: None] Whether to draw the annotation when the annotation point *xy* is outside the axes area.

- If *True*, the annotation will only be drawn when *xy* is within the axes.
- If *False*, the annotation will always be drawn.
- If *None*, the annotation will only be drawn when *xy* is within the axes and *xycoords* is 'data'.

****kwargs**

Additional kwargs are passed to *Text*.

Returns

Annotation

See also:

Advanced Annotations

`property anncoords`
The coordinate system to use for *Annotation.xyann*.

`contains`(*self*, *event*)
Return whether the mouse event occurred inside the axis-aligned bounding-box of the text.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`get_anncoords`(*self*)
Return the coordinate system to use for *Annotation.xyann*.

See also *xycoords* in *Annotation*.

`get_window_extent`(*self*, *renderer=None*)
Return the *Bbox* bounding the text and arrow, in display units.

Parameters

renderer

[Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling *get_window_extent* before the first *draw*. In practice, it is usually easier to trigger a draw first (e.g. by saving the figure).

`set_anncoords`(*self*, *coords*)
Set the coordinate system to use for *Annotation.xyann*.

See also *xycoords* in *Annotation*.

`set_figure`(*self*, *fig*)
Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

`update_positions`(*self*, *renderer*)
Update the pixel positions of the annotation text and the arrow patch.

`property xyann`
The text position.

See also *xytext* in *Annotation*.

`property xycoords`

`class matplotlib.text.OffsetFrom`(*artist*, *ref_coord*, *unit='points'*)
Bases: `object`

Callable helper class for working with *Annotation*.

Parameters

artist

[*Artist* or *BboxBase* or *Transform*] The object to compute the offset from.

ref_coord

[(float, float)] If *artist* is an *Artist* or *BboxBase*, this values is the location to of the offset origin in fractions of the *artist* bounding box.

If *artist* is a transform, the offset origin is the transform applied to this value.

unit

[{'points, 'pixels'}, default: 'points'] The screen units to use (pixels or points) for the offset input.

`get_unit`(*self*)
Return the unit for input to the transform used by `__call__`.

`set_unit`(*self*, *unit*)
Set the unit for input to the transform used by `__call__`.

Parameters

unit

[{'points', 'pixels'}]

`class matplotlib.text.Text`(*x=0*, *y=0*, *text=''*, *color=None*, *verticalalignment='baseline'*, *horizontalalignment='left'*, *multialignment=None*, *fontproperties=None*, *rotation=None*, *linespacing=None*, *rotation_mode=None*, *usetex=None*, *wrap=False*, ***kwargs*)

Bases: *matplotlib.artist.Artist*

Handle storing and drawing of text in window or data coordinates.

Create a *Text* instance at *x*, *y* with string *text*.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array an
alpha	float or None
animated	bool
backgroundcolor	color
bbox	dict with properties for *patches.FancyBboxPatch*
clip_box	*Bbox*

Tabl

Property	Description
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
figure	*Figure*
fontfamily or family	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', '
fontproperties or font or font_properties	*font_manager.FontProperties* or `str` or `pathlib.Path`
fontsize or size	float or {'xx-small', 'x-small', 'small', 'medium', 'large',
fontstretch or stretch	{a numeric value in range 0-1000, 'ultra-condensed',
fontstyle or style	{'normal', 'italic', 'oblique'}
fontvariant or variant	{'normal', 'small-caps'}
fontweight or weight	{a numeric value in range 0-1000, 'ultralight', 'light',
gid	str
horizontalalignment or ha	{'center', 'right', 'left'}
in_layout	bool
label	object
linespacing	float (multiple of font size)
multialignment or ma	{'left', 'right', 'center'}
path_effects	*AbstractPathEffect*
picker	None or bool or callable
position	(float, float)
rasterized	bool or None
rotation	float or {'vertical', 'horizontal'}
rotation_mode	{None, 'default', 'anchor'}
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
text	object
transform	*Transform*
url	str
usetex	bool or None
verticalalignment or va	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
visible	bool
wrap	bool
x	float
y	float
zorder	float

`contains`(*self*, *mouseevent*)
: Return whether the mouse event occurred inside the axis-aligned bounding-box of the text.

`draw`(*self*, *renderer*)
: Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`get_bbox_patch`(*self*)
Return the bbox Patch, or None if the *patches.FancyBboxPatch* is not made.

`get_c`(*self*)
Alias for *get_color*.

`get_color`(*self*)
Return the color of the text.

`get_family`(*self*)
Alias for *get_fontfamily*.

`get_font`(*self*)
Alias for *get_fontproperties*.

`get_font_properties`(*self*)
Alias for *get_fontproperties*.

`get_fontfamily`(*self*)
Return the list of font families used for font lookup.

See also:

font_manager.FontProperties.get_family

`get_fontname`(*self*)
Return the font name as a string.

See also:

font_manager.FontProperties.get_name

`get_fontproperties`(*self*)
Return the *font_manager.FontProperties*.

`get_fontsize`(*self*)
Return the font size as an integer.

See also:

font_manager.FontProperties.get_size_in_points

get_fontstyle(*self*)
Return the font style as a string.

See also:

font_manager.FontProperties.get_style

get_fontvariant(*self*)
Return the font variant as a string.

See also:

font_manager.FontProperties.get_variant

get_fontweight(*self*)
Return the font weight as a string or a number.

See also:

font_manager.FontProperties.get_weight

get_ha(*self*)
Alias for *get_horizontalalignment*.

get_horizontalalignment(*self*)
Return the horizontal alignment as a string. Will be one of 'left', 'center' or 'right'.

get_name(*self*)
Alias for *get_fontname*.

get_position(*self*)
Return the (x, y) position of the text.

get_prop_tup(*self*, *renderer=None*)
Return a hashable tuple of properties.

Not intended to be human readable, but useful for backends who want to cache derived information about text (e.g., layouts) and need to know if the text has changed.

get_rotation(*self*)
Return the text angle in degrees between 0 and 360.

get_rotation_mode(*self*)
Return the text rotation mode.

get_size(*self*)
Alias for *get_fontsize*.

get_stretch(*self*)
Return the font stretch as a string or a number.

See also:

font_manager.FontProperties.get_stretch

get_style(*self*)
Alias for *get_fontstyle*.

get_text(*self*)
Return the text string.

get_unitless_position(*self*)
Return the (x, y) unitless position of the text.

get_usetex(*self*)
Return whether this *Text* object uses TeX for rendering.

get_va(*self*)
Alias for *get_verticalalignment*.

get_variant(*self*)
Alias for *get_fontvariant*.

get_verticalalignment(*self*)
Return the vertical alignment as a string. Will be one of 'top', 'center', 'bottom' or 'baseline'.

get_weight(*self*)
Alias for *get_fontweight*.

get_window_extent(*self*, *renderer=None*, *dpi=None*)
Return the *Bbox* bounding the text, in display units.

In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

Parameters

renderer

[Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling *get_window_extent* before the first *draw*. In practice, it is usually easier to trigger a draw first (e.g. by saving the figure).

dpi

[float, optional] The dpi value for computing the bbox, defaults to `self.figure.dpi` (*not* the renderer dpi); should be set e.g. if to match regions with a figure saved with a custom dpi value.

`get_wrap`(*self*)
Return whether the text can be wrapped.

`set_backgroundcolor`(*self*, *color*)
Set the background color of the text by updating the bbox.

Parameters

color

[color]

See also:

set_bbox

To change the position of the bounding box

`set_bbox`(*self*, *rectprops*)
Draw a bounding box around self.

Parameters

rectprops

[dict with properties for *patches.FancyBboxPatch*] The default boxstyle is 'square'. The mutation scale of the *patches.FancyBboxPatch* is set to the fontsize.

Examples

```
t.set_bbox(dict(facecolor='red', alpha=0.5))
```

`set_c`(*self*, *color*)
Alias for *set_color*.

`set_clip_box`(*self*, *clipbox*)
Set the artist's clip *Bbox*.

Parameters

clipbox

[*Bbox*]

`set_clip_on`(*self*, *b*)
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*self*, *path*, *transform=None*)
Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_color(*self*, *color*)
Set the foreground color of the text

Parameters

color

[color]

set_family(*self*, *fontname*)
Alias for *set_fontfamily*.

set_font(*self*, *fp*)
Alias for *set_fontproperties*.

set_font_properties(*self*, *fp*)
Alias for *set_fontproperties*.

set_fontfamily(*self*, *fontname*)
Set the font family. May be either a single string, or a list of strings in decreasing priority. Each string may be either a real font name or a generic font class name. If the latter, the specific font names will be looked up in the corresponding rcParams.

If a *Text* instance is constructed with `fontfamily=None`, then the font is set to `rcParams["font.family"]` (default: `['sans-serif']`), and the same is done when *set_fontfamily()* is called on an existing *Text* instance.

Parameters

fontname

[{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}]

See also:

font_manager.FontProperties.set_family

`set_fontname`(*self*, *fontname*)
Alias for *set_family*.

One-way alias only: the getter differs.

Parameters

fontname

[{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}]

See also:

font_manager.FontProperties.set_family

`set_fontproperties`(*self*, *fp*)
Set the font properties that control the text.

Parameters

fp

[*font_manager.FontProperties* or `str` or `pathlib.Path`] If a `str`, it is interpreted as a fontconfig pattern parsed by *FontProperties*. If a `pathlib.Path`, it is interpreted as the absolute path to a font file.

`set_fontsize`(*self*, *fontsize*)
Set the font size.

Parameters

fontsize

[float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] If float, the fontsize in points. The string values denote sizes relative to the default font size.

See also:

font_manager.FontProperties.set_size

`set_fontstretch`(*self*, *stretch*)
Set the font stretch (horizontal condensation or expansion).

Parameters

stretch

[{a numeric value in range 0-1000, 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded', 'ultra-expanded'}]

See also:

font_manager.FontProperties.set_stretch

`set_fontstyle`(*self*, *fontstyle*)
Set the font style.

Parameters

fontstyle

[{'normal', 'italic', 'oblique'}]

See also:

font_manager.FontProperties.set_style

`set_fontvariant`(*self*, *variant*)
Set the font variant.

Parameters

variant

[{'normal', 'small-caps'}]

See also:

font_manager.FontProperties.set_variant

`set_fontweight`(*self*, *weight*)
Set the font weight.

Parameters

weight

[{a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'}]

See also:

font_manager.FontProperties.set_weight

`set_ha`(*self*, *align*)
Alias for *set_horizontalalignment*.

`set_horizontalalignment`(*self*, *align*)
Set the horizontal alignment to one of

Parameters

align

[{'center', 'right', 'left'}]

`set_linespacing`(*self*, *spacing*)
Set the line spacing as a multiple of the font size.

The default line spacing is 1.2.

Parameters

spacing

[float (multiple of font size)]

`set_ma`(*self*, *align*)
Alias for *set_multialignment*.

`set_multialignment`(*self*, *align*)
Set the text alignment for multiline texts.

The layout of the bounding box of all the lines is determined by the horizontalalignment and verticalalignment properties. This property controls the alignment of the text lines within that box.

Parameters

align

[{'left', 'right', 'center'}]

`set_name`(*self*, *fontname*)
Alias for *set_fontname*.

set_position(*self*, *xy*)
Set the (*x*, *y*) position of the text.

Parameters

xy

[(float, float)]

set_rotation(*self*, *s*)
Set the rotation of the text.

Parameters

s

[float or {'vertical', 'horizontal'}] The rotation angle in degrees in mathematically positive direction (counterclockwise). 'horizontal' equals 0, 'vertical' equals 90.

set_rotation_mode(*self*, *m*)
Set text rotation mode.

Parameters

m

[{None, 'default', 'anchor'}] If `None` or `"default"`, the text will be first rotated, then aligned according to their horizontal and vertical alignments. If `"anchor"`, then alignment occurs before rotation.

set_size(*self*, *fontsize*)
Alias for *set_fontsize*.

set_stretch(*self*, *stretch*)
Alias for *set_fontstretch*.

set_style(*self*, *fontstyle*)
Alias for *set_fontstyle*.

set_text(*self*, *s*)
Set the text string *s*.

It may contain newlines (`\n`) or math in LaTeX syntax.

Parameters

s

[object] Any object gets converted to its `str` representation, except for `None` which is converted to an empty string.

set_usetex(*self*, *usetex*)

Parameters

usetex

[bool or None] Whether to render using TeX, `None` means to use `rcParams["text.usetex"]` (default: `False`).

`set_va`(*self*, *align*)
Alias for *set_verticalalignment*.

`set_variant`(*self*, *variant*)
Alias for *set_fontvariant*.

`set_verticalalignment`(*self*, *align*)
Set the vertical alignment.

Parameters

align

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}]

`set_weight`(*self*, *weight*)
Alias for *set_fontweight*.

`set_wrap`(*self*, *wrap*)
Set whether the text can be wrapped.

Parameters

wrap

[bool]

`set_x`(*self*, *x*)
Set the *x* position of the text.

Parameters

x

[float]

`set_y`(*self*, *y*)
Set the *y* position of the text.

Parameters

y

[float]

`update`(*self*, *kwargs*)
Update this artist's properties from the dict *props*.

Parameters

props

[dict]

`update_bbox_position_size`(*self*, *renderer*)
Update the location and the size of the bbox.

This method should be used when the position and size of the bbox needs to be updated before actually drawing the bbox.

`update_from`(*self*, *other*)
Copy properties from *other* to *self*.

`zorder = 3`

`matplotlib.text.get_rotation`(*rotation*)
Return *rotation* normalized to an angle between 0 and 360 degrees.

Parameters

rotation

[float or {None, 'horizontal', 'vertical'}] Rotation angle in degrees. *None* and 'horizontal' equal 0, 'vertical' equals 90.

Returns

float

18.51 matplotlib.texmanager

Support for embedded TeX expressions in Matplotlib via dvipng and dvips for the raster and PostScript backends. The tex and dvipng/dvips information is cached in ~/.matplotlib/tex.cache for reuse between sessions.

Requirements:

- latex
- *Agg backends: dvipng>=1.6
- PS backend: psfrag, dvips, and Ghostscript>=8.60

Backends:

- *Agg
- PS
- PDF

For raster output, you can get RGBA numpy arrays from TeX expressions as follows:

```
texmanager = TexManager()
s = ('\TeX\ is Number '
     '$\displaystyle\sum_{n=1}^\infty\frac{-e^{i\pi}}{2^n}$!')
Z = texmanager.get_rgba(s, fontsize=12, dpi=80, rgb=(1, 0, 0))
```

To enable tex rendering of all text in your matplotlib figure, set `rcParams["text.usetex"]` (default: `False`) to True.

class matplotlib.texmanager.**TexManager**

Bases: `object`

Convert strings to dvi files using TeX, caching the results to a directory.

Repeated calls to this constructor always return the same instance.

property cachedir

property cursive

font_families = ('serif', 'sans-serif', 'cursive', 'monospace')

font_family = 'serif'

font_info = {'avant garde': ('pag', '\\usepackage{avant}'), 'bookman': ('pbk', '\\renewco

get_basefile(*self*, *tex*, *fontsize*, *dpi=None*)
Return a filename based on a hash of the string, fontsize, and dpi.

get_custom_preamble(*self*)
Return a string containing user additions to the tex preamble.

get_font_config(*self*)

get_font_preamble(*self*)
Return a string containing font configuration for the tex preamble.

get_grey(*self*, *tex*, *fontsize=None*, *dpi=None*)
Return the alpha channel.

get_rgba(*self*, *tex*, *fontsize=None*, *dpi=None*, *rgb=0, 0, 0*)
Return latex's rendering of the tex string as an rgba array.

get_text_width_height_descent(*self*, *tex*, *fontsize*, *renderer=None*)
Return width, height and descent of the text.

grey_arrayd = {('$+1$', 'sans-serifcmrcmsspzccmttd41d8cd98f00b204e9800998ecf8427e', 20.0,

make_dvi(*self*, *tex*, *fontsize*)
Generate a dvi file containing latex's layout of tex string.

Return the file name.

make_dvi_preview(*self*, *tex*, *fontsize*)
[*Deprecated*] Generate a dvi file containing latex's layout of tex string.

It calls make_tex_preview() method and store the size information (width, height, descent) in a separate file.

Return the file name.

Notes

Deprecated since version 3.3.

`make_png`(*self*, *tex*, *fontsize*, *dpi*)
Generate a png file containing latex's rendering of tex string.

Return the file name.

`make_tex`(*self*, *tex*, *fontsize*)
Generate a tex file to render the tex string at a specific font size.

Return the file name.

`make_tex_preview`(*self*, *tex*, *fontsize*)
[*Deprecated*] Generate a tex file to render the tex string at a specific font size.

It uses the preview.sty to determine the dimension (width, height, descent) of the output.

Return the file name.

Notes

Deprecated since version 3.3.

`property monospace`

`property rgba_arrayd`

`property sans_serif`

`property serif`

`texcache = '/root/.cache/matplotlib/tex.cache'`

18.52 matplotlib.textpath

`class matplotlib.textpath.TextPath`(*xy*, *s*, *size=None*, *prop=None*, *_interpolation_steps=1*, *usetex=False*)
Bases: *matplotlib.path.Path*

Create a path from the text.

Create a path from the text. Note that it simply is a path, not an artist. You need to use the *PathPatch* (or other artists) to draw this path onto the canvas.

Parameters

xy

[tuple or array of two float values] Position of the text. For no offset, use `xy=(0, 0)`.

s

[str] The text to convert to a path.

size

[float, optional] Font size in points. Defaults to the size specified via the font properties *prop*.

prop

[*matplotlib.font_manager.FontProperties*, optional] Font property. If not provided, will use a default `FontProperties` with parameters from the *rcParams*.

_interpolation_steps

[int, optional] (Currently ignored)

usetex

[bool, default: False] Whether to use tex rendering.

Examples

The following creates a path from the string "ABC" with Helvetica font face; and another path from the latex fraction 1/2:

```
from matplotlib.textpath import TextPath
from matplotlib.font_manager import FontProperties

fp = FontProperties(family="Helvetica", style="italic")
path1 = TextPath((12, 12), "ABC", size=12, prop=fp)
path2 = TextPath((0, 0), r"$\frac{1}{2}$", size=12, usetex=True)
```

Also see /gallery/text_labels_and_annotations/demo_text_path.

`property codes`
Return the codes

`get_size`(*self*)
Get the text size.

`set_size`(*self*, *size*)
Set the text size.

`property vertices`
Return the cached path after updating it if necessary.

class matplotlib.textpath.TextToPath

Bases: object

A class that converts strings to paths.

DPI = 72

FONT_SCALE = 100.0

get_glyphs_mathtext(*self*, *prop*, *s*, *glyph_map=None*, *return_new_glyphs_only=False*)

Parse mathtext string *s* and convert it to a (vertices, codes) pair.

get_glyphs_tex(*self*, *prop*, *s*, *glyph_map=None*, *return_new_glyphs_only=False*)

Convert the string *s* to vertices and codes using usetex mode.

get_glyphs_with_font(*self*, *font*, *s*, *glyph_map=None*, *return_new_glyphs_only=False*)

Convert string *s* to vertices and codes using the provided ttf font.

get_texmanager(*self*)

Return the cached *TexManager* instance.

get_text_path(*self*, *prop*, *s*, *ismath=False*)

Convert text *s* to path (a tuple of vertices and codes for matplotlib.path.Path).

Parameters

prop

[*FontProperties*] The font properties for the text.

s

[str] The text to be converted.

ismath

[{False, True, "TeX"}] If True, use mathtext parser. If "TeX", use tex for rendering.

Returns

verts

[list] A list of numpy arrays containing the x and y coordinates of the vertices.

codes

[list] A list of path codes.

Examples

Create a list of vertices and codes from a text, and create a *Path* from those:

```
from matplotlib.path import Path
from matplotlib.textpath import TextToPath
from matplotlib.font_manager import FontProperties

fp = FontProperties(family="Humor Sans", style="italic")
verts, codes = TextToPath().get_text_path(fp, "ABC")
path = Path(verts, codes, closed=False)
```

Also see *TextPath* for a more direct way to create a path from a text.

get_text_width_height_descent(*self*, *s*, *prop*, *ismath*)

18.53 matplotlib.ticker

18.53.1 Tick locating and formatting

This module contains classes for configuring tick locating and formatting. Generic tick locators and formatters are provided, as well as domain specific custom ones.

Although the locators know nothing about major or minor ticks, they are used by the Axis class to support major and minor tick locating and formatting.

Tick locating

The Locator class is the base class for all tick locators. The locators handle autoscaling of the view limits based on the data limits, and the choosing of tick locations. A useful semi-automatic tick locator is *MultipleLocator*. It is initialized with a base, e.g., 10, and it picks axis limits and ticks that are multiples of that base.

The Locator subclasses defined here are

AutoLocator

MaxNLocator with simple defaults. This is the default tick locator for most plotting.

MaxNLocator

Finds up to a max number of intervals with ticks at nice locations.

LinearLocator

Space ticks evenly from min to max.

LogLocator

Space ticks logarithmically from min to max.

MultipleLocator

Ticks and range are a multiple of base; either integer or float.

FixedLocator

Tick locations are fixed.

IndexLocator

Locator for index plots (e.g., where `x = range(len(y))`).

NullLocator

No ticks.

SymmetricalLogLocator

Locator for use with with the symlog norm; works like *LogLocator* for the part outside of the threshold and adds 0 if inside the limits.

LogitLocator

Locator for logit scaling.

OldAutoLocator

Choose a *MultipleLocator* and dynamically reassign it for intelligent ticking during navigation.

AutoMinorLocator

Locator for minor ticks when the axis is linear and the major ticks are uniformly spaced. Subdivides the major tick interval into a specified number of minor intervals, defaulting to 4 or 5 depending on the major interval.

There are a number of locators specialized for date locations - see the *dates* module.

You can define your own locator by deriving from Locator. You must override the `__call__` method, which returns a sequence of locations, and you will probably want to override the autoscale method to set the view limits from the data limits.

If you want to override the default locator, use one of the above or a custom locator and pass it to the x or y axis instance. The relevant methods are:

```
ax.xaxis.set_major_locator(xmajor_locator)
ax.xaxis.set_minor_locator(xminor_locator)
ax.yaxis.set_major_locator(ymajor_locator)
ax.yaxis.set_minor_locator(yminor_locator)
```

The default minor locator is *NullLocator*, i.e., no minor ticks on by default.

Tick formatting

Tick formatting is controlled by classes derived from Formatter. The formatter operates on a single tick value and returns a string to the axis.

NullFormatter

No labels on the ticks.

IndexFormatter

Set the strings from a list of labels.

FixedFormatter

Set the strings manually for the labels.

FuncFormatter

User defined function sets the labels.

StrMethodFormatter

Use string `format` method.

FormatStrFormatter

Use an old-style sprintf format string.

ScalarFormatter

Default formatter for scalars: autopick the format string.

LogFormatter

Formatter for log axes.

LogFormatterExponent

Format values for log axis using `exponent = log_base(value)`.

LogFormatterMathtext

Format values for log axis using `exponent = log_base(value)` using Math text.

LogFormatterSciNotation

Format values for log axis using scientific notation.

LogitFormatter

Probability formatter.

EngFormatter

Format labels in engineering notation.

PercentFormatter

Format labels as a percentage.

You can derive your own formatter from the Formatter base class by simply overriding the `__call__` method. The formatter class has access to the axis view and data limits.

To control the major and minor tick label formats, use one of the following methods:

```
ax.xaxis.set_major_formatter(xmajor_formatter)
ax.xaxis.set_minor_formatter(xminor_formatter)
ax.yaxis.set_major_formatter(ymajor_formatter)
ax.yaxis.set_minor_formatter(yminor_formatter)
```

In addition to a *Formatter* instance, *set_major_formatter* and *set_minor_formatter* also accept a `str` or function. `str` input will be internally replaced with an autogenerated *StrMethodFormatter* with the input `str`. For function input, a *FuncFormatter* with the input function will be generated and used.

See /gallery/ticks_and_spines/major_minor_demo for an example of setting major and minor ticks. See the *matplotlib.dates* module for more information and examples of using date locators and formatters.

class matplotlib.ticker.**AutoLocator**

Bases: *matplotlib.ticker.MaxNLocator*

Dynamically find major tick positions. This is actually a subclass of *MaxNLocator*, with parameters *nbins* = '*auto*' and *steps* = *[1, 2, 2.5, 5, 10]*.

To know the values of the non-public parameters, please have a look to the defaults of *MaxNLocator*.

class matplotlib.ticker.**AutoMinorLocator**(*n=None*)

Bases: *matplotlib.ticker.Locator*

Dynamically find minor tick positions based on the positions of major ticks. The scale must be linear with major ticks evenly spaced.

n is the number of subdivisions of the interval between major ticks; e.g., n=2 will place a single minor tick midway between major ticks.

If *n* is omitted or None, it will be set to 5 or 4.

tick_values(*self*, *vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

class matplotlib.ticker.**EngFormatter**(*unit=''*, *places=None*, *sep=' '*, ***, *usetex=None*, *useMathText=None*)

Bases: *matplotlib.ticker.Formatter*

Format axis values using engineering prefixes to represent powers of 1000, plus a specified unit, e.g., 10 MHz instead of 1e7.

Parameters

unit

[str, default: ""] Unit symbol to use, suitable for use with single-letter representations of powers of 1000. For example, 'Hz' or 'm'.

places

[int, default: None] Precision with which to display the number, specified in digits after the decimal point (there will be between one and three digits before the decimal point). If it is None, the formatting falls back to the floating point format '%g', which displays up to 6 *significant* digits, i.e. the equivalent value for *places* varies between 0 and 5 (inclusive).

sep

[str, default: " "] Separator used between the value and the prefix/unit. For example, one get '3.14 mV' if `sep` is " " (default) and '3.14mV' if `sep` is "". Besides the default behavior, some other useful options may be:

- `sep=""` to append directly the prefix/unit to the value;
- `sep="\N{THIN SPACE}"` (`U+2009`);
- `sep="\N{NARROW NO-BREAK SPACE}"` (`U+202F`);
- `sep="\N{NO-BREAK SPACE}"` (`U+00A0`).

usetex

[bool, default: `rcParams["text.usetex"]` (default: `False`)] To enable/disable the use of TeX's math mode for rendering the numbers in the formatter.

useMathText

[bool, default: `rcParams["axes.formatter.use_mathtext"]` (default: `False`)] To enable/disable the use mathtext for rendering the numbers in the formatter.

`ENG_PREFIXES = {-24: 'y', -21: 'z', -18: 'a', -15: 'f', -12: 'p', -9: 'n', -6: 'µ', -3:`

`format_eng`(*self*, *num*)

Format a number in engineering notation, appending a letter representing the power of 1000 of the original number. Some examples:

```
>>> format_eng(0)       # for self.places = 0
'0'
```

```
>>> format_eng(1000000) # for self.places = 1
'1.0 M'
```

```
>>> format_eng("-1e-6") # for self.places = 2
'-1.00 µ'
```

get_useMathText(*self*)

get_usetex(*self*)

set_useMathText(*self*, *val*)

set_usetex(*self*, *val*)

property useMathText

property usetex

class matplotlib.ticker.**FixedFormatter**(*seq*)

Bases: *matplotlib.ticker.Formatter*

Return fixed strings for tick labels based only on position, not value.

Note: *FixedFormatter* should only be used together with *FixedLocator*. Otherwise, the labels may end up in unexpected positions.

Set the sequence *seq* of strings that will be used for labels.

get_offset(*self*)

set_offset_string(*self*, *ofs*)

class matplotlib.ticker.**FixedLocator**(*locs*, *nbins=None*)

Bases: *matplotlib.ticker.Locator*

Tick locations are fixed. If nbins is not None, the array of possible positions will be subsampled to keep the number of ticks <= nbins +1. The subsampling will be done so as to include the smallest absolute value; for example, if zero is included in the array of possibilities, then it is guaranteed to be one of the chosen ticks.

set_params(*self*, *nbins=None*)

Set parameters within this locator.

tick_values(*self*, *vmin*, *vmax*)

Return the locations of the ticks.

Note: Because the values are fixed, vmin and vmax are not used in this method.

---

class matplotlib.ticker.**FormatStrFormatter**(*fmt*)

Bases: *matplotlib.ticker.Formatter*

Use an old-style ('%' operator) format string to format the tick.

The format string should have a single variable format (%) in it. It will be applied to the value (not the position) of the tick.

class matplotlib.ticker.**Formatter**

Bases: *matplotlib.ticker.TickHelper*

Create a string based on a tick value and location.

static fix_minus(*s*)

Some classes may want to replace a hyphen for minus with the proper unicode symbol (U+2212) for typographical correctness. This is a helper method to perform such a replacement when it is enabled via `rcParams["axes.unicode_minus"]` (default: `True`).

format_data(*self*, *value*)

Return the full string representation of the value with the position unspecified.

format_data_short(*self*, *value*)

Return a short string version of the tick value.

Defaults to the position-independent long value.

format_ticks(*self*, *values*)

Return the tick labels for all the ticks at once.

get_offset(*self*)

locs = []

set_locs(*self*, *locs*)

Set the locations of the ticks.

This method is called before computing the tick labels because some formatters need to know all tick locations to do so.

class matplotlib.ticker.**FuncFormatter**(*func*)

Bases: *matplotlib.ticker.Formatter*

Use a user-defined function for formatting.

The function should take in two inputs (a tick value `x` and a position `pos`), and return a string containing the corresponding tick label.

get_offset(*self*)

set_offset_string(*self*, *ofs*)

class matplotlib.ticker.**IndexFormatter**(***kwargs*)

Bases: *matplotlib.ticker.Formatter*

[*Deprecated*] Format the position x to the nearest i-th label where `i = int(x + 0.5)`. Positions where `i < 0` or `i > len(list)` have no tick labels.

Parameters

labels

[list] List of labels.

Notes

Deprecated since version 3.3.

class matplotlib.ticker.**IndexLocator**(*base*, *offset*)

Bases: *matplotlib.ticker.Locator*

Place a tick on every multiple of some base number of points plotted, e.g., on every 5th point. It is assumed that you are doing index plotting; i.e., the axis is 0, len(data). This is mainly useful for x ticks.

Place ticks every *base* data point, starting at *offset*.

set_params(*self*, *base=None*, *offset=None*)

Set parameters within this locator

tick_values(*self*, *vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

class matplotlib.ticker.**LinearLocator**(*numticks=None*, *presets=None*)

Bases: *matplotlib.ticker.Locator*

Determine the tick locations

The first time this function is called it will try to set the number of ticks to make a nice tick partitioning. Thereafter the number of ticks will be fixed so that interactive navigation will be nice

Use presets to set locs based on lom. A dict mapping vmin, vmax->locs

property numticks

set_params(*self*, *numticks=None*, *presets=None*)

Set parameters within this locator.

tick_values(*self*, *vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

`view_limits`(*self*, *vmin*, *vmax*)
Try to choose the view limits intelligently.

`class matplotlib.ticker.Locator`
Bases: *matplotlib.ticker.TickHelper*

Determine the tick locations;

Note that the same locator should not be used across multiple *Axis* because the locator stores references to the Axis data and view limits.

`MAXTICKS = 1000`

`autoscale`(*self*)
[*Deprecated*] Autoscale the view limits.

Notes

Deprecated since version 3.2.

`nonsingular`(*self*, *v0*, *v1*)
Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with `(v0, v1)` set to the data limits on the axes if the axes contains any data, or `(-inf, +inf)` if not.

- If `v0 == v1` (possibly up to some floating point slop), this method returns an expanded interval around this value.
- If `(v0, v1) == (-inf, +inf)`, this method returns appropriate default view limits.
- Otherwise, `(v0, v1)` is returned without modification.

`pan`(*self*, *numsteps*)
[*Deprecated*] Pan numticks (can be positive or negative)

Notes

Deprecated since version 3.3.

`raise_if_exceeds`(*self*, *locs*)
Log at WARNING level if *locs* is longer than *Locator.MAXTICKS*.

This is intended to be called immediately before returning *locs* from `__call__` to inform users in case their Locator returns a huge number of ticks, causing Matplotlib to run out of memory.

The "strange" name of this method dates back to when it would raise an exception instead of emitting a log.

`refresh`(*self*)
[*Deprecated*] Refresh internal information based on current limits.

Notes

Deprecated since version 3.3.

`set_params`(*self*, ***kwargs*)
Do nothing, and raise a warning. Any locator class not supporting the set_params() function will call this.

`tick_values`(*self*, *vmin*, *vmax*)
Return the values of the located ticks given **vmin** and **vmax**.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

`view_limits`(*self*, *vmin*, *vmax*)
Select a scale for the range from vmin to vmax.

Subclasses should override this method to change locator behaviour.

`zoom`(*self*, *direction*)
[*Deprecated*] Zoom in/out on axis; if direction is >0 zoom in, else zoom out.

Notes

Deprecated since version 3.3.

class matplotlib.ticker.**LogFormatter**(*base=10.0*, *labelOnlyBase=False*, *minor_thresholds=None*, *linthresh=None*)

Bases: *matplotlib.ticker.Formatter*

Base class for formatting ticks on a log or symlog scale.

It may be instantiated directly, or subclassed.

Parameters

base

[float, default: 10.] Base of the logarithm used in all calculations.

labelOnlyBase

[bool, default: False] If True, label ticks only at integer powers of base. This is normally True for major ticks and False for minor ticks.

minor_thresholds

[(subset, all), default: (1, 0.4)] If labelOnlyBase is False, these two numbers control the labeling of ticks that are not at integer powers of base; normally these are the minor ticks. The controlling parameter is the log of the axis data range. In the typical case where base is 10 it is the number of decades spanned by the axis, so we can call it 'numdec'. If `numdec <= all`, all minor ticks will be labeled. If `all < numdec <= subset`, then only a subset of minor ticks will be labeled, so as to avoid crowding. If `numdec > subset` then no minor ticks will be labeled.

linthresh

[None or float, default: None] If a symmetric log scale is in use, its `linthresh` parameter must be supplied here.

Notes

The *set_locs* method must be called to enable the subsetting logic controlled by the `minor_thresholds` parameter.

In some cases such as the colorbar, there is no distinction between major and minor ticks; the tick locations might be set manually, or by a locator that puts ticks at integer powers of base and at intermediate locations. For this situation, disable the minor_thresholds logic by using `minor_thresholds=(np.inf, np.inf)`, so that all ticks will be labeled.

To disable labeling of minor ticks when 'labelOnlyBase' is False, use `minor_thresholds=(0, 0)`. This is the default for the "classic" style.

Examples

To label a subset of minor ticks when the view limits span up to 2 decades, and all of the ticks when zoomed in to 0.5 decades or less, use `minor_thresholds=(2, 0.5)`.

To label all minor ticks when the view limits span up to 1.5 decades, use `minor_thresholds=(1.5, 1.5)`.

`base`(*self*, *base*)
Change the *base* for labeling.

> **Warning:** Should always match the base used for *LogLocator*

`format_data`(*self*, *value*)
Return the full string representation of the value with the position unspecified.

`format_data_short`(*self*, *value*)
Return a short string version of the tick value.

Defaults to the position-independent long value.

`label_minor`(*self*, *labelOnlyBase*)
Switch minor tick labeling on or off.

Parameters

labelOnlyBase

[bool] If True, label ticks only at integer powers of base.

`set_locs`(*self*, *locs=None*)
Use axis view limits to control which ticks are labeled.

The *locs* parameter is ignored in the present algorithm.

`class matplotlib.ticker.LogFormatterExponent`(*base=10.0*, *labelOnlyBase=False*, *minor_thresholds=None*, *linthresh=None*)
Bases: *matplotlib.ticker.LogFormatter*

Format values for log axis using `exponent = log_base(value)`.

class matplotlib.ticker.**LogFormatterMathtext**(*base=10.0*, *labelOnlyBase=False*, *minor_thresholds=None*, *linthresh=None*)

Bases: *matplotlib.ticker.LogFormatter*

Format values for log axis using `exponent = log_base(value)`.

class matplotlib.ticker.**LogFormatterSciNotation**(*base=10.0*, *labelOnlyBase=False*, *minor_thresholds=None*, *linthresh=None*)

Bases: *matplotlib.ticker.LogFormatterMathtext*

Format values following scientific notation in a logarithmic axis.

class matplotlib.ticker.**LogLocator**(*base=10.0*, *subs=1.0*, *numdecs=4*, *numticks=None*)

Bases: *matplotlib.ticker.Locator*

Determine the tick locations for log axes

Place ticks on the locations : subs[j] * base**i

Parameters

subs

[None or str or sequence of float, default: (1.0,)] Gives the multiples of integer powers of the base at which to place ticks. The default places ticks only at integer powers of the base. The permitted string values are `'auto'` and `'all'`, both of which use an algorithm based on the axis view limits to determine whether and how to put ticks between integer powers of the base. With `'auto'`, ticks are placed only between integer powers; with `'all'`, the integer powers are included. A value of None is equivalent to `'auto'`.

base(*self*, *base*)

Set the log base (major tick every `base**i`, i integer).

nonsingular(*self*, *vmin*, *vmax*)

Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with `(v0, v1)` set to the data limits on the axes if the axes contains any data, or `(-inf, +inf)` if not.

- If `v0 == v1` (possibly up to some floating point slop), this method returns an expanded interval around this value.
- If `(v0, v1) == (-inf, +inf)`, this method returns appropriate default view limits.
- Otherwise, `(v0, v1)` is returned without modification.

`set_params`(*self*, *base=None*, *subs=None*, *numdecs=None*, *numticks=None*)
Set parameters within this locator.

`subs`(*self*, *subs*)
Set the minor ticks for the log scaling every `base**i*subs[j]`.

`tick_values`(*self*, *vmin*, *vmax*)
Return the values of the located ticks given **vmin** and **vmax**.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

`view_limits`(*self*, *vmin*, *vmax*)
Try to choose the view limits intelligently.

class matplotlib.ticker.**LogitFormatter**(*, *use_overline=False*, *one_half='\x0crac{1}{2}'*, *minor=False*, *minor_threshold=25*, *minor_number=6*)
Bases: *matplotlib.ticker.Formatter*

Probability formatter (using Math text).

Parameters

use_overline

[bool, default: False] If x > 1/2, with x = 1-v, indicate if x should be displayed as $overline{v}$. The default is to display $1-v$.

one_half

[str, default: r"frac{1}{2}"] The string used to represent 1/2.

minor

[bool, default: False] Indicate if the formatter is formatting minor ticks or not. Basically minor ticks are not labelled, except when only few ticks are provided, ticks with most space with neighbor ticks are labelled. See other parameters to change the default behavior.

minor_threshold

[int, default: 25] Maximum number of locs for labelling some minor ticks. This parameter have no effect if minor is False.

minor_number

[int, default: 6] Number of ticks which are labelled when the number of ticks is below the threshold.

`format_data_short`(*self*, *value*)
Return a short string version of the tick value.

Defaults to the position-independent long value.

`set_locs`(*self*, *locs*)
Set the locations of the ticks.

This method is called before computing the tick labels because some formatters need to know all tick locations to do so.

`set_minor_number`(*self*, *minor_number*)
Set the number of minor ticks to label when some minor ticks are labelled.

Parameters

minor_number

[int] Number of ticks which are labelled when the number of ticks is below the threshold.

`set_minor_threshold`(*self*, *minor_threshold*)
Set the threshold for labelling minors ticks.

Parameters

minor_threshold

[int] Maximum number of locations for labelling some minor ticks. This parameter have no effect if minor is False.

`set_one_half`(*self*, *one_half*)
Set the way one half is displayed.

one_half

[str, default: r"frac{1}{2}"] The string used to represent 1/2.

`use_overline`(*self*, *use_overline*)
Switch display mode with overline for labelling p>1/2.

Parameters

use_overline

[bool, default: False] If x > 1/2, with x = 1-v, indicate if x should be displayed as $overline{v}$. The default is to display $1-v$.

class matplotlib.ticker.LogitLocator(*minor=False*, ***, *nbins='auto'*)

Bases: *matplotlib.ticker.MaxNLocator*

Determine the tick locations for logit axes

Place ticks on the logit locations

Parameters

nbins

[int or 'auto', optional] Number of ticks. Only used if minor is False.

minor

[bool, default: False] Indicate if this locator is for minor ticks or not.

property minor

nonsingular(*self*, *vmin*, *vmax*)

Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with `(v0, v1)` set to the data limits on the axes if the axes contains any data, or `(-inf, +inf)` if not.

- If `v0 == v1` (possibly up to some floating point slop), this method returns an expanded interval around this value.
- If `(v0, v1) == (-inf, +inf)`, this method returns appropriate default view limits.
- Otherwise, `(v0, v1)` is returned without modification.

set_params(*self*, *minor=None*, ***kwargs*)

Set parameters within this locator.

tick_values(*self*, *vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

class matplotlib.ticker.MaxNLocator(**args*, ***kwargs*)

Bases: *matplotlib.ticker.Locator*

Find nice tick locations with no more than N being within the view limits. Locations beyond the limits are added to support autoscaling.

Parameters

nbins

[int or 'auto', default: 10] Maximum number of intervals; one less than max number of ticks. If the string 'auto', the number of bins will be automatically determined based on the length of the axis.

steps

[array-like, optional] Sequence of nice numbers starting with 1 and ending with 10; e.g., [1, 2, 4, 5, 10], where the values are acceptable tick multiples. i.e. for the example, 20, 40, 60 would be an acceptable set of ticks, as would 0.4, 0.6, 0.8, because they are multiples of 2. However, 30, 60, 90 would not be allowed because 3 does not appear in the list of steps.

integer

[bool, default: False] If True, ticks will take only integer values, provided at least *min_n_ticks* integers are found within the view limits.

symmetric

[bool, default: False] If True, autoscaling will result in a range symmetric about zero.

prune

[{'lower', 'upper', 'both', None}, default: None] Remove edge ticks -- useful for stacked or ganged plots where the upper tick of one axes overlaps with the lower tick of the axes above it, primarily when `rcParams["axes.autolimit_mode"]` (default: `'data'`) is `'round_numbers'`. If `prune=='lower'`, the smallest tick will be removed. If `prune == 'upper'`, the largest tick will be removed. If `prune == 'both'`, the largest and smallest ticks will be removed. If *prune* is *None*, no ticks will be removed.

min_n_ticks

[int, default: 2] Relax *nbins* and *integer* constraints if necessary to obtain this minimum number of ticks.

`default_params = {'integer': False, 'min_n_ticks': 2, 'nbins': 10, 'prune': None, 'steps`

`set_params`(*self*, ***kwargs*)

Set parameters for this locator.

Parameters

nbins

[int or 'auto', optional] see *MaxNLocator*

steps

[array-like, optional] see *MaxNLocator*

integer

[bool, optional] see *MaxNLocator*

symmetric

[bool, optional] see *MaxNLocator*

prune

[{'lower', 'upper', 'both', None}, optional] see *MaxNLocator*

min_n_ticks

[int, optional] see *MaxNLocator*

`tick_values`(*self*, *vmin*, *vmax*)
Return the values of the located ticks given **vmin** and **vmax**.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

`view_limits`(*self*, *dmin*, *dmax*)
Select a scale for the range from vmin to vmax.

Subclasses should override this method to change locator behaviour.

`class matplotlib.ticker.MultipleLocator`(*base=1.0*)
Bases: *matplotlib.ticker.Locator*

Set a tick on each integer multiple of a base within the view interval.

`set_params`(*self*, *base*)
Set parameters within this locator.

`tick_values`(*self*, *vmin*, *vmax*)
Return the values of the located ticks given **vmin** and **vmax**.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

`view_limits`(*self*, *dmin*, *dmax*)
Set the view limits to the nearest multiples of base that contain the data.

`class matplotlib.ticker.NullFormatter`
Bases: *matplotlib.ticker.Formatter*

Always return the empty string.

`class matplotlib.ticker.NullLocator`
Bases: *matplotlib.ticker.Locator*

No ticks

`tick_values`(*self*, *vmin*, *vmax*)
Return the locations of the ticks.

Note: Because the values are Null, vmin and vmax are not used in this method.

`class matplotlib.ticker.OldAutoLocator`(**args*, ***kwargs*)
Bases: *matplotlib.ticker.Locator*

[*Deprecated*] On autoscale this class picks the best MultipleLocator to set the view limits and the tick locs.

Notes

Deprecated since version 3.3.

`get_locator`(*self*, *d*)
Pick the best locator based on a distance *d*.

`tick_values`(*self*, *vmin*, *vmax*)
Return the values of the located ticks given **vmin** and **vmax**.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

`view_limits`(*self*, *vmin*, *vmax*)
Select a scale for the range from vmin to vmax.

Subclasses should override this method to change locator behaviour.

class matplotlib.ticker.**OldScalarFormatter**(**args*, ***kwargs*)

Bases: *matplotlib.ticker.Formatter*

[*Deprecated*] Tick location is a plain old number.

Notes

Deprecated since version 3.3.

class matplotlib.ticker.**PercentFormatter**(*xmax=100*, *decimals=None*, *symbol='%'*, *is_latex=False*)

Bases: *matplotlib.ticker.Formatter*

Format numbers as a percentage.

Parameters

xmax

[float] Determines how the number is converted into a percentage. *xmax* is the data value that corresponds to 100%. Percentages are computed as `x / xmax * 100`. So if the data is already scaled to be percentages, *xmax* will be 100. Another common situation is where *xmax* is 1.0.

decimals

[None or int] The number of decimal places to place after the point. If *None* (the default), the number will be computed automatically.

symbol

[str or None] A string that will be appended to the label. It may be *None* or empty to indicate that no symbol should be used. LaTeX special characters are escaped in *symbol* whenever latex mode is enabled, unless *is_latex* is *True*.

is_latex

[bool] If *False*, reserved LaTeX characters in *symbol* will be escaped.

convert_to_pct(*self*, *x*)

format_pct(*self*, *x*, *display_range*)

Format the number as a percentage number with the correct number of decimals and adds the percent symbol, if any.

If `self.decimals` is `None`, the number of digits after the decimal point is set based on the *display_range* of the axis as follows:

display_range	decimals	sample
>50	0	`x = 34.5` => 35%
>5	1	`x = 34.5` => 34.5%
>0.5	2	`x = 34.5` => 34.50%
...	...	...

This method will not be very good for tiny axis ranges or extremely large ones. It assumes that the values on the chart are percentages displayed on a reasonable scale.

`property symbol`

The configured percent symbol as a string.

If LaTeX is enabled via `rcParams["text.usetex"]` (default: `False`), the special characters `{'#', '$', '%', '&', '~', '_', '^', '\', '{', '}'}` are automatically escaped in the string.

`class matplotlib.ticker.ScalarFormatter(`*useOffset=None*, *useMathText=None*, *useLocale=None*`)`

Bases: *matplotlib.ticker.Formatter*

Format tick values as a number.

Parameters

useOffset

[bool or float, default: `rcParams["axes.formatter.useoffset"]` (default: `True`)] Whether to use offset notation. See *set_useOffset*.

useMathText

[bool, default: `rcParams["axes.formatter.use_mathtext"]` (default: `False`)] Whether to use fancy math formatting. See *set_useMathText*.

useLocale

[bool, default: `rcParams["axes.formatter.use_locale"]` (default: `False`).] Whether to use locale settings for decimal sign and positive sign. See *set_useLocale*.

Notes

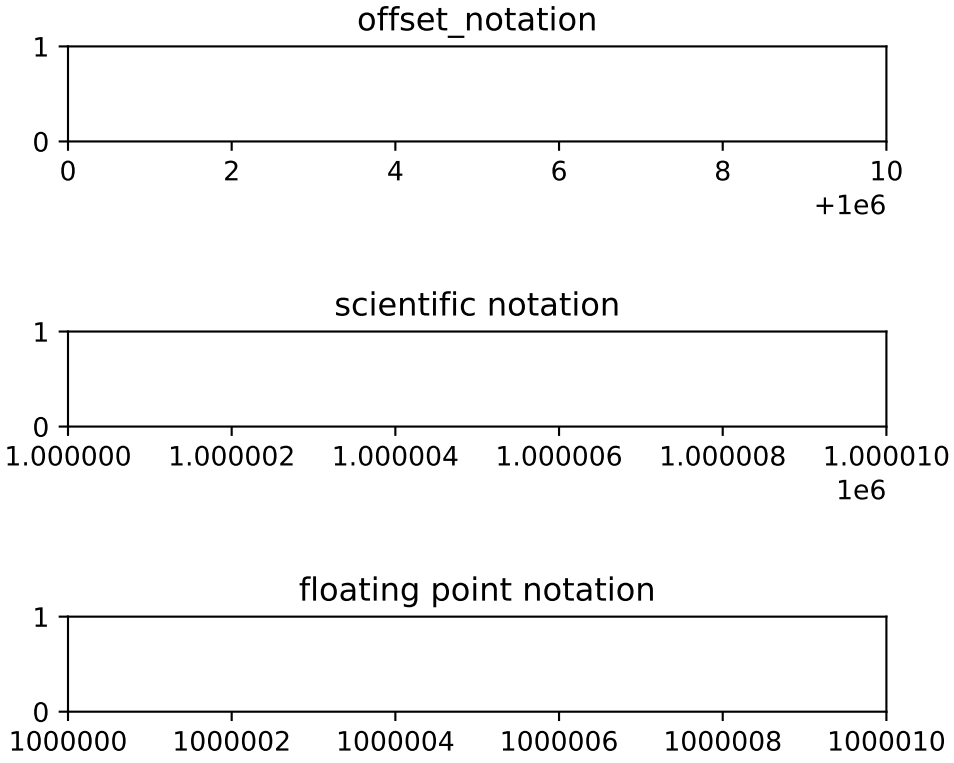
In addition to the parameters above, the formatting of scientific vs. floating point representation can be configured via *set_scientific* and *set_powerlimits*).

Offset notation and scientific notation

Offset notation and scientific notation look quite similar at first sight. Both split some information from the formatted tick values and display it at the end of the axis.

- The scientific notation splits up the order of magnitude, i.e. a multiplicative scaling factor, e.g. `1e6`.
- The offset notation separates an additive constant, e.g. `+1e6`. The offset notation label is always prefixed with a + or – sign and is thus distinguishable from the order of magnitude label.

The following plot with x limits `1_000_000` to `1_000_010` illustrates the different formatting. Note the labels at the right edge of the x axis.



`format_data`(*self*, *value*)
: Return the full string representation of the value with the position unspecified.

`format_data_short`(*self*, *value*)
: Return a short string version of the tick value.

  Defaults to the position-independent long value.

`get_offset`(*self*)
: Return scientific notation, plus offset.

`get_useLocale`(*self*)
: Return whether locale settings are used for formatting.

  See also:

ScalarFormatter.set_useLocale

`get_useMathText`(*self*)
Return whether to use fancy math formatting.

See also:

ScalarFormatter.set_useMathText

`get_useOffset`(*self*)
Return whether automatic mode for offset notation is active.

This returns True if `set_useOffset(True)`; it returns False if an explicit offset was set, e.g. `set_useOffset(1000)`.

See also:

ScalarFormatter.set_useOffset

`set_locs`(*self*, *locs*)
Set the locations of the ticks.

This method is called before computing the tick labels because some formatters need to know all tick locations to do so.

`set_powerlimits`(*self*, *lims*)
Set size thresholds for scientific notation.

Parameters

lims

[(int, int)] A tuple *(min_exp, max_exp)* containing the powers of 10 that determine the switchover threshold. For a number representable as $a \times 10^{\text{exp}}$ with $1 <= |a| < 10$, scientific notation will be used if `exp <= min_exp` or `exp >= max_exp`.

The default limits are controlled by `rcParams["axes.formatter.limits"]` (default: `[-5, 6]`).

In particular numbers with *exp* equal to the thresholds are written in scientific notation.

Typically, *min_exp* will be negative and *max_exp* will be positive.

For example, `formatter.set_powerlimits((-3, 4))` will provide the following formatting: $1 \times 10^{-3}, 9.9 \times 10^{-3}, 0.01, 9999, 1 \times 10^{4}$.

See also:

ScalarFormatter.set_scientific

`set_scientific`(*self*, *b*)
Turn scientific notation on or off.

See also:

ScalarFormatter.set_powerlimits

`set_useLocale`(*self*, *val*)
Set whether to use locale settings for decimal sign and positive sign.

Parameters

val

[bool or None] *None* resets to `rcParams["axes.formatter.use_locale"]` (default: `False`).

`set_useMathText`(*self*, *val*)
Set whether to use fancy math formatting.

If active, scientific notation is formatted as 1.2×10^3.

Parameters

val

[bool or None] *None* resets to `rcParams["axes.formatter.use_mathtext"]` (default: `False`).

`set_useOffset`(*self*, *val*)
Set whether to use offset notation.

When formatting a set numbers whose value is large compared to their range, the formatter can separate an additive constant. This can shorten the formatted numbers so that they are less likely to overlap when drawn on an axis.

Parameters

val

[bool or float]

- If False, do not use offset notation.
- If True (=automatic mode), use offset notation if it can make the residual numbers significantly shorter. The exact behavior is controlled by `rcParams["axes.formatter.offset_threshold"]` (default: `4`).
- If a number, force an offset of the given value.

Examples

With active offset notation, the values

`100_000, 100_002, 100_004, 100_006, 100_008`

will be formatted as `0, 2, 4, 6, 8` plus an offset `+1e5`, which is written to the edge of the axis.

property useLocale
Return whether locale settings are used for formatting.

See also:

ScalarFormatter.set_useLocale

property useMathText
Return whether to use fancy math formatting.

See also:

ScalarFormatter.set_useMathText

property useOffset
Return whether automatic mode for offset notation is active.

This returns True if `set_useOffset(True)`; it returns False if an explicit offset was set, e.g. `set_useOffset(1000)`.

See also:

ScalarFormatter.set_useOffset

class matplotlib.ticker.**StrMethodFormatter**(*fmt*)
Bases: *matplotlib.ticker.Formatter*

Use a new-style format string (as used by `str.format`) to format the tick.

The field used for the tick value must be labeled *x* and the field used for the tick position must be labeled *pos*.

class matplotlib.ticker.**SymmetricalLogLocator**(*transform=None*, *subs=None*, *linthresh=None*, *base=None*)
Bases: *matplotlib.ticker.Locator*

Determine the tick locations for symmetric log axes.

Parameters

transform

[*SymmetricalLogTransform*, optional] If set, defines the *base* and *linthresh* of the symlog transform.

base, linthresh

[float, optional] The *base* and *linthresh* of the symlog transform, as documented for *SymmetricalLogScale*. These parameters are only used if *transform* is not set.

subs

[sequence of float, default: [1]] The multiples of integer powers of the base where ticks are placed, i.e., ticks are placed at `[sub * base**i for i in ... for sub in subs]`.

Notes

Either *transform*, or both *base* and *linthresh*, must be given.

`set_params`(*self*, *subs=None*, *numticks=None*)
Set parameters within this locator.

`tick_values`(*self*, *vmin*, *vmax*)
Return the values of the located ticks given **vmin** and **vmax**.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

`view_limits`(*self*, *vmin*, *vmax*)
Try to choose the view limits intelligently.

`class matplotlib.ticker.TickHelper`
Bases: `object`

`axis = None`

`create_dummy_axis`(*self*, ***kwargs*)

`set_axis`(*self*, *axis*)

`set_bounds`(*self*, *vmin*, *vmax*)

`set_data_interval`(*self*, *vmin*, *vmax*)

`set_view_interval`(*self*, *vmin*, *vmax*)

18.54 matplotlib.tight_layout

Routines to adjust subplot params so that subplots are nicely fit in the figure. In doing so, only axis labels, tick labels, axes titles and offsetboxes that are anchored to axes are currently considered.

Internally, this module assumes that the margins (left_margin, etc.) which are differences between ax.get_tightbbox and ax.bbox are independent of axes position. This may fail if Axes.adjustable is datalim. Also, This will fail for some cases (for example, left or right margin is affected by xlabel).

matplotlib.tight_layout.**auto_adjust_subplotpars**(*fig*, *renderer*, *nrows_ncols*, *num1num2_list*, *subplot_list*, *ax_bbox_list=None*, *pad=1.08*, *h_pad=None*, *w_pad=None*, *rect=None*)

Return a dict of subplot parameters to adjust spacing between subplots or `None` if resulting axes would have zero height or width.

Note that this function ignores geometry information of subplot itself, but uses what is given by the *nrows_ncols* and *num1num2_list* parameters. Also, the results could be incorrect if some subplots have `adjustable=datalim`.

Parameters

nrows_ncols

[Tuple[int, int]] Number of rows and number of columns of the grid.

num1num2_list

[List[int]] List of numbers specifying the area occupied by the subplot

subplot_list

[list of subplots] List of subplots that will be used to calculate optimal subplot_params.

pad

[float] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

h_pad, w_pad

[float] Padding (height/width) between edges of adjacent subplots, as a fraction of the font size. Defaults to *pad*.

rect

[Tuple[float, float, float, float]] [left, bottom, right, top] in normalized (0, 1) figure coordinates.

matplotlib.tight_layout.**get_renderer**(*fig*)

matplotlib.tight_layout.**get_subplotspec_list**(*axes_list*, *grid_spec=None*)

Return a list of subplotspec from the given list of axes.

For an instance of axes that does not support subplotspec, None is inserted in the list.

If grid_spec is given, None is inserted for those not from the given grid_spec.

matplotlib.tight_layout.**get_tight_layout_figure**(*fig*, *axes_list*, *subplotspec_list*, *renderer*, *pad=1.08*, *h_pad=None*, *w_pad=None*, *rect=None*)

Return subplot parameters for tight-layouted-figure with specified padding.

Parameters

fig

[Figure]

axes_list

[list of Axes]

subplotspec_list

[list of *SubplotSpec*] The subplotspecs of each axes.

renderer

[renderer]

pad

[float] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

h_pad, w_pad

[float] Padding (height/width) between edges of adjacent subplots. Defaults to *pad*.

rect

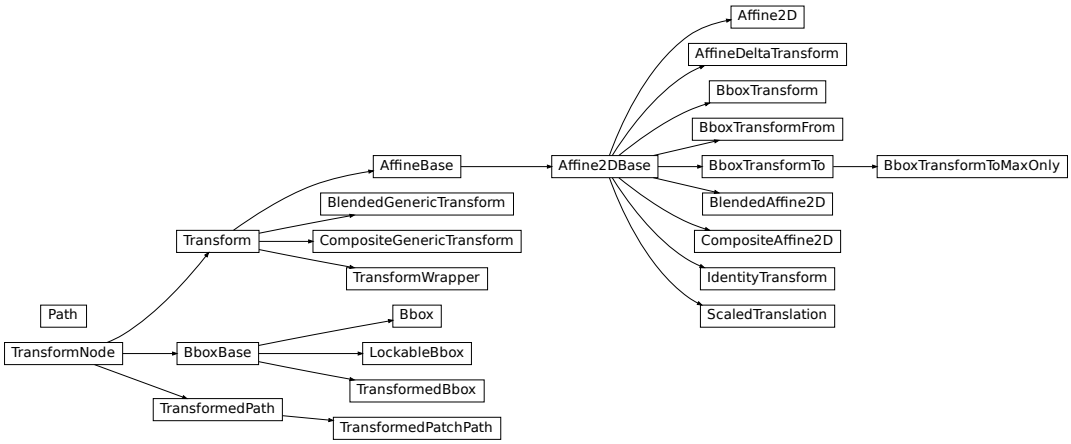
[Tuple[float, float, float, float], optional] (left, bottom, right, top) rectangle in normalized figure coordinates that the whole subplots area (including labels) will fit into. Defaults to using the entire figure.

Returns

subplotspec or None

subplotspec kwargs to be passed to *Figure.subplots_adjust* or None if tight_layout could not be accomplished.

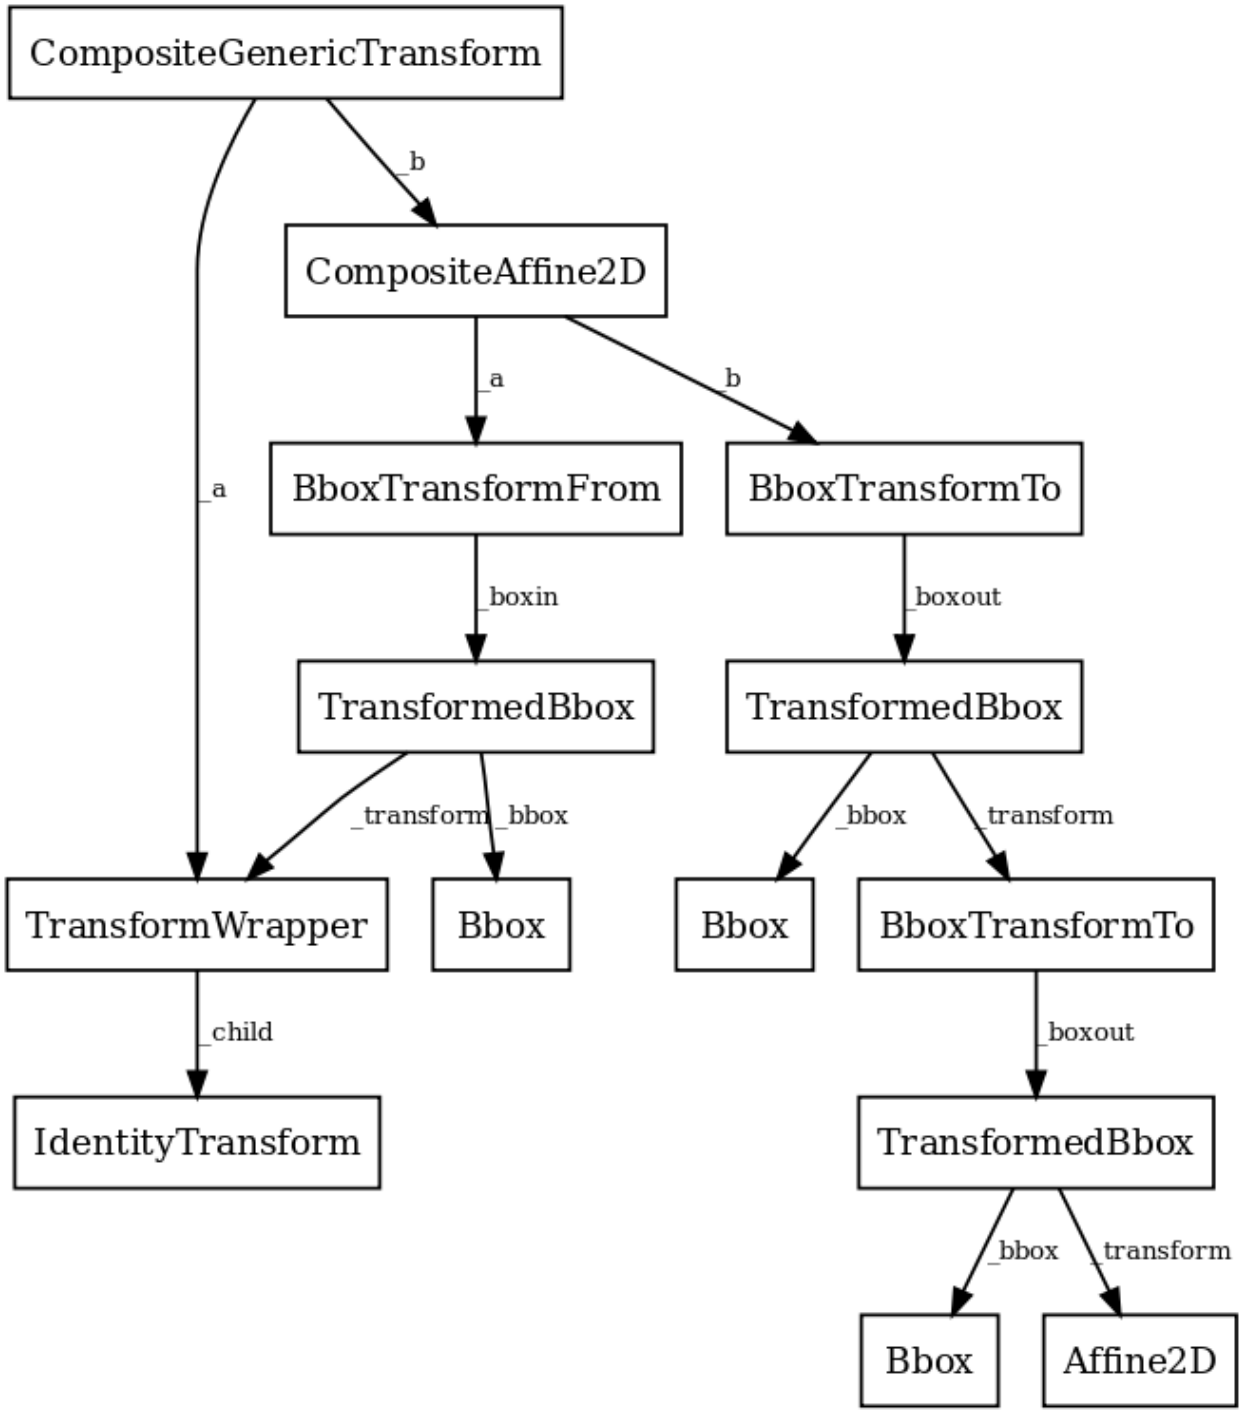
18.55 matplotlib.transforms



Matplotlib includes a framework for arbitrary geometric transformations that is used determine the final position of all elements drawn on the canvas.

Transforms are composed into trees of *TransformNode* objects whose actual value depends on their children. When the contents of children change, their parents are automatically invalidated. The next time an invalidated transform is accessed, it is recomputed to reflect those changes. This invalidation/caching approach prevents unnecessary recomputations of transforms, and contributes to better interactive performance.

For example, here is a graph of the transform tree used to plot data to the graph:



The framework can be used for both affine and non-affine transformations. However, for speed, we want use the backend renderers to perform affine transformations whenever possible. Therefore, it is possible to perform just the affine or non-affine part of a transformation on a set of data. The affine is always assumed to occur after the non-affine. For any transform:

```
full transform == non-affine part + affine part
```

The backends are not expected to handle non-affine transformations themselves.

class matplotlib.transforms.**Affine2D**(*matrix=None*, ***kwargs*)

Bases: *matplotlib.transforms.Affine2DBase*

A mutable 2D affine transformation.

Initialize an Affine transform from a 3x3 numpy float array:

```
a c e
b d f
0 0 1
```

If *matrix* is None, initialize with the identity transform.

__init__(*self*, *matrix=None*, ***kwargs*)

Initialize an Affine transform from a 3x3 numpy float array:

```
a c e
b d f
0 0 1
```

If *matrix* is None, initialize with the identity transform.

__module__ = 'matplotlib.transforms'

__str__(*self*)

Return str(self).

clear(*self*)

Reset the underlying matrix to the identity transform.

static from_values(*a*, *b*, *c*, *d*, *e*, *f*)

Create a new Affine2D instance from the given values:

```
a c e
b d f
0 0 1
```

.

get_matrix(*self*)

Get the underlying transformation matrix as a 3x3 numpy array:

```
a c e
b d f
0 0 1
```

.

static identity()

Return a new *Affine2D* object that is the identity transform.

Unless this transform will be mutated later on, consider using the faster *IdentityTransform* class instead.

rotate(*self*, *theta*)
Add a rotation (in radians) to this transform in place.

Returns *self*, so this method can easily be chained with more calls to *rotate()*, *rotate_deg()*, *translate()* and *scale()*.

rotate_around(*self*, *x*, *y*, *theta*)
Add a rotation (in radians) around the point (x, y) in place.

Returns *self*, so this method can easily be chained with more calls to *rotate()*, *rotate_deg()*, *translate()* and *scale()*.

rotate_deg(*self*, *degrees*)
Add a rotation (in degrees) to this transform in place.

Returns *self*, so this method can easily be chained with more calls to *rotate()*, *rotate_deg()*, *translate()* and *scale()*.

rotate_deg_around(*self*, *x*, *y*, *degrees*)
Add a rotation (in degrees) around the point (x, y) in place.

Returns *self*, so this method can easily be chained with more calls to *rotate()*, *rotate_deg()*, *translate()* and *scale()*.

scale(*self*, *sx*, *sy=None*)
Add a scale in place.

If *sy* is None, the same scale is applied in both the *x*- and *y*-directions.

Returns *self*, so this method can easily be chained with more calls to *rotate()*, *rotate_deg()*, *translate()* and *scale()*.

set(*self*, *other*)
Set this transformation from the frozen copy of another *Affine2DBase* object.

set_matrix(*self*, *mtx*)
Set the underlying transformation matrix from a 3x3 numpy array:

```
a c e
b d f
0 0 1
```

.

skew(*self*, *xShear*, *yShear*)
Add a skew in place.

xShear and *yShear* are the shear angles along the *x*- and *y*-axes, respectively, in radians.

Returns *self*, so this method can easily be chained with more calls to *rotate()*, *rotate_deg()*, *translate()* and *scale()*.

skew_deg(*self*, *xShear*, *yShear*)
Add a skew in place.

xShear and *yShear* are the shear angles along the *x*- and *y*-axes, respectively, in degrees.

Returns *self*, so this method can easily be chained with more calls to *rotate()*, *rotate_deg()*, *translate()* and *scale()*.

translate(*self*, *tx*, *ty*)
Add a translation in place.

Returns *self*, so this method can easily be chained with more calls to *rotate()*, *rotate_deg()*, *translate()* and *scale()*.

class matplotlib.transforms.**Affine2DBase**(**args*, ***kwargs*)
Bases: *matplotlib.transforms.AffineBase*

The base class of all 2D affine transformations.

2D affine transformations are performed using a 3x3 numpy array:

```
a c e
b d f
0 0 1
```

This class provides the read-only interface. For a mutable 2D affine transformation, use *Affine2D*.

Subclasses of this class will generally only need to override a constructor and `get_matrix()` that generates a custom 3x3 matrix.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

__module__ = 'matplotlib.transforms'

frozen(*self*)
Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

has_inverse = True

input_dims = 2

inverted(*self*)
Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`property is_separable`
bool(x) -> bool

Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

`static matrix_from_values`(*a*, *b*, *c*, *d*, *e*, *f*)
[*Deprecated*] Create a new transformation matrix as a 3x3 numpy array of the form:

```
a c e
b d f
0 0 1
```

Notes

Deprecated since version 3.2.

`output_dims = 2`

`to_values`(*self*)
Return the values of the matrix as an `(a, b, c, d, e, f)` tuple.

`transform_affine`(*self*, *points*)
Apply only the affine part of this transformation on the given array of values.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

Parameters

values

[array] The input values as NumPy array of length *input_dims* or shape (N x *input_dims*).

Returns

array

The output values as NumPy array of length *input_dims* or shape (N x *output_dims*), depending on the input.

`class matplotlib.transforms.AffineBase`(**args*, ***kwargs*)
Bases: *matplotlib.transforms.Transform*

The base class of all affine transformations of any number of dimensions.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

`__array__`(*self*, **args*, ***kwargs*)
Array interface to get at this Transform's affine matrix.

`__eq__`(*self*, *other*)
Return self==value.

`__hash__ = None`

`__init__`(*self*, **args*, ***kwargs*)

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

`__module__ = 'matplotlib.transforms'`

`get_affine`(*self*)
Get the affine part of this transform.

`is_affine = True`

`transform`(*self*, *values*)
Apply this transformation on the given array of *values*.

Parameters

values

[array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

Returns

array

The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

`transform_affine`(*self*, *values*)
Apply only the affine part of this transformation on the given array of values.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

Parameters

values

[array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

Returns

array

The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

`transform_non_affine`(*self*, *points*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

Returns

array

The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

`transform_path`(*self*, *path*)

Apply the transform to *Path* *path*, returning a new *Path*.

In some cases, this transform may insert curves into the path that began as line segments.

`transform_path_affine`(*self*, *path*)

Apply the affine part of this transform to *Path* *path*, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(va`

`transform_path_non_affine`(*self*, *path*)

Apply the non-affine part of this transform to *Path* *path*, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(va`

class matplotlib.transforms.**AffineDeltaTransform**(*transform*, ***kwargs*)

Bases: *matplotlib.transforms.Affine2DBase*

A transform wrapper for transforming displacements between pairs of points.

This class is intended to be used to transform displacements ("position deltas") between pairs of points (e.g., as the `offset_transform` of *Collection*s): given a transform `t` such that `t = AffineDeltaTransform(t) + offset`, `AffineDeltaTransform` satisfies `AffineDeltaTransform(a - b) == AffineDeltaTransform(a) - AffineDeltaTransform(b)`.

This is implemented by forcing the offset components of the transform matrix to zero.

This class is experimental as of 3.3, and the API may change.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

__init__(*self*, *transform*, ***kwargs*)

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

__module__ = 'matplotlib.transforms'

__str__(*self*)

Return str(self).

get_matrix(*self*)

Get the matrix for the affine part of this transform.

class matplotlib.transforms.**Bbox**(*points*, ***kwargs*)

Bases: *matplotlib.transforms.BboxBase*

A mutable bounding box.

Examples

Create from known bounds

The default constructor takes the boundary "points" `[[xmin, ymin], [xmax, ymax]]`.

```
>>> Bbox([[1, 1], [3, 7]])
Bbox([[1.0, 1.0], [3.0, 7.0]])
```

Alternatively, a Bbox can be created from the flattened points array, the so-called "extents" `(xmin, ymin, xmax, ymax)`

```
>>> Bbox.from_extents(1, 1, 3, 7)
Bbox([[1.0, 1.0], [3.0, 7.0]])
```

or from the "bounds" `(xmin, ymin, width, height)`.

```
>>> Bbox.from_bounds(1, 1, 2, 6)
Bbox([[1.0, 1.0], [3.0, 7.0]])
```

Create from collections of points

The "empty" object for accumulating Bboxs is the null bbox, which is a stand-in for the empty set.

```
>>> Bbox.null()
Bbox([[inf, inf], [-inf, -inf]])
```

Adding points to the null bbox will give you the bbox of those points.

```
>>> box = Bbox.null()
>>> box.update_from_data_xy([[1, 1]])
>>> box
Bbox([[1.0, 1.0], [1.0, 1.0]])
>>> box.update_from_data_xy([[2, 3], [3, 2]], ignore=False)
>>> box
Bbox([[1.0, 1.0], [3.0, 3.0]])
```

Setting `ignore=True` is equivalent to starting over from a null bbox.

```
>>> box.update_from_data_xy([[1, 1]], ignore=True)
>>> box
Bbox([[1.0, 1.0], [1.0, 1.0]])
```

Warning: It is recommended to always specify `ignore` explicitly. If not, the default value of `ignore` can be changed at any time by code with access to your Bbox, for example using the method *ignore*.

Properties of the ``null`` bbox

Note: The current behavior of *Bbox.null()* may be surprising as it does not have all of the properties of the "empty set", and as such does not behave like a "zero" object in the mathematical sense. We may change that in the future (with a deprecation period).

The null bbox is the identity for intersections

```
>>> Bbox.intersection(Bbox([[1, 1], [3, 7]]), Bbox.null())
Bbox([[1.0, 1.0], [3.0, 7.0]])
```

except with itself, where it returns the full space.

```
>>> Bbox.intersection(Bbox.null(), Bbox.null())
Bbox([[-inf, -inf], [inf, inf]])
```

A union containing null will always return the full space (not the other set!)

```
>>> Bbox.union([Bbox([[0, 0], [0, 0]]), Bbox.null()])
Bbox([[-inf, -inf], [inf, inf]])
```

Parameters

points

[ndarray] A 2x2 numpy array of the form `[[x0, y0], [x1, y1]]`.

`__format__`(*self*, *fmt*)
Default object formatter.

`__init__`(*self*, *points*, ***kwargs*)

Parameters

points

[ndarray] A 2x2 numpy array of the form `[[x0, y0], [x1, y1]]`.

`__module__ = 'matplotlib.transforms'`

`__repr__`(*self*)
Return repr(self).

`__str__`(*self*)
Return str(self).

`property bounds`
Return (*x0*, *y0*, `width`, `height`).

`static from_bounds`(*x0*, *y0*, *width*, *height*)
Create a new *Bbox* from *x0*, *y0*, *width* and *height*.

width and *height* may be negative.

static from_extents(*args)
Create a new Bbox from *left*, *bottom*, *right* and *top*.

The *y*-axis increases upwards.

get_points(self)
Get the points of the bounding box directly as a numpy array of the form: `[[x0, y0], [x1, y1]]`.

ignore(self, value)
Set whether the existing bounds of the box should be ignored by subsequent calls to *update_from_data_xy()*.

value

[bool]

- When `True`, subsequent calls to *update_from_data_xy()* will ignore the existing bounds of the *Bbox*.
- When `False`, subsequent calls to *update_from_data_xy()* will include the existing bounds of the *Bbox*.

property intervalx
The pair of *x* coordinates that define the bounding box.

This is not guaranteed to be sorted from left to right.

property intervaly
The pair of *y* coordinates that define the bounding box.

This is not guaranteed to be sorted from bottom to top.

property minpos

property minposx

property minposy

mutated(self)
Return whether the bbox has changed since init.

mutatedx(self)
Return whether the x-limits have changed since init.

mutatedy(self)
Return whether the y-limits have changed since init.

static null()
Create a new null *Bbox* from (inf, inf) to (-inf, -inf).

property p0
The first pair of (*x*, *y*) coordinates that define the bounding box.

This is not guaranteed to be the bottom-left corner (for that, use `min`).

property p1
The second pair of (*x*, *y*) coordinates that define the bounding box.

This is not guaranteed to be the top-right corner (for that, use `max`).

`set`(*self*, *other*)
Set this bounding box from the "frozen" bounds of another *Bbox*.

`set_points`(*self*, *points*)
Set the points of the bounding box directly from a numpy array of the form: `[[x0, y0], [x1, y1]]`. No error checking is performed, as this method is mainly for internal use.

`static unit`()
Create a new unit *Bbox* from (0, 0) to (1, 1).

`update_from_data_xy`(*self*, *xy*, *ignore=None*, *updatex=True*, *updatey=True*)
Update the bounds of the *Bbox* based on the passed in data. After updating, the bounds will have positive *width* and *height*; *x0* and *y0* will be the minimal values.

Parameters

xy

[ndarray] A numpy array of 2D points.

ignore

[bool, optional]

- When `True`, ignore the existing bounds of the *Bbox*.
- When `False`, include the existing bounds of the *Bbox*.
- When `None`, use the last value passed to *ignore()*.

updatex, updatey

[bool, default: True] When `True`, update the x/y values.

`update_from_path`(*self*, *path*, *ignore=None*, *updatex=True*, *updatey=True*)
Update the bounds of the *Bbox* to contain the vertices of the provided path. After updating, the bounds will have positive *width* and *height*; *x0* and *y0* will be the minimal values.

Parameters

path

[*Path*]

ignore

[bool, optional]

- when `True`, ignore the existing bounds of the *Bbox*.
- when `False`, include the existing bounds of the *Bbox*.
- when `None`, use the last value passed to *ignore()*.

updatex, updatey

[bool, default: True] When `True`, update the x/y values.

property x0
The first of the pair of *x* coordinates that define the bounding box.

This is not guaranteed to be less than *x1* (for that, use `xmin`).

property x1
The second of the pair of *x* coordinates that define the bounding box.

This is not guaranteed to be greater than *x0* (for that, use `xmax`).

property y0
The first of the pair of *y* coordinates that define the bounding box.

This is not guaranteed to be less than *y1* (for that, use `ymin`).

property y1
The second of the pair of *y* coordinates that define the bounding box.

This is not guaranteed to be greater than *y0* (for that, use `ymax`).

class matplotlib.transforms.BboxBase(*shorthand_name=None*)
Bases: *matplotlib.transforms.TransformNode*

The base class of all bounding boxes.

This class is immutable; *Bbox* is a mutable subclass.

The canonical representation is as two points, with no restrictions on their ordering. Convenience properties are provided to get the left, bottom, right and top edges and width and height, but these are not stored explicitly.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

__array__(*self*, **args*, ***kwargs*)

__module__ = 'matplotlib.transforms'

anchored(*self*, *c*, *container=None*)
Return a copy of the *Bbox* shifted to position *c* within *container*.

Parameters

c

[(float, float) or str] May be either:

- A sequence (*cx*, *cy*) where *cx* and *cy* range from 0 to 1, where 0 is left or bottom and 1 is right or top
- a string: - 'C' for centered - 'S' for bottom-center - 'SE' for bottom-left - 'E' for left - etc.

container

[*Bbox*, optional] The box within which the *Bbox* is positioned; it defaults to the initial *Bbox*.

`property bounds`
Return (*x0*, *y0*, *width*, *height*).

`coefs = {'C': (0.5, 0.5), 'E': (1.0, 0.5), 'N': (0.5, 1.0), 'NE': (1.0, 1.0), 'NW': (0, 1.`

`contains`(*self*, *x*, *y*)
Return whether `(x, y)` is in the bounding box or on its edge.

`containsx`(*self*, *x*)
Return whether *x* is in the closed (*x0*, *x1*) interval.

`containsy`(*self*, *y*)
Return whether *y* is in the closed (*y0*, *y1*) interval.

`corners`(*self*)
Return the corners of this rectangle as an array of points.

Specifically, this returns the array `[[x0, y0], [x0, y1], [x1, y0], [x1, y1]]`.

`count_contains`(*self*, *vertices*)
Count the number of vertices contained in the *Bbox*. Any vertices with a non-finite x or y value are ignored.

Parameters

vertices

[Nx2 Numpy array.]

`count_overlaps`(*self*, *bboxes*)
Count the number of bounding boxes that overlap this one.

Parameters

bboxes

[sequence of *BboxBase*]

`expanded`(*self*, *sw*, *sh*)
Construct a *Bbox* by expanding this one around its center by the factors *sw* and *sh*.

property extents
: Return (*x0*, *y0*, *x1*, *y1*).

frozen(*self*)
: The base class for anything that participates in the transform tree and needs to invalidate its parents or be invalidated. This includes classes that are not really transforms, such as bounding boxes, since some transforms depend on bounding boxes to compute their values.

fully_contains(*self*, *x*, *y*)
: Return whether `x, y` is in the bounding box, but not on its edge.

fully_containsx(*self*, *x*)
: Return whether *x* is in the open (*x0*, *x1*) interval.

fully_containsy(*self*, *y*)
: Return whether *y* is in the open (*y0*, *y1*) interval.

fully_overlaps(*self*, *other*)
: Return whether this bounding box overlaps with the other bounding box, not including the edges.

Parameters

other

[*BboxBase*]

get_points(*self*)

property height
: The (signed) height of the bounding box.

static intersection(*bbox1*, *bbox2*)
: Return the intersection of *bbox1* and *bbox2* if they intersect, or None if they don't.

property intervalx
: The pair of *x* coordinates that define the bounding box.

  This is not guaranteed to be sorted from left to right.

property intervaly
: The pair of *y* coordinates that define the bounding box.

  This is not guaranteed to be sorted from bottom to top.

inverse_transformed(*self*, *transform*)
: [*Deprecated*] Construct a *Bbox* by statically transforming this one by the inverse of *transform*.

Notes

Deprecated since version 3.3.

`is_affine = True`

`is_bbox = True`

`is_unit`(*self*)
[*Deprecated*] Return whether this is the unit box (from (0, 0) to (1, 1)).

Notes

Deprecated since version 3.2.

`property max`
The top-right corner of the bounding box.

`property min`
The bottom-left corner of the bounding box.

`overlaps`(*self*, *other*)
Return whether this bounding box overlaps with the other bounding box.

Parameters

other

[*BboxBase*]

`property p0`
The first pair of (*x*, *y*) coordinates that define the bounding box.

This is not guaranteed to be the bottom-left corner (for that, use *min*).

`property p1`
The second pair of (*x*, *y*) coordinates that define the bounding box.

This is not guaranteed to be the top-right corner (for that, use *max*).

`padded`(*self*, *p*)
Construct a *Bbox* by padding this one on all four sides by *p*.

`rotated`(*self*, *radians*)
Return the axes-aligned bounding box that bounds the result of rotating this *Bbox* by an angle of *radians*.

`shrunk`(*self*, *mx*, *my*)
Return a copy of the *Bbox*, shrunk by the factor *mx* in the *x* direction and the factor *my* in the *y* direction. The lower left corner of the box remains unchanged. Normally *mx* and *my* will be less than 1, but this is not enforced.

`shrunk_to_aspect`(*self*, *box_aspect*, *container=None*, *fig_aspect=1.0*)
Return a copy of the *Bbox*, shrunk so that it is as large as it can be while having the desired aspect ratio, *box_aspect*. If the box coordinates are relative (i.e. fractions of a larger box such as a figure) then the physical aspect ratio of that figure is specified with *fig_aspect*, so that *box_aspect* can also be given as a ratio of the absolute dimensions, not the relative dimensions.

`property size`
The (signed) width and height of the bounding box.

`splitx`(*self*, **args*)
Return a list of new *Bbox* objects formed by splitting the original one with vertical lines at fractional positions given by *args*.

`splity`(*self*, **args*)
Return a list of new *Bbox* objects formed by splitting the original one with horizontal lines at fractional positions given by *args*.

`transformed`(*self*, *transform*)
Construct a *Bbox* by statically transforming this one by *transform*.

`translated`(*self*, *tx*, *ty*)
Construct a *Bbox* by translating this one by *tx* and *ty*.

`static union`(*bboxes*)
Return a *Bbox* that contains all of the given *bboxes*.

`property width`
The (signed) width of the bounding box.

`property x0`
The first of the pair of *x* coordinates that define the bounding box.

This is not guaranteed to be less than *x1* (for that, use *xmin*).

`property x1`
The second of the pair of *x* coordinates that define the bounding box.

This is not guaranteed to be greater than *x0* (for that, use *xmax*).

`property xmax`
The right edge of the bounding box.

`property xmin`
The left edge of the bounding box.

`property y0`
The first of the pair of *y* coordinates that define the bounding box.

This is not guaranteed to be less than *y1* (for that, use *ymin*).

`property y1`
The second of the pair of *y* coordinates that define the bounding box.

This is not guaranteed to be greater than *y0* (for that, use *ymax*).

property ymax
The top edge of the bounding box.

property ymin
The bottom edge of the bounding box.

class matplotlib.transforms.BboxTransform(*boxin*, *boxout*, ***kwargs*)
Bases: *matplotlib.transforms.Affine2DBase*

BboxTransform linearly transforms points from one *Bbox* to another.

Create a new *BboxTransform* that linearly transforms points from *boxin* to *boxout*.

__init__(*self*, *boxin*, *boxout*, ***kwargs*)
Create a new *BboxTransform* that linearly transforms points from *boxin* to *boxout*.

__module__ = 'matplotlib.transforms'

__str__(*self*)
Return str(self).

get_matrix(*self*)
Get the matrix for the affine part of this transform.

is_separable = True

class matplotlib.transforms.BboxTransformFrom(*boxin*, ***kwargs*)
Bases: *matplotlib.transforms.Affine2DBase*

BboxTransformFrom linearly transforms points from a given *Bbox* to the unit bounding box.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

__init__(*self*, *boxin*, ***kwargs*)

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

__module__ = 'matplotlib.transforms'

__str__(*self*)
Return str(self).

get_matrix(*self*)
Get the matrix for the affine part of this transform.

is_separable = True

class matplotlib.transforms.BboxTransformTo(*boxout*, ***kwargs*)
Bases: *matplotlib.transforms.Affine2DBase*

BboxTransformTo is a transformation that linearly transforms points from the unit bounding box to a given *Bbox*.

Create a new *BboxTransformTo* that linearly transforms points from the unit bounding box to *boxout*.

__init__(*self*, *boxout*, ***kwargs*)
Create a new *BboxTransformTo* that linearly transforms points from the unit bounding box to *boxout*.

__module__ = 'matplotlib.transforms'

__str__(*self*)
Return str(self).

get_matrix(*self*)
Get the matrix for the affine part of this transform.

is_separable = True

class matplotlib.transforms.BboxTransformToMaxOnly(*boxout*, ***kwargs*)
Bases: *matplotlib.transforms.BboxTransformTo*

BboxTransformTo is a transformation that linearly transforms points from the unit bounding box to a given *Bbox* with a fixed upper left of (0, 0).

Create a new *BboxTransformTo* that linearly transforms points from the unit bounding box to *boxout*.

__module__ = 'matplotlib.transforms'

get_matrix(*self*)
Get the matrix for the affine part of this transform.

class matplotlib.transforms.BlendedAffine2D(*x_transform*, *y_transform*, ***kwargs*)
Bases: matplotlib.transforms._BlendedMixin, *matplotlib.transforms.Affine2DBase*

A "blended" transform uses one transform for the *x*-direction, and another transform for the *y*-direction.

This version is an optimization for the case where both child transforms are of type *Affine2DBase*.

Create a new "blended" transform using *x_transform* to transform the *x*-axis and *y_transform* to transform the *y*-axis.

Both *x_transform* and *y_transform* must be 2D affine transforms.

You will generally not call this constructor directly but use the *blended_transform_factory* function instead, which can determine automatically which kind of blended transform to create.

__init__(*self*, *x_transform*, *y_transform*, ***kwargs*)
Create a new "blended" transform using *x_transform* to transform the *x*-axis and *y_transform* to transform the *y*-axis.

Both *x_transform* and *y_transform* must be 2D affine transforms.

You will generally not call this constructor directly but use the *blended_transform_factory* function instead, which can determine automatically which kind of blended transform to create.

__module__ = 'matplotlib.transforms'

get_matrix(*self*)
Get the matrix for the affine part of this transform.

is_separable = True

class matplotlib.transforms.BlendedGenericTransform(*x_transform*, *y_transform*, ***kwargs*)
Bases: matplotlib.transforms._BlendedMixin, *matplotlib.transforms.Transform*

A "blended" transform uses one transform for the *x*-direction, and another transform for the *y*-direction.

This "generic" version can handle any given child transform in the *x*- and *y*-directions.

Create a new "blended" transform using *x_transform* to transform the *x*-axis and *y_transform* to transform the *y*-axis.

You will generally not call this constructor directly but use the *blended_transform_factory* function instead, which can determine automatically which kind of blended transform to create.

__init__(*self*, *x_transform*, *y_transform*, ***kwargs*)
Create a new "blended" transform using *x_transform* to transform the *x*-axis and *y_transform* to transform the *y*-axis.

You will generally not call this constructor directly but use the *blended_transform_factory* function instead, which can determine automatically which kind of blended transform to create.

__module__ = 'matplotlib.transforms'

contains_branch(*self*, *other*)
Return whether the given transform is a sub-tree of this transform.

This routine uses transform equality to identify sub-trees, therefore in many situations it is object id which will be used.

For the case where the given transform represents the whole of this transform, returns True.

property depth
: Return the number of transforms which have been chained together to form this Transform instance.

  Note: For the special case of a Composite transform, the maximum depth of the two is returned.

frozen(*self*)
: Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

get_affine(*self*)
: Get the affine part of this transform.

property has_inverse
: bool(x) -> bool

  Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

input_dims = 2

inverted(*self*)
: Return the corresponding inverse transformation.

  It holds `x == self.inverted().transform(self.transform(x))`.

  The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

property is_affine
: bool(x) -> bool

  Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

is_separable = True

output_dims = 2

pass_through = True

transform_non_affine(*self*, *points*)
: Apply only the non-affine part of this transformation.

  `transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

  In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

  Parameters

values

[array] The input values as NumPy array of length *input_dims* or shape (N x *input_dims*).

Returns

array

The output values as NumPy array of length *input_dims* or shape (N x *output_dims*), depending on the input.

class matplotlib.transforms.**CompositeAffine2D**(*a*, *b*, ***kwargs*)

Bases: *matplotlib.transforms.Affine2DBase*

A composite transform formed by applying transform *a* then transform *b*.

This version is an optimization that handles the case where both *a* and *b* are 2D affines.

Create a new composite transform that is the result of applying *Affine2DBase* *a* then *Affine2DBase* *b*.

You will generally not call this constructor directly but write `a + b` instead, which will automatically choose the best kind of composite transform instance to create.

__init__(*self*, *a*, *b*, ***kwargs*)

Create a new composite transform that is the result of applying *Affine2DBase* *a* then *Affine2DBase* *b*.

You will generally not call this constructor directly but write `a + b` instead, which will automatically choose the best kind of composite transform instance to create.

__module__ = 'matplotlib.transforms'

__str__(*self*)

Return str(self).

property **depth**

Return the number of transforms which have been chained together to form this Transform instance.

Note: For the special case of a Composite transform, the maximum depth of the two is returned.

---

get_matrix(*self*)

Get the matrix for the affine part of this transform.

class matplotlib.transforms.**CompositeGenericTransform**(*a*, *b*, ***kwargs*)

Bases: *matplotlib.transforms.Transform*

A composite transform formed by applying transform *a* then transform *b*.

This "generic" version can handle any two arbitrary transformations.

Create a new composite transform that is the result of applying transform *a* then transform *b*.

You will generally not call this constructor directly but write `a + b` instead, which will automatically choose the best kind of composite transform instance to create.

`__eq__`(*self*, *other*)
Return self==value.

`__hash__ = None`

`__init__`(*self*, *a*, *b*, ***kwargs*)
Create a new composite transform that is the result of applying transform *a* then transform *b*.

You will generally not call this constructor directly but write `a + b` instead, which will automatically choose the best kind of composite transform instance to create.

`__module__ = 'matplotlib.transforms'`

`__str__`(*self*)
Return str(self).

`property depth`
Return the number of transforms which have been chained together to form this Transform instance.

Note: For the special case of a Composite transform, the maximum depth of the two is returned.

`frozen`(*self*)
Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

`get_affine`(*self*)
Get the affine part of this transform.

`property has_inverse`
bool(x) -> bool

Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

`inverted`(*self*)
Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`property is_affine`
bool(x) -> bool

Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

`property is_separable`
bool(x) -> bool

Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

`pass_through = True`

`transform_affine`(*self*, *points*)
Apply only the affine part of this transformation on the given array of values.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

Parameters

values

[array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

Returns

array

The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

`transform_non_affine`(*self*, *points*)
Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

Returns

array

The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

`transform_path_non_affine`(*self*, *path*)

Apply the non-affine part of this transform to *Path* *path*, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(va`

`class matplotlib.transforms.IdentityTransform`(**args*, ***kwargs*)

Bases: *matplotlib.transforms.Affine2DBase*

A special class that does one thing, the identity transform, in a fast way.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

`__module__ = 'matplotlib.transforms'`

`__str__`(*self*)

Return str(self).

`frozen`(*self*)

Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

`get_affine`(*self*)

Get the affine part of this transform.

`get_matrix`(*self*)

Get the matrix for the affine part of this transform.

`inverted`(*self*)

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`transform`(*self*, *points*)

Apply this transformation on the given array of *values*.

Parameters

values

[array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

Returns

array

The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

`transform_affine`(*self*, *points*)

Apply only the affine part of this transformation on the given array of values.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

Parameters

values

[array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

Returns

array

The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

`transform_non_affine`(*self*, *points*)

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

Returns

array

The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

`transform_path`(*self*, *path*)
Apply the transform to *Path* *path*, returning a new *Path*.

In some cases, this transform may insert curves into the path that began as line segments.

`transform_path_affine`(*self*, *path*)
Apply the affine part of this transform to *Path* *path*, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(va`

`transform_path_non_affine`(*self*, *path*)
Apply the non-affine part of this transform to *Path* *path*, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(va`

`class matplotlib.transforms.LockableBbox`(*bbox*, *x0=None*, *y0=None*, *x1=None*, *y1=None*, ***kwargs*)

Bases: *matplotlib.transforms.BboxBase*

A *Bbox* where some elements may be locked at certain values.

When the child bounding box changes, the bounds of this bbox will update accordingly with the exception of the locked elements.

Parameters

bbox

[*Bbox*] The child bounding box to wrap.

x0

[float or None] The locked value for x0, or None to leave unlocked.

y0

[float or None] The locked value for y0, or None to leave unlocked.

x1

[float or None] The locked value for x1, or None to leave unlocked.

y1

[float or None] The locked value for y1, or None to leave unlocked.

`__init__`(*self*, *bbox*, *x0=None*, *y0=None*, *x1=None*, *y1=None*, ***kwargs*)

Parameters

bbox

[*Bbox*] The child bounding box to wrap.

x0

[float or None] The locked value for x0, or None to leave unlocked.

y0

[float or None] The locked value for y0, or None to leave unlocked.

x1

[float or None] The locked value for x1, or None to leave unlocked.

y1

[float or None] The locked value for y1, or None to leave unlocked.

`__module__ = 'matplotlib.transforms'`

`__str__`(*self*)
Return str(self).

`get_points`(*self*)

`property locked_x0`
float or None: The value used for the locked x0.

`property locked_x1`
float or None: The value used for the locked x1.

`property locked_y0`
float or None: The value used for the locked y0.

`property locked_y1`
float or None: The value used for the locked y1.

`class matplotlib.transforms.ScaledTranslation`(*xt*, *yt*, *scale_trans*, ***kwargs*)
Bases: *matplotlib.transforms.Affine2DBase*

A transformation that translates by *xt* and *yt*, after *xt* and *yt* have been transformed by *scale_trans*.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

`__init__`(*self*, *xt*, *yt*, *scale_trans*, ***kwargs*)

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

`__module__ = 'matplotlib.transforms'`

`__str__`(*self*)
Return str(self).

`get_matrix`(*self*)
Get the matrix for the affine part of this transform.

`class matplotlib.transforms.Transform`(*shorthand_name=None*)
Bases: *matplotlib.transforms.TransformNode*

The base class of all *TransformNode* instances that actually perform a transformation.

All non-affine transformations should be subclasses of this class. New affine transformations should be subclasses of *Affine2D*.

Subclasses of this class should override the following members (at minimum):

- *input_dims*
- *output_dims*
- *transform()*
- *inverted()* (if an inverse exists)

The following attributes may be overridden if the default is unsuitable:

- *is_separable* (defaults to True for 1d -> 1d transforms, False otherwise)
- *has_inverse* (defaults to True if *inverted()* is overridden, False otherwise)

If the transform needs to do something non-standard with *matplotlib.path.Path* objects, such as adding curves where there were once line segments, it should override:

- *transform_path()*

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

`__add__`(*self*, *other*)
Compose two transforms together so that *self* is followed by *other*.

`A + B` returns a transform `C` so that `C.transform(x) == B.transform(A.transform(x))`.

`__array__`(*self*, **args*, ***kwargs*)
Array interface to get at this Transform's affine matrix.

`classmethod __init_subclass__`()
This method is called when a class is subclassed.

The default implementation does nothing. It may be overridden to extend subclasses.

`__module__ = 'matplotlib.transforms'`

`__sub__`(*self*, *other*)
Compose *self* with the inverse of *other*, cancelling identical terms if any:

```
# In general:
A - B == A + B.inverted()
# (but see note regarding frozen transforms below).

# If A "ends with" B (i.e. A == A' + B for some A') we can cancel
# out B:
(A' + B) - B == A'

# Likewise, if B "starts with" A (B = A + B'), we can cancel out A:
A - (A + B') == B'.inverted() == B'^-1
```

Cancellation (rather than naively returning `A + B.inverted()`) is important for multiple reasons:

- It avoids floating-point inaccuracies when computing the inverse of B: `B - B` is guaranteed to cancel out exactly (resulting in the identity transform), whereas `B + B.inverted()` may differ by a small epsilon.
- `B.inverted()` always returns a frozen transform: if one computes `A + B + B.inverted()` and later mutates `B`, then `B.inverted()` won't be updated and the last two terms won't cancel out anymore; on the other hand, `A + B - B` will always be equal to `A` even if `B` is mutated.

`contains_branch`(*self*, *other*)
Return whether the given transform is a sub-tree of this transform.

This routine uses transform equality to identify sub-trees, therefore in many situations it is object id which will be used.

For the case where the given transform represents the whole of this transform, returns True.

`contains_branch_seperately`(*self*, *other_transform*)
Return whether the given branch is a sub-tree of this transform on each separate dimension.

A common use for this method is to identify if a transform is a blended transform containing an axes' data transform. e.g.:

```
x_isdata, y_isdata = trans.contains_branch_seperately(ax.transData)
```

`property depth`
Return the number of transforms which have been chained together to form this Transform instance.

Note: For the special case of a Composite transform, the maximum depth of the two is returned.

`get_affine`(*self*)
Get the affine part of this transform.

`get_matrix`(*self*)
Get the matrix for the affine part of this transform.

`has_inverse = False`
True if this transform has a corresponding inverse transform.

`input_dims = None`
The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

`inverted`(*self*)
Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`is_separable = False`
True if this transform is separable in the x- and y- dimensions.

`output_dims = None`
The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

`transform`(*self*, *values*)
Apply this transformation on the given array of *values*.

Parameters

values

[array] The input values as NumPy array of length *input_dims* or shape (N x *input_dims*).

Returns

array

The output values as NumPy array of length *input_dims* or shape (N x *output_dims*), depending on the input.

`transform_affine`(*self*, *values*)

Apply only the affine part of this transformation on the given array of values.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

Parameters

values

[array] The input values as NumPy array of length *input_dims* or shape (N x *input_dims*).

Returns

array

The output values as NumPy array of length *input_dims* or shape (N x *output_dims*), depending on the input.

`transform_angles`(*self*, *angles*, *pts*, *radians=False*, *pushoff=1e-05*)

Transform a set of angles anchored at specific locations.

Parameters

angles

[(N,) array-like] The angles to transform.

pts

[(N, 2) array-like] The points where the angles are anchored.

radians

[bool, default: False] Whether *angles* are radians or degrees.

pushoff

[float] For each point in *pts* and angle in *angles*, the transformed angle is computed by transforming a segment of length *pushoff* starting at that point and making that angle relative

to the horizontal axis, and measuring the angle between the horizontal axis and the transformed segment.

Returns

(N,) array

`transform_bbox`(*self*, *bbox*)
Transform the given bounding box.

For smarter transforms including caching (a common requirement in Matplotlib), see *TransformedBbox*.

`transform_non_affine`(*self*, *values*)
Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as NumPy array of length *input_dims* or shape (N x *input_dims*).

Returns

array

The output values as NumPy array of length *input_dims* or shape (N x *output_dims*), depending on the input.

`transform_path`(*self*, *path*)
Apply the transform to *Path* *path*, returning a new *Path*.

In some cases, this transform may insert curves into the path that began as line segments.

`transform_path_affine`(*self*, *path*)
Apply the affine part of this transform to *Path* *path*, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(va`

`transform_path_non_affine`(*self*, *path*)
Apply the non-affine part of this transform to *Path* *path*, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(va`

transform_point(*self*, *point*)
Return a transformed point.

This function is only kept for backcompatibility; the more general *transform* method is capable of transforming both a list of points and a single point.

The point is given as a sequence of length *input_dims*. The transformed point is returned as a sequence of length *output_dims*.

class matplotlib.transforms.TransformNode(*shorthand_name=None*)
Bases: object

The base class for anything that participates in the transform tree and needs to invalidate its parents or be invalidated. This includes classes that are not really transforms, such as bounding boxes, since some transforms depend on bounding boxes to compute their values.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

INVALID = 3

INVALID_AFFINE = 2

INVALID_NON_AFFINE = 1

__copy__(*self*, **args*)

__deepcopy__(*self*, **args*)

__dict__ = mappingproxy({'__module__': 'matplotlib.transforms', '__doc__': '\n The base c

__getstate__(*self*)

__init__(*self*, *shorthand_name=None*)

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

__module__ = 'matplotlib.transforms'

__setstate__(*self*, *data_dict*)

__weakref__
list of weak references to the object (if defined)

frozen(*self*)
Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

invalidate(*self*)
Invalidate this *TransformNode* and triggers an invalidation of its ancestors. Should be called any time the transform changes.

is_affine = False

is_bbox = False

pass_through = False
If pass_through is True, all ancestors will always be invalidated, even if 'self' is already invalid.

set_children(*self*, **children*)
Set the children of the transform, to let the invalidation system know which transforms can invalidate this transform. Should be called from the constructor of any transforms that depend on other transforms.

class matplotlib.transforms.**TransformWrapper**(*child*)
Bases: *matplotlib.transforms.Transform*

A helper class that holds a single child transform and acts equivalently to it.

This is useful if a node of the transform tree must be replaced at run time with a transform of a different type. This class allows that replacement to correctly trigger invalidation.

TransformWrapper instances must have the same input and output dimensions during their entire lifetime, so the child transform may only be replaced with another child transform of the same dimensions.

child: A *Transform* instance. This child may later be replaced with *set()*.

__eq__(*self*, *other*)
Return self==value.

__hash__ = None

__init__(*self*, *child*)
child: A *Transform* instance. This child may later be replaced with *set()*.

__module__ = 'matplotlib.transforms'

__str__(*self*)
Return str(self).

frozen(*self*)
Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

property has_inverse
bool(x) -> bool

Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

property is_affine
bool(x) -> bool

Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

property is_separable
bool(x) -> bool

Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

pass_through = True

set(*self*, *child*)
Replace the current child of this transform with another one.

The new child must have the same number of input and output dimensions as the current child.

class matplotlib.transforms.TransformedBbox(*bbox*, *transform*, ***kwargs*)
Bases: *matplotlib.transforms.BboxBase*

A *Bbox* that is automatically transformed by a given transform. When either the child bounding box or transform changes, the bounds of this bbox will update accordingly.

Parameters

bbox

[*Bbox*]

transform

[*Transform*]

__init__(*self*, *bbox*, *transform*, ***kwargs*)

Parameters

bbox

[*Bbox*]

transform

[*Transform*]

__module__ = 'matplotlib.transforms'

__str__(*self*)
Return str(self).

get_points(*self*)

class matplotlib.transforms.**TransformedPatchPath**(*patch*)
Bases: *matplotlib.transforms.TransformedPath*

A *TransformedPatchPath* caches a non-affine transformed copy of the *Patch*. This cached copy is automatically updated when the non-affine part of the transform or the patch changes.

Parameters

patch

[*Patch*]

__init__(*self*, *patch*)

Parameters

patch

[*Patch*]

__module__ = 'matplotlib.transforms'

class matplotlib.transforms.**TransformedPath**(*path*, *transform*)
Bases: *matplotlib.transforms.TransformNode*

A *TransformedPath* caches a non-affine transformed copy of the *Path*. This cached copy is automatically updated when the non-affine part of the transform changes.

Note: Paths are considered immutable by this class. Any update to the path's vertices/codes will not trigger a transform recomputation.

Parameters

path

[*Path*]

transform

[*Transform*]

__init__(*self*, *path*, *transform*)

Parameters

path

[*Path*]

transform

[*Transform*]

`__module__ = 'matplotlib.transforms'`

`get_affine`(*self*)

`get_fully_transformed_path`(*self*)
Return a fully-transformed copy of the child path.

`get_transformed_path_and_affine`(*self*)
Return a copy of the child path, with the non-affine part of the transform already applied, along with the affine part of the path necessary to complete the transformation.

`get_transformed_points_and_affine`(*self*)
Return a copy of the child path, with the non-affine part of the transform already applied, along with the affine part of the path necessary to complete the transformation. Unlike *get_transformed_path_and_affine()*, no interpolation will be performed.

`matplotlib.transforms.blended_transform_factory`(*x_transform*, *y_transform*)
Create a new "blended" transform using *x_transform* to transform the *x*-axis and *y_transform* to transform the *y*-axis.

A faster version of the blended transform is returned for the case where both child transforms are affine.

`matplotlib.transforms.composite_transform_factory`(*a*, *b*)
Create a new composite transform that is the result of applying transform a then transform b.

Shortcut versions of the blended transform are provided for the case where both child transforms are affine, or one or the other is the identity transform.

Composite transforms may also be created using the '+' operator, e.g.:

```
c = a + b
```

`matplotlib.transforms.interval_contains`(*interval*, *val*)
Check, inclusively, whether an interval includes a given value.

Parameters

interval

[(float, float)] The endpoints of the interval.

val

[float] Value to check is within interval.

Returns

bool

Whether *val* is within the *interval*.

matplotlib.transforms.**interval_contains_open**(*interval*, *val*)

Check, excluding endpoints, whether an interval includes a given value.

Parameters

interval

[(float, float)] The endpoints of the interval.

val

[float] Value to check is within interval.

Returns

bool

Whether *val* is within the *interval*.

matplotlib.transforms.**nonsingular**(*vmin*, *vmax*, *expander=0.001*, *tiny=1e-15*, *increasing=True*)

Modify the endpoints of a range as needed to avoid singularities.

Parameters

vmin, vmax

[float] The initial endpoints.

expander

[float, default: 0.001] Fractional amount by which *vmin* and *vmax* are expanded if the original interval is too small, based on *tiny*.

tiny

[float, default: 1e-15] Threshold for the ratio of the interval to the maximum absolute value of its endpoints. If the interval is smaller than this, it will be expanded. This value should be around 1e-15 or larger; otherwise the interval will be approaching the double precision resolution limit.

increasing

[bool, default: True] If True, swap *vmin*, *vmax* if *vmin* > *vmax*.

Returns

vmin, vmax

[float] Endpoints, expanded and/or swapped if necessary. If either input is inf or NaN, or if both inputs are 0 or very close to zero, it returns -*expander*, *expander*.

matplotlib.transforms.**offset_copy**(*trans*, *fig=None*, *x=0.0*, *y=0.0*, *units='inches'*)

Return a new transform with an added offset.

Parameters

trans

[*Transform* subclass] Any transform, to which offset will be applied.

fig

[*Figure*, default: None] Current figure. It can be None if *units* are 'dots'.

x, y

[float, default: 0.0] The offset to apply.

units

[{'inches', 'points', 'dots'}, default: 'inches'] Units of the offset.

Returns

Transform **subclass**

Transform with applied offset.

18.56 matplotlib.tri

Unstructured triangular grid functions.

class matplotlib.tri.**Triangulation**(*x*, *y*, *triangles=None*, *mask=None*)

An unstructured triangular grid consisting of npoints points and ntri triangles. The triangles can either be specified by the user or automatically generated using a Delaunay triangulation.

Parameters

x, y

[array-like of shape (npoints)] Coordinates of grid points.

triangles

[int array-like of shape (ntri, 3), optional] For each triangle, the indices of the three points that make up the triangle, ordered in an anticlockwise manner. If not specified, the Delaunay triangulation is calculated.

mask

[bool array-like of shape (ntri), optional] Which triangles are masked out.

Notes

For a Triangulation to be valid it must not have duplicate points, triangles formed from colinear points, or overlapping triangles.

Attributes

edges

[int array of shape (nedges, 2)] Return integer array of shape (nedges, 2) containing all edges of non-masked triangles.

neighbors

[int array of shape (ntri, 3)] Return integer array of shape (ntri, 3) containing neighbor triangles.

mask

[bool array of shape (ntri, 3)] Masked out triangles.

is_delaunay

[bool] Whether the Triangulation is a calculated Delaunay triangulation (where *triangles* was not specified) or not.

`calculate_plane_coefficients`(*self*, *z*)

Calculate plane equation coefficients for all unmasked triangles from the point (x, y) coordinates and specified z-array of shape (npoints). The returned array has shape (npoints, 3) and allows z-value at (x, y) position in triangle tri to be calculated using `z = array[tri, 0] * x + array[tri, 1] * y + array[tri, 2]`.

`property edges`

Return integer array of shape (nedges, 2) containing all edges of non-masked triangles.

Each row defines an edge by it's start point index and end point index. Each edge appears only once, i.e. for an edge between points *i* and *j*, there will only be either *(i, j)* or *(j, i)*.

`get_cpp_triangulation`(*self*)
Return the underlying C++ Triangulation object, creating it if necessary.

`static get_from_args_and_kwargs`(**args*, ***kwargs*)
Return a Triangulation object from the args and kwargs, and the remaining args and kwargs with the consumed values removed.

There are two alternatives: either the first argument is a Triangulation object, in which case it is returned, or the args and kwargs are sufficient to create a new Triangulation to return. In the latter case, see Triangulation.__init__ for the possible args and kwargs.

`get_masked_triangles`(*self*)
Return an array of triangles that are not masked.

`get_trifinder`(*self*)
Return the default *matplotlib.tri.TriFinder* of this triangulation, creating it if necessary. This allows the same TriFinder object to be easily shared.

`property neighbors`
Return integer array of shape (ntri, 3) containing neighbor triangles.

For each triangle, the indices of the three triangles that share the same edges, or -1 if there is no such neighboring triangle. `neighbors[i, j]` is the triangle that is the neighbor to the edge from point index `triangles[i, j]` to point index `triangles[i, (j+1)%3]`.

`set_mask`(*self*, *mask*)
Set or clear the mask array.

Parameters

mask

[None or bool array of length ntri]

`class matplotlib.tri.TriContourSet`(*ax*, **args*, ***kwargs*)
Bases: *matplotlib.contour.ContourSet*

Create and store a set of contour lines or filled regions for a triangular grid.

User-callable method: clabel

Attributes

ax

The axes object in which the contours are drawn.

collections

A silent_list of LineCollections or PolyCollections.

levels

Contour levels.

layers

Same as levels for line contours; half-way between levels for filled contours. See `_process_colors()`.

Draw triangular grid contour lines or filled regions, depending on whether keyword arg 'filled' is False (default) or True.

The first argument of the initializer must be an axes object. The remaining arguments and keyword arguments are described in the docstring of *tricontour*.

class matplotlib.tri.**TriFinder**(*triangulation*)

Abstract base class for classes used to find the triangles of a Triangulation in which (x, y) points lie.

Rather than instantiate an object of a class derived from TriFinder, it is usually better to use the function *Triangulation.get_trifinder*.

Derived classes implement __call__(x, y) where x and y are array-like point coordinates of the same shape.

class matplotlib.tri.**TrapezoidMapTriFinder**(*triangulation*)

Bases: `matplotlib.tri.trifinder.TriFinder`

TriFinder class implemented using the trapezoid map algorithm from the book "Computational Geometry, Algorithms and Applications", second edition, by M. de Berg, M. van Kreveld, M. Overmars and O. Schwarzkopf.

The triangulation must be valid, i.e. it must not have duplicate points, triangles formed from colinear points, or overlapping triangles. The algorithm has some tolerance to triangles formed from colinear points, but this should not be relied upon.

class matplotlib.tri.**TriInterpolator**(*triangulation*, *z*, *trifinder=None*)

Abstract base class for classes used to interpolate on a triangular grid.

Derived classes implement the following methods:

- `__call__(x, y)`, where x, y are array-like point coordinates of the same shape, and that returns a masked array of the same shape containing the interpolated z-values.
- `gradient(x, y)`, where x, y are array-like point coordinates of the same shape, and that returns a list of 2 masked arrays of the same shape containing the 2 derivatives of the interpolator (derivatives of interpolated z values with respect to x and y).

class matplotlib.tri.**LinearTriInterpolator**(*triangulation*, *z*, *trifinder=None*)

Bases: `matplotlib.tri.triinterpolate.TriInterpolator`

Linear interpolator on a triangular grid.

Each triangle is represented by a plane so that an interpolated value at point (x, y) lies on the plane of the triangle containing (x, y). Interpolated values

are therefore continuous across the triangulation, but their first derivatives are discontinuous at edges between triangles.

Parameters

triangulation

[*Triangulation*] The triangulation to interpolate over.

z

[array-like of shape (npoints,)] Array of values, defined at grid points, to interpolate between.

trifinder

[*TriFinder*, optional] If this is not specified, the Triangulation's default TriFinder will be used by calling *Triangulation.get_trifinder*.

Methods

`__call__` (x, y)	(Returns interpolated values at (x, y) points.)
`gradient` (x, y)	(Returns interpolated derivatives at (x, y) points.)

`gradient`(*self*, *x*, *y*)

Returns a list of 2 masked arrays containing interpolated derivatives at the specified (x, y) points.

Parameters

x, y

[array-like] x and y coordinates of the same shape and any number of dimensions.

Returns

dzdx, dzdy

[np.ma.array] 2 masked arrays of the same shape as *x* and *y*; values corresponding to (x, y) points outside of the triangulation are masked out. The first returned array contains the values of $\frac{\partial z}{\partial x}$ and the second those of $\frac{\partial z}{\partial y}$.

`class matplotlib.tri.CubicTriInterpolator`(*triangulation*, *z*, *kind='min_E'*, *trifinder=None*, *dz=None*)

Bases: `matplotlib.tri.triinterpolate.TriInterpolator`

Cubic interpolator on a triangular grid.

In one-dimension - on a segment - a cubic interpolating function is defined by the values of the function and its derivative at both ends. This is almost the same in 2-d inside a triangle, except that the values of the function and its 2 derivatives have to be defined at each triangle node.

The CubicTriInterpolator takes the value of the function at each node - provided by the user - and internally computes the value of the derivatives, resulting in a smooth interpolation. (As a special feature, the user can also impose the value of the derivatives at each node, but this is not supposed to be the common usage.)

Parameters

triangulation

[*Triangulation*] The triangulation to interpolate over.

z

[array-like of shape (npoints,)] Array of values, defined at grid points, to interpolate between.

kind

[{'min_E', 'geom', 'user'}, optional] Choice of the smoothing algorithm, in order to compute the interpolant derivatives (defaults to 'min_E'):

- if 'min_E': (default) The derivatives at each node is computed to minimize a bending energy.
- if 'geom': The derivatives at each node is computed as a weighted average of relevant triangle normals. To be used for speed optimization (large grids).
- if 'user': The user provides the argument *dz*, no computation is hence needed.

trifinder

[*TriFinder*, optional] If not specified, the Triangulation's default TriFinder will be used by calling *Triangulation.get_trifinder*.

dz

[tuple of array-likes (dzdx, dzdy), optional] Used only if *kind* ='user'. In this case *dz* must be provided as (dzdx, dzdy) where dzdx, dzdy are arrays of the same shape as *z* and are the interpolant first derivatives at the *triangulation* points.

Notes

This note is a bit technical and details how the cubic interpolation is computed.

The interpolation is based on a Clough-Tocher subdivision scheme of the *triangulation* mesh (to make it clearer, each triangle of the grid will be divided in 3 child-triangles, and on each child triangle the interpolated function is a cubic polynomial of the 2 coordinates). This technique originates from FEM (Finite Element Method) analysis; the element used is a reduced Hsieh-Clough-Tocher (HCT) element. Its shape functions are described in [1]. The assembled function is guaranteed to be C1-smooth, i.e. it is continuous and its first derivatives are also continuous (this is easy to show inside the triangles but is also true when crossing the edges).

In the default case (*kind* ='min_E'), the interpolant minimizes a curvature energy on the functional space generated by the HCT element shape functions - with imposed values but arbitrary derivatives at each node. The minimized functional is the integral of the so-called total curvature (implementation based on an algorithm from [2] - PCG sparse solver):

$$E(z) = \frac{1}{2} \int_{\Omega} \left(\left(\frac{\partial^2 z}{\partial x^2} \right)^2 + \left(\frac{\partial^2 z}{\partial y^2} \right)^2 + 2 \left(\frac{\partial^2 z}{\partial y \partial x} \right)^2 \right) dx\, dy$$

If the case *kind* ='geom' is chosen by the user, a simple geometric approximation is used (weighted average of the triangle normal vectors), which could improve speed on very large grids.

References

[1], [2]

Methods

`__call__` (x, y)	(Returns interpolated values at (x, y) points.)
`gradient` (x, y)	(Returns interpolated derivatives at (x, y) points.)

`gradient`(*self*, *x*, *y*)

Returns a list of 2 masked arrays containing interpolated derivatives at the specified (x, y) points.

Parameters

x, y

[array-like] x and y coordinates of the same shape and any number of dimensions.

Returns

dzdx, dzdy

[np.ma.array] 2 masked arrays of the same shape as *x* and *y*; values corresponding to (x, y) points outside of the triangulation are masked out. The first returned array contains the values of $\frac{\partial z}{\partial x}$ and the second those of $\frac{\partial z}{\partial y}$.

`class matplotlib.tri.TriRefiner(`*triangulation*`)`

Abstract base class for classes implementing mesh refinement.

A TriRefiner encapsulates a Triangulation object and provides tools for mesh refinement and interpolation.

Derived classes must implement:

- `refine_triangulation(return_tri_index=False, **kwargs)` , where the optional keyword arguments *kwargs* are defined in each TriRefiner concrete implementation, and which returns:
  - a refined triangulation,
  - optionally (depending on *return_tri_index*), for each point of the refined triangulation: the index of the initial triangulation triangle to which it belongs.
- `refine_field(z, triinterpolator=None, **kwargs)`, where:
  - *z* array of field values (to refine) defined at the base triangulation nodes,
  - *triinterpolator* is an optional *TriInterpolator*,
  - the other optional keyword arguments *kwargs* are defined in each TriRefiner concrete implementation;

  and which returns (as a tuple) a refined triangular mesh and the interpolated values of the field at the refined triangulation nodes.

`class matplotlib.tri.UniformTriRefiner(`*triangulation*`)`

Bases: `matplotlib.tri.trirefine.TriRefiner`

Uniform mesh refinement by recursive subdivisions.

Parameters

triangulation

[*Triangulation*] The encapsulated triangulation (to be refined)

`refine_field(`*self, z, triinterpolator=None, subdiv=3*`)`

Refine a field defined on the encapsulated triangulation.

Parameters

z

[1d-array-like of length `n_points`] Values of the field to refine, defined at the nodes of the encapsulated triangulation. (`n_points` is the number of points in the initial triangulation)

triinterpolator

[*TriInterpolator*, optional] Interpolator used for field interpolation. If not specified, a *CubicTriInterpolator* will be used.

subdiv

[int, default: 3] Recursion level for the subdivision. Each triangle is divided into `4**subdiv` child triangles.

Returns

refi_tri

[*Triangulation*] The returned refined triangulation.

refi_z

[1d array of length: *refi_tri* node count.] The returned interpolated field (at *refi_tri* nodes).

`refine_triangulation`(*self*, *return_tri_index=False*, *subdiv=3*)

Compute an uniformly refined triangulation *refi_triangulation* of the encapsulated `triangulation`.

This function refines the encapsulated triangulation by splitting each father triangle into 4 child sub-triangles built on the edges midside nodes, recursing *subdiv* times. In the end, each triangle is hence divided into `4**subdiv` child triangles.

Parameters

return_tri_index

[bool, default: False] Whether an index table indicating the father triangle index of each point is returned.

subdiv

[int, default: 3] Recursion level for the subdivision. Each triangle is divided into `4**subdiv` child triangles; hence, the default results in 64 refined subtriangles for each triangle of the initial triangulation.

Returns

refi_triangulation

[*Triangulation*] The refined triangulation.

found_index

[int array] Index of the initial triangulation containing triangle, for each point of *refi_triangulation*. Returned only if *return_tri_index* is set to True.

class matplotlib.tri.**TriAnalyzer**(*triangulation*)

Define basic tools for triangular mesh analysis and improvement.

A TriAnalyzer encapsulates a *Triangulation* object and provides basic tools for mesh analysis and mesh improvement.

Parameters

triangulation

[*Triangulation*] The encapsulated triangulation to analyze.

Attributes

scale_factors

Factors to rescale the triangulation into a unit square.

circle_ratios(*self*, *rescale=True*)

Return a measure of the triangulation triangles flatness.

The ratio of the incircle radius over the circumcircle radius is a widely used indicator of a triangle flatness. It is always `<= 0.5` and `== 0.5` only for equilateral triangles. Circle ratios below 0.01 denote very flat triangles.

To avoid unduly low values due to a difference of scale between the 2 axis, the triangular mesh can first be rescaled to fit inside a unit square with *scale_factors* (Only if *rescale* is True, which is its default value).

Parameters

rescale

[bool, default: True] If True, internally rescale (based on *scale_factors*), so that the (unmasked) triangles fit exactly inside a unit square mesh.

Returns

masked array

Ratio of the incircle radius over the circumcircle radius, for each 'rescaled' triangle of the encapsulated triangulation. Values corresponding to masked triangles are masked out.

`get_flat_tri_mask`(*self*, *min_circle_ratio=0.01*, *rescale=True*)

Eliminate excessively flat border triangles from the triangulation.

Returns a mask *new_mask* which allows to clean the encapsulated triangulation from its border-located flat triangles (according to their *circle_ratios()*). This mask is meant to be subsequently applied to the triangulation using *Triangulation.set_mask*. *new_mask* is an extension of the initial triangulation mask in the sense that an initially masked triangle will remain masked.

The *new_mask* array is computed recursively; at each step flat triangles are removed only if they share a side with the current mesh border. Thus no new holes in the triangulated domain will be created.

Parameters

min_circle_ratio

[float, default: 0.01] Border triangles with incircle/circumcircle radii ratio r/R will be removed if r/R < *min_circle_ratio*.

rescale

[bool, default: True] If True, first, internally rescale (based on *scale_factors*) so that the (unmasked) triangles fit exactly inside a unit square mesh. This rescaling accounts for the difference of scale which might exist between the 2 axis.

Returns

bool array-like

Mask to apply to encapsulated triangulation. All the initially masked triangles remain masked in the *new_mask*.

Notes

The rationale behind this function is that a Delaunay triangulation - of an unstructured set of points - sometimes contains almost flat triangles at its border, leading to artifacts in plots (especially for high-resolution contouring). Masked with computed *new_mask*, the encapsulated triangulation would contain no more unmasked border triangles with a circle ratio below *min_circle_ratio*, thus improving the mesh quality for subsequent plots or interpolation.

`property scale_factors`

Factors to rescale the triangulation into a unit square.

Returns

(float, float)

Scaling factors (kx, ky) so that the triangulation `[triangulation.x * kx, triangulation.y * ky]` fits exactly inside a unit square.

18.57 matplotlib.type1font

A class representing a Type 1 font.

This version reads pfa and pfb files and splits them for embedding in pdf files. It also supports SlantFont and ExtendFont transformations, similarly to pdfTeX and friends. There is no support yet for subsetting.

Usage:

```
>>> font = Type1Font(filename)
>>> clear_part, encrypted_part, finale = font.parts
>>> slanted_font = font.transform({'slant': 0.167})
>>> extended_font = font.transform({'extend': 1.2})
```

Sources:

- Adobe Technical Note #5040, Supporting Downloadable PostScript Language Fonts.
- Adobe Type 1 Font Format, Adobe Systems Incorporated, third printing, v1.1, 1993. ISBN 0-201-57044-0.

class matplotlib.type1font.**Type1Font**(*input*)

Bases: `object`

A class representing a Type-1 font, for use by backends.

Attributes

parts

[tuple] A 3-tuple of the cleartext part, the encrypted part, and the finale of zeros.

prop

[Dict[str, Any]] A dictionary of font properties.

Initialize a Type-1 font.

Parameters

input

[str or 3-tuple] Either a pfb file name, or a 3-tuple of already-decoded Type-1 font *parts*.

parts

`prop`

`transform`(*self*, *effects*)
Return a new font that is slanted and/or extended.

Parameters

effects

[dict] A dict with optional entries:

- **'slant'**

  [float, default: 0] Tangent of the angle that the font is to be slanted to the right. Negative values slant to the left.

- **'extend'**

  [float, default: 1] Scaling factor for the font width. Values less than 1 condense the glyphs.

Returns

Type1Font

18.58 matplotlib.units

The classes here provide support for using custom classes with Matplotlib, e.g., those that do not expose the array interface but know how to convert themselves to arrays. It also supports classes with units and units conversion. Use cases include converters for custom objects, e.g., a list of datetime objects, as well as for objects that are unit aware. We don't assume any particular units implementation; rather a units implementation must provide the register with the Registry converter dictionary and a *ConversionInterface*. For example, here is a complete implementation which supports plotting with native datetime objects:

```
import matplotlib.units as units
import matplotlib.dates as dates
import matplotlib.ticker as ticker
import datetime

class DateConverter(units.ConversionInterface):

    @staticmethod
    def convert(value, unit, axis):
        'Convert a datetime value to a scalar or array'
        return dates.date2num(value)

    @staticmethod
    def axisinfo(unit, axis):
```

(continues on next page)

(continued from previous page)

```
        'Return major and minor tick locators and formatters'
        if unit!='date': return None
        majloc = dates.AutoDateLocator()
        majfmt = dates.AutoDateFormatter(majloc)
        return AxisInfo(majloc=majloc,
                        majfmt=majfmt,
                        label='date')

    @staticmethod
    def default_units(x, axis):
        'Return the default unit for x or None'
        return 'date'

# Finally we register our object type with the Matplotlib units registry.
units.registry[datetime.date] = DateConverter()
```

class matplotlib.units.**AxisInfo**(*majloc=None*, *minloc=None*, *majfmt=None*, *minfmt=None*, *label=None*, *default_limits=None*)

Bases: object

Information to support default axis labeling, tick labeling, and limits.

An instance of this class must be returned by *ConversionInterface.axisinfo*.

Parameters

majloc, minloc

[Locator, optional] Tick locators for the major and minor ticks.

majfmt, minfmt

[Formatter, optional] Tick formatters for the major and minor ticks.

label

[str, optional] The default axis label.

default_limits

[optional] The default min and max limits of the axis if no data has been plotted.

Notes

If any of the above are `None`, the axis will simply use the default value.

exception matplotlib.units.**ConversionError**
Bases: `TypeError`

class matplotlib.units.**ConversionInterface**
Bases: `object`

The minimal interface for a converter to take custom data types (or sequences) and convert them to values Matplotlib can use.

static axisinfo(*unit*, *axis*)
Return an *AxisInfo* for the axis with the specified units.

static convert(*obj*, *unit*, *axis*)
Convert *obj* using *unit* for the specified *axis*.

If *obj* is a sequence, return the converted sequence. The output must be a sequence of scalars that can be used by the numpy array layer.

static default_units(*x*, *axis*)
Return the default unit for *x* or `None` for the given axis.

static is_numlike(*x*)
The Matplotlib datalim, autoscaling, locators etc work with scalars which are the units converted to floats given the current unit. The converter may be passed these floats, or arrays of them, even when units are set.

class matplotlib.units.**DecimalConverter**
Bases: *matplotlib.units.ConversionInterface*

Converter for decimal.Decimal data to float.

static axisinfo(*unit*, *axis*)
Return an *AxisInfo* for the axis with the specified units.

static convert(*value*, *unit*, *axis*)
Convert Decimals to floats.

The *unit* and *axis* arguments are not used.

Parameters

value

[decimal.Decimal or iterable] Decimal or list of Decimal need to be converted

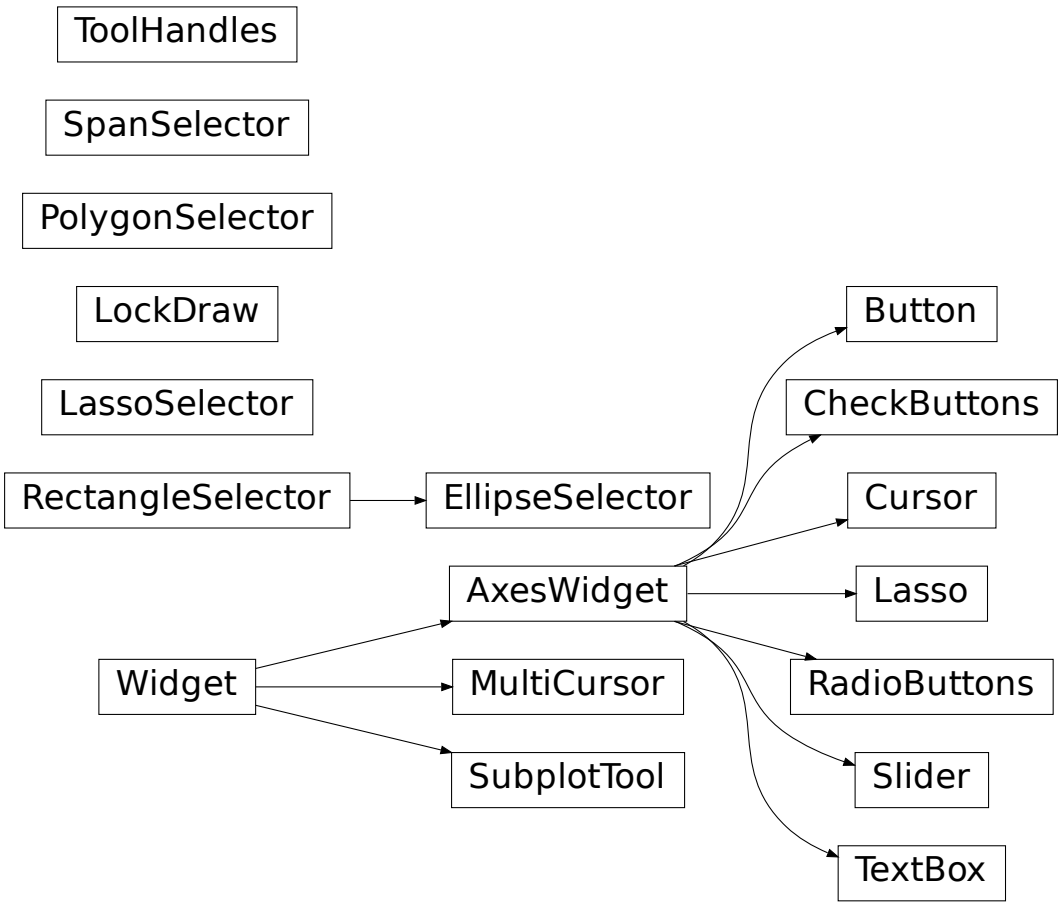
static default_units(*x*, *axis*)
Return the default unit for *x* or `None` for the given axis.

class matplotlib.units.**Registry**
Bases: `dict`

Register types with conversion interface.

`get_converter`(*self*, *x*)
Get the converter interface instance for *x*, or None.

18.59 matplotlib.widgets



18.59.1 GUI neutral widgets

Widgets that are designed to work for any of the GUI backends. All of these widgets require you to predefine a *matplotlib.axes.Axes* instance and pass that as the first parameter. Matplotlib doesn't try to be too smart with respect to layout -- you will have to figure out how wide and tall you want your Axes to be to accommodate your widget.

class matplotlib.widgets.**AxesWidget**(*ax*)

Bases: *matplotlib.widgets.Widget*

Widget connected to a single *Axes*.

To guarantee that the widget remains responsive and not garbage-collected, a reference to the object should be maintained by the user.

This is necessary because the callback registry maintains only weak-refs to the functions, which are member functions of the widget. If there are no references to the widget object it may be garbage collected which will disconnect the callbacks.

Attributes

ax

[*Axes*] The parent axes for the widget.

canvas

[*FigureCanvasBase*] The parent figure canvas for the widget.

`active`

[bool] Is the widget active?

`connect_event`(*self*, *event*, *callback*)

Connect callback with an event.

This should be used in lieu of `figure.canvas.mpl_connect` since this function stores callback ids for later clean up.

`disconnect_events`(*self*)

Disconnect all events created by this widget.

class matplotlib.widgets.**Button**(*ax*, *label*, *image=None*, *color='0.85'*, *hovercolor='0.95'*)

Bases: *matplotlib.widgets.AxesWidget*

A GUI neutral button.

For the button to remain responsive you must keep a reference to it. Call *on_clicked* to connect to the button.

Attributes

ax

The *matplotlib.axes.Axes* the button renders into.

label

A *matplotlib.text.Text* instance.

color

The color of the button when not hovering.

hovercolor

The color of the button when hovering.

Parameters

ax

[*Axes*] The *Axes* instance the button will be placed into.

label

[str] The button text.

image

[array-like or PIL Image] The image to place in the button, if not *None*. The parameter is directly forwarded to *imshow*.

color

[color] The color of the button when not activated.

hovercolor

[color] The color of the button when the mouse is over it.

`disconnect`(*self*, *cid*)
Remove the callback function with connection id *cid*.

`on_clicked`(*self*, *func*)
Connect the callback function *func* to button click events.

Returns a connection id, which can be used to disconnect the callback.

`class matplotlib.widgets.CheckButtons`(*ax*, *labels*, *actives=None*)
Bases: *matplotlib.widgets.AxesWidget*

A GUI neutral set of check buttons.

For the check buttons to remain responsive you must keep a reference to this object.

Connect to the CheckButtons with the *on_clicked* method.

Attributes

ax

[*Axes*] The parent axes for the widget.

labels

[list of *Text*]

rectangles

[list of *Rectangle*]

lines

[list of (*Line2D*, *Line2D*) pairs] List of lines for the x's in the check boxes. These lines exist for each box, but have `set_visible(False)` when its box is not checked.

Add check buttons to *matplotlib.axes.Axes* instance *ax*

Parameters

ax

[*Axes*] The parent axes for the widget.

labels

[list of str] The labels of the check buttons.

actives

[list of bool, optional] The initial check states of the buttons. The list must have the same length as *labels*. If not given, all buttons are unchecked.

`disconnect`(*self*, *cid*)
Remove the observer with connection id *cid*.

`get_status`(*self*)
Return a tuple of the status (True/False) of all of the check buttons.

`on_clicked`(*self*, *func*)
Connect the callback function *func* to button click events.

Returns a connection id, which can be used to disconnect the callback.

`set_active`(*self*, *index*)
Toggle (activate or deactivate) a check button by index.

Callbacks will be triggered if `eventson` is True.

Parameters

index

[int] Index of the check button to toggle.

Raises

ValueError

If *index* is invalid.

class matplotlib.widgets.Cursor(*ax*, *horizOn=True*, *vertOn=True*, *useblit=False*, ***lineprops*)

Bases: *matplotlib.widgets.AxesWidget*

A crosshair cursor that spans the axes and moves with mouse cursor.

For the cursor to remain responsive you must keep a reference to it.

Parameters

ax

[*matplotlib.axes.Axes*] The *Axes* to attach the cursor to.

horizOn

[bool, default: True] Whether to draw the horizontal line.

vertOn

[bool, default: True] Whether to draw the vertical line.

useblit

[bool, default: False] Use blitting for faster drawing if supported by the backend.

Other Parameters

****lineprops**

Line2D properties that control the appearance of the lines. See also *axhline*.

Examples

See /gallery/widgets/cursor.

clear(*self*, *event*)
Internal event handler to clear the cursor.

onmove(*self*, *event*)
Internal event handler to draw the cursor when the mouse moves.

class matplotlib.widgets.EllipseSelector(*ax*, *onselect*, *drawtype='box'*, *minspanx=0*, *minspany=0*, *useblit=False*, *lineprops=None*, *rectprops=None*, *spancoords='data'*, *button=None*, *maxdist=10*, *marker_props=None*, *interactive=False*, *state_modifier_keys=None*)

Bases: *matplotlib.widgets.RectangleSelector*

Select an elliptical region of an axes.

For the cursor to remain responsive you must keep a reference to it.

Example usage:

```
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.widgets import EllipseSelector

def onselect(eclick, erelease):
    "eclick and erelease are matplotlib events at press and release."
    print('startposition: (%f, %f)' % (eclick.xdata, eclick.ydata))
    print('endposition  : (%f, %f)' % (erelease.xdata, erelease.ydata))
    print('used button  : ', eclick.button)

def toggle_selector(event):
    print(' Key pressed.')
    if event.key in ['Q', 'q'] and toggle_selector.ES.active:
        print('EllipseSelector deactivated.')
        toggle_selector.RS.set_active(False)
    if event.key in ['A', 'a'] and not toggle_selector.ES.active:
        print('EllipseSelector activated.')
        toggle_selector.ES.set_active(True)

x = np.arange(100.) / 99
y = np.sin(x)
fig, ax = plt.subplots()
ax.plot(x, y)

toggle_selector.ES = EllipseSelector(ax, onselect, drawtype='line')
fig.canvas.mpl_connect('key_press_event', toggle_selector)
plt.show()
```

Parameters

ax

[*Axes*] The parent axes for the widget.

onselect

[function] A callback function that is called after a selection is completed. It must have the signature:

```
def onselect(eclick: MouseEvent, erelease: MouseEvent)
```

where *eclick* and *erelease* are the mouse click and release *MouseEvent*s that start and complete the selection.

drawtype

[{"box", "line", "none"}, default: "box"] Whether to draw the full rectangle box, the diagonal line of the rectangle, or nothing at all.

minspanx

[float, default: 0] Selections with an x-span less than *minspanx* are ignored.

minspany

[float, default: 0] Selections with an y-span less than *minspany* are ignored.

useblit

[bool, default: False] Whether to use blitting for faster drawing (if supported by the backend).

lineprops

[dict, optional] Properties with which the line is drawn, if `drawtype == "line"`. Default:

```
dict(color="black", linestyle="-", linewidth=2, alpha=0.5)
```

rectprops

[dict, optional] Properties with which the rectangle is drawn, if `drawtype == "box"`. Default:

```
dict(facecolor="red", edgecolor="black", alpha=0.2, fill=True)
```

spancoords

[{"data", "pixels"}, default: "data"] Whether to interpret *minspanx* and *minspany* in data or in pixel coordinates.

button

[*MouseButton*, list of *MouseButton*, default: all buttons] Button(s) that trigger rectangle selection.

maxdist

[float, default: 10] Distance in pixels within which the interactive tool handles can be activated.

marker_props

[dict] Properties with which the interactive handles are drawn. Currently not implemented and ignored.

interactive

[bool, default: False] Whether to draw a set of handles that allow interaction with the widget after it is drawn.

state_modifier_keys

[dict, optional] Keyboard modifiers which affect the widget's behavior. Values amend the defaults.

- "move": Move the existing shape, default: no modifier.
- "clear": Clear the current shape, default: "escape".
- "square": Makes the shape square, default: "shift".
- "center": Make the initial point the center of the shape, default: "ctrl".

"square" and "center" can be combined.

`draw_shape`(*self*, *extents*)

`class matplotlib.widgets.Lasso`(*ax*, *xy*, *callback=None*, *useblit=True*)

Bases: *matplotlib.widgets.AxesWidget*

Selection curve of an arbitrary shape.

The selected path can be used in conjunction with *contains_point* to select data points from an image.

Unlike *LassoSelector*, this must be initialized with a starting point *xy*, and the *Lasso* events are destroyed upon release.

Parameters

ax

[*Axes*] The parent axes for the widget.

xy

[(float, float)] Coordinates of the start of the lasso.

callback

[callable] Whenever the lasso is released, the *callback* function is called and passed the vertices of the selected path.

`onmove`(*self*, *event*)

`onrelease`(*self*, *event*)

class matplotlib.widgets.**LassoSelector**(*ax*, *onselect=None*, *useblit=True*, *lineprops=None*, *button=None*)

Bases: matplotlib.widgets._SelectorWidget

Selection curve of an arbitrary shape.

For the selector to remain responsive you must keep a reference to it.

The selected path can be used in conjunction with *contains_point* to select data points from an image.

In contrast to *Lasso*, *LassoSelector* is written with an interface similar to *RectangleSelector* and *SpanSelector*, and will continue to interact with the axes until disconnected.

Example usage:

```
ax = subplot(111)
ax.plot(x, y)

def onselect(verts):
    print(verts)
lasso = LassoSelector(ax, onselect)
```

Parameters

ax

[*Axes*] The parent axes for the widget.

onselect

[function] Whenever the lasso is released, the *onselect* function is called and passed the vertices of the selected path.

button

[*MouseButton* or list of *MouseButton*, optional] The mouse buttons used for rectangle selection. Default is None, which corresponds to all buttons.

onpress(*self*, *event*)

onrelease(*self*, *event*)

class matplotlib.widgets.**LockDraw**

Bases: object

Some widgets, like the cursor, draw onto the canvas, and this is not desirable under all circumstances, like when the toolbar is in zoom-to-rect mode and drawing a rectangle. To avoid this, a widget can acquire a canvas' lock with canvas.widgetlock(widget) before drawing on the canvas; this will prevent other widgets from doing so at the same time (if they also try to acquire the lock first).

`available`(*self*, *o*)
Return whether drawing is available to *o*.

`isowner`(*self*, *o*)
Return whether *o* owns this lock.

`locked`(*self*)
Return whether the lock is currently held by an owner.

`release`(*self*, *o*)
Release the lock from *o*.

`class matplotlib.widgets.MultiCursor`(*canvas*, *axes*, *useblit=True*, *horizOn=False*, *vertOn=True*, ***lineprops*)
Bases: *matplotlib.widgets.Widget*

Provide a vertical (default) and/or horizontal line cursor shared between multiple axes.

For the cursor to remain responsive you must keep a reference to it.

Example usage:

```
from matplotlib.widgets import MultiCursor
import matplotlib.pyplot as plt
import numpy as np

fig, (ax1, ax2) = plt.subplots(nrows=2, sharex=True)
t = np.arange(0.0, 2.0, 0.01)
ax1.plot(t, np.sin(2*np.pi*t))
ax2.plot(t, np.sin(4*np.pi*t))

multi = MultiCursor(fig.canvas, (ax1, ax2), color='r', lw=1,
                    horizOn=False, vertOn=True)
plt.show()
```

`clear`(*self*, *event*)
Clear the cursor.

`connect`(*self*)
Connect events.

`disconnect`(*self*)
Disconnect events.

`onmove`(*self*, *event*)

`class matplotlib.widgets.PolygonSelector`(*ax*, *onselect*, *useblit=False*, *lineprops=None*, *markerprops=None*, *vertex_select_radius=15*)
Bases: `matplotlib.widgets._SelectorWidget`

Select a polygon region of an axes.

Place vertices with each mouse click, and make the selection by completing the polygon (clicking on the first vertex). Hold the *ctrl* key and click and drag a

vertex to reposition it (the *ctrl* key is not necessary if the polygon has already been completed). Hold the *shift* key and click and drag anywhere in the axes to move all vertices. Press the *esc* key to start a new polygon.

For the selector to remain responsive you must keep a reference to it.

Parameters

ax

[*Axes*] The parent axes for the widget.

onselect

[function] When a polygon is completed or modified after completion, the *onselect* function is called and passed a list of the vertices as `(xdata, ydata)` tuples.

useblit

[bool, default: False]

lineprops

[dict, default: `dict(color='k', linestyle='-', linewidth=2, alpha=0.5)`.] Artist properties for the line representing the edges of the polygon.

markerprops

[dict, default: `dict(marker='o', markersize=7, mec='k', mfc='k', alpha=0.5)`.] Artist properties for the markers drawn at the vertices of the polygon.

vertex_select_radius

[float, default: 15px] A vertex is selected (to complete the polygon or to move a vertex) if the mouse click is within *vertex_select_radius* pixels of the vertex.

Examples

/gallery/widgets/polygon_selector_demo

`onmove`(*self*, *event*)
Cursor move event handler and validator

`property verts`
The polygon vertices, as a list of `(x, y)` pairs.

`class matplotlib.widgets.RadioButtons`(*ax*, *labels*, *active=0*, *activecolor='blue'*)
Bases: *matplotlib.widgets.AxesWidget*

A GUI neutral radio button.

For the buttons to remain responsive you must keep a reference to this object.

Connect to the RadioButtons with the *on_clicked* method.

Attributes

ax

[*Axes*] The parent axes for the widget.

activecolor

[color] The color of the selected button.

labels

[list of *Text*] The button labels.

circles

[list of *Circle*] The buttons.

value_selected

[str] The label text of the currently selected button.

Add radio buttons to an *Axes*.

Parameters

ax

[*Axes*] The axes to add the buttons to.

labels

[list of str] The button labels.

active

[int] The index of the initially selected button.

activecolor

[color] The color of the selected button.

`disconnect`(*self*, *cid*)
Remove the observer with connection id *cid*.

`on_clicked`(*self*, *func*)
Connect the callback function *func* to button click events.

Returns a connection id, which can be used to disconnect the callback.

`set_active`(*self*, *index*)
Select button with number *index*.

Callbacks will be triggered if `eventson` is True.

class matplotlib.widgets.**RectangleSelector**(*ax*, *onselect*, *drawtype='box'*, *minspanx=0*, *minspany=0*, *useblit=False*, *lineprops=None*, *rectprops=None*, *spancoords='data'*, *button=None*, *maxdist=10*, *marker_props=None*, *interactive=False*, *state_modifier_keys=None*)

Bases: matplotlib.widgets._SelectorWidget

Select a rectangular region of an axes.

For the cursor to remain responsive you must keep a reference to it.

Examples

/gallery/widgets/rectangle_selector

Parameters

ax

[*Axes*] The parent axes for the widget.

onselect

[function] A callback function that is called after a selection is completed. It must have the signature:

```
def onselect(eclick: MouseEvent, erelease: MouseEvent)
```

where *eclick* and *erelease* are the mouse click and release *MouseEvent*s that start and complete the selection.

drawtype

[{"box", "line", "none"}, default: "box"] Whether to draw the full rectangle box, the diagonal line of the rectangle, or nothing at all.

minspanx

[float, default: 0] Selections with an x-span less than *minspanx* are ignored.

minspany

[float, default: 0] Selections with an y-span less than *minspany* are ignored.

useblit

[bool, default: False] Whether to use blitting for faster drawing (if supported by the backend).

lineprops

[dict, optional] Properties with which the line is drawn, if `drawtype == "line"`. Default:

```
dict(color="black", linestyle="-", linewidth=2, alpha=0.5)
```

rectprops

[dict, optional] Properties with which the rectangle is drawn, if `drawtype == "box"`. Default:

```
dict(facecolor="red", edgecolor="black", alpha=0.2, fill=True)
```

spancoords

[{"data", "pixels"}, default: "data"] Whether to interpret *minspanx* and *minspany* in data or in pixel coordinates.

button

[*MouseButton*, list of *MouseButton*, default: all buttons] Button(s) that trigger rectangle selection.

maxdist

[float, default: 10] Distance in pixels within which the interactive tool handles can be activated.

marker_props

[dict] Properties with which the interactive handles are drawn. Currently not implemented and ignored.

interactive

[bool, default: False] Whether to draw a set of handles that allow interaction with the widget after it is drawn.

state_modifier_keys

[dict, optional] Keyboard modifiers which affect the widget's behavior. Values amend the defaults.

- "move": Move the existing shape, default: no modifier.
- "clear": Clear the current shape, default: "escape".
- "square": Makes the shape square, default: "shift".
- "center": Make the initial point the center of the shape, default: "ctrl".

"square" and "center" can be combined.

`property center`
Center of rectangle

property corners
Corners of rectangle from lower left, moving clockwise.

draw_shape(*self*, *extents*)

property edge_centers
Midpoint of rectangle edges from left, moving clockwise.

property extents
Return (xmin, xmax, ymin, ymax).

property geometry
Return an array of shape (2, 5) containing the x (`RectangleSelector.geometry[1, :]`) and y (`RectangleSelector.geometry[0, :]`) coordinates of the four corners of the rectangle starting and ending in the top left corner.

class matplotlib.widgets.Slider(*ax*, *label*, *valmin*, *valmax*, *valinit=0.5*, *valfmt=None*, *closedmin=True*, *closedmax=True*, *slidermin=None*, *slidermax=None*, *dragging=True*, *valstep=None*, *orientation='horizontal'*, ***kwargs*)

Bases: *matplotlib.widgets.AxesWidget*

A slider representing a floating point range.

Create a slider from *valmin* to *valmax* in axes *ax*. For the slider to remain responsive you must maintain a reference to it. Call *on_changed()* to connect to the slider event.

Attributes

val

[float] Slider value.

Parameters

ax

[Axes] The Axes to put the slider in.

label

[str] Slider label.

valmin

[float] The minimum value of the slider.

valmax

[float] The maximum value of the slider.

valinit

[float, default: 0.5] The slider initial position.

valfmt

[str, default: None] %-format string used to format the slider value. If None, a *ScalarFormatter* is used instead.

closedmin

[bool, default: True] Whether the slider interval is closed on the bottom.

closedmax

[bool, default: True] Whether the slider interval is closed on the top.

slidermin

[Slider, default: None] Do not allow the current slider to have a value less than the value of the Slider *slidermin*.

slidermax

[Slider, default: None] Do not allow the current slider to have a value greater than the value of the Slider *slidermax*.

dragging

[bool, default: True] If True the slider can be dragged by the mouse.

valstep

[float, default: None] If given, the slider will snap to multiples of *valstep*.

orientation

[{'horizontal', 'vertical'}, default: 'horizontal'] The orientation of the slider.

Notes

Additional kwargs are passed on to `self.poly` which is the *Rectangle* that draws the slider knob. See the *Rectangle* documentation for valid property names (`facecolor`, `edgecolor`, `alpha`, etc.).

`disconnect`(*self*, *cid*)

Remove the observer with connection id *cid*

Parameters

cid

[int] Connection id of the observer to be removed

on_changed(*self*, *func*)
When the slider value is changed call *func* with the new slider value

Parameters

func

[callable] Function to call when slider is changed. The function must accept a single float as its arguments.

Returns

int

Connection id (which can be used to disconnect *func*)

reset(*self*)
Reset the slider to the initial value

set_val(*self*, *val*)
Set slider value to *val*

Parameters

val

[float]

class matplotlib.widgets.**SpanSelector**(*ax*, *onselect*, *direction*, *minspan=None*, *useblit=False*, *rectprops=None*, *onmove_callback=None*, *span_stays=False*, *button=None*)
Bases: matplotlib.widgets._SelectorWidget

Visually select a min/max range on a single axis and call a function with those values.

To guarantee that the selector remains responsive, keep a reference to it.

In order to turn off the SpanSelector, set span_selector.active to False. To turn it back on, set it to True.

Parameters

ax

[*matplotlib.axes.Axes*]

onselect

[func(min, max), min/max are floats]

direction

[{"horizontal", "vertical"}] The direction along which to draw the span selector.

minspan

[float, default: None] If selection is less than *minspan*, do not call *onselect*.

useblit

[bool, default: False] If True, use the backend-dependent blitting features for faster canvas updates.

rectprops

[dict, default: None] Dictionary of *matplotlib.patches.Patch* properties.

onmove_callback

[func(min, max), min/max are floats, default: None] Called on mouse move while the span is being selected.

span_stays

[bool, default: False] If True, the span stays visible after the mouse is released.

button

[*MouseButton* or list of *MouseButton*] The mouse buttons which activate the span selector.

Examples

```
>>> import matplotlib.pyplot as plt
>>> import matplotlib.widgets as mwidgets
>>> fig, ax = plt.subplots()
>>> ax.plot([1, 2, 3], [10, 50, 100])
>>> def onselect(vmin, vmax):
...     print(vmin, vmax)
>>> rectprops = dict(facecolor='blue', alpha=0.5)
>>> span = mwidgets.SpanSelector(ax, onselect, 'horizontal',
...                              rectprops=rectprops)
>>> fig.show()
```

See also: /gallery/widgets/span_selector

`ignore`(*self*, *event*)
Return whether *event* should be ignored.

This method should be called at the beginning of any event callback.

`new_axes`(*self*, *ax*)
Set SpanSelector to operate on a new Axes.

class matplotlib.widgets.SubplotTool(*targetfig*, *toolfig*)

Bases: *matplotlib.widgets.Widget*

A tool to adjust the subplot params of a *matplotlib.figure.Figure*.

Parameters

targetfig

[*Figure*] The figure instance to adjust.

toolfig

[*Figure*] The figure instance to embed the subplot tool into.

property axbottom

property axhspace

property axleft

property axright

property axtop

property axwspace

funcbottom(*self*, *val*)

[*Deprecated*]

Notes

Deprecated since version 3.3:

funchspace(*self*, *val*)

[*Deprecated*]

Notes

Deprecated since version 3.3:

funcleft(*self*, *val*)

[*Deprecated*]

Notes

Deprecated since version 3.3:

`funcright`(*self*, *val*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`functop`(*self*, *val*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`funcwspace`(*self*, *val*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

`class matplotlib.widgets.TextBox`(*ax*, *label*, *initial=''*, *color='.95'*, *hovercolor='1'*, *label_pad=0.01*)

Bases: *matplotlib.widgets.AxesWidget*

A GUI neutral text input box.

For the text box to remain responsive you must keep a reference to it.

Call *on_text_change* to be updated whenever the text changes.

Call *on_submit* to be updated whenever the user hits enter or leaves the text entry field.

Attributes

ax

[*Axes*] The parent axes for the widget.

label

[*Text*]

color

[color] The color of the text box when not hovering.

hovercolor

[color] The color of the text box when hovering.

Parameters

ax

[*Axes*] The *Axes* instance the button will be placed into.

label

[str] Label for this text box.

initial

[str] Initial value in the text box.

color

[color] The color of the box.

hovercolor

[color] The color of the box when the mouse is over it.

label_pad

[float] The distance between the label and the right side of the textbox.

`begin_typing`(*self*, *x*)

`disconnect`(*self*, *cid*)
Remove the observer with connection id *cid*.

`on_submit`(*self*, *func*)
When the user hits enter or leaves the submission box, call this *func* with event.

A connection id is returned which can be used to disconnect.

`on_text_change`(*self*, *func*)
When the text changes, call this *func* with event.

A connection id is returned which can be used to disconnect.

`property params_to_disable`

`position_cursor`(*self*, *x*)

`set_val`(*self*, *val*)

`stop_typing`(*self*)

`property text`

class matplotlib.widgets.ToolHandles(*ax*, *x*, *y*, *marker='o'*, *marker_props=None*, *useblit=True*)

Bases: object

Control handles for canvas tools.

Parameters

ax

[*matplotlib.axes.Axes*] Matplotlib axes where tool handles are displayed.

x, y

[1D arrays] Coordinates of control handles.

marker

[str] Shape of marker used to display handle. See *matplotlib.pyplot.plot*.

marker_props

[dict] Additional marker properties. See *matplotlib.lines.Line2D*.

closest(*self*, *x*, *y*)
Return index and pixel distance to closest index.

set_animated(*self*, *val*)

set_data(*self*, *pts*, *y=None*)
Set x and y positions of handles

set_visible(*self*, *val*)

property x

property y

class matplotlib.widgets.Widget

Bases: object

Abstract base class for GUI neutral widgets

property active
Is the widget active?

drawon = True

eventson = True

get_active(*self*)
Get whether the widget is active.

ignore(*self*, *event*)
Return whether *event* should be ignored.

This method should be called at the beginning of any event callback.

`set_active`(*self, active*)
Set whether the widget is active.

CHAPTER

NINETEEN

TOOLKITS

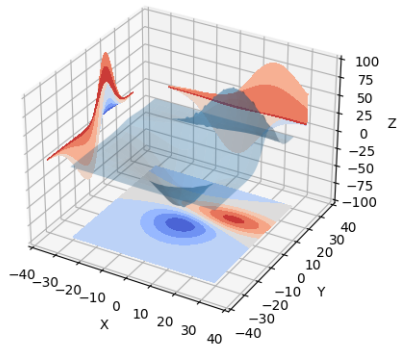
Toolkits are collections of application-specific functions that extend Matplotlib. The following toolkits are included:

19.1 Toolkits

Toolkits are collections of application-specific functions that extend Matplotlib.

19.1.1 mplot3d

`mpl_toolkits.mplot3d` provides some basic 3D plotting (scatter, surf, line, mesh) tools. Not the fastest or most feature complete 3D library out there, but it ships with Matplotlib and thus may be a lighter weight solution for some use cases. Check out the *mplot3d tutorial* for more information.

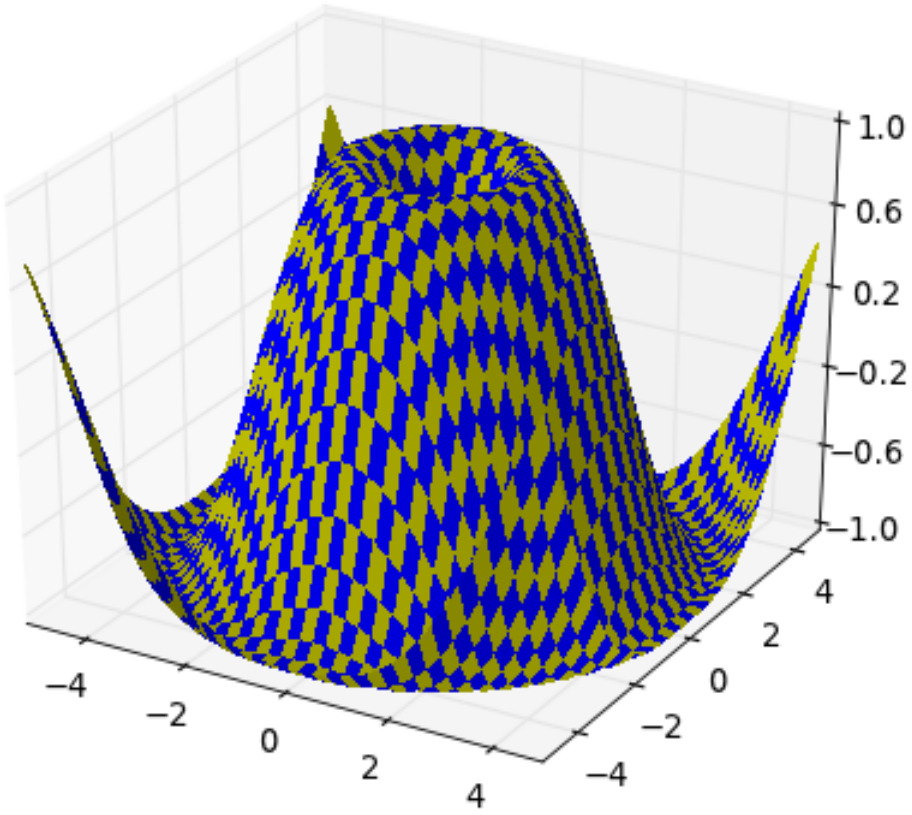


mplot3d

Matplotlib mplot3d toolkit

The mplot3d toolkit adds simple 3D plotting capabilities to matplotlib by supplying an axes object that can create a 2D projection of a 3D scene. The resulting graph will have the same look and feel as regular 2D plots.

See the *mplot3d tutorial* for more information on how to use this toolkit.



The interactive backends also provide the ability to rotate and zoom the 3D scene. One can rotate the 3D scene by simply clicking-and-dragging the scene. Zooming is done by right-clicking the scene and dragging the mouse up and down. Note that one does not use the zoom button like one would use for regular 2D plots.

mplot3d FAQ

How is mplot3d different from Mayavi?

Mayavi is a very powerful and featureful 3D graphing library. For advanced 3D scenes and excellent rendering capabilities, it is highly recommended to use Mayavi.

mplot3d was intended to allow users to create simple 3D graphs with the same "look-and-feel" as matplotlib's 2D plots. Furthermore, users can use the same toolkit that they are already familiar with to generate both their 2D and 3D plots.

My 3D plot doesn't look right at certain viewing angles

This is probably the most commonly reported issue with mplot3d. The problem is that -- from some viewing angles -- a 3D object would appear in front of another object, even though it is physically behind it. This can result in plots that do not look "physically correct."

Unfortunately, while some work is being done to reduce the occurrence of this artifact, it is currently an intractable problem, and can not be fully solved until matplotlib supports 3D graphics rendering at its core.

The problem occurs due to the reduction of 3D data down to 2D + z-order scalar. A single value represents the 3rd dimension for all parts of 3D objects in a collection. Therefore, when the bounding boxes of two collections intersect, it becomes possible for this artifact to occur. Furthermore, the intersection of two 3D objects (such as polygons or patches) can not be rendered properly in matplotlib's 2D rendering engine.

This problem will likely not be solved until OpenGL support is added to all of the backends (patches are greatly welcomed). Until then, if you need complex 3D scenes, we recommend using MayaVi.

I don't like how the 3D plot is laid out, how do I change that?

Historically, mplot3d has suffered from a hard-coding of parameters used to control visuals such as label spacing, tick length, and grid line width. Work is being done to eliminate this issue. For matplotlib v1.1.0, there is a semi-official manner to modify these parameters. See the note in the *mplot3d.axis3d* section of the mplot3d API documentation for more information.

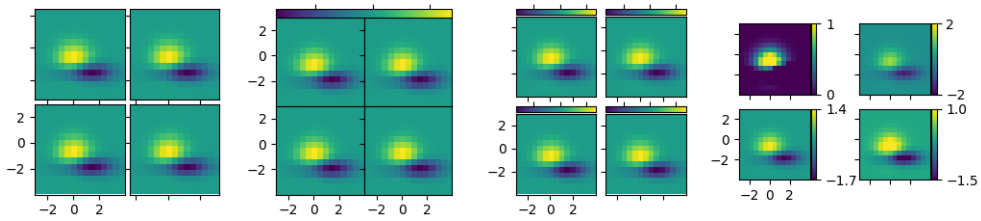
19.1.2 Matplotlib axes_grid1 Toolkit

The matplotlib *mpl_toolkits.axes_grid1* toolkit is a collection of helper classes to ease displaying multiple images in matplotlib. While the aspect parameter in matplotlib adjust the position of the single axes, axes_grid1 toolkit provides a framework to adjust the position of multiple axes according to their aspects.

See *What is axes_grid1 toolkit?* for a guide on the usage of axes_grid1.



The submodules of the axes_grid1 API are:

axes_grid1.anchored_artists	
axes_grid1.axes_divider	Helper classes to adjust the positions of multiple axes at drawing time.
axes_grid1.axes_grid	
axes_grid1.axes_rgb	
axes_grid1.axes_size	Provides classes of simple units that will be used with AxesDivider class (or others) to determine the size of each axes.
axes_grid1.colorbar	Colorbar toolkit with two classes and a function:
axes_grid1.inset_locator	A collection of functions and objects for creating or placing inset axes.
axes_grid1.mpl_axes	
axes_grid1.parasite_axes	

mpl_toolkits.axes_grid1.anchored_artists

Classes

AnchoredAuxTransformBox(transform, loc[, ...])	An anchored container with transformed coordinates.
AnchoredDirectionArrows(transform, label_x, ...)	Draw two perpendicular arrows to indicate directions.
AnchoredDrawingArea(width, height, xdescent, ...)	An anchored container with a fixed size and fillable DrawingArea.
AnchoredEllipse(transform, width, height, ...)	Draw an anchored ellipse of a given size.
AnchoredSizeBar(transform, size, label, loc)	Draw a horizontal scale bar with a center-aligned label underneath.

mpl_toolkits.axes_grid1.anchored_artists.AnchoredAuxTransformBox

class mpl_toolkits.axes_grid1.anchored_artists.**AnchoredAuxTransformBox**(*transform*, *loc*, *pad=0.4*, *borderpad=0.5*, *prop=None*, *frameon=True*, ***kwargs*)

Bases: *matplotlib.offsetbox.AnchoredOffsetbox*

An anchored container with transformed coordinates.

Artists added to the *drawing_area* are scaled according to the coordinates of the transformation used. The dimensions of this artist will scale to contain the artists added.

Parameters

transform

[*matplotlib.transforms.Transform*] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transData`.

loc

[int] Location of this artist. Valid location codes are:

```
'upper right'  : 1,
'upper left'   : 2,
```

(continues on next page)

(continued from previous page)

```
'lower left'   : 3,
'lower right'  : 4,
'right'        : 5,
'center left'  : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center'       : 10
```

pad

[float, default: 0.4] Padding around the child objects, in fraction of the font size.

borderpad

[float, default: 0.5] Border padding, in fraction of the font size.

prop

[*matplotlib.font_manager.FontProperties*, optional] Font property used as a reference for paddings.

frameon

[bool, default: True] If True, draw a box around this artists.

****kwargs**

Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

Examples

To display an ellipse in the upper left, with a width of 0.1 and height of 0.4 in data coordinates:

```
>>> box = AnchoredAuxTransformBox(ax.transData, loc='upper left')
>>> el = Ellipse((0, 0), width=0.1, height=0.4, angle=30)
>>> box.drawing_area.add_artist(el)
>>> ax.add_artist(box)
```

Attributes

drawing_area

[*matplotlib.offsetbox.AuxTransformBox*] A container for artists to display.

`__init__`(*self*, *transform*, *loc*, *pad=0.4*, *borderpad=0.5*, *prop=None*, *frameon=True*, ***kwargs*)

An anchored container with transformed coordinates.

Artists added to the *drawing_area* are scaled according to the coordinates of the transformation used. The dimensions of this artist will scale to contain the artists added.

Parameters

transform

[*matplotlib.transforms.Transform*] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transData`.

loc

[int] Location of this artist. Valid location codes are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4,
'right'        : 5,
'center left'  : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center'       : 10
```

pad

[float, default: 0.4] Padding around the child objects, in fraction of the font size.

borderpad

[float, default: 0.5] Border padding, in fraction of the font size.

prop

[*matplotlib.font_manager.FontProperties*, optional] Font property used as a reference for paddings.

frameon

[bool, default: True] If True, draw a box around this artists.

****kwargs**

Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

Examples

To display an ellipse in the upper left, with a width of 0.1 and height of 0.4 in data coordinates:

```
>>> box = AnchoredAuxTransformBox(ax.transData, loc='upper left')
>>> el = Ellipse((0, 0), width=0.1, height=0.4, angle=30)
>>> box.drawing_area.add_artist(el)
>>> ax.add_artist(box)
```

Attributes

drawing_area

[*matplotlib.offsetbox.AuxTransformBox*] A container for artists to display.

```
__module__ = 'mpl_toolkits.axes_grid1.anchored_artists'
```

Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredAuxTransformBox`

- sphx_glr_gallery_userdemo_anchored_box03.py

mpl_toolkits.axes_grid1.anchored_artists.AnchoredDirectionArrows

class mpl_toolkits.axes_grid1.anchored_artists.**AnchoredDirectionArrows**(*transform*, *label_x*, *label_y*, *length=0.15*, *fontsize=0.08*, *loc=2*, *angle=0*, *aspect_ratio=1*, *pad=0.4*, *borderpad=0.4*, *frameon=False*, *color='w'*, *alpha=1*, *sep_x=0.01*, *sep_y=0*, *fontproperties=None*, *back_length=0.15*, *head_width=10*, *head_length=15*, *tail_width=2*, *text_props=None*, *arrow_props=None*, ***kwargs*)

Bases: *matplotlib.offsetbox.AnchoredOffsetbox*

Draw two perpendicular arrows to indicate directions.

Parameters

transform

[*matplotlib.transforms.Transform*] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transAxes`.

label_x, label_y

[str] Label text for the x and y arrows

length

[float, default: 0.15] Length of the arrow, given in coordinates of *transform*.

fontsize

[float, default: 0.08] Size of label strings, given in coordinates of *transform*.

loc

[int, default: 2] Location of the direction arrows. Valid location codes are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4,
'right'        : 5,
'center left'  : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center'       : 10
```

angle

[float, default: 0] The angle of the arrows in degrees.

aspect_ratio

[float, default: 1] The ratio of the length of arrow_x and arrow_y. Negative numbers can be used to change the direction.

pad

[float, default: 0.4] Padding around the labels and arrows, in fraction of the font size.

borderpad

[float, default: 0.4] Border padding, in fraction of the font size.

frameon

[bool, default: False] If True, draw a box around the arrows and labels.

color

[str, default: 'white'] Color for the arrows and labels.

alpha

[float, default: 1] Alpha values of the arrows and labels

sep_x, sep_y

[float, default: 0.01 and 0 respectively] Separation between the arrows and labels in coordinates of *transform*.

fontproperties

[*matplotlib.font_manager.FontProperties*, optional] Font properties for the label text.

back_length

[float, default: 0.15] Fraction of the arrow behind the arrow crossing.

head_width

[float, default: 10] Width of arrow head, sent to ArrowStyle.

head_length

[float, default: 15] Length of arrow head, sent to ArrowStyle.

tail_width

[float, default: 2] Width of arrow tail, sent to ArrowStyle.

text_props, arrow_props

[dict] Properties of the text and arrows, passed to *textpath.TextPath* and *patches.FancyArrowPatch*.

****kwargs**

Keyword arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

Notes

If *prop* is passed as a keyword argument, but *fontproperties* is not, then *prop* is be assumed to be the intended *fontproperties*. Using both *prop* and *fontproperties* is not supported.

Examples

```
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import (
...     AnchoredDirectionArrows)
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10, 10)))
```

(continues on next page)

(continued from previous page)

```
>>> arrows = AnchoredDirectionArrows(ax.transAxes, '111', '110')
>>> ax.add_artist(arrows)
>>> fig.show()
```

Using several of the optional parameters, creating downward pointing arrow and high contrast text labels.

```
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(family='monospace')
>>> arrows = AnchoredDirectionArrows(ax.transAxes, 'East', 'South',
...                                  loc='lower left', color='k',
...                                  aspect_ratio=-1, sep_x=0.02,
...                                  sep_y=-0.01,
...                                  text_props={'ec':'w', 'fc':'k'},
...                                  fontproperties=fontprops)
```

Attributes

arrow_x, arrow_y

[*matplotlib.patches.FancyArrowPatch*] Arrow x and y

text_path_x, text_path_y

[*matplotlib.textpath.TextPath*] Path for arrow labels

p_x, p_y

[*matplotlib.patches.PathPatch*] Patch for arrow labels

box

[*matplotlib.offsetbox.AuxTransformBox*] Container for the arrows and labels.

`__init__`(*self*, *transform*, *label_x*, *label_y*, *length=0.15*, *fontsize=0.08*, *loc=2*, *angle=0*, *aspect_ratio=1*, *pad=0.4*, *borderpad=0.4*, *frameon=False*, *color='w'*, *alpha=1*, *sep_x=0.01*, *sep_y=0*, *fontproperties=None*, *back_length=0.15*, *head_width=10*, *head_length=15*, *tail_width=2*, *text_props=None*, *arrow_props=None*, ***kwargs*)

Draw two perpendicular arrows to indicate directions.

Parameters

transform

[*matplotlib.transforms.Transform*] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transAxes`.

label_x, label_y

[str] Label text for the x and y arrows

length

[float, default: 0.15] Length of the arrow, given in coordinates of *transform*.

fontsize

[float, default: 0.08] Size of label strings, given in coordinates of *transform*.

loc

[int, default: 2] Location of the direction arrows. Valid location codes are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4,
'right'        : 5,
'center left'  : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center'       : 10
```

angle

[float, default: 0] The angle of the arrows in degrees.

aspect_ratio

[float, default: 1] The ratio of the length of arrow_x and arrow_y. Negative numbers can be used to change the direction.

pad

[float, default: 0.4] Padding around the labels and arrows, in fraction of the font size.

borderpad

[float, default: 0.4] Border padding, in fraction of the font size.

frameon

[bool, default: False] If True, draw a box around the arrows and labels.

color

[str, default: 'white'] Color for the arrows and labels.

alpha

[float, default: 1] Alpha values of the arrows and labels

sep_x, sep_y

[float, default: 0.01 and 0 respectively] Separation between the arrows and labels in coordinates of *transform*.

fontproperties

[*matplotlib.font_manager.FontProperties*, optional] Font properties for the label text.

back_length

[float, default: 0.15] Fraction of the arrow behind the arrow crossing.

head_width

[float, default: 10] Width of arrow head, sent to ArrowStyle.

head_length

[float, default: 15] Length of arrow head, sent to ArrowStyle.

tail_width

[float, default: 2] Width of arrow tail, sent to ArrowStyle.

text_props, arrow_props

[dict] Properties of the text and arrows, passed to *textpath.TextPath* and *patches.FancyArrowPatch*.

****kwargs**

Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

Notes

If *prop* is passed as a keyword argument, but *fontproperties* is not, then *prop* is be assumed to be the intended *fontproperties*. Using both *prop* and *fontproperties* is not supported.

Examples

```
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import (
...     AnchoredDirectionArrows)
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10, 10)))
>>> arrows = AnchoredDirectionArrows(ax.transAxes, '111', '110')
>>> ax.add_artist(arrows)
>>> fig.show()
```

Using several of the optional parameters, creating downward pointing arrow and high contrast text labels.

```
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(family='monospace')
>>> arrows = AnchoredDirectionArrows(ax.transAxes, 'East', 'South',
...                                  loc='lower left', color='k',
...                                  aspect_ratio=-1, sep_x=0.02,
...                                  sep_y=-0.01,
...                                  text_props={'ec':'w', 'fc':'k'},
...                                  fontproperties=fontprops)
```

Attributes

arrow_x, arrow_y

[*matplotlib.patches.FancyArrowPatch*] Arrow x and y

text_path_x, text_path_y

[*matplotlib.textpath.TextPath*] Path for arrow labels

p_x, p_y

[*matplotlib.patches.PathPatch*] Patch for arrow labels

box

[*matplotlib.offsetbox.AuxTransformBox*] Container for the arrows and labels.

```
__module__ = 'mpl_toolkits.axes_grid1.anchored_artists'
```

Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredDirectionArrows`

- sphx_glr_gallery_axes_grid1_demo_anchored_direction_arrows.py

mpl_toolkits.axes_grid1.anchored_artists.AnchoredDrawingArea

class mpl_toolkits.axes_grid1.anchored_artists.**AnchoredDrawingArea**(*width*, *height*, *xdescent*, *ydescent*, *loc*, *pad=0.4*, *borderpad=0.5*, *prop=None*, *frameon=True*, ***kwargs*)

Bases: *matplotlib.offsetbox.AnchoredOffsetbox*

An anchored container with a fixed size and fillable DrawingArea.

Artists added to the *drawing_area* will have their coordinates interpreted as pixels. Any transformations set on the artists will be overridden.

Parameters

width, height

[float] width and height of the container, in pixels.

xdescent, ydescent

[float] descent of the container in the x- and y- direction, in pixels.

loc

[int] Location of this artist. Valid location codes are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4,
'right'        : 5,
'center left'  : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center'       : 10
```

pad

[float, default: 0.4] Padding around the child objects, in fraction of the font size.

borderpad

[float, default: 0.5] Border padding, in fraction of the font size.

prop

[*matplotlib.font_manager.FontProperties*, optional] Font property used as a reference for paddings.

frameon

[bool, default: True] If True, draw a box around this artists.

****kwargs**

Keyword arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

Examples

To display blue and red circles of different sizes in the upper right of an axes *ax*:

```
>>> ada = AnchoredDrawingArea(20, 20, 0, 0,
...                           loc='upper right', frameon=False)
>>> ada.drawing_area.add_artist(Circle((10, 10), 10, fc="b"))
>>> ada.drawing_area.add_artist(Circle((30, 10), 5, fc="r"))
>>> ax.add_artist(ada)
```

Attributes

drawing_area

[*matplotlib.offsetbox.DrawingArea*] A container for artists to display.

`__init__`(*self*, *width*, *height*, *xdescent*, *ydescent*, *loc*, *pad=0.4*, *borderpad=0.5*, *prop=None*, *frameon=True*, ***kwargs*)

An anchored container with a fixed size and fillable DrawingArea.

Artists added to the *drawing_area* will have their coordinates interpreted as pixels. Any transformations set on the artists will be overridden.

Parameters

width, height

[float] width and height of the container, in pixels.

xdescent, ydescent

[float] descent of the container in the x- and y- direction, in pixels.

loc

[int] Location of this artist. Valid location codes are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4,
'right'        : 5,
'center left'  : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center'       : 10
```

pad

[float, default: 0.4] Padding around the child objects, in fraction of the font size.

borderpad

[float, default: 0.5] Border padding, in fraction of the font size.

prop

[*matplotlib.font_manager.FontProperties*, optional] Font property used as a reference for paddings.

frameon

[bool, default: True] If True, draw a box around this artists.

****kwargs**

Keywords arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

Examples

To display blue and red circles of different sizes in the upper right of an axes *ax*:

```
>>> ada = AnchoredDrawingArea(20, 20, 0, 0,
...                           loc='upper right', frameon=False)
>>> ada.drawing_area.add_artist(Circle((10, 10), 10, fc="b"))
>>> ada.drawing_area.add_artist(Circle((30, 10), 5, fc="r"))
>>> ax.add_artist(ada)
```

Attributes

drawing_area

[*matplotlib.offsetbox.DrawingArea*] A container for artists to display.

```
__module__ = 'mpl_toolkits.axes_grid1.anchored_artists'
```

Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredDrawingArea`

- sphx_glr_gallery_axes_grid1_simple_anchored_artists.py
- sphx_glr_gallery_userdemo_anchored_box02.py

mpl_toolkits.axes_grid1.anchored_artists.AnchoredEllipse

class mpl_toolkits.axes_grid1.anchored_artists.**AnchoredEllipse**(*transform*, *width*, *height*, *angle*, *loc*, *pad=0.1*, *borderpad=0.1*, *prop=None*, *frameon=True*, ***kwargs*)

Bases: *matplotlib.offsetbox.AnchoredOffsetbox*

Draw an anchored ellipse of a given size.

Parameters

transform

[*matplotlib.transforms.Transform*] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transData`.

width, height

[float] Width and height of the ellipse, given in coordinates of *transform*.

angle

[float] Rotation of the ellipse, in degrees, anti-clockwise.

loc

[int] Location of this size bar. Valid location codes are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4,
'right'        : 5,
'center left'  : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center'       : 10
```

pad

[float, optional] Padding around the ellipse, in fraction of the font size. Defaults to 0.1.

borderpad

[float, default: 0.1] Border padding, in fraction of the font size.

frameon

[bool, default: True] If True, draw a box around the ellipse.

prop

[*matplotlib.font_manager.FontProperties*, optional] Font property used as a reference for paddings.

****kwargs**

Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

Attributes

ellipse

[*matplotlib.patches.Ellipse*] Ellipse patch drawn.

`__init__`(*self*, *transform*, *width*, *height*, *angle*, *loc*, *pad=0.1*, *borderpad=0.1*, *prop=None*, *frameon=True*, ***kwargs*)

Draw an anchored ellipse of a given size.

Parameters

transform

[*matplotlib.transforms.Transform*] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transData`.

width, height

[float] Width and height of the ellipse, given in coordinates of *transform*.

angle

[float] Rotation of the ellipse, in degrees, anti-clockwise.

loc

[int] Location of this size bar. Valid location codes are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4,
'right'        : 5,
'center left'  : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center'       : 10
```

pad

[float, optional] Padding around the ellipse, in fraction of the font size. Defaults to 0.1.

borderpad

[float, default: 0.1] Border padding, in fraction of the font size.

frameon

[bool, default: True] If True, draw a box around the ellipse.

prop

[*matplotlib.font_manager.FontProperties*, optional] Font property used as a reference for paddings.

****kwargs**

Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

Attributes

ellipse

[*matplotlib.patches.Ellipse*] Ellipse patch drawn.

```
__module__ = 'mpl_toolkits.axes_grid1.anchored_artists'
```

Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredEllipse`

- sphx_glr_gallery_axes_grid1_simple_anchored_artists.py

mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar

class mpl_toolkits.axes_grid1.anchored_artists.**AnchoredSizeBar**(*transform*, *size*, *label*, *loc*, *pad=0.1*, *borderpad=0.1*, *sep=2*, *frameon=True*, *size_vertical=0*, *color='black'*, *label_top=False*, *fontproperties=None*, *fill_bar=None*, ***kwargs*)

Bases: *matplotlib.offsetbox.AnchoredOffsetbox*

Draw a horizontal scale bar with a center-aligned label underneath.

Parameters

transform

[*matplotlib.transforms.Transform*] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transData`.

size

[float] Horizontal length of the size bar, given in coordinates of *transform*.

label

[str] Label to display.

loc

[int] Location of this size bar. Valid location codes are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4,
'right'        : 5,
'center left'  : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center'       : 10
```

pad

[float, default: 0.1] Padding around the label and size bar, in fraction of the font size.

borderpad

[float, default: 0.1] Border padding, in fraction of the font size.

sep

[float, default: 2] Separation between the label and the size bar, in points.

frameon

[bool, default: True] If True, draw a box around the horizontal bar and label.

size_vertical

[float, default: 0] Vertical length of the size bar, given in coordinates of *transform*.

color

[str, default: 'black'] Color for the size bar and label.

label_top

[bool, default: False] If True, the label will be over the size bar.

fontproperties

[*matplotlib.font_manager.FontProperties*, optional] Font properties for the label text.

fill_bar

[bool, optional] If True and if size_vertical is nonzero, the size bar will be filled in with the color specified by the size bar. Defaults to True if `size_vertical` is greater than zero and False otherwise.

****kwargs**

Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

Notes

If *prop* is passed as a keyworded argument, but *fontproperties* is not, then *prop* is be assumed to be the intended *fontproperties*. Using both *prop* and *fontproperties* is not supported.

Examples

```
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import (
...     AnchoredSizeBar)
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10, 10)))
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 data units', 4)
>>> ax.add_artist(bar)
>>> fig.show()
```

Using all the optional parameters

```
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(size=14, family='monospace')
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 units', 4, pad=0.5,
...                       sep=5, borderpad=0.5, frameon=False,
...                       size_vertical=0.5, color='white',
...                       fontproperties=fontprops)
```

Attributes

size_bar

[*matplotlib.offsetbox.AuxTransformBox*] Container for the size bar.

txt_label

[*matplotlib.offsetbox.TextArea*] Container for the label of the size bar.

`__init__`(*self*, *transform*, *size*, *label*, *loc*, *pad=0.1*, *borderpad=0.1*, *sep=2*, *frameon=True*, *size_vertical=0*, *color='black'*, *label_top=False*, *fontproperties=None*, *fill_bar=None*, ***kwargs*)

Draw a horizontal scale bar with a center-aligned label underneath.

Parameters

transform

[*matplotlib.transforms.Transform*] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transData`.

size

[float] Horizontal length of the size bar, given in coordinates of *transform*.

label

[str] Label to display.

loc

[int] Location of this size bar. Valid location codes are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4,
'right'        : 5,
'center left'  : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center'       : 10
```

pad

[float, default: 0.1] Padding around the label and size bar, in fraction of the font size.

borderpad

[float, default: 0.1] Border padding, in fraction of the font size.

sep

[float, default: 2] Separation between the label and the size bar, in points.

frameon

[bool, default: True] If True, draw a box around the horizontal bar and label.

size_vertical

[float, default: 0] Vertical length of the size bar, given in coordinates of *transform*.

color

[str, default: 'black'] Color for the size bar and label.

label_top

[bool, default: False] If True, the label will be over the size bar.

fontproperties

[*matplotlib.font_manager.FontProperties*, optional] Font properties for the label text.

fill_bar

[bool, optional] If True and if size_vertical is nonzero, the size bar will be filled in with the color specified by the size bar. De-

faults to True if `size_vertical` is greater than zero and False otherwise.

****kwargs**

Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

Notes

If *prop* is passed as a keyworded argument, but *fontproperties* is not, then *prop* is be assumed to be the intended *fontproperties*. Using both *prop* and *fontproperties* is not supported.

Examples

```
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import (
...     AnchoredSizeBar)
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10, 10)))
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 data units', 4)
>>> ax.add_artist(bar)
>>> fig.show()
```

Using all the optional parameters

```
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(size=14, family='monospace')
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 units', 4, pad=0.5,
...                       sep=5, borderpad=0.5, frameon=False,
...                       size_vertical=0.5, color='white',
...                       fontproperties=fontprops)
```

Attributes

size_bar

[*matplotlib.offsetbox.AuxTransformBox*] Container for the size bar.

txt_label

[*matplotlib.offsetbox.TextArea*] Container for the label of the size bar.

```
__module__ = 'mpl_toolkits.axes_grid1.anchored_artists'
```

Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar`

- sphx_glr_gallery_axes_grid1_inset_locator_demo2.py
- sphx_glr_gallery_axes_grid1_simple_anchored_artists.py

mpl_toolkits.axes_grid1.axes_divider

Helper classes to adjust the positions of multiple axes at drawing time.

Classes

AxesDivider(axes[, xref, yref])	Divider based on the pre-existing axes.
AxesLocator(axes_divider, nx, ny[, nx1, ny1])	A simple callable object, initialized with AxesDivider class, returns the position and size of the given cell.
Divider(fig, pos, horizontal, vertical[, ...])	An Axes positioning class.
HBoxDivider(fig, *args[, horizontal, ...])	**Parameters**
SubplotDivider(fig, *args[, horizontal, ...])	The Divider class whose rectangle area is specified as a subplot geometry.
VBoxDivider(fig, *args[, horizontal, ...])	The Divider class whose rectangle area is specified as a subplot geometry.

mpl_toolkits.axes_grid1.axes_divider.AxesDivider

class mpl_toolkits.axes_grid1.axes_divider.**AxesDivider**(*axes*, *xref=None*, *yref=None*)

Bases: *mpl_toolkits.axes_grid1.axes_divider.Divider*

Divider based on the pre-existing axes.

Parameters

axes

[*Axes*]

xref

yref

__init__(*self*, *axes*, *xref=None*, *yref=None*)

Parameters

axes

[*Axes*]

xref

yref

`__module__ = 'mpl_toolkits.axes_grid1.axes_divider'`

`append_axes`(*self*, *position*, *size*, *pad=None*, *add_to_figure=True*, ***kwargs*)
Create an axes at the given *position* with the same height (or width) of the main axes.

position

["left"|"right"|"bottom"|"top"]

size and *pad* should be axes_grid.axes_size compatible.

`get_anchor`(*self*)
Return the anchor.

`get_aspect`(*self*)
Return aspect.

`get_position`(*self*)
Return the position of the rectangle.

`get_subplotspec`(*self*)

`new_horizontal`(*self*, *size*, *pad=None*, *pack_start=False*, ***kwargs*)
Add a new axes on the right (or left) side of the main axes.

Parameters

size

[*axes_size* or float or str] A width of the axes. If float or string is given, *from_any* function is used to create the size, with *ref_size* set to AxesX instance of the current axes.

pad

[*axes_size* or float or str] Pad between the axes. It takes same argument as *size*.

pack_start

[bool] If False, the new axes is appended at the end of the list, i.e., it became the right-most axes. If True, it is inserted at the start of the list, and becomes the left-most axes.

****kwargs**

All extra keywords arguments are passed to the created axes. If *axes_class* is given, the new axes will be created as an instance of the given class. Otherwise, the same class of the main axes will be used.

`new_vertical`(*self*, *size*, *pad=None*, *pack_start=False*, ***kwargs*)

Add a new axes on the top (or bottom) side of the main axes.

Parameters

size

[*axes_size* or float or str] A height of the axes. If float or string is given, *from_any* function is used to create the size, with *ref_size* set to AxesX instance of the current axes.

pad

[*axes_size* or float or str] Pad between the axes. It takes same argument as *size*.

pack_start

[bool] If False, the new axes is appended at the end of the list, i.e., it became the right-most axes. If True, it is inserted at the start of the list, and becomes the left-most axes.

****kwargs**

All extra keywords arguments are passed to the created axes. If *axes_class* is given, the new axes will be created as an instance of the given class. Otherwise, the same class of the main axes will be used.

Examples using `mpl_toolkits.axes_grid1.axes_divider.AxesDivider`

- sphx_glr_gallery_axes_grid1_demo_colorbar_with_axes_divider.py
- sphx_glr_gallery_axes_grid1_make_room_for_ylabel_using_axesgrid.py
- sphx_glr_gallery_axes_grid1_scatter_hist_locatable_axes.py
- sphx_glr_gallery_axes_grid1_simple_colorbar.py
- *Tight Layout guide*

mpl_toolkits.axes_grid1.axes_divider.AxesLocator

class mpl_toolkits.axes_grid1.axes_divider.**AxesLocator**(*axes_divider*, *nx*, *ny*, *nx1=None*, *ny1=None*)

Bases: object

A simple callable object, initialized with AxesDivider class, returns the position and size of the given cell.

Parameters

axes_divider

[AxesDivider]

nx, nx1

[int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

ny, ny1

[int] Same as *nx* and *nx1*, but for row positions.

__call__(*self*, *axes*, *renderer*)

Call self as a function.

__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.axes_divider', '__doc__':

__init__(*self*, *axes_divider*, *nx*, *ny*, *nx1=None*, *ny1=None*)

Parameters

axes_divider

[AxesDivider]

nx, nx1

[int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

ny, ny1

[int] Same as *nx* and *nx1*, but for row positions.

__module__ = 'mpl_toolkits.axes_grid1.axes_divider'

__weakref__

list of weak references to the object (if defined)

get_subplotspec(*self*)

Examples using `mpl_toolkits.axes_grid1.axes_divider.AxesLocator`

mpl_toolkits.axes_grid1.axes_divider.Divider

class mpl_toolkits.axes_grid1.axes_divider.Divider(*fig*, *pos*, *horizontal*, *vertical*, *aspect=None*, *anchor='C'*)

Bases: `object`

An Axes positioning class.

The divider is initialized with lists of horizontal and vertical sizes (*mpl_toolkits.axes_grid1.axes_size*) based on which a given rectangular area will be divided.

The *new_locator* method then creates a callable object that can be used as the *axes_locator* of the axes.

Parameters

fig

[Figure]

pos

[tuple of 4 floats] Position of the rectangle that will be divided.

horizontal

[list of *axes_size*] Sizes for horizontal division.

vertical

[list of *axes_size*] Sizes for vertical division.

aspect

[bool] Whether overall rectangular area is reduced so that the relative part of the horizontal and vertical scales have the same scale.

anchor

[{'C', 'SW', 'S', 'SE', 'E', 'NE', 'N', 'NW', 'W'}] Placement of the reduced rectangle, when *aspect* is True.

__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.axes_divider', '__doc__':

__init__(*self*, *fig*, *pos*, *horizontal*, *vertical*, *aspect=None*, *anchor='C'*)

Parameters

fig

[Figure]

pos

[tuple of 4 floats] Position of the rectangle that will be divided.

horizontal

[list of *axes_size*] Sizes for horizontal division.

vertical

[list of *axes_size*] Sizes for vertical division.

aspect

[bool] Whether overall rectangular area is reduced so that the relative part of the horizontal and vertical scales have the same scale.

anchor

[{'C', 'SW', 'S', 'SE', 'E', 'NE', 'N', 'NW', 'W'}] Placement of the reduced rectangle, when *aspect* is True.

`__module__ = 'mpl_toolkits.axes_grid1.axes_divider'`

`__weakref__`
list of weak references to the object (if defined)

`add_auto_adjustable_area`(*self*, *use_axes*, *pad=0.1*, *adjust_dirs=None*)

`append_size`(*self*, *position*, *size*)

`get_anchor`(*self*)
Return the anchor.

`get_aspect`(*self*)
Return aspect.

`get_horizontal`(*self*)
Return horizontal sizes.

`get_horizontal_sizes`(*self*, *renderer*)

`get_locator`(*self*)

`get_position`(*self*)
Return the position of the rectangle.

`get_position_runtime`(*self*, *ax*, *renderer*)

`get_vertical`(*self*)
Return vertical sizes.

`get_vertical_sizes`(*self*, *renderer*)

`get_vsize_hsize`(*self*)

`locate`(*self*, *nx*, *ny*, *nx1=None*, *ny1=None*, *axes=None*, *renderer=None*)

Parameters

nx, nx1

[int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

ny, ny1

[int] Same as *nx* and *nx1*, but for row positions.

axes

renderer

`new_locator`(*self*, *nx*, *ny*, *nx1=None*, *ny1=None*)

Return a new *AxesLocator* for the specified cell.

Parameters

nx, nx1

[int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

ny, ny1

[int] Same as *nx* and *nx1*, but for row positions.

`set_anchor`(*self*, *anchor*)

Parameters

anchor

[{'C', 'SW', 'S', 'SE', 'E', 'NE', 'N', 'NW', 'W'}]

anchor position

value	description
'C'	Center
'SW'	bottom left
'S'	bottom
'SE'	bottom right
'E'	right
'NE'	top right
'N'	top
'NW'	top left
'W'	left

`set_aspect`(*self*, *aspect=False*)

Parameters

aspect

[bool]

`set_horizontal`(*self*, *h*)

Parameters

h

[list of *axes_size*] sizes for horizontal division

`set_locator`(*self*, *_locator*)

`set_position`(*self*, *pos*)

Set the position of the rectangle.

Parameters

pos

[tuple of 4 floats] position of the rectangle that will be divided

`set_vertical`(*self*, *v*)

Parameters

v

[list of *axes_size*] sizes for vertical division

Examples using `mpl_toolkits.axes_grid1.axes_divider.Divider`

mpl_toolkits.axes_grid1.axes_divider.HBoxDivider

`class mpl_toolkits.axes_grid1.axes_divider.HBoxDivider(`*fig*, **args*, *horizontal=None*, *vertical=None*, *aspect=None*, *anchor='C'*`)`

Bases: *mpl_toolkits.axes_grid1.axes_divider.SubplotDivider*

Parameters

fig

[*matplotlib.figure.Figure*]

***args**

[tuple (*nrows*, *ncols*, *index*) or int] The array of subplots in the figure has dimensions `(nrows, ncols)`, and *index* is the index of the subplot being created. *index* starts at 1 in the upper left corner and increases to the right.

If *nrows*, *ncols*, and *index* are all single digit numbers, then *args* can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

`__module__ = 'mpl_toolkits.axes_grid1.axes_divider'`

`locate(`*self*, *nx*, *ny*, *nx1=None*, *ny1=None*, *axes=None*, *renderer=None*`)`

Parameters

axes_divider

[AxesDivider]

nx, nx1

[int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

ny, ny1

[int] Same as *nx* and *nx1*, but for row positions.

axes

renderer

`new_locator(`*self*, *nx*, *nx1=None*`)`

Create a new `AxesLocator` for the specified cell.

Parameters

nx, nx1

[int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

ny, ny1

[int] Same as *nx* and *nx1*, but for row positions.

Examples using `mpl_toolkits.axes_grid1.axes_divider.HBoxDivider`

- sphx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py

mpl_toolkits.axes_grid1.axes_divider.SubplotDivider

`class mpl_toolkits.axes_grid1.axes_divider.SubplotDivider(`*fig*, **args*, *horizontal=None*, *vertical=None*, *aspect=None*, *anchor='C'*`)`

Bases: *mpl_toolkits.axes_grid1.axes_divider.Divider*

The Divider class whose rectangle area is specified as a subplot geometry.

Parameters

fig

[*matplotlib.figure.Figure*]

***args**

[tuple (*nrows*, *ncols*, *index*) or int] The array of subplots in the figure has dimensions `(nrows, ncols)`, and *index* is the index of the subplot being created. *index* starts at 1 in the upper left corner and increases to the right.

If *nrows*, *ncols*, and *index* are all single digit numbers, then *args* can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

`__init__(`*self*, *fig*, **args*, *horizontal=None*, *vertical=None*, *aspect=None*, *anchor='C'*`)`

Parameters

fig

[*matplotlib.figure.Figure*]

***args**

[tuple (*nrows*, *ncols*, *index*) or int] The array of subplots in the figure has dimensions `(nrows, ncols)`, and *index* is the index of the subplot being created. *index* starts at 1 in the upper left corner and increases to the right.

If *nrows*, *ncols*, and *index* are all single digit numbers, then *args* can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

`__module__ = 'mpl_toolkits.axes_grid1.axes_divider'`

`change_geometry`(*self*, *numrows*, *numcols*, *num*)
Change subplot geometry, e.g., from (1, 1, 1) to (2, 2, 3).

`get_geometry`(*self*)
Get the subplot geometry, e.g., (2, 2, 3).

`get_position`(*self*)
Return the bounds of the subplot box.

`get_subplotspec`(*self*)
Get the SubplotSpec instance.

`set_subplotspec`(*self*, *subplotspec*)
Set the SubplotSpec instance.

`update_params`(*self*)
Update the subplot position from fig.subplotpars.

Examples using `mpl_toolkits.axes_grid1.axes_divider.SubplotDivider`

mpl_toolkits.axes_grid1.axes_divider.VBoxDivider

`class mpl_toolkits.axes_grid1.axes_divider.VBoxDivider`(*fig*, **args*, *horizontal=None*, *vertical=None*, *aspect=None*, *anchor='C'*)

Bases: *mpl_toolkits.axes_grid1.axes_divider.HBoxDivider*

The Divider class whose rectangle area is specified as a subplot geometry.

Parameters

fig

[*matplotlib.figure.Figure*]

***args**

[tuple (*nrows*, *ncols*, *index*) or int] The array of subplots in the figure has dimensions `(nrows, ncols)`, and *index* is the index of the subplot being created. *index* starts at 1 in the upper left corner and increases to the right.

If *nrows*, *ncols*, and *index* are all single digit numbers, then *args* can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

`__module__ = 'mpl_toolkits.axes_grid1.axes_divider'`

`locate`(*self*, *nx*, *ny*, *nx1=None*, *ny1=None*, *axes=None*, *renderer=None*)

Parameters

axes_divider

[AxesDivider]

nx, nx1

[int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

ny, ny1

[int] Same as *nx* and *nx1*, but for row positions.

axes

renderer

`new_locator`(*self*, *ny*, *ny1=None*)

Create a new `AxesLocator` for the specified cell.

Parameters

ny, ny1

[int] Integers specifying the row-position of the cell. When *ny1* is None, a single *ny*-th row is specified. Otherwise location of rows spanning between *ny* to *ny1* (but excluding *ny1*-th row) is specified.

Examples using `mpl_toolkits.axes_grid1.axes_divider.VBoxDivider`

Functions

make_axes_area_auto_adjustable(ax[, ...])	
make_axes_locatable(axes)	

mpl_toolkits.axes_grid1.axes_divider.make_axes_area_auto_adjustable

mpl_toolkits.axes_grid1.axes_divider.**make_axes_area_auto_adjustable**(*ax*, *use_axes=None*, *pad=0.1*, *adjust_dirs=None*)

Examples using `mpl_toolkits.axes_grid1.axes_divider.make_axes_area_auto_adjustable`

- sphx_glr_gallery_axes_grid1_make_room_for_ylabel_using_axesgrid.py

mpl_toolkits.axes_grid1.axes_divider.make_axes_locatable

mpl_toolkits.axes_grid1.axes_divider.**make_axes_locatable**(*axes*)

Examples using `mpl_toolkits.axes_grid1.axes_divider.make_axes_locatable`

mpl_toolkits.axes_grid1.axes_grid.CbarAxes

class mpl_toolkits.axes_grid1.axes_grid.**CbarAxes**(**args*, *orientation*, ***kwargs*)
Bases: *mpl_toolkits.axes_grid1.axes_grid.CbarAxesBase*, *mpl_toolkits.axes_grid1.mpl_axes.Axes*

__module__ = 'mpl_toolkits.axes_grid1.axes_grid'

Examples using mpl_toolkits.axes_grid1.axes_grid.CbarAxes

mpl_toolkits.axes_grid1.axes_grid.CbarAxesBase

class mpl_toolkits.axes_grid1.axes_grid.**CbarAxesBase**(**args*, *orientation*, ***kwargs*)
Bases: object

__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.axes_grid', '__init__': <

__init__(*self*, **args*, *orientation*, ***kwargs*)
Initialize self. See help(type(self)) for accurate signature.

__module__ = 'mpl_toolkits.axes_grid1.axes_grid'

__weakref__
list of weak references to the object (if defined)

property **cbid**

cla(*self*)

colorbar(*self*, *mappable*, *, *ticks=None*, ***kwargs*)

property **locator**

toggle_label(*self*, *b*)

Examples using `mpl_toolkits.axes_grid1.axes_grid.CbarAxesBase`

mpl_toolkits.axes_grid1.axes_grid.Grid

`class mpl_toolkits.axes_grid1.axes_grid.Grid`(*fig*, *rect*, *nrows_ncols*, *ngrids=None*, *direction='row'*, *axes_pad=0.02*, *add_all=<deprecated parameter>*, *share_all=False*, *share_x=True*, *share_y=True*, *label_mode='L'*, *axes_class=None*, *, *aspect=False*)

Bases: `object`

A grid of Axes.

In Matplotlib, the axes location (and size) is specified in normalized figure coordinates. This may not be ideal for images that needs to be displayed with a given aspect ratio; for example, it is difficult to display multiple images of a same size with some fixed padding between them. AxesGrid can be used in such case.

Parameters

fig

[*Figure*] The parent figure.

rect

[(float, float, float, float) or int] The axes position, as a `(left, bottom, width, height)` tuple or as a three-digit subplot position code (e.g., "121").

nrows_ncols

[(int, int)] Number of rows and columns in the grid.

ngrids

[int or None, default: None] If not None, only the first *ngrids* axes in the grid are created.

direction

[{"row", "column"}, default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column").

axes_pad

[float or (float, float), default: 0.02] Padding or (horizontal padding, vertical padding) between axes, in inches.

add_all

[bool, default: True] Whether to add the axes to the figure using *Figure.add_axes*. This parameter is deprecated.

share_all

[bool, default: False] Whether all axes share their x- and y-axis. Overrides *share_x* and *share_y*.

share_x

[bool, default: True] Whether all axes of a column share their x-axis.

share_y

[bool, default: True] Whether all axes of a row share their y-axis.

label_mode

[{"L", "1", "all"}, default: "L"] Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

axes_class

[subclass of *matplotlib.axes.Axes*, default: None]

aspect

[bool, default: False] Whether the axes aspect ratio follows the aspect ratio of the data limits.

`__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.axes_grid', '__doc__': '\`

`__getitem__`(*self*, *i*)

`__init__`(*self*, *fig*, *rect*, *nrows_ncols*, *ngrids=None*, *direction='row'*, *axes_pad=0.02*, *add_all=<deprecated parameter>*, *share_all=False*, *share_x=True*, *share_y=True*, *label_mode='L'*, *axes_class=None*, ***, *aspect=False*)

Parameters

fig

[*Figure*] The parent figure.

rect

[(float, float, float, float) or int] The axes position, as a `(left, bottom, width, height)` tuple or as a three-digit subplot position code (e.g., "121").

nrows_ncols

[(int, int)] Number of rows and columns in the grid.

ngrids

[int or None, default: None] If not None, only the first *ngrids* axes in the grid are created.

direction

[{"row", "column"}, default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column").

axes_pad

[float or (float, float), default: 0.02] Padding or (horizontal padding, vertical padding) between axes, in inches.

add_all

[bool, default: True] Whether to add the axes to the figure using *Figure.add_axes*. This parameter is deprecated.

share_all

[bool, default: False] Whether all axes share their x- and y-axis. Overrides *share_x* and *share_y*.

share_x

[bool, default: True] Whether all axes of a column share their x-axis.

share_y

[bool, default: True] Whether all axes of a row share their y-axis.

label_mode

[{"L", "1", "all"}, default: "L"] Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

axes_class

[subclass of *matplotlib.axes.Axes*, default: None]

aspect

[bool, default: False] Whether the axes aspect ratio follows the aspect ratio of the data limits.

`__len__`(*self*)

`__module__ = 'mpl_toolkits.axes_grid1.axes_grid'`

`__weakref__`
list of weak references to the object (if defined)

`get_aspect`(*self*)
Return the aspect of the SubplotDivider.

`get_axes_locator`(*self*)

`get_axes_pad`(*self*)
Return the axes padding.

Returns

hpad, vpad

Padding (horizontal pad, vertical pad) in inches.

`get_divider`(*self*)

`get_geometry`(*self*)
Return the number of rows and columns of the grid as (nrows, ncols).

`get_vsize_hsize`(*self*)

`set_aspect`(*self*, *aspect*)
Set the aspect of the SubplotDivider.

`set_axes_locator`(*self*, *locator*)

`set_axes_pad`(*self*, *axes_pad*)
Set the padding between the axes.

Parameters

axes_pad

[(float, float)] The padding (horizontal pad, vertical pad) in inches.

`set_label_mode`(*self*, *mode*)
Define which axes have tick labels.

Parameters

mode

[{"L", "1", "all"}] The label mode:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.

- "all": all axes are labelled.

Examples using `mpl_toolkits.axes_grid1.axes_grid.Grid`

mpl_toolkits.axes_grid1.axes_grid.ImageGrid

class mpl_toolkits.axes_grid1.axes_grid.**ImageGrid**(*fig*, *rect*, *nrows_ncols*, *ngrids=None*, *direction='row'*, *axes_pad=0.02*, *add_all=<deprecated parameter>*, *share_all=False*, *aspect=True*, *label_mode='L'*, *cbar_mode=None*, *cbar_location='right'*, *cbar_pad=None*, *cbar_size='5%'*, *cbar_set_cax=True*, *axes_class=None*)

Bases: *mpl_toolkits.axes_grid1.axes_grid.Grid*

Parameters

fig

[*Figure*] The parent figure.

rect

[(float, float, float, float) or int] The axes position, as a `(left, bottom, width, height)` tuple or as a three-digit subplot position code (e.g., "121").

nrows_ncols

[(int, int)] Number of rows and columns in the grid.

ngrids

[int or None, default: None] If not None, only the first *ngrids* axes in the grid are created.

direction

[{"row", "column"}, default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column"). This also affects the order in which axes are accessed using indexing (`grid[index]`).

axes_pad

[float or (float, float), default: 0.02in] Padding or (horizontal padding, vertical padding) between axes, in inches.

add_all

[bool, default: True] Whether to add the axes to the figure using *Figure.add_axes*. This parameter is deprecated.

share_all

[bool, default: False] Whether all axes share their x- and y-axis.

aspect

[bool, default: True] Whether the axes aspect ratio follows the aspect ratio of the data limits.

label_mode

[{"L", "1", "all"}, default: "L"] Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

cbar_mode

[{"each", "single", "edge", None}, default: None] Whether to create a colorbar for "each" axes, a "single" colorbar for the entire grid, colorbars only for axes on the "edge" determined by *cbar_location*, or no colorbars. The colorbars are stored in the `cbar_axes` attribute.

cbar_location

[{"left", "right", "bottom", "top"}, default: "right"]

cbar_pad

[float, default: None] Padding between the image axes and the colorbar axes.

cbar_size

[size specification (see `Size.from_any`), default: "5%"] Colorbar size.

cbar_set_cax

[bool, default: True] If True, each axes in the grid has a *cax* attribute that is bound to associated *cbar_axes*.

axes_class

[subclass of *matplotlib.axes.Axes*, default: None]

`__init__`(*self*, *fig*, *rect*, *nrows_ncols*, *ngrids=None*, *direction='row'*, *axes_pad=0.02*, *add_all=<deprecated parameter>*, *share_all=False*, *aspect=True*, *label_mode='L'*, *cbar_mode=None*, *cbar_location='right'*, *cbar_pad=None*, *cbar_size='5%'*, *cbar_set_cax=True*, *axes_class=None*)

Parameters

fig

[*Figure*] The parent figure.

rect

[(float, float, float, float) or int] The axes position, as a `(left, bottom, width, height)` tuple or as a three-digit subplot position code (e.g., "121").

nrows_ncols

[(int, int)] Number of rows and columns in the grid.

ngrids

[int or None, default: None] If not None, only the first *ngrids* axes in the grid are created.

direction

[{"row", "column"}, default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column"). This also affects the order in which axes are accessed using indexing (`grid[index]`).

axes_pad

[float or (float, float), default: 0.02in] Padding or (horizontal padding, vertical padding) between axes, in inches.

add_all

[bool, default: True] Whether to add the axes to the figure using *Figure.add_axes*. This parameter is deprecated.

share_all

[bool, default: False] Whether all axes share their x- and y-axis.

aspect

[bool, default: True] Whether the axes aspect ratio follows the aspect ratio of the data limits.

label_mode

[{"L", "1", "all"}, default: "L"] Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

cbar_mode

[{"each", "single", "edge", None}, default: None] Whether to create a colorbar for "each" axes, a "single" colorbar for the entire grid, colorbars only for axes on the "edge" determined by *cbar_location*, or no colorbars. The colorbars are stored in the `cbar_axes` attribute.

cbar_location

[{"left", "right", "bottom", "top"}, default: "right"]

cbar_pad

[float, default: None] Padding between the image axes and the colorbar axes.

cbar_size

[size specification (see `Size.from_any`), default: "5%"] Colorbar size.

cbar_set_cax

[bool, default: True] If True, each axes in the grid has a *cax* attribute that is bound to associated *cbar_axes*.

axes_class

[subclass of *matplotlib.axes.Axes*, default: None]

```
__module__ = 'mpl_toolkits.axes_grid1.axes_grid'
```

Examples using `mpl_toolkits.axes_grid1.axes_grid.ImageGrid`

mpl_toolkits.axes_grid1.axes_rgb

Classes

RGBAxes(*args[, pad, add_all])	4-panel imshow (RGB, R, G, B).
RGBAxesBase(*args[, pad, add_all])	[*Deprecated*]

mpl_toolkits.axes_grid1.axes_rgb.RGBAxes

class mpl_toolkits.axes_grid1.axes_rgb.RGBAxes(*args, pad=0, add_all=<deprecated parameter>, **kwargs)

Bases: object

4-panel imshow (RGB, R, G, B).

Layout: +---------------+-----+ | | R | + +-----+ | RGB | G | + +-----+ | | B | +---------------+-----+

Subclasses can override the _defaultAxesClass attribute.

Attributes

RGB

[_defaultAxesClass] The axes object for the three-channel imshow.

R

[_defaultAxesClass] The axes object for the red channel imshow.

G

[_defaultAxesClass] The axes object for the green channel imshow.

B

[_defaultAxesClass] The axes object for the blue channel imshow.

Parameters

pad

[float, default: 0] fraction of the axes height to put as padding.

add_all

[bool, default: True] Whether to add the {rgb, r, g, b} axes to the figure. This parameter is deprecated.

axes_class

[matplotlib.axes.Axes]

***args**

Unpacked into axes_class() init for RGB

****kwargs**

Unpacked into axes_class() init for RGB, R, G, B axes

`__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.axes_rgb', '__doc__': '\n`

`__init__`(*self*, **args*, *pad=0*, *add_all=<deprecated parameter>*, ***kwargs*)

Parameters

pad

[float, default: 0] fraction of the axes height to put as padding.

add_all

[bool, default: True] Whether to add the {rgb, r, g, b} axes to the figure. This parameter is deprecated.

axes_class

[matplotlib.axes.Axes]

***args**

Unpacked into axes_class() init for RGB

****kwargs**

Unpacked into axes_class() init for RGB, R, G, B axes

`__module__ = 'mpl_toolkits.axes_grid1.axes_rgb'`

`__weakref__`
list of weak references to the object (if defined)

`add_RGB_to_figure`(*self*)
[*Deprecated*] Add red, green and blue axes to the RGB composite's axes figure.

Notes

Deprecated since version 3.3.

`imshow_rgb`(*self*, *r*, *g*, *b*, ***kwargs*)
Create the four images {rgb, r, g, b}.

Parameters

r

[array-like] The red array

g

[array-like] The green array

b

[array-like] The blue array

kwargs

[imshow kwargs] kwargs get unpacked into the imshow calls for the four images

Returns

rgb

[matplotlib.image.AxesImage]

r

[matplotlib.image.AxesImage]

g

[matplotlib.image.AxesImage]

b

[matplotlib.image.AxesImage]

Examples using `mpl_toolkits.axes_grid1.axes_rgb.RGBAxes`

- sphx_glr_gallery_pyplots_whats_new_99_axes_grid.py
- sphx_glr_gallery_axes_grid1_demo_axes_rgb.py

mpl_toolkits.axes_grid1.axes_rgb.RGBAxesBase

`class mpl_toolkits.axes_grid1.axes_rgb.RGBAxesBase(*args, pad=0, add_all=<deprecated parameter>, **kwargs)`

Bases: *mpl_toolkits.axes_grid1.axes_rgb.RGBAxes*

[*Deprecated*]

Notes

Deprecated since version 3.3:

Parameters

pad

[float, default: 0] fraction of the axes height to put as padding.

add_all

[bool, default: True] Whether to add the {rgb, r, g, b} axes to the figure. This parameter is deprecated.

axes_class

[matplotlib.axes.Axes]

***args**

Unpacked into axes_class() init for RGB

****kwargs**

Unpacked into axes_class() init for RGB, R, G, B axes

`__init__`(*self*, **args*, *pad=0*, *add_all=<deprecated parameter>*, ***kwargs*)

Parameters

pad

[float, default: 0] fraction of the axes height to put as padding.

add_all

[bool, default: True] Whether to add the {rgb, r, g, b} axes to the figure. This parameter is deprecated.

axes_class

[matplotlib.axes.Axes]

***args**

Unpacked into axes_class() init for RGB

****kwargs**

Unpacked into axes_class() init for RGB, R, G, B axes

`__module__ = 'mpl_toolkits.axes_grid1.axes_rgb'`

Examples using `mpl_toolkits.axes_grid1.axes_rgb.RGBAxesBase`

Functions

imshow_rgb(ax, r, g, b, **kwargs)	[*Deprecated*]
make_rgb_axes(ax[, pad, axes_class, add_all])	**Parameters**

mpl_toolkits.axes_grid1.axes_rgb.imshow_rgb

mpl_toolkits.axes_grid1.axes_rgb.**imshow_rgb**(*ax*, *r*, *g*, *b*, ***kwargs*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

Examples using mpl_toolkits.axes_grid1.axes_rgb.imshow_rgb

mpl_toolkits.axes_grid1.axes_rgb.make_rgb_axes

mpl_toolkits.axes_grid1.axes_rgb.**make_rgb_axes**(*ax*, *pad=0.01*, *axes_class=None*, *add_all=<deprecated parameter>*, ***kwargs*)

Parameters

pad

[float] Fraction of the axes height.

Examples using mpl_toolkits.axes_grid1.axes_rgb.make_rgb_axes

- sphx_glr_gallery_axes_grid1_demo_axes_rgb.py

mpl_toolkits.axes_grid1.axes_size

Provides classes of simple units that will be used with AxesDivider class (or others) to determine the size of each axes. The unit classes define `get_size` method that returns a tuple of two floats, meaning relative and absolute sizes, respectively.

Note that this class is nothing more than a simple tuple of two floats. Take a look at the Divider class to see how these two values are used.

Classes

Add(a, b)	
AddList(add_list)	
AxesX(axes[, aspect, ref_ax])	Scaled size whose relative part corresponds to the data width of the *axes* multiplied by the *aspect*.
AxesY(axes[, aspect, ref_ax])	Scaled size whose relative part corresponds to the data height of the *axes* multiplied by the *aspect*.
Fixed(fixed_size)	Simple fixed size with absolute part = *fixed_size* and relative part = 0.
Fraction(fraction, ref_size)	An instance whose size is a *fraction* of the *ref_size*.
GetExtentHelper(ax, direction)	
MaxExtent(artist_list, w_or_h)	Size whose absolute part is either the largest width or the largest height of the given *artist_list*.
MaxHeight(artist_list)	Size whose absolute part is the largest height of the given *artist_list*.
MaxWidth(artist_list)	Size whose absolute part is the largest width of the given *artist_list*.
Padded(size, pad)	Return a instance where the absolute part of *size* is increase by the amount of *pad*.
Scalable	alias of *mpl_toolkits.axes_grid1.axes_size.Scaled*
Scaled(scalable_size)	Simple scaled(?) size with absolute part = 0 and relative part = *scalable_size*.
SizeFromFunc(func)	

mpl_toolkits.axes_grid1.axes_size.Add

class mpl_toolkits.axes_grid1.axes_size.Add(*a*, *b*)

Bases: mpl_toolkits.axes_grid1.axes_size._Base

__init__(*self*, *a*, *b*)

Initialize self. See help(type(self)) for accurate signature.

mpl_toolkits.axes_grid1.axes_size.SizeFromFunc

class mpl_toolkits.axes_grid1.axes_size.**SizeFromFunc**(*func*)

Bases: mpl_toolkits.axes_grid1.axes_size._Base

__init__(*self*, *func*)

Initialize self. See help(type(self)) for accurate signature.

__module__ = 'mpl_toolkits.axes_grid1.axes_size'

get_size(*self*, *renderer*)

Examples using mpl_toolkits.axes_grid1.axes_size.SizeFromFunc

Functions

from_any(size[, fraction_ref])	Create a Fixed unit when the first argument is a float, or a Fraction unit if that is a string that ends with %.

mpl_toolkits.axes_grid1.axes_size.from_any

mpl_toolkits.axes_grid1.axes_size.**from_any**(*size*, *fraction_ref=None*)

Create a Fixed unit when the first argument is a float, or a Fraction unit if that is a string that ends with %. The second argument is only meaningful when Fraction unit is created.

```
>>> a = Size.from_any(1.2) # => Size.Fixed(1.2)
>>> Size.from_any("50%", a) # => Size.Fraction(0.5, a)
```

Examples using mpl_toolkits.axes_grid1.axes_size.from_any

mpl_toolkits.axes_grid1.colorbar

Colorbar toolkit with two classes and a function:

ColorbarBase

the base class with full colorbar drawing functionality. It can be used as-is to make a colorbar for a given colormap; a mappable object (e.g., image) is not needed.

Colorbar

the derived class for use with images or contour plots.

make_axes()

a function for resizing an axes and adding a second axes suitable for a colorbar

The *colorbar()* method uses *make_axes()* and *Colorbar*; the *colorbar()* function is a thin wrapper over *colorbar()*.

class mpl_toolkits.axes_grid1.colorbar.CbarAxesLocator(*locator=None*, *extend='neither'*, *orientation='vertical'*)

CbarAxesLocator is a axes_locator for colorbar axes. It adjust the position of the axes to make a room for extended ends, i.e., the extended ends are located outside the axes area.

locator

[the bbox returned from the locator is used as a] initial axes location. If None, axes.bbox is used.

extend : same as in ColorbarBase *orientation* : same as in ColorbarBase

get_end_vertices(*self*)

Return a tuple of two vertices for the colorbar extended ends.

The first vertices is for the minimum end, and the second is for the maximum end.

get_original_position(*self*, *axes*, *renderer*)

Return the original position of the axes.

get_path_ends(*self*)

Return the paths for extended ends.

get_path_patch(*self*)

Return the path for axes patch.

class mpl_toolkits.axes_grid1.colorbar.Colorbar(*ax*, *mappable*, ***kw*)

Parameters

norm

[*matplotlib.colors.Normalize* (or subclass thereof)] The normalizing object which scales data, typically into the interval `[0, 1]`. If *None*, *norm* defaults to a *colors.Normalize* object which initializes its scaling based on the first data processed.

cmap

[str or *Colormap*] The colormap used to map normalized data values to RGBA colors.

add_lines(*self*, *CS*)

Add the lines from a non-filled *ContourSet* to the colorbar.

update_bruteforce(*self*, *mappable*)
Update the colorbar artists to reflect the change of the associated mappable.

update_normal(*self*, *mappable*)
Update solid patches, lines, etc.

This is meant to be called when the norm of the image or contour plot to which this colorbar belongs changes.

If the norm on the mappable is different than before, this resets the locator and formatter for the axis, so if these have been customized, they will need to be customized again. However, if the norm only changes values of *vmin*, *vmax* or *cmap* then the old formatter and locator will be preserved.

class mpl_toolkits.axes_grid1.colorbar.ColorbarBase(*ax*, *cmap=None*, *norm=None*, *alpha=1.0*, *values=None*, *boundaries=None*, *orientation='vertical'*, *extend='neither'*, *spacing='uniform'*, *ticks=None*, *format=None*, *drawedges=False*, *filled=True*)

Draw a colorbar in an existing axes.

This is a base class for the *Colorbar* class, which is the basis for the *colorbar()* method and pyplot function.

It is also useful by itself for showing a colormap. If the *cmap* kwarg is given but *boundaries* and *values* are left as None, then the colormap will be displayed on a 0-1 scale. To show the under- and over-value colors, specify the *norm* as:

```
colors.Normalize(clip=False)
```

To show the colors versus index instead of on the 0-1 scale, use:

```
norm=colors.NoNorm.
```

Useful attributes:

ax
the Axes instance in which the colorbar is drawn

lines
a LineCollection if lines were drawn, otherwise None

dividers
a LineCollection if *drawedges* is True, otherwise None

Useful public methods are `set_label()` and *add_lines()*.

Parameters

norm

[*matplotlib.colors.Normalize* (or subclass thereof)] The normalizing object which scales data, typically into the interval `[0, 1]`. If *None*, *norm* defaults to a *colors.Normalize* object which initializes its scaling based on the first data processed.

cmap

[str or *Colormap*] The colormap used to map normalized data values to RGBA colors.

`add_lines`(*self*, *levels*, *colors*, *linewidths*)
Draw lines on the colorbar. It deletes preexisting lines.

`set_alpha`(*self*, *alpha*)
Set the alpha value for transparency.

`set_label_text`(*self*, *label*, ***kw*)
Label the long axis of the colorbar.

`update_artists`(*self*)
Update the colorbar associated artists, *filled* and *ends*. Note that *lines* are not updated. This needs to be called whenever clim of associated image changes.

mpl_toolkits.axes_grid1.colorbar.`colorbar`(*mappable*, *cax=None*, *ax=None*, ***kw*)

Create a colorbar for a ScalarMappable instance.

Documentation for the pyplot thin wrapper:

Add a colorbar to a plot.

Function signatures for the *pyplot* interface; all but the first are also method signatures for the *colorbar()* method:

```
colorbar(**kwargs)
colorbar(mappable, **kwargs)
colorbar(mappable, cax=cax, **kwargs)
colorbar(mappable, ax=ax, **kwargs)
```

arguments:

mappable

the `Image`, *ContourSet*, etc. to which the colorbar applies; this argument is mandatory for the *colorbar()* method but optional for the *colorbar()* function, which sets the default to the current image.

keyword arguments:

cax

None | axes object into which the colorbar will be drawn

ax

None | parent axes object from which space for a new colorbar axes will be stolen

Additional keyword arguments are of two kinds:

axes properties:

Property	Description
orientation	vertical or horizontal
fraction	0.15; fraction of original axes to use for colorbar
pad	0.05 if vertical, 0.15 if horizontal; fraction of original axes between colorbar and new image axes
shrink	1.0; fraction by which to shrink the colorbar
aspect	20; ratio of long to short dimensions

colorbar properties:

Property	Description
extend	['neither' | 'both' | 'min' | 'max'] If not 'neither', make pointed end(s) for out-of- range values. These are set for a given colormap using the colormap set_under and set_over methods.
spacing	['uniform' | 'proportional'] Uniform spacing gives each discrete color the same space; proportional makes the space proportional to the data interval.
ticks	[None | list of ticks | Locator object] If None, ticks are determined automatically from the input.
format	[None | format string | Formatter object] If None, the *ScalarFormatter* is used. If a format string is given, e.g., '%.3f', that is used. An alternative *Formatter* object may be given instead.
drawedges	bool Whether to draw lines at color boundaries.

The following will probably be useful only in the context of indexed colors (that is, when the mappable has norm=NoNorm()), or other unusual circumstances.

Property	Description
boundaries	None or a sequence
values	None or a sequence which must be of length 1 less than the sequence of *boundaries*. For each region delimited by adjacent entries in *boundaries*, the color mapped to the corresponding value in values will be used.

If *mappable* is a `ContourSet`, its *extend* kwarg is included automatically.

Note that the *shrink* kwarg provides a simple way to keep a vertical colorbar, for example, from being taller than the axes of the mappable to which the colorbar is attached; but it is a manual method requiring some trial and error. If the colorbar is too tall (or a horizontal colorbar is too wide) use a smaller value of *shrink*.

For more precise control, you can manually specify the positions of the axes objects in which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewer (svg and pdf) renders white gaps between segments of the colorbar. This is due to bugs in the viewers not matplotlib. As a workaround the colorbar can be rendered with overlapping segments:

```
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However this has negative consequences in other circumstances. Particularly with semi transparent images (alpha < 1) and colorbar extensions and is not enabled by default see (issue #1188).

returns:

Colorbar instance; see also its base class, *ColorbarBase*. Call the *set_label()* method to label the colorbar.

The transData of the *cax* is adjusted so that the limits in the longest axis actually corresponds to the limits in colorbar range. On the other hand, the shortest axis has a data limits of [1,2], whose unconventional value is to prevent underflow when log scale is used.

`mpl_toolkits.axes_grid1.colorbar.`**`make_axes`**(*parent*, *, *fraction=0.15*, *shrink=1.0*, *aspect=20*, ***kw*)

Resize and reposition a parent axes, and return a child axes suitable for a colorbar

```
cax, kw = make_axes(parent, **kw)
```

Keyword arguments may include the following (with defaults):

orientation

'vertical' or 'horizontal'

Property	Description
orientation	vertical or horizontal
fraction	0.15; fraction of original axes to use for colorbar
pad	0.05 if vertical, 0.15 if horizontal; fraction of original axes between colorbar and new image axes
shrink	1.0; fraction by which to shrink the colorbar
aspect	20; ratio of long to short dimensions

All but the first of these are stripped from the input kw set.

Returns (cax, kw), the child axes and the reduced kw dictionary.

mpl_toolkits.axes_grid1.inset_locator

A collection of functions and objects for creating or placing inset axes.

Classes

AnchoredLocatorBase(bbox_to_anchor, ...[, ...])	**Parameters**
AnchoredSizeLocator(bbox_to_anchor, x_size, ...)	**Parameters**
AnchoredZoomLocator(parent_axes, zoom, loc)	**Parameters**
BboxConnector(bbox1, bbox2, loc1[, loc2])	Connect two bboxes with a straight line.
BboxConnectorPatch(bbox1, bbox2, loc1a, ...)	Connect two bboxes with a quadrilateral.
BboxPatch(bbox, **kwargs)	Patch showing the shape bounded by a Bbox.
InsetPosition(parent, lbwh)	An object for positioning an inset axes.

mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase

class mpl_toolkits.axes_grid1.inset_locator.**AnchoredLocatorBase**(*bbox_to_anchor*, *offsetbox*, *loc*, *borderpad=0.5*, *bbox_transform=None*)

Bases: *matplotlib.offsetbox.AnchoredOffsetbox*

Parameters

loc

[str] The box location. Supported values:

- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'
- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter *loc* of *Legend* for details.

pad

[float, default: 0.4] Padding around the child as fraction of the fontsize.

borderpad

[float, default: 0.5] Padding between the offsetbox frame and the *bbox_to_anchor*.

child

[*OffsetBox*] The box that will be anchored.

prop

[*FontProperties*] This is only used as a reference for paddings. If not given, `rcParams["legend.fontsize"]` (default: `'medium'`) is used.

frameon

[bool] Whether to draw a frame around the box.

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

bbox_transform

[None or *matplotlib.transforms.Transform*] The transform for the bounding box (*bbox_to_anchor*).

****kwargs**

All other parameters are passed on to *OffsetBox*.

Notes

See *Legend* for a detailed description of the anchoring mechanism.

`__call__`(*self*, *ax*, *renderer*)
Call self as a function.

`__init__`(*self*, *bbox_to_anchor*, *offsetbox*, *loc*, *borderpad=0.5*, *bbox_transform=None*)

Parameters

loc

[str] The box location. Supported values:

- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'
- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter *loc* of *Legend* for details.

pad

[float, default: 0.4] Padding around the child as fraction of the fontsize.

borderpad

[float, default: 0.5] Padding between the offsetbox frame and the *bbox_to_anchor*.

child

[*OffsetBox*] The box that will be anchored.

prop

[*FontProperties*] This is only used as a reference for paddings. If not given, `rcParams["legend.fontsize"]` (default: `'medium'`) is used.

frameon

[bool] Whether to draw a frame around the box.

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

bbox_transform

[None or *matplotlib.transforms.Transform*] The transform for the bounding box (*bbox_to_anchor*).

****kwargs**

All other parameters are passed on to *OffsetBox*.

Notes

See *Legend* for a detailed description of the anchoring mechanism.

`__module__ = 'mpl_toolkits.axes_grid1.inset_locator'`

`draw`(*self*, *renderer*)
Update the location of children if necessary and draw them to the given *renderer*.

Examples using `mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase`

mpl_toolkits.axes_grid1.inset_locator.AnchoredSizeLocator

class mpl_toolkits.axes_grid1.inset_locator.**AnchoredSizeLocator**(*bbox_to_anchor*, *x_size*, *y_size*, *loc*, *borderpad=0.5*, *bbox_transform=None*)

Bases: *mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase*

Parameters

loc

[str] The box location. Supported values:

- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'
- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter *loc* of *Legend* for details.

pad

[float, default: 0.4] Padding around the child as fraction of the fontsize.

borderpad

[float, default: 0.5] Padding between the offsetbox frame and the *bbox_to_anchor*.

child

[*OffsetBox*] The box that will be anchored.

prop

[*FontProperties*] This is only used as a reference for paddings. If not given, `rcParams["legend.fontsize"]` (default: `'medium'`) is used.

frameon

[bool] Whether to draw a frame around the box.

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

bbox_transform

[None or *matplotlib.transforms.Transform*] The transform for the bounding box (*bbox_to_anchor*).

****kwargs**

All other parameters are passed on to *OffsetBox*.

Notes

See *Legend* for a detailed description of the anchoring mechanism.

`__init__`(*self*, *bbox_to_anchor*, *x_size*, *y_size*, *loc*, *borderpad=0.5*, *bbox_transform=None*)

Parameters

loc

[str] The box location. Supported values:

- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'
- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter *loc* of *Legend* for details.

pad

[float, default: 0.4] Padding around the child as fraction of the fontsize.

borderpad

[float, default: 0.5] Padding between the offsetbox frame and the *bbox_to_anchor*.

child

[*OffsetBox*] The box that will be anchored.

prop

[*FontProperties*] This is only used as a reference for paddings. If not given, `rcParams["legend.fontsize"]` (default: `'medium'`) is used.

frameon

[bool] Whether to draw a frame around the box.

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

bbox_transform

[None or *matplotlib.transforms.Transform*] The transform for the bounding box (*bbox_to_anchor*).

****kwargs**

All other parameters are passed on to *OffsetBox*.

Notes

See *Legend* for a detailed description of the anchoring mechanism.

`__module__ = 'mpl_toolkits.axes_grid1.inset_locator'`

`get_extent`(*self*, *renderer*)

Return the extent of the box as (width, height, x, y).

This is the extent of the child plus the padding.

Examples using `mpl_toolkits.axes_grid1.inset_locator.AnchoredSizeLocator`

mpl_toolkits.axes_grid1.inset_locator.AnchoredZoomLocator

class mpl_toolkits.axes_grid1.inset_locator.**AnchoredZoomLocator**(*parent_axes*, *zoom*, *loc*, *borderpad=0.5*, *bbox_to_anchor=None*, *bbox_transform=None*)

Bases: *mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase*

Parameters

loc

[str] The box location. Supported values:

- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'
- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter *loc* of *Legend* for details.

pad

[float, default: 0.4] Padding around the child as fraction of the fontsize.

borderpad

[float, default: 0.5] Padding between the offsetbox frame and the *bbox_to_anchor*.

child

[*OffsetBox*] The box that will be anchored.

prop

[*FontProperties*] This is only used as a reference for paddings. If not given, `rcParams["legend.fontsize"]` (default: `'medium'`) is used.

frameon

[bool] Whether to draw a frame around the box.

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

bbox_transform

[None or *matplotlib.transforms.Transform*] The transform for the bounding box (*bbox_to_anchor*).

****kwargs**

All other parameters are passed on to *OffsetBox*.

Notes

See *Legend* for a detailed description of the anchoring mechanism.

`__init__`(*self*, *parent_axes*, *zoom*, *loc*, *borderpad=0.5*, *bbox_to_anchor=None*, *bbox_transform=None*)

Parameters

loc

[str] The box location. Supported values:

- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'
- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter *loc* of *Legend* for details.

pad

[float, default: 0.4] Padding around the child as fraction of the fontsize.

borderpad

[float, default: 0.5] Padding between the offsetbox frame and the *bbox_to_anchor*.

child

[*OffsetBox*] The box that will be anchored.

prop

[*FontProperties*] This is only used as a reference for paddings. If not given, `rcParams["legend.fontsize"]` (default: `'medium'`) is used.

frameon

[bool] Whether to draw a frame around the box.

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

bbox_transform

[None or *matplotlib.transforms.Transform*] The transform for the bounding box (*bbox_to_anchor*).

****kwargs**

All other parameters are passed on to *OffsetBox*.

Notes

See *Legend* for a detailed description of the anchoring mechanism.

`__module__ = 'mpl_toolkits.axes_grid1.inset_locator'`

`get_extent`(*self*, *renderer*)

Return the extent of the box as (width, height, x, y).

This is the extent of the child plus the padding.

Examples using `mpl_toolkits.axes_grid1.inset_locator.AnchoredZoomLocator`

mpl_toolkits.axes_grid1.inset_locator.BboxConnector

`class mpl_toolkits.axes_grid1.inset_locator.BboxConnector`(*bbox1*, *bbox2*, *loc1*, *loc2=None*, ***kwargs*)

Bases: *matplotlib.patches.Patch*

Connect two bboxes with a straight line.

Parameters

bbox1, bbox2

[*matplotlib.transforms.Bbox*] Bounding boxes to connect.

loc1

[{1, 2, 3, 4}] Corner of *bbox1* to draw the line. Valid values are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4
```

loc2

[{1, 2, 3, 4}, optional] Corner of *bbox2* to draw the line. If None, defaults to *loc1*. Valid values are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4
```

**kwargs

Patch properties for the line drawn. Valid arguments include:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}

Table 11 – continued from previous page

Property	Description
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

__init__(*self*, *bbox1*, *bbox2*, *loc1*, *loc2=None*, ***kwargs*)

Connect two bboxes with a straight line.

Parameters

bbox1, bbox2

[*matplotlib.transforms.Bbox*] Bounding boxes to connect.

loc1

[{1, 2, 3, 4}] Corner of *bbox1* to draw the line. Valid values are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4
```

loc2

[{1, 2, 3, 4}, optional] Corner of *bbox2* to draw the line. If None, defaults to *loc1*. Valid values are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4
```

****kwargs**

Patch properties for the line drawn. Valid arguments include:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown

Table 12 – continued from previous page

Property	Description
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

`__module__ = 'mpl_toolkits.axes_grid1.inset_locator'`

`static connect_bbox`(*bbox1*, *bbox2*, *loc1*, *loc2=None*)

Helper function to obtain a Path from one bbox to another.

Parameters

bbox1, bbox2

[*matplotlib.transforms.Bbox*] Bounding boxes to connect.

loc1

[{1, 2, 3, 4}] Corner of *bbox1* to use. Valid values are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4
```

loc2

[{1, 2, 3, 4}, optional] Corner of *bbox2* to use. If None, defaults to *loc1*. Valid values are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4
```

Returns

path

[*matplotlib.path.Path*] A line segment from the *loc1* corner of *bbox1* to the *loc2* corner of *bbox2*.

`static get_bbox_edge_pos(`*bbox*, *loc*`)`

Helper function to obtain the location of a corner of a bbox

Parameters

bbox

[*matplotlib.transforms.Bbox*]

loc

[{1, 2, 3, 4}] Corner of *bbox*. Valid values are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4
```

Returns

x, y

[float] Coordinates of the corner specified by *loc*.

`get_path(`*self*`)`

Return the path of this patch.

Examples using `mpl_toolkits.axes_grid1.inset_locator.BboxConnector`

- sphx_glr_gallery_subplots_axes_and_figures_axes_zoom_effect.py

mpl_toolkits.axes_grid1.inset_locator.BboxConnectorPatch

class mpl_toolkits.axes_grid1.inset_locator.**BboxConnectorPatch**(*bbox1*, *bbox2*, *loc1a*, *loc2a*, *loc1b*, *loc2b*, ***kwargs*)

Bases: *mpl_toolkits.axes_grid1.inset_locator.BboxConnector*

Connect two bboxes with a quadrilateral.

The quadrilateral is specified by two lines that start and end at corners of the bboxes. The four sides of the quadrilateral are defined by the two lines given, the line between the two corners specified in *bbox1* and the line between the two corners specified in *bbox2*.

Parameters

bbox1, bbox2

[*matplotlib.transforms.Bbox*] Bounding boxes to connect.

loc1a, loc2a

[{1, 2, 3, 4}] Corners of *bbox1* and *bbox2* to draw the first line. Valid values are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4
```

loc1b, loc2b

[{1, 2, 3, 4}] Corners of *bbox1* and *bbox2* to draw the second line. Valid values are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4
```

****kwargs**

Patch properties for the line drawn:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

`__init__`(*self*, *bbox1*, *bbox2*, *loc1a*, *loc2a*, *loc1b*, *loc2b*, ***kwargs*)

Connect two bboxes with a quadrilateral.

The quadrilateral is specified by two lines that start and end at corners of the bboxes. The four sides of the quadrilateral are defined by the two lines given, the line between the two corners specified in *bbox1* and the line between the two corners specified in *bbox2*.

Parameters

bbox1, bbox2

[*matplotlib.transforms.Bbox*] Bounding boxes to connect.

loc1a, loc2a

[{1, 2, 3, 4}] Corners of *bbox1* and *bbox2* to draw the first line.

Valid values are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4
```

loc1b, loc2b

[{1, 2, 3, 4}] Corners of *bbox1* and *bbox2* to draw the second line. Valid values are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4
```

**kwargs

Patch properties for the line drawn:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None

Property	Description
transform	*Transform*
url	str
visible	bool
zorder	float

```
__module__ = 'mpl_toolkits.axes_grid1.inset_locator'
```

get_path(*self*)
Return the path of this patch.

Examples using mpl_toolkits.axes_grid1.inset_locator.BboxConnectorPatch

- sphx_glr_gallery_subplots_axes_and_figures_axes_zoom_effect.py

mpl_toolkits.axes_grid1.inset_locator.BboxPatch

class mpl_toolkits.axes_grid1.inset_locator.BboxPatch(*bbox*, ***kwargs*)
Bases: *matplotlib.patches.Patch*

Patch showing the shape bounded by a Bbox.

Parameters

bbox

[*matplotlib.transforms.Bbox*] Bbox to use for the extents of this patch.

****kwargs**

Patch properties. Valid arguments include:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*

zorder	float

```
__module__ = 'mpl_toolkits.axes_grid1.inset_locator'
```

get_path(*self*)
Return the path of this patch.

Examples using mpl_toolkits.axes_grid1.inset_locator.BboxPatch

- sphx_glr_gallery_subplots_axes_and_figures_axes_zoom_effect.py

mpl_toolkits.axes_grid1.inset_locator.InsetPosition

class mpl_toolkits.axes_grid1.inset_locator.**InsetPosition**(*parent*, *lbwh*)
Bases: object

An object for positioning an inset axes.

This is created by specifying the normalized coordinates in the axes, instead of the figure.

Parameters

parent

[*matplotlib.axes.Axes*] Axes to use for normalizing coordinates.

lbwh

[iterable of four floats] The left edge, bottom edge, width, and height of the inset axes, in units of the normalized coordinate of the *parent* axes.

See also:

matplotlib.axes.Axes.set_axes_locator()

Examples

The following bounds the inset axes to a box with 20% of the parent axes's height and 40% of the width. The size of the axes specified ([0, 0, 1, 1]) ensures that the axes completely fills the bounding box:

```
>>> parent_axes = plt.gca()
>>> ax_ins = plt.axes([0, 0, 1, 1])
>>> ip = InsetPosition(ax, [0.5, 0.1, 0.4, 0.2])
>>> ax_ins.set_axes_locator(ip)
```

`__call__`(*self*, *ax*, *renderer*)
Call self as a function.

`__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.inset_locator', '__init__`

`__init__`(*self*, *parent*, *lbwh*)
An object for positioning an inset axes.

This is created by specifying the normalized coordinates in the axes, instead of the figure.

Parameters

parent

[*matplotlib.axes.Axes*] Axes to use for normalizing coordinates.

lbwh

[iterable of four floats] The left edge, bottom edge, width, and height of the inset axes, in units of the normalized coordinate of the *parent* axes.

See also:

matplotlib.axes.Axes.set_axes_locator()

Examples

The following bounds the inset axes to a box with 20% of the parent axes's height and 40% of the width. The size of the axes specified ([0, 0, 1, 1]) ensures that the axes completely fills the bounding box:

```
>>> parent_axes = plt.gca()
>>> ax_ins = plt.axes([0, 0, 1, 1])
>>> ip = InsetPosition(ax, [0.5, 0.1, 0.4, 0.2])
>>> ax_ins.set_axes_locator(ip)
```

__module__ = 'mpl_toolkits.axes_grid1.inset_locator'

__weakref__
list of weak references to the object (if defined)

Examples using `mpl_toolkits.axes_grid1.inset_locator.InsetPosition`

Functions

inset_axes(parent_axes, width, height[, ...])	Create an inset axes with a given width and height.
mark_inset(parent_axes, inset_axes, loc1, ...)	Draw a box to mark the location of an area represented by an inset axes.
zoomed_inset_axes(parent_axes, zoom[, loc, ...])	Create an anchored inset axes by scaling a parent axes.

mpl_toolkits.axes_grid1.inset_locator.inset_axes

mpl_toolkits.axes_grid1.inset_locator.**inset_axes**(*parent_axes*, *width*, *height*, *loc='upper right'*, *bbox_to_anchor=None*, *bbox_transform=None*, *axes_class=None*, *axes_kwargs=None*, *borderpad=0.5*)

Create an inset axes with a given width and height.

Both sizes used can be specified either in inches or percentage. For example,:

```
inset_axes(parent_axes, width='40%', height='30%', loc=3)
```

creates in inset axes in the lower left corner of *parent_axes* which spans over 30% in height and 40% in width of the *parent_axes*. Since the usage of *inset_axes* may become slightly tricky when exceeding such standard cases, it is recommended to read the examples.

Parameters

parent_axes

[*matplotlib.axes.Axes*] Axes to place the inset axes.

width, height

[float or str] Size of the inset axes to create. If a float is provided, it is the size in inches, e.g. *width=1.3*. If a string is provided, it is the size in relative units, e.g. *width='40%'*. By default, i.e. if neither *bbox_to_anchor* nor *bbox_transform* are specified, those are relative to the parent_axes. Otherwise they are to be understood relative to the bounding box provided via *bbox_to_anchor*.

loc

[int or str, default: 1] Location to place the inset axes. The valid locations are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4,
'right'        : 5,
'center left'  : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center'       : 10
```

bbox_to_anchor

[tuple or *matplotlib.transforms.BboxBase*, optional] Bbox that the inset axes will be anchored to. If None, a tuple of (0, 0, 1, 1) is used if *bbox_transform* is set to *parent_axes.transAxes* or *parent_axes.figure.transFigure*. Otherwise, *parent_axes.bbox* is used. If a tuple, can be either [left, bottom, width, height], or [left, bottom]. If the kwargs *width* and/or *height* are specified in relative units, the 2-tuple [left, bottom] cannot be used. Note that, unless *bbox_transform* is set, the units of the bounding box are interpreted in the pixel coordinate. When using *bbox_to_anchor* with tuple, it almost always makes sense to also specify a *bbox_transform*. This might often be the axes transform *parent_axes.transAxes*.

bbox_transform

[*matplotlib.transforms.Transform*, optional] Transformation for the bbox that contains the inset axes. If None, a *transforms.IdentityTransform* is used. The value of *bbox_to_anchor* (or the return value of its get_points method) is transformed by the *bbox_transform* and then interpreted as points in the

pixel coordinate (which is dpi dependent). You may provide *bbox_to_anchor* in some normalized coordinate, and give an appropriate transform (e.g., *parent_axes.transAxes*).

axes_class

[*matplotlib.axes.Axes* type, optional] If specified, the inset axes created will be created with this class's constructor.

axes_kwargs

[dict, optional] Keyworded arguments to pass to the constructor of the inset axes. Valid arguments include:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and r
alpha	float or None
anchor	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
animated	bool
aspect	{'auto'} or num
autoscale_on	bool
autoscalex_on	bool
autoscaley_on	bool
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	None, or a number
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
contains	unknown
facecolor or fc	color
figure	*Figure*
frame_on	bool
gid	str
in_layout	bool
label	object
navigate	bool
navigate_mode	unknown
path_effects	*AbstractPathEffect*
picker	None or bool or callable
position	[left, bottom, width, height] or *Bbox*
prop_cycle	unknown
rasterization_zorder	float or None
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None

Table 18 – continued from previous page

Property	Description
title	str
transform	*Transform*
url	str
visible	bool
xbound	unknown
xlabel	str
xlim	(bottom: float, top: float)
xmargin	float greater than -0.5
xscale	{"linear", "log", "symlog", "logit", ...}
xticklabels	unknown
xticks	unknown
ybound	unknown
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	{"linear", "log", "symlog", "logit", ...}
yticklabels	unknown
yticks	unknown
zorder	float

borderpad

[float, default: 0.5] Padding between inset axes and the bbox_to_anchor. The units are axes font size, i.e. for a default font size of 10 points *borderpad = 0.5* is equivalent to a padding of 5 points.

Returns

inset_axes

[*axes_class*] Inset axes object created.

Notes

The meaning of *bbox_to_anchor* and *bbox_to_transform* is interpreted differently from that of legend. The value of bbox_to_anchor (or the return value of its get_points method; the default is *parent_axes.bbox*) is transformed by the bbox_transform (the default is Identity transform) and then interpreted as points in the pixel coordinate (which is dpi dependent).

Thus, following three calls are identical and creates an inset axes with respect to the *parent_axes*:

```
axins = inset_axes(parent_axes, "30%", "40%")
axins = inset_axes(parent_axes, "30%", "40%",
                   bbox_to_anchor=parent_axes.bbox)
axins = inset_axes(parent_axes, "30%", "40%",
                   bbox_to_anchor=(0, 0, 1, 1),
                   bbox_transform=parent_axes.transAxes)
```

Examples using `mpl_toolkits.axes_grid1.inset_locator.inset_axes`

- sphx_glr_gallery_axes_grid1_demo_colorbar_of_inset_axes.py
- sphx_glr_gallery_axes_grid1_demo_colorbar_with_inset_locator.py
- sphx_glr_gallery_axes_grid1_inset_locator_demo.py
- *Overview of axes_grid1 toolkit*

mpl_toolkits.axes_grid1.inset_locator.mark_inset

mpl_toolkits.axes_grid1.inset_locator.**mark_inset**(*parent_axes*, *inset_axes*, *loc1*, *loc2*, ***kwargs*)

Draw a box to mark the location of an area represented by an inset axes.

This function draws a box in *parent_axes* at the bounding box of *inset_axes*, and shows a connection with the inset axes by drawing lines at the corners, giving a "zoomed in" effect.

Parameters

parent_axes

[*matplotlib.axes.Axes*] Axes which contains the area of the inset axes.

inset_axes

[*matplotlib.axes.Axes*] The inset axes.

loc1, loc2

[{1, 2, 3, 4}] Corners to use for connecting the inset axes and the area in the parent axes.

****kwargs**

Patch properties for the lines and box drawn:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None

Table 19 – continued from previous page

Property	Description
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

Returns

pp

[*matplotlib.patches.Patch*] The patch drawn to represent the area of the inset axes.

p1, p2

[*matplotlib.patches.Patch*] The patches connecting two corners of the inset axes and its area.

Examples using `mpl_toolkits.axes_grid1.inset_locator.mark_inset`

- sphx_glr_gallery_axes_grid1_inset_locator_demo2.py

mpl_toolkits.axes_grid1.inset_locator.zoomed_inset_axes

mpl_toolkits.axes_grid1.inset_locator.**zoomed_inset_axes**(*parent_axes*, *zoom*, *loc='upper right'*, *bbox_to_anchor=None*, *bbox_transform=None*, *axes_class=None*, *axes_kwargs=None*, *borderpad=0.5*)

Create an anchored inset axes by scaling a parent axes. For usage, also see the examples.

Parameters

parent_axes

[*matplotlib.axes.Axes*] Axes to place the inset axes.

zoom

[float] Scaling factor of the data axes. *zoom* > 1 will enlargen the coordinates (i.e., "zoomed in"), while *zoom* < 1 will shrink the coordinates (i.e., "zoomed out").

loc

[int or str, default: 'upper right'] Location to place the inset axes. The valid locations are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4,
'right'        : 5,
'center left'  : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center'       : 10
```

bbox_to_anchor

[tuple or *matplotlib.transforms.BboxBase*, optional] Bbox that the inset axes will be anchored to. If None, *parent_axes.bbox* is used. If a tuple, can be either [left, bottom, width, height], or [left, bottom]. If the kwargs *width* and/or *height* are specified in relative units, the 2-tuple [left, bottom] cannot be used. Note that

the units of the bounding box are determined through the transform in use. When using *bbox_to_anchor* it almost always makes sense to also specify a *bbox_transform*. This might often be the axes transform *parent_axes.transAxes*.

bbox_transform

[*matplotlib.transforms.Transform*, optional] Transformation for the bbox that contains the inset axes. If None, a *transforms.IdentityTransform* is used (i.e. pixel coordinates). This is useful when not providing any argument to *bbox_to_anchor*. When using *bbox_to_anchor* it almost always makes sense to also specify a *bbox_transform*. This might often be the axes transform *parent_axes.transAxes*. Inversely, when specifying the axes- or figure-transform here, be aware that not specifying *bbox_to_anchor* will use *parent_axes.bbox*, the units of which are in display (pixel) coordinates.

axes_class

[*matplotlib.axes.Axes* type, optional] If specified, the inset axes created will be created with this class's constructor.

axes_kwargs

[dict, optional] Keyworded arguments to pass to the constructor of the inset axes. Valid arguments include:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and r
alpha	float or None
anchor	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
animated	bool
aspect	{'auto'} or num
autoscale_on	bool
autoscalex_on	bool
autoscaley_on	bool
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	None, or a number
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
contains	unknown
facecolor or fc	color
figure	*Figure*
frame_on	bool
gid	str

Table 20 – continued from previous page

Property	Description
in_layout	bool
label	object
navigate	bool
navigate_mode	unknown
path_effects	*AbstractPathEffect*
picker	None or bool or callable
position	[left, bottom, width, height] or *Bbox*
prop_cycle	unknown
rasterization_zorder	float or None
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
title	str
transform	*Transform*
url	str
visible	bool
xbound	unknown
xlabel	str
xlim	(bottom: float, top: float)
xmargin	float greater than -0.5
xscale	{"linear", "log", "symlog", "logit", ...}
xticklabels	unknown
xticks	unknown
ybound	unknown
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	{"linear", "log", "symlog", "logit", ...}
yticklabels	unknown
yticks	unknown
zorder	float

borderpad

[float, default: 0.5] Padding between inset axes and the bbox_to_anchor. The units are axes font size, i.e. for a default font size of 10 points *borderpad = 0.5* is equivalent to a padding of 5 points.

Returns

inset_axes

[*axes_class*] Inset axes object created.

Examples using `mpl_toolkits.axes_grid1.inset_locator.zoomed_inset_axes`

- sphx_glr_gallery_axes_grid1_demo_colorbar_of_inset_axes.py
- sphx_glr_gallery_axes_grid1_inset_locator_demo2.py

mpl_toolkits.axes_grid1.mpl_axes

Classes

Axes(fig, rect[, facecolor, frameon, ...])	Build an axes in a figure.
SimpleAxisArtist(axis, axisnum, spine)	
SimpleChainedObjects(objects)	

mpl_toolkits.axes_grid1.mpl_axes.Axes

class mpl_toolkits.axes_grid1.mpl_axes.**Axes**(*fig*, *rect*, *facecolor=None*, *frameon=True*, *sharex=None*, *sharey=None*, *label=''*, *xscale=None*, *yscale=None*, *box_aspect=None*, **kwargs*)

Bases: `matplotlib.axes._axes.Axes`

Build an axes in a figure.

Parameters

fig

[*Figure*] The axes is build in the *Figure* *fig*.

rect

[[left, bottom, width, height]] The axes is build in the rectangle *rect*. *rect* is in *Figure* coordinates.

sharex, sharey

[*Axes*, optional] The x or y *axis* is shared with the x or y axis in the input *Axes*.

frameon

[bool, default: True] Whether the axes frame is visible.

box_aspect

[None, or a number, optional] Sets the aspect of the axes box. See *set_box_aspect* for details.

****kwargs**

Other optional keyword arguments:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and r
alpha	float or None
anchor	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
animated	bool
aspect	{'auto'} or num
autoscale_on	bool
autoscalex_on	bool
autoscaley_on	bool
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	None, or a number
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
contains	unknown
facecolor or fc	color
figure	*Figure*
frame_on	bool
gid	str
in_layout	bool
label	object
navigate	bool
navigate_mode	unknown
path_effects	*AbstractPathEffect*
picker	None or bool or callable
position	[left, bottom, width, height] or *Bbox*
prop_cycle	unknown
rasterization_zorder	float or None
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
title	str
transform	*Transform*
url	str
visible	bool
xbound	unknown
xlabel	str
xlim	(bottom: float, top: float)
xmargin	float greater than -0.5
xscale	{"linear", "log", "symlog", "logit", ...}

Table 22 – continued from previous page

Property	Description
xticklabels	unknown
xticks	unknown
ybound	unknown
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	{"linear", "log", "symlog", "logit", ...}
yticklabels	unknown
yticks	unknown
zorder	float

Returns

Axes

The new *Axes* object.

`class AxisDict`*() -> new empty dictionary dict(mapping) -> new dictionary initialized from a mapping object's (key, value) pairs dict(iterable) -> new dictionary initialized as if via: d = {} for k, v in iterable: d[k] = v dict(**kwargs) -> new dictionary initialized with the name=value pairs in the keyword argument list. For example: dict(one=1, two=2)*

Bases: `dict`

`__call__`(*self*, **v*, ***kwargs*)
Call self as a function.

`__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.mpl_axes', '__init__'`

`__getitem__`(*self*, *k*)
x.__getitem__(y) <==> x[y]

`__init__`(*self*, *axes*)
Initialize self. See help(type(self)) for accurate signature.

`__module__ = 'mpl_toolkits.axes_grid1.mpl_axes'`

`__weakref__`
list of weak references to the object (if defined)

`__module__ = 'mpl_toolkits.axes_grid1.mpl_axes'`

`property axis`
Convenience method to get or set some axis properties.

Call signatures:

```
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])
```

(continues on next page)

(continued from previous page)

```
xmin, xmax, ymin, ymax = axis(option)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

Parameters

xmin, xmax, ymin, ymax

[float, optional] The axis limits to be set. This can also be achieved using

```
ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
```

option

[bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

Value	Description
'on'	Turn on axis lines and labels. Same as `True`.
'off'	Turn off axis lines and labels. Same as `False`.
'equal'	Set equal scaling (i.e., make circles circular) by changing axis limits. This is the same as `ax.set_aspect('equal', adjustable='datalim')`. Explicit data limits may not be respected in this case.
'scaled'	Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as `ax.set_aspect('equal', adjustable='box', anchor='C')`. Additionally, further autoscaling will be disabled.
'tight'	Set limits just large enough to show all data, then disable further autoscaling.
'auto'	Automatic scaling (fill plot box with data).
'image'	'scaled' with axis limits equal to data limits.
'square'	Square plot; similar to 'scaled', but initially forcing `xmax-xmin == ymax-ymin`.

emit

[bool, default: True] Whether observers are notified of the axis limit change. This option is passed on to *set_xlim* and *set_ylim*.

Returns

xmin, xmax, ymin, ymax

[float] The axis limits.

See also:

matplotlib.axes.Axes.set_xlim

matplotlib.axes.Axes.set_ylim

cla(*self*)
Clear the current axes.

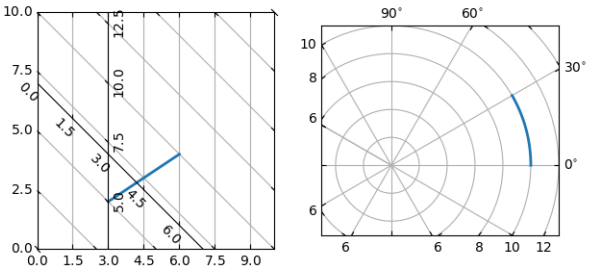
19.1.3 Matplotlib axisartist Toolkit

The *axisartist* namespace includes a derived Axes implementation (`mpl_toolkits.axisartist.Axes`). The biggest difference is that the artists that are responsible for drawing axis lines, ticks, ticklabels, and axis labels are separated out from the mpl's Axis class. This change was strongly motivated to support curvilinear grid.

You can find a tutorial describing usage of axisartist at the *axisartist* user guide.



The submodules of the axisartist API are:

axisartist.angle_helper	
axisartist.axes_divider	
axisartist.axes_grid	
axisartist.axes_rgb	
axisartist.axis_artist	axis_artist.py module provides axis-related artists.
axisartist.axisline_style	
axisartist.axislines	Axislines includes modified implementation of the Axes class.
axisartist.clip_path	
axisartist.floating_axes	An experimental support for curvilinear grid.
axisartist.grid_finder	
axisartist.grid_helper_curvelinear	An experimental support for curvilinear grid.
axisartist.parasite_axes	

mpl_toolkits.axisartist.angle_helper

Classes

ExtremeFinderCycle(nx, ny[, lon_cycle, ...])	This subclass handles the case where one or both coordinates should be taken modulo 360, or be restricted to not exceed a specific range.
FormatterDMS()	
FormatterHMS()	
LocatorBase(**kwargs)	
LocatorD(**kwargs)	
LocatorDM(**kwargs)	
LocatorDMS(**kwargs)	
LocatorH(**kwargs)	
LocatorHM(**kwargs)	
LocatorHMS(**kwargs)	

mpl_toolkits.axisartist.angle_helper.ExtremeFinderCycle

class mpl_toolkits.axisartist.angle_helper.**ExtremeFinderCycle**(*nx*, *ny*, *lon_cycle=360.0*, *lat_cycle=None*, *lon_minmax=None*, *lat_minmax=-90, 90*)

Bases: *mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple*

This subclass handles the case where one or both coordinates should be taken modulo 360, or be restricted to not exceed a specific range.

Parameters

nx, ny

[int] The number of samples in each direction.

lon_cycle, lat_cycle

[360 or None] If not None, values in the corresponding direction are taken modulo *lon_cycle* or *lat_cycle*; in theory this can be any number but the implementation actually assumes that it is 360 (if not None); other values give nonsensical results.

This is done by "unwrapping" the transformed grid coordinates so that jumps are less than a half-cycle; then normalizing the span to no more than a full cycle.

For example, if values are in the union of the [0, 2] and [358, 360] intervals (typically, angles measured modulo 360), the values in the second interval are normalized to [-2, 0] instead so that the values now cover [-2, 2]. If values are in a range of [5, 1000], this gets normalized to [5, 365].

lon_minmax, lat_minmax

[(float, float) or None] If not None, the computed bounding box is clipped to the given range in the corresponding direction.

__call__(*self*, *transform_xy*, *x1*, *y1*, *x2*, *y2*)

Compute an approximation of the bounding box obtained by applying *transform_xy* to the box delimited by `(x1, y1, x2, y2)`.

The intended use is to have `(x1, y1, x2, y2)` in axes coordinates, and have *transform_xy* be the transform from axes coordinates to data coordinates; this method then returns the range of data coordinates that span the actual axes.

The computation is done by sampling `nx * ny` equispaced points in the `(x1, y1, x2, y2)` box and finding the resulting points with extremal coordinates; then adding some padding to take into account the finite sampling.

As each sampling step covers a relative range of *1/nx* or *1/ny*, the padding is computed by expanding the span covered by the extremal coordinates by these fractions.

`__init__`(*self*, *nx*, *ny*, *lon_cycle=360.0*, *lat_cycle=None*, *lon_minmax=None*, *lat_minmax=- 90, 90*)

This subclass handles the case where one or both coordinates should be taken modulo 360, or be restricted to not exceed a specific range.

Parameters

nx, ny

[int] The number of samples in each direction.

lon_cycle, lat_cycle

[360 or None] If not None, values in the corresponding direction are taken modulo *lon_cycle* or *lat_cycle*; in theory this can be any number but the implementation actually assumes that it is 360 (if not None); other values give nonsensical results.

This is done by "unwrapping" the transformed grid coordinates so that jumps are less than a half-cycle; then normalizing the span to no more than a full cycle.

For example, if values are in the union of the [0, 2] and [358, 360] intervals (typically, angles measured modulo 360), the values in the second interval are normalized to [-2, 0] instead so that the values now cover [-2, 2]. If values are in a range of [5, 1000], this gets normalized to [5, 365].

lon_minmax, lat_minmax

[(float, float) or None] If not None, the computed bounding box is clipped to the given range in the corresponding direction.

__module__ = 'mpl_toolkits.axisartist.axes_grid'

Examples using mpl_toolkits.axisartist.axes_grid.CbarAxes

mpl_toolkits.axisartist.axes_grid.Grid

class mpl_toolkits.axisartist.axes_grid.**Grid**(*fig*, *rect*, *nrows_ncols*, *ngrids=None*, *direction='row'*, *axes_pad=0.02*, *add_all=<deprecated parameter>*, *share_all=False*, *share_x=True*, *share_y=True*, *label_mode='L'*, *axes_class=None*, ***, *aspect=False*)
Bases: *mpl_toolkits.axes_grid1.axes_grid.Grid*

Parameters

fig

[*Figure*] The parent figure.

rect

[(float, float, float, float) or int] The axes position, as a `(left, bottom, width, height)` tuple or as a three-digit subplot position code (e.g., "121").

nrows_ncols

[(int, int)] Number of rows and columns in the grid.

ngrids

[int or None, default: None] If not None, only the first *ngrids* axes in the grid are created.

direction

[{"row", "column"}, default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column").

axes_pad

[float or (float, float), default: 0.02] Padding or (horizontal padding, vertical padding) between axes, in inches.

add_all

[bool, default: True] Whether to add the axes to the figure using *Figure.add_axes*. This parameter is deprecated.

share_all

[bool, default: False] Whether all axes share their x- and y-axis. Overrides *share_x* and *share_y*.

share_x

[bool, default: True] Whether all axes of a column share their x-axis.

share_y

[bool, default: True] Whether all axes of a row share their y-axis.

label_mode

[{"L", "1", "all"}, default: "L"] Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

axes_class

[subclass of *matplotlib.axes.Axes*, default: None]

aspect

[bool, default: False] Whether the axes aspect ratio follows the aspect ratio of the data limits.

Bases: *mpl_toolkits.axes_grid1.axes_grid.ImageGrid*

Parameters

fig

[*Figure*] The parent figure.

rect

[(float, float, float, float) or int] The axes position, as a `(left, bottom, width, height)` tuple or as a three-digit subplot position code (e.g., "121").

nrows_ncols

[(int, int)] Number of rows and columns in the grid.

ngrids

[int or None, default: None] If not None, only the first *ngrids* axes in the grid are created.

direction

[{"row", "column"}, default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column"). This also affects the order in which axes are accessed using indexing (`grid[index]`).

axes_pad

[float or (float, float), default: 0.02in] Padding or (horizontal padding, vertical padding) between axes, in inches.

add_all

[bool, default: True] Whether to add the axes to the figure using *Figure.add_axes*. This parameter is deprecated.

share_all

[bool, default: False] Whether all axes share their x- and y-axis.

aspect

[bool, default: True] Whether the axes aspect ratio follows the aspect ratio of the data limits.

label_mode

[{"L", "1", "all"}, default: "L"] Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

cbar_mode

[{"each", "single", "edge", None}, default: None] Whether to create a colorbar for "each" axes, a "single" colorbar for the entire grid, colorbars only for axes on the "edge" determined by *cbar_location*, or no colorbars. The colorbars are stored in the `cbar_axes` attribute.

cbar_location

[{"left", "right", "bottom", "top"}, default: "right"]

cbar_pad

[float, default: None] Padding between the image axes and the colorbar axes.

cbar_size

[size specification (see `Size.from_any`), default: "5%"] Colorbar size.

cbar_set_cax

[bool, default: True] If True, each axes in the grid has a *cax* attribute that is bound to associated *cbar_axes*.

axes_class

[subclass of *matplotlib.axes.Axes*, default: None]

```
__module__ = 'mpl_toolkits.axisartist.axes_grid'
```

Examples using `mpl_toolkits.axisartist.axes_grid.ImageGrid`

mpl_toolkits.axisartist.axes_rgb

Classes

RGBAxes(*args[, pad, add_all])	**Parameters**

mpl_toolkits.axisartist.axes_rgb.RGBAxes

class mpl_toolkits.axisartist.axes_rgb.**RGBAxes**(**args*, *pad=0*, *add_all=<deprecated parameter>*, ***kwargs*)

Bases: *mpl_toolkits.axes_grid1.axes_rgb.RGBAxes*

Parameters

pad

[float, default: 0] fraction of the axes height to put as padding.

add_all

[bool, default: True] Whether to add the {rgb, r, g, b} axes to the figure. This parameter is deprecated.

axes_class

[matplotlib.axes.Axes]

***args**

Unpacked into axes_class() init for RGB

****kwargs**

Unpacked into axes_class() init for RGB, R, G, B axes

```
__module__ = 'mpl_toolkits.axisartist.axes_rgb'
```

Examples using `mpl_toolkits.axisartist.axes_rgb.RGBAxes`

mpl_toolkits.axisartist.axis_artist

axis_artist.py module provides axis-related artists. They are

- axis line
- tick lines
- tick labels
- axis label
- grid lines

The main artist classes are *AxisArtist* and *GridlinesCollection*. While *GridlinesCollection* is responsible for drawing grid lines, *AxisArtist* is responsible for all other artists. *AxisArtist* has attributes that are associated with each type of artists:

- line: axis line
- major_ticks: major tick lines
- major_ticklabels: major tick labels
- minor_ticks: minor tick lines
- minor_ticklabels: minor tick labels
- label: axis label

Typically, the *AxisArtist* associated with an axes will be accessed with the *axis* dictionary of the axes, i.e., the *AxisArtist* for the bottom axis is

```
ax.axis["bottom"]
```

where *ax* is an instance of `mpl_toolkits.axislines.Axes`. Thus, `ax.axis["bottom"].line` is an artist associated with the axis line, and `ax.axis["bottom"].major_ticks` is an artist associated with the major tick lines.

You can change the colors, fonts, line widths, etc. of these artists by calling suitable set method. For example, to change the color of the major ticks of the bottom axis to red, use

```
ax.axis["bottom"].major_ticks.set_color("r")
```

However, things like the locations of ticks, and their ticklabels need to be changed from the side of the grid_helper.

axis_direction

AxisArtist, *AxisLabel*, *TickLabels* have an *axis_direction* attribute, which adjusts the location, angle, etc. The *axis_direction* must be one of "left", "right", "bottom", "top", and follows the Matplotlib convention for rectangular axis.

For example, for the *bottom* axis (the left and right is relative to the direction of the increasing coordinate),

- ticklabels and axislabel are on the right
- ticklabels and axislabel have text angle of 0
- ticklabels are baseline, center-aligned
- axislabel is top, center-aligned

The text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

Parameter	left	bottom	right	top
ticklabels location	left	right	right	left
axislabel location	left	right	right	left
ticklabels angle	90	0	-90	180
axislabel angle	180	0	0	180
ticklabel va	center	baseline	center	baseline
axislabel va	center	top	center	bottom
ticklabel ha	right	center	right	center
axislabel ha	right	center	right	center

Ticks are by default direct opposite side of the ticklabels. To make ticks to the same side of the ticklabels,

```
ax.axis["bottom"].major_ticks.set_ticks_out(True)
```

The following attributes can be customized (use the `set_xxx` methods):

- *Ticks*: ticksize, tick_out
- *TickLabels*: pad
- *AxisLabel*: pad

Classes

AttributeCopier(**kwargs)	[*Deprecated*]
AxisArtist(axes, helper[, offset, ...])	An artist which draws axis (a line along which the n-th axes coord is constant) line, ticks, ticklabels, and axis label.
AxisLabel(*args[, axis_direction, axis])	Axis Label.
BezierPath(**kwargs)	[*Deprecated*]
GridlinesCollection(*args[, which, axis])	**Parameters**
LabelBase(*args, **kwargs)	A base class for AxisLabel and TickLabels.
TickLabels(*[, axis_direction])	Tick Labels.
Ticks(ticksize[, tick_out, axis])	Ticks are derived from Line2D, and note that ticks themselves are markers.

mpl_toolkits.axisartist.axis_artist.AttributeCopier

class mpl_toolkits.axisartist.axis_artist.**AttributeCopier**(***kwargs*)

Bases: object

[*Deprecated*]

Notes

Deprecated since version 3.2:

__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axisartist.axis_artist', '__init__':

__init__(*self*, *ref_artist*, *klass=<class 'matplotlib.artist.Artist'>*)

[*Deprecated*]

Notes

Deprecated since version 3.2:

__module__ = 'mpl_toolkits.axisartist.axis_artist'

__weakref__

list of weak references to the object (if defined)

get_attribute_from_ref_artist(*self*, *attr_name*, *default_value=<deprecated parameter>*)

get_ref_artist(*self*)
Return the underlying artist that actually defines some properties (e.g., color) of this artist.

set_ref_artist(*self*, *artist*)
[*Deprecated*]

Notes

Deprecated since version 3.2:

Examples using mpl_toolkits.axisartist.axis_artist.AttributeCopier

mpl_toolkits.axisartist.axis_artist.AxisArtist

class mpl_toolkits.axisartist.axis_artist.**AxisArtist**(*axes*, *helper*, *offset=None*, *axis_direction='bottom'*, ***kwargs*)

Bases: *matplotlib.artist.Artist*

An artist which draws axis (a line along which the n-th axes coord is constant) line, ticks, ticklabels, and axis label.

Parameters

axes

[*mpl_toolkits.axisartist.axislines.Axes*]

helper

[*AxisArtistHelper*]

property LABELPAD

ZORDER = 2.5

__init__(*self*, *axes*, *helper*, *offset=None*, *axis_direction='bottom'*, ***kwargs*)

Parameters

axes

[*mpl_toolkits.axisartist.axislines.Axes*]

helper

[*AxisArtistHelper*]

__module__ = 'mpl_toolkits.axisartist.axis_artist'

property dpi_transform

draw(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_axisline_style(*self*)
Return the current axisline style.

get_helper(*self*)
Return axis artist helper instance.

get_tightbbox(*self*, *renderer*)
Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

get_transform(*self*)
Return the *Transform* instance used by this artist.

invert_ticklabel_direction(*self*)

set_axis_direction(*self*, *axis_direction*)
Adjust the direction, text angle, text alignment of ticklabels, labels following the matplotlib convention for the rectangle axes.

The *axis_direction* must be one of [left, right, bottom, top].

property	left	bottom	right	top
ticklabels location	"-"	"+"	"+"	"-"
axislabel location	"-"	"+"	"+"	"-"
ticklabels angle	90	0	-90	180
ticklabel va	center	baseline	center	baseline
ticklabel ha	right	center	right	center
axislabel angle	180	0	0	180
axislabel va	center	top	center	bottom
axislabel ha	right	center	right	center

Note that the direction "+" and "-" are relative to the direction of the increasing coordinate. Also, the text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

`set_axislabel_direction`(*self*, *label_direction*)

Adjust the direction of the axislabel.

Note that the *label_direction*s '+' and '-' are relative to the direction of the increasing coordinate.

Parameters

tick_direction

[{"+", "-"}]

`set_axisline_style`(*self*, *axisline_style=None*, ***kwargs*)

Set the axisline style.

The new style is completely defined by the passed attributes. Existing style attributes are forgotten.

Parameters

axisline_style

[str or None] The line style, e.g. '->', optionally followed by a comma-separated list of attributes. Alternatively, the attributes can be provided as keywords.

If *None* this returns a string containing the available styles.

Examples

The following two commands are equal: >>> set_axisline_style("->,size=1.5") >>> set_axisline_style("->", size=1.5)

`set_label`(*self*, *s*)
Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

`set_ticklabel_direction`(*self*, *tick_direction*)
Adjust the direction of the ticklabel.

Note that the *label_direction*s '+' and '-' are relative to the direction of the increasing coordinate.

Parameters

tick_direction

[{"+", "-"}]

`toggle`(*self*, *all=None*, *ticks=None*, *ticklabels=None*, *label=None*)
Toggle visibility of ticks, ticklabels, and (axis) label. To turn all off,

```
axis.toggle(all=False)
```

To turn all off but ticks on

```
axis.toggle(all=False, ticks=True)
```

To turn all on but (axis) label off

```
axis.toggle(all=True, label=False))
```

`zorder = 2.5`

Examples using `mpl_toolkits.axisartist.axis_artist.AxisArtist`

mpl_toolkits.axisartist.axis_artist.AxisLabel

`class mpl_toolkits.axisartist.axis_artist.AxisLabel`(**args*, *axis_direction='bottom'*, *axis=None*, ***kwargs*)
Bases: *mpl_toolkits.axisartist.axis_artist.AttributeCopier*, *mpl_toolkits.axisartist.axis_artist.LabelBase*

Axis Label. Derived from Text. The position of the text is updated in the fly, so changing text position has no effect. Otherwise, the properties can be changed as a normal Text.

To change the pad between ticklabels and axis label, use set_pad.

[*Deprecated*]

Notes

Deprecated since version 3.2:

`__init__`(*self*, **args*, *axis_direction='bottom'*, *axis=None*, ***kwargs*)
[*Deprecated*]

Notes

Deprecated since version 3.2:

`__module__ = 'mpl_toolkits.axisartist.axis_artist'`

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`get_color`(*self*)
Return the color of the text.

`get_pad`(*self*)
Return the internal pad in points.

See *set_pad* for more details.

`get_ref_artist`(*self*)
Return the underlying artist that actually defines some properties (e.g., color) of this artist.

`get_text`(*self*)
Return the text string.

`get_window_extent`(*self*, *renderer*)

Return the *Bbox* bounding the text, in display units.

In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

Parameters

renderer

[Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling *get_window_extent* before the first *draw*. In practice, it is usually easier to trigger a draw first (e.g. by saving the figure).

dpi

[float, optional] The dpi value for computing the bbox, defaults to `self.figure.dpi` (*not* the renderer dpi); should be set e.g. if to match regions with a figure saved with a custom dpi value.

`set_axis_direction`(*self*, *d*)

Adjust the text angle and text alignment of axis label according to the matplotlib convention.

property	left	bottom	right	top
axislabel angle	180	0	0	180
axislabel va	center	top	center	bottom
axislabel ha	right	center	right	center

Note that the text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

`set_default_alignment`(*self*, *d*)

`set_default_angle`(*self*, *d*)

`set_pad`(*self*, *pad*)

Set the internal pad in points.

The actual pad will be the sum of the internal pad and the external pad (the latter is set automatically by the AxisArtist).

Examples using `mpl_toolkits.axisartist.axis_artist.AxisLabel`

mpl_toolkits.axisartist.axis_artist.BezierPath

class mpl_toolkits.axisartist.axis_artist.**BezierPath**(***kwargs*)

Bases: *matplotlib.lines.Line2D*

[*Deprecated*]

Notes

Deprecated since version 3.2:

Parameters

path

[*Path*] The path to draw.

****kwargs**

All remaining keyword arguments are passed to *Line2D*.

__init__(*self*, *path*, **args*, ***kwargs*)

Parameters

path

[*Path*] The path to draw.

****kwargs**

All remaining keyword arguments are passed to *Line2D*.

__module__ = 'mpl_toolkits.axisartist.axis_artist'

draw(*self*, *renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`recache`(*self*)

`set_path`(*self*, *path*)

Examples using `mpl_toolkits.axisartist.axis_artist.BezierPath`

mpl_toolkits.axisartist.axis_artist.GridlinesCollection

`class mpl_toolkits.axisartist.axis_artist.GridlinesCollection`(**args*, *which='major'*, *axis='both'*, ***kwargs*)

Bases: *matplotlib.collections.LineCollection*

Parameters

which

[{"major", "minor"}]

axis

[{"both", "x", "y"}]

`__init__`(*self*, **args*, *which='major'*, *axis='both'*, ***kwargs*)

Parameters

which

[{"major", "minor"}]

axis

[{"both", "x", "y"}]

`__module__ = 'mpl_toolkits.axisartist.axis_artist'`

`draw`(*self*, *renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`set_axis`(*self*, *axis*)

`set_grid_helper`(*self*, *grid_helper*)

`set_which`(*self*, *which*)

Examples using `mpl_toolkits.axisartist.axis_artist.GridlinesCollection`

mpl_toolkits.axisartist.axis_artist.LabelBase

`class mpl_toolkits.axisartist.axis_artist.LabelBase`(**args*, ***kwargs*)

Bases: *matplotlib.text.Text*

A base class for AxisLabel and TickLabels. The position and angle of the text are calculated by to offset_ref_angle, text_ref_angle, and offset_radius attributes.

Create a *Text* instance at *x*, *y* with string *text*.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array an
alpha	float or None
animated	bool
backgroundcolor	color
bbox	dict with properties for *patches.FancyBboxPatch*
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
figure	*Figure*
fontfamily or family	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', '
fontproperties or font or font_properties	*font_manager.FontProperties* or `str` or `pathlib.Path`
fontsize or size	float or {'xx-small', 'x-small', 'small', 'medium', 'large',
fontstretch or stretch	{a numeric value in range 0-1000, 'ultra-condensed',
fontstyle or style	{'normal', 'italic', 'oblique'}
fontvariant or variant	{'normal', 'small-caps'}
fontweight or weight	{a numeric value in range 0-1000, 'ultralight', 'light',
gid	str
horizontalalignment or ha	{'center', 'right', 'left'}
in_layout	bool
label	object

Tab

Property	Description
linespacing	float (multiple of font size)
multialignment or ma	{'left', 'right', 'center'}

`__module__ = 'mpl_toolkits.axisartist.axis_artist'`

`draw`(*self*, *renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`get_window_extent`(*self*, *renderer*)
Return the *Bbox* bounding the text, in display units.

In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

Parameters

renderer

[Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling *get_window_extent* before the first *draw*. In practice, it is usually easier to trigger a draw first (e.g. by saving the figure).

dpi

[float, optional] The dpi value for computing the bbox, defaults to `self.figure.dpi` (*not* the renderer dpi); should be set e.g. if to match regions with a figure saved with a custom dpi value.

Examples using `mpl_toolkits.axisartist.axis_artist.LabelBase`

mpl_toolkits.axisartist.axis_artist.TickLabels

`class mpl_toolkits.axisartist.axis_artist.`**`TickLabels`**(*, *axis_direction='bottom'*, ***kwargs*)
Bases: *mpl_toolkits.axisartist.axis_artist.AxisLabel*

Tick Labels. While derived from Text, this single artist draws all ticklabels. As in AxisLabel, the position of the text is updated in the fly, so changing text position has no effect. Otherwise, the properties can be changed as a normal Text. Unlike the ticklabels of the mainline matplotlib, properties of single ticklabel alone cannot modified.

To change the pad between ticks and ticklabels, use set_pad.

[*Deprecated*]

Notes

Deprecated since version 3.2:

`__init__`(*self*, ***, *axis_direction='bottom'*, ***kwargs*)
[*Deprecated*]

Notes

Deprecated since version 3.2:

`__module__ = 'mpl_toolkits.axisartist.axis_artist'`

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`get_ref_artist`(*self*)
Return the underlying artist that actually defines some properties (e.g., color) of this artist.

`get_texts_widths_heights_descents`(*self*, *renderer*)
Return a list of `(width, height, descent)` tuples for ticklabels.

Empty labels are left out.

`get_window_extents`(*self*, *renderer*)

`invert_axis_direction`(*self*)

`set_axis_direction`(*self*, *label_direction*)
Adjust the text angle and text alignment of ticklabels according to the matplotlib convention.

The *label_direction* must be one of [left, right, bottom, top].

property	left	bottom	right	top
ticklabels angle	90	0	-90	180
ticklabel va	center	baseline	center	baseline
ticklabel ha	right	center	right	center

Note that the text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

`set_locs_angles_labels`(*self*, *locs_angles_labels*)

Examples using `mpl_toolkits.axisartist.axis_artist.TickLabels`

mpl_toolkits.axisartist.axis_artist.Ticks

`class mpl_toolkits.axisartist.axis_artist.Ticks`(*ticksize*, *tick_out=False*, *, *axis=None*, ***kwargs*)

Bases: *mpl_toolkits.axisartist.axis_artist.AttributeCopier*, *matplotlib.lines.Line2D*

Ticks are derived from Line2D, and note that ticks themselves are markers. Thus, you should use set_mec, set_mew, etc.

To change the tick size (length), you need to use set_ticksize. To change the direction of the ticks (ticks are in opposite direction of ticklabels by default), use set_tick_out(False).

[*Deprecated*]

Notes

Deprecated since version 3.2:

`__init__`(*self*, *ticksize*, *tick_out=False*, *, *axis=None*, ***kwargs*)

[*Deprecated*]

Notes

Deprecated since version 3.2:

`__module__ = 'mpl_toolkits.axisartist.axis_artist'`

`draw`(*self*, *renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`get_color`(*self*)
Return the line color.

See also *set_color*.

`get_markeredgecolor`(*self*)
Return the marker edge color.

See also *set_markeredgecolor*.

`get_markeredgewidth`(*self*)
Return the marker edge width in points.

See also *set_markeredgewidth*.

`get_ref_artist`(*self*)
Return the underlying artist that actually defines some properties (e.g., color) of this artist.

`get_tick_out`(*self*)
Return whether ticks are drawn inside or outside the axes.

`get_ticksize`(*self*)
Return length of the ticks in points.

`set_locs_angles`(*self*, *locs_angles*)

`set_tick_out`(*self*, *b*)
Set whether ticks are drawn inside or outside the axes.

`set_ticksize`(*self*, *ticksize*)
Set length of the ticks in points.

Examples using `mpl_toolkits.axisartist.axis_artist.Ticks`

mpl_toolkits.axisartist.axisline_style

Classes

AxislineStyle(stylename, **kw)	A container class which defines style classes for AxisArtists.

mpl_toolkits.axisartist.axisline_style.AxislineStyle

class mpl_toolkits.axisartist.axisline_style.**AxislineStyle**(*stylename*, ***kw*)

Bases: matplotlib.patches._Style

A container class which defines style classes for AxisArtists.

An instance of any axisline style class is an callable object, whose call signature is

```
__call__(self, axis_artist, path, transform)
```

When called, this should return an *Artist* with the following methods:

```
def set_path(self, path):
    # set the path for axisline.

def set_line_mutation_scale(self, scale):
    # set the scale

def draw(self, renderer):
    # draw
```

Return the instance of the subclass with the given style name.

class **FilledArrow**(*size=1*)

Bases: *mpl_toolkits.axisartist.axisline_style.AxislineStyle.SimpleArrow*

Parameters

size

[float] Size of the arrow as a fraction of the ticklabel size.

ArrowAxisClass

alias of _FancyAxislineStyle.FilledArrow

__module__ = 'mpl_toolkits.axisartist.axisline_style'

class **SimpleArrow**(*size=1*)

Bases: mpl_toolkits.axisartist.axisline_style.AxislineStyle._Base

A simple arrow.

Parameters

size

[float] Size of the arrow as a fraction of the ticklabel size.

ArrowAxisClass

alias of _FancyAxislineStyle.SimpleArrow

__init__(*self*, *size=1*)

Parameters

size

[float] Size of the arrow as a fraction of the ticklabel size.

`__module__ = 'mpl_toolkits.axisartist.axisline_style'`

`new_line`(*self*, *axis_artist*, *transform*)

`__module__ = 'mpl_toolkits.axisartist.axisline_style'`

Examples using `mpl_toolkits.axisartist.axisline_style.AxislineStyle`

mpl_toolkits.axisartist.axislines

Axislines includes modified implementation of the Axes class. The biggest difference is that the artists responsible for drawing the axis spine, ticks, ticklabels and axis labels are separated out from Matplotlib's Axis class. Originally, this change was motivated to support curvilinear grid. Here are a few reasons that I came up with a new axes class:

- "top" and "bottom" x-axis (or "left" and "right" y-axis) can have different ticks (tick locations and labels). This is not possible with the current Matplotlib, although some twin axes trick can help.
- Curvilinear grid.
- angled ticks.

In the new axes class, xaxis and yaxis is set to not visible by default, and new set of artist (AxisArtist) are defined to draw axis line, ticks, ticklabels and axis label. Axes.axis attribute serves as a dictionary of these artists, i.e., ax.axis["left"] is a AxisArtist instance responsible to draw left y-axis. The default Axes.axis contains "bottom", "left", "top" and "right".

AxisArtist can be considered as a container artist and has following children artists which will draw ticks, labels, etc.

- line
- major_ticks, major_ticklabels
- minor_ticks, minor_ticklabels
- offsetText
- label

Note that these are separate artists from *`matplotlib.axis.Axis`*, thus most tick-related functions in Matplotlib won't work. For example, color and markerwidth of the `ax.axis["bottom"].major_ticks` will follow those of Axes.xaxis unless explicitly specified.

In addition to AxisArtist, the Axes will have *gridlines* attribute, which obviously draws grid lines. The gridlines needs to be separated from the axis as some gridlines can never pass any axis.

Classes

Axes(*args[, grid_helper])	Build an axes in a figure.
AxesZero(*args[, grid_helper])	Build an axes in a figure.
AxisArtistHelper()	AxisArtistHelper should define following method with given APIs.
AxisArtistHelperRectlinear()	
GridHelperBase()	
GridHelperRectlinear(axes)	

mpl_toolkits.axisartist.axislines.Axes

class mpl_toolkits.axisartist.axislines.**Axes**(**args*, *grid_helper=None*, ***kwargs*)

Bases: matplotlib.axes._axes.Axes

Build an axes in a figure.

Parameters

fig

[*Figure*] The axes is build in the *Figure* *fig*.

rect

[[left, bottom, width, height]] The axes is build in the rectangle *rect*. *rect* is in *Figure* coordinates.

sharex, sharey

[*Axes*, optional] The x or y *axis* is shared with the x or y axis in the input *Axes*.

frameon

[bool, default: True] Whether the axes frame is visible.

box_aspect

[None, or a number, optional] Sets the aspect of the axes box. See *set_box_aspect* for details.

****kwargs**

Other optional keyword arguments:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and r
alpha	float or None
anchor	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
animated	bool
aspect	{'auto'} or num
autoscale_on	bool
autoscalex_on	bool
autoscaley_on	bool
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	None, or a number
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
contains	unknown
facecolor or fc	color
figure	*Figure*
frame_on	bool
gid	str
in_layout	bool
label	object
navigate	bool
navigate_mode	unknown
path_effects	*AbstractPathEffect*
picker	None or bool or callable
position	[left, bottom, width, height] or *Bbox*
prop_cycle	unknown
rasterization_zorder	float or None
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
title	str
transform	*Transform*
url	str
visible	bool
xbound	unknown
xlabel	str
xlim	(bottom: float, top: float)
xmargin	float greater than -0.5
xscale	{"linear", "log", "symlog", "logit", ...}
xticklabels	unknown
xticks	unknown

Table 35 – continued from previous page

Property	Description
ybound	unknown
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	{"linear", "log", "symlog", "logit", ...}
yticklabels	unknown
yticks	unknown
zorder	float

Returns

Axes

The new *Axes* object.

`__call__`(*self*, **args*, ***kwargs*)
Call self as a function.

`__init__`(*self*, **args*, *grid_helper=None*, ***kwargs*)
Build an axes in a figure.

Parameters

fig

[*Figure*] The axes is build in the *Figure* *fig*.

rect

[[left, bottom, width, height]] The axes is build in the rectangle *rect*. *rect* is in *Figure* coordinates.

sharex, sharey

[*Axes*, optional] The x or y *axis* is shared with the x or y axis in the input *Axes*.

frameon

[bool, default: True] Whether the axes frame is visible.

box_aspect

[None, or a number, optional] Sets the aspect of the axes box. See *set_box_aspect* for details.

****kwargs**

Other optional keyword arguments:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and r
alpha	float or None
anchor	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
animated	bool

xmargin	float greater than -0.5
xscale	{"linear", "log", "symlog", "logit", ...}
xticklabels	unknown
xticks	unknown
ybound	unknown

Table 36 – continued from previous page

Property	Description
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	{"linear", "log", "symlog", "logit", ...}
yticklabels	unknown
yticks	unknown
zorder	float

Returns

Axes

The new *Axes* object.

__module__ = 'mpl_toolkits.axisartist.axislines'

property axis

Convenience method to get or set some axis properties.

Call signatures:

```
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])
xmin, xmax, ymin, ymax = axis(option)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

Parameters

xmin, xmax, ymin, ymax

[float, optional] The axis limits to be set. This can also be achieved using

```
ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
```

option

[bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

Value	Description
'on'	Turn on axis lines and labels. Same as `True`.
'off'	Turn off axis lines and labels. Same as `False`.
'equal'	Set equal scaling (i.e., make circles circular) by changing axis limits. This is the same as `ax.set_aspect('equal', adjustable='datalim')`. Explicit data limits may not be respected in this case.
'scaled'	Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as `ax.set_aspect('equal', adjustable='box', anchor='C')`. Additionally, further autoscaling will be disabled.
'tight'	Set limits just large enough to show all data, then disable further autoscaling.
'auto'	Automatic scaling (fill plot box with data).
'image'	'scaled' with axis limits equal to data limits.
'square'	Square plot; similar to 'scaled', but initially forcing `xmax-xmin == ymax-ymin`.

emit

[bool, default: True] Whether observers are notified of the axis limit change. This option is passed on to *set_xlim* and *set_ylim*.

Returns

xmin, xmax, ymin, ymax

[float] The axis limits.

See also:

matplotlib.axes.Axes.set_xlim

matplotlib.axes.Axes.set_ylim

`cla`(*self*)
Clear the current axes.

`get_children`(*self*)
Return a list of the child *Artist*s of this *Artist*.

`get_grid_helper`(*self*)

`grid`(*self*, *b=None*, *which='major'*, *axis='both'*, ***kwargs*)
Toggle the gridlines, and optionally set the properties of the lines.

`invalidate_grid_helper`(*self*)

`new_fixed_axis`(*self*, *loc*, *offset=None*)

`new_floating_axis`(*self*, *nth_coord*, *value*, *axis_direction='bottom'*)

`new_gridlines`(*self*, *grid_helper=None*)
Create and return a new GridlineCollection instance.

which : "major" or "minor" *axis* : "both", "x" or "y"

`toggle_axisline`(*self*, *b=None*)

Examples using `mpl_toolkits.axisartist.axislines.Axes`

mpl_toolkits.axisartist.axislines.AxesZero

`class mpl_toolkits.axisartist.axislines.AxesZero`(**args*, *grid_helper=None*, ***kwargs*)

Bases: *mpl_toolkits.axisartist.axislines.Axes*

Build an axes in a figure.

Parameters

fig

[*Figure*] The axes is build in the *Figure* *fig*.

rect

[[left, bottom, width, height]] The axes is build in the rectangle *rect*. *rect* is in *Figure* coordinates.

sharex, sharey

[*Axes*, optional] The x or y *axis* is shared with the x or y axis in the input *Axes*.

frameon

[bool, default: True] Whether the axes frame is visible.

box_aspect

[None, or a number, optional] Sets the aspect of the axes box. See *set_box_aspect* for details.

****kwargs**

Other optional keyword arguments:

Returns

Axes

The new *Axes* object.

```
__module__ = 'mpl_toolkits.axisartist.axislines'
```

Examples using `mpl_toolkits.axisartist.axislines.AxesZero`

mpl_toolkits.axisartist.axislines.AxisArtistHelper

class mpl_toolkits.axisartist.axislines.**AxisArtistHelper**

Bases: `object`

AxisArtistHelper should define following method with given APIs. Note that the first axes argument will be axes attribute of the caller artist.:

```
# LINE (spinal line?)

def get_line(self, axes):
    # path : Path
    return path

def get_line_transform(self, axes):
    # ...
    # trans : transform
    return trans

# LABEL

def get_label_pos(self, axes):
    # x, y : position
    return (x, y), trans

def get_label_offset_transform(self,
        axes,
        pad_points, fontprops, renderer,
        bboxes,
        ):
```

(continues on next page)

(continued from previous page)

```
    # va : vertical alignment
    # ha : horizontal alignment
    # a : angle
    return trans, va, ha, a

# TICK

def get_tick_transform(self, axes):
    return trans

def get_tick_iterators(self, axes):
    # iter : iterable object that yields (c, angle, l) where
    # c, angle, l is position, tick angle, and label

    return iter_major, iter_minor
```

class Fixed(*loc*, *nth_coord=None*)

Bases: mpl_toolkits.axisartist.axislines.AxisArtistHelper._Base

Helper class for a fixed (in the axes coordinate) axis.

nth_coord = along which coordinate value varies in 2d, nth_coord = 0 -> x axis, nth_coord = 1 -> y axis

__init__(*self*, *loc*, *nth_coord=None*)

mpl_toolkits.axisartist.floating_axes

An experimental support for curvilinear grid.

Classes

ExtremeFinderFixed(extremes)	This subclass always returns the same bounding box.
FixedAxisArtistHelper(grid_helper, side[, ...])	nth_coord = along which coordinate value varies.
FloatingAxes	alias of `mpl_toolkits.axisartist.floating_axes.Floating AxesHostAxes`
FloatingAxesBase(*args, **kwargs)	
FloatingAxisArtistHelper(grid_helper, ...[, ...])	nth_coord = along which coordinate value varies.
GridHelperCurveLinear(aux_trans, extremes[, ...])	aux_trans : a transform from the source (curved) coordinate to target (rectilinear) coordinate.

mpl_toolkits.axisartist.floating_axes.ExtremeFinderFixed

class mpl_toolkits.axisartist.floating_axes.**ExtremeFinderFixed**(*extremes*)

Bases: *mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple*

This subclass always returns the same bounding box.

Parameters

extremes

[(float, float, float, float)] The bounding box that this helper always returns.

__call__(*self*, *transform_xy*, *x1*, *y1*, *x2*, *y2*)

Compute an approximation of the bounding box obtained by applying *transform_xy* to the box delimited by `(x1, y1, x2, y2)`.

The intended use is to have `(x1, y1, x2, y2)` in axes coordinates, and have *transform_xy* be the transform from axes coordinates to data coordinates; this method then returns the range of data coordinates that span the actual axes.

The computation is done by sampling `nx * ny` equispaced points in the `(x1, y1, x2, y2)` box and finding the resulting points with extremal coordinates;

then adding some padding to take into account the finite sampling.

As each sampling step covers a relative range of *1/nx* or *1/ny*, the padding is computed by expanding the span covered by the extremal coordinates by these fractions.

`__init__`(*self*, *extremes*)
This subclass always returns the same bounding box.

Parameters

extremes

[(float, float, float, float)] The bounding box that this helper always returns.

`__module__ = 'mpl_toolkits.axisartist.floating_axes'`

Examples using `mpl_toolkits.axisartist.floating_axes.ExtremeFinderFixed`

mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple

class mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple(*nx*, *ny*)

Bases: object

A helper class to figure out the range of grid lines that need to be drawn.

Parameters

nx, ny

[int] The number of samples in each direction.

__call__(*self*, *transform_xy*, *x1*, *y1*, *x2*, *y2*)
Compute an approximation of the bounding box obtained by applying *transform_xy* to the box delimited by `(x1, y1, x2, y2)`.

The intended use is to have `(x1, y1, x2, y2)` in axes coordinates, and have *transform_xy* be the transform from axes coordinates to data coordinates; this method then returns the range of data coordinates that span the actual axes.

The computation is done by sampling `nx * ny` equispaced points in the `(x1, y1, x2, y2)` box and finding the resulting points with extremal coordinates; then adding some padding to take into account the finite sampling.

As each sampling step covers a relative range of *1/nx* or *1/ny*, the padding is computed by expanding the span covered by the extremal coordinates by these fractions.

`__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axisartist.grid_finder', '__doc__':`

`__init__`(*self*, *nx*, *ny*)

Parameters

nx, ny

[int] The number of samples in each direction.

`__module__ = 'mpl_toolkits.axisartist.grid_finder'`

`__weakref__`
list of weak references to the object (if defined)

Examples using `mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple`

- sphx_glr_gallery_axisartist_demo_axis_direction.py
- sphx_glr_gallery_axisartist_demo_curvelinear_grid.py
- sphx_glr_gallery_axisartist_demo_curvelinear_grid2.py
- sphx_glr_gallery_axisartist_demo_floating_axis.py
- sphx_glr_gallery_axisartist_simple_axis_pad.py

mpl_toolkits.axisartist.grid_finder.FixedLocator

`class mpl_toolkits.axisartist.grid_finder.FixedLocator`(*locs*)
Bases: `object`

`__call__`(*self*, *v1*, *v2*)
Call self as a function.

`__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axisartist.grid_finder', '__init__':`

`__init__`(*self*, *locs*)
Initialize self. See help(type(self)) for accurate signature.

`__module__ = 'mpl_toolkits.axisartist.grid_finder'`

`__weakref__`
list of weak references to the object (if defined)

set_factor(*self*, *f*)
[*Deprecated*]

Notes

Deprecated since version 3.3:

Examples using `mpl_toolkits.axisartist.grid_finder.FixedLocator`

- sphx_glr_gallery_axisartist_demo_floating_axes.py

mpl_toolkits.axisartist.grid_finder.FormatterPrettyPrint

class mpl_toolkits.axisartist.grid_finder.FormatterPrettyPrint(*useMathText=True*)
Bases: `object`

__call__(*self*, *direction*, *factor*, *values*)
Call self as a function.

__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axisartist.grid_finder', '__init__':

__init__(*self*, *useMathText=True*)
Initialize self. See help(type(self)) for accurate signature.

```
__module__ = 'mpl_toolkits.axisartist.grid_finder'
```

Examples using `mpl_toolkits.axisartist.grid_finder.GridFinderBase`

mpl_toolkits.axisartist.grid_finder.MaxNLocator

```
class mpl_toolkits.axisartist.grid_finder.MaxNLocator(nbins=10, steps=None,
                                                      trim=True, integer=False,
                                                      symmetric=False,
                                                      prune=None)
```

Bases: *matplotlib.ticker.MaxNLocator*

Parameters

nbins

[int or 'auto', default: 10] Maximum number of intervals; one less than max number of ticks. If the string 'auto', the number of bins will be automatically determined based on the length of the axis.

steps

[array-like, optional] Sequence of nice numbers starting with 1 and ending with 10; e.g., [1, 2, 4, 5, 10], where the values are acceptable tick multiples. i.e. for the example, 20, 40, 60 would be an acceptable set of ticks, as would 0.4, 0.6, 0.8, because they are multiples of 2. However, 30, 60, 90 would not be allowed because 3 does not appear in the list of steps.

integer

[bool, default: False] If True, ticks will take only integer values, provided at least *min_n_ticks* integers are found within the view limits.

symmetric

[bool, default: False] If True, autoscaling will result in a range symmetric about zero.

prune

[{'lower', 'upper', 'both', None}, default: None] Remove edge ticks -- useful for stacked or ganged plots where the upper tick of one axes overlaps with the lower tick of the axes above it, primarily when `rcParams["axes.autolimit_mode"]` (default: `'data'`) is

'round_numbers'. If prune=='lower', the smallest tick will be removed. If prune == 'upper', the largest tick will be removed. If prune == 'both', the largest and smallest ticks will be removed. If *prune* is *None*, no ticks will be removed.

min_n_ticks

[int, default: 2] Relax *nbins* and *integer* constraints if necessary to obtain this minimum number of ticks.

__call__(*self*, *v1*, *v2*)

Return the locations of the ticks.

__init__(*self*, *nbins=10*, *steps=None*, *trim=True*, *integer=False*, *symmetric=False*, *prune=None*)

Parameters

nbins

[int or 'auto', default: 10] Maximum number of intervals; one less than max number of ticks. If the string 'auto', the number of bins will be automatically determined based on the length of the axis.

steps

[array-like, optional] Sequence of nice numbers starting with 1 and ending with 10; e.g., [1, 2, 4, 5, 10], where the values are acceptable tick multiples. i.e. for the example, 20, 40, 60 would be an acceptable set of ticks, as would 0.4, 0.6, 0.8, because they are multiples of 2. However, 30, 60, 90 would not be allowed because 3 does not appear in the list of steps.

integer

[bool, default: False] If True, ticks will take only integer values, provided at least *min_n_ticks* integers are found within the view limits.

symmetric

[bool, default: False] If True, autoscaling will result in a range symmetric about zero.

prune

[{'lower', 'upper', 'both', None}, default: None] Remove edge ticks -- useful for stacked or ganged plots where the upper tick of one axes overlaps with the lower tick of the axes above it, primarily when rcParams["axes.autolimit_mode"] (default: 'data') is 'round_numbers'. If prune=='lower', the smallest tick will be removed. If prune == 'upper', the largest tick will be removed.

If `prune == 'both'`, the largest and smallest ticks will be removed. If *prune* is *None*, no ticks will be removed.

min_n_ticks

[int, default: 2] Relax *nbins* and *integer* constraints if necessary to obtain this minimum number of ticks.

mpl_toolkits.axisartist.parasite_axes

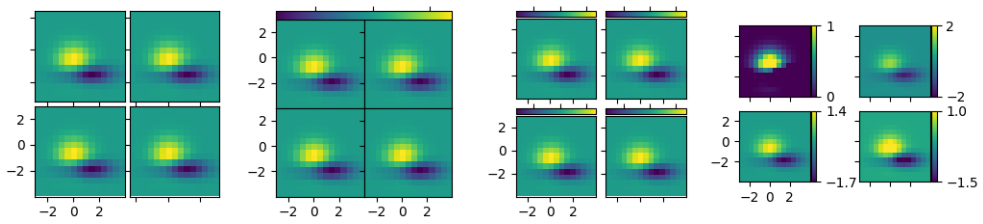
19.1.4 Matplotlib axes_grid Toolkit

Note: AxesGrid toolkit has been a part of matplotlib since v 0.99. Originally, the toolkit had a single namespace of *axes_grid*. In more recent version, the toolkit has divided into two separate namespace (*axes_grid1* and *axisartist*). While *axes_grid* namespace is maintained for the backward compatibility, use of *axes_grid1* and *axisartist* is recommended. For the documentation on `axes_grid`, see the previous version of the docs.

Matplotlib axes_grid1 Toolkit

The matplotlib *mpl_toolkits.axes_grid1* toolkit is a collection of helper classes to ease displaying multiple images in matplotlib. While the aspect parameter in matplotlib adjust the position of the single axes, axes_grid1 toolkit provides a framework to adjust the position of multiple axes according to their aspects.

See *What is axes_grid1 toolkit?* for a guide on the usage of axes_grid1.



The submodules of the axes_grid1 API are:

axes_grid1.anchored_artists

continues on next page

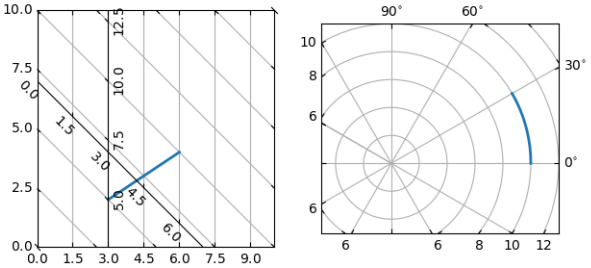
Table 43 – continued from previous page

axes_grid1.axes_divider	Helper classes to adjust the positions of multiple axes at drawing time.
axes_grid1.axes_grid	
axes_grid1.axes_rgb	
axes_grid1.axes_size	Provides classes of simple units that will be used with AxesDivider class (or others) to determine the size of each axes.
axes_grid1.colorbar	Colorbar toolkit with two classes and a function:
axes_grid1.inset_locator	A collection of functions and objects for creating or placing inset axes.
axes_grid1.mpl_axes	
axes_grid1.parasite_axes	

Matplotlib axisartist Toolkit

The *axisartist* namespace includes a derived Axes implementation (`mpl_toolkits.axisartist.Axes`). The biggest difference is that the artists that are responsible for drawing axis lines, ticks, ticklabels, and axis labels are separated out from the mpl's Axis class. This change was strongly motivated to support curvilinear grid.

You can find a tutorial describing usage of axisartist at the *axisartist* user guide.



The submodules of the axisartist API are:

axisartist.angle_helper	
axisartist.axes_divider	
axisartist.axes_grid	
axisartist.axes_rgb	
axisartist.axis_artist	axis_artist.py module provides axis-related artists.
axisartist.axisline_style	

continues on next page

Table 44 – continued from previous page

axisartist.axislines	Axislines includes modified implementation of the Axes class.
axisartist.clip_path	
axisartist.floating_axes	An experimental support for curvilinear grid.
axisartist.grid_finder	
axisartist.grid_helper_curvelinear	An experimental support for curvilinear grid.
axisartist.parasite_axes	

19.2 mplot3d API

Contents

19.2.1 axes3d

Note: Significant effort went into bringing axes3d to feature-parity with regular axes objects for version 1.1.0. However, more work remains. Please report any functions that do not behave as expected as a bug. In addition, help and patches would be greatly appreciated!

axes3d.Axes3D(fig[, rect, azim, elev, ...])	3D axes object.

mpl_toolkits.mplot3d.axes3d.Axes3D

class mpl_toolkits.mplot3d.axes3d.**Axes3D**(*fig*, *rect=None*, **args*, *azim=-60*, *elev=30*, *sharez=None*, *proj_type='persp'*, *box_aspect=None*, ***kwargs*)

Bases: `matplotlib.axes._axes.Axes`

3D axes object.

Parameters

fig

[Figure] The parent figure.

rect

[(float, float, float, float)] The `(left, bottom, width, height)` axes position.

azim

[float, default: -60] Azimuthal viewing angle.

elev

[float, default: 30] Elevation viewing angle.

sharez

[Axes3D, optional] Other axes to share z-limits with.

proj_type

[{'persp', 'ortho'}] The projection type, default 'persp'.

****kwargs**

Other optional keyword arguments:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and r
alpha	float or None
anchor	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
animated	bool
aspect	{'auto'}
autoscale_on	bool
autoscalex_on	bool
autoscaley_on	bool
autoscalez_on	bool
axes_locator	Callable[[Axes, Renderer], Bbox]

Table 46 – continued from previous page

Property	Description
axisbelow	bool or 'line'
box_aspect	3-tuple of floats or None
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
contains	unknown
facecolor or fc	color
figure	*Figure*
frame_on	bool
gid	str

Notes

New in version 1.2.1: The *sharez* parameter.

`__module__ = 'mpl_toolkits.mplot3d.axes3d'`

`add_collection3d`(*self*, *col*, *zs=0*, *zdir='z'*)
Add a 3D collection object to the plot.

2D collection types are converted to a 3D version by modifying the object and adding z coordinate information.

Supported are:

- PolyCollection
- LineCollection
- PatchCollection

`add_contour_set`(*self*, *cset*, *extend3d=False*, *stride=5*, *zdir='z'*, *offset=None*)

`add_contourf_set`(*self*, *cset*, *zdir='z'*, *offset=None*)

`apply_aspect`(*self*, *position=None*)
Adjust the Axes for a specified data aspect ratio.

Depending on *get_adjustable* this will modify either the Axes box (position) or the view limits. In the former case, *get_anchor* will affect the position.

See also:

matplotlib.axes.Axes.set_aspect

For a description of aspect ratio handling.

matplotlib.axes.Axes.set_adjustable

Set how the Axes adjusts to achieve the required aspect ratio.

matplotlib.axes.Axes.set_anchor

Set the position in case of extra space.

Notes

This is called automatically when each Axes is drawn. You may need to call it yourself if you need to update the Axes position and/or view limits before the Figure is drawn.

`auto_scale_xyz`(*self*, *X*, *Y*, *Z=None*, *had_data=None*)

`autoscale`(*self*, *enable=True*, *axis='both'*, *tight=None*)
Convenience method for simple axis view autoscaling. See *matplotlib.axes.Axes.autoscale()* for full explanation. Note that this function behaves the same, but for all three axes. Therefore, 'z' can be passed for *axis*, and 'both' applies to all three axes.

New in version 1.1.0.

`autoscale_view`(*self*, *tight=None*, *scalex=True*, *scaley=True*, *scalez=True*)
Autoscale the view limits using the data limits. See *matplotlib.axes.Axes.autoscale_view()* for documentation. Note that this function applies to the 3D axes, and as such adds the *scalez* to the function arguments.

Changed in version 1.1.0: Function signature was changed to better match the 2D version. *tight* is now explicitly a kwarg and placed first.

Changed in version 1.2.1: This is now fully functional.

`bar`(*self*, *left*, *height*, *zs=0*, *zdir='z'*, **args*, ***kwargs*)
Add 2D bar(s).

Parameters

left

[1D array-like] The x coordinates of the left sides of the bars.

height

[1D array-like] The height of the bars.

zs

[float or 1D array-like] Z coordinate of bars; if a single value is specified, it will be used for all bars.

zdir

[{'x', 'y', 'z'}, default: 'z'] When plotting 2D data, the direction to use as z ('x', 'y' or 'z').

****kwargs**

Other arguments are forwarded to *matplotlib.axes.Axes.bar*.

Returns

mpl_toolkits.mplot3d.art3d.Patch3DCollection

`bar3d`(*self*, *x*, *y*, *z*, *dx*, *dy*, *dz*, *color=None*, *zsort='average'*, *shade=True*, *lightsource=None*, **args*, ***kwargs*)

Generate a 3D barplot.

This method creates three dimensional barplot where the width, depth, height, and color of the bars can all be uniquely set.

Parameters

x, y, z

[array-like] The coordinates of the anchor point of the bars.

dx, dy, dz

[float or array-like] The width, depth, and height of the bars, respectively.

color

[sequence of colors, optional] The color of the bars can be specified globally or individually. This parameter can be:

- A single color, to color all bars the same color.
- An array of colors of length N bars, to color each bar independently.
- An array of colors of length 6, to color the faces of the bars similarly.
- An array of colors of length 6 * N bars, to color each face independently.

When coloring the faces of the boxes specifically, this is the order of the coloring:

1. -Z (bottom of box)
2. +Z (top of box)
3. -Y
4. +Y
5. -X
6. +X

zsort

[str, optional] The z-axis sorting scheme passed onto *Poly3DCollection*

shade

[bool, default: True] When true, this shades the dark sides of the bars (relative to the plot's source of light).

lightsource

[*LightSource*] The lightsource to use when *shade* is True.

****kwargs**

Any additional keyword arguments are passed onto *Poly3DCollection*.

Returns

collection

[*Poly3DCollection*] A collection of three dimensional polygons representing the bars.

`can_pan`(*self*)
Return *True* if this axes supports the pan/zoom button functionality.

3D axes objects do not use the pan/zoom button.

`can_zoom`(*self*)
Return *True* if this axes supports the zoom box button functionality.

3D axes objects do not use the zoom box button.

`cla`(*self*)
Clear the current axes.

`clabel`(*self*, **args*, ***kwargs*)
Currently not implemented for 3D axes, and returns *None*.

`contour`(*self*, *X*, *Y*, *Z*, **args*, *extend3d=False*, *stride=5*, *zdir='z'*, *offset=None*, ***kwargs*)
Create a 3D contour plot.

Parameters

X, Y, Z

[array-like] Input data.

extend3d

[bool, default: False] Whether to extend contour in 3D.

stride

[int] Step size for extending contour.

zdir

[{'x', 'y', 'z'}, default: 'z'] The direction to use.

offset

[float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

***args, **kwargs**

Other arguments are forwarded to *matplotlib.axes.Axes.contour*.

Returns

matplotlib.contour.QuadContourSet

`contour3D`(*self*, *X*, *Y*, *Z*, **args*, *extend3d=False*, *stride=5*, *zdir='z'*, *offset=None*, ***kwargs*)

Create a 3D contour plot.

Parameters

X, Y, Z

[array-like] Input data.

extend3d

[bool, default: False] Whether to extend contour in 3D.

stride

[int] Step size for extending contour.

zdir

[{'x', 'y', 'z'}, default: 'z'] The direction to use.

offset

[float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

***args, **kwargs**

Other arguments are forwarded to *matplotlib.axes.Axes.contour*.

Returns

matplotlib.contour.QuadContourSet

contourf(*self*, *X*, *Y*, *Z*, **args*, *zdir='z'*, *offset=None*, ***kwargs*)

Create a 3D filled contour plot.

Parameters

X, Y, Z

[array-like] Input data.

zdir

[{'x', 'y', 'z'}, default: 'z'] The direction to use.

offset

[float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

***args, **kwargs**

Other arguments are forwarded to *matplotlib.axes.Axes.contourf*.

Returns

matplotlib.contour.QuadContourSet

Notes

New in version 1.1.0: The *zdir* and *offset* parameters.

contourf3D(*self*, *X*, *Y*, *Z*, **args*, *zdir='z'*, *offset=None*, ***kwargs*)

Create a 3D filled contour plot.

Parameters

X, Y, Z

[array-like] Input data.

zdir

[{'x', 'y', 'z'}, default: 'z'] The direction to use.

offset

[float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

***args, **kwargs**

Other arguments are forwarded to *matplotlib.axes.Axes.contourf*.

Returns

matplotlib.contour.QuadContourSet

Notes

New in version 1.1.0: The *zdir* and *offset* parameters.

`convert_zunits`(*self*, *z*)
For artists in an axes, if the zaxis has units support, convert *z* using zaxis unit type

New in version 1.2.1.

`disable_mouse_rotation`(*self*)
Disable mouse buttons for 3D rotation and zooming.

`draw`(*self*, *renderer*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`format_coord`(*self*, *xd*, *yd*)
Given the 2D view coordinates attempt to guess a 3D coordinate. Looks for the nearest edge to the point and then assumes that the point is at the same z location as the nearest point on the edge.

`format_zdata`(*self*, *z*)
Return *z* string formatted. This function will use the `fmt_zdata` attribute if it is callable, else will fall back on the zaxis major formatter

`get_autoscale_on`(*self*)
Get whether autoscaling is applied for all axes on plot commands

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`get_autoscalez_on`(*self*)
Get whether autoscaling for the z-axis is applied on plot commands

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`get_axis_position`(*self*)

`get_frame_on`(*self*)
Get whether the 3D axes panels are drawn.

`get_proj`(*self*)
Create the projection matrix from the current viewing position.

`get_tightbbox`(*self*, *renderer*, *call_axes_locator=True*, *bbox_extra_artists=None*, *, *for_layout_only=False*)
Return the tight bounding box of the axes, including axis and their decorators (xlabel, title, etc).

Artists that have `artist.set_in_layout(False)` are not included in the bbox.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

bbox_extra_artists

[list of *Artist* or `None`] List of artists to include in the tight bounding box. If `None` (default), then all artist children of the axes are included in the tight bounding box.

call_axes_locator

[bool, default: True] If *call_axes_locator* is `False`, it does not call the `_axes_locator` attribute, which is necessary to get the correct bounding box. `call_axes_locator=False` can be used if the caller is only interested in the relative size of the tightbbox compared to the axes bbox.

for_layout_only

[default: False] The bounding box will *not* include the x-extent of the title and the xlabel, or the y-extent of the ylabel.

Returns

BboxBase

Bounding box in figure pixel coordinates.

See also:

matplotlib.axes.Axes.get_window_extent

matplotlib.axis.Axis.get_tightbbox

matplotlib.spines.Spine.get_window_extent

`get_w_lims`(*self*)
Get 3D world limits.

get_xlim(*self*)
Alias for *get_xlim3d*.

get_xlim3d(*self*)
Return the x-axis view limits.

Returns

left, right

[(float, float)] The current x-axis limits in data coordinates.

See also:

set_xlim

set_xbound, get_xbound

invert_xaxis, xaxis_inverted

Notes

The x-axis may be inverted, in which case the *left* value will be greater than the *right* value.

Changed in version 1.1.0: This function now correctly refers to the 3D x-limits

get_ylim(*self*)
Alias for *get_ylim3d*.

get_ylim3d(*self*)
Return the y-axis view limits.

Returns

bottom, top

[(float, float)] The current y-axis limits in data coordinates.

See also:

set_ylim

set_ybound, get_ybound

invert_yaxis, yaxis_inverted

Notes

The y-axis may be inverted, in which case the *bottom* value will be greater than the *top* value.

Changed in version 1.1.0: This function now correctly refers to the 3D y-limits.

`get_zaxis`(*self*)
Return the `ZAxis` (*Axis*) instance.

`get_zbound`(*self*)
Return the lower and upper z-axis bounds, in increasing order.

New in version 1.1.0.

`get_zgridlines`(*self*)
Return the zaxis' grid lines as a list of *Line2D*s.

`get_zlabel`(*self*)
Get the z-label text string.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`get_zlim`(*self*)
Alias for *get_zlim3d*.

`get_zlim3d`(*self*)
Get 3D z limits.

`get_zmajorticklabels`(*self*)
Return the zaxis' major tick labels, as a list of *Text*.

`get_zminorticklabels`(*self*)
Return the zaxis' minor tick labels, as a list of *Text*.

`get_zscale`(*self*)

`get_zticklabels`(*self*, *minor=False*, *which=None*)
Get the zaxis' tick labels.

Parameters

minor

[bool] Whether to return the minor or the major ticklabels.

which

[None, ('minor', 'major', 'both')] Overrides *minor*.

Selects which ticklabels to return

Returns

list of *Text*

Notes

The tick label strings are not populated until a `draw` method has been called.

See also: *draw* and *draw*.

`get_zticklines`(*self*, *minor=False*)
Return the zaxis' tick lines as a list of *Line2D*s.

`get_zticks`(*self*, *, *minor=False*)
Return the zaxis' tick locations in data coordinates.

`grid`(*self*, *b=True*, ***kwargs*)
Set / unset 3D grid.

Note: Currently, this function does not behave the same as *matplotlib.axes.Axes.grid()*, but it is intended to eventually support that behavior.

New in version 1.1.0.

`invert_zaxis`(*self*)
Invert the z-axis.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`locator_params`(*self*, *axis='both'*, *tight=None*, ***kwargs*)
Convenience method for controlling tick locators.

See *matplotlib.axes.Axes.locator_params()* for full documentation. Note that this is for Axes3D objects, therefore, setting *axis* to 'both' will result in the parameters being set for all three axes. Also, *axis* can also take a value of 'z' to apply parameters to the z axis.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`margins`(*self*, **margins*, *x=None*, *y=None*, *z=None*, *tight=True*)
Convenience method to set or retrieve autoscaling margins.

Call signatures:

```
margins()
```

returns xmargin, ymargin, zmargin

```
margins(margin)

margins(xmargin, ymargin, zmargin)
```

(continues on next page)

(continued from previous page)

```
margins(x=xmargin, y=ymargin, z=zmargin)

margins(..., tight=False)
```

All forms above set the xmargin, ymargin and zmargin parameters. All keyword parameters are optional. A single positional argument specifies xmargin, ymargin and zmargin. Passing both positional and keyword arguments for xmargin, ymargin, and/or zmargin is invalid.

The *tight* parameter is passed to *autoscale_view()*, which is executed after a margin is changed; the default here is *True*, on the assumption that when margins are specified, no additional padding to match tick marks is usually desired. Setting *tight* to *None* will preserve the previous setting.

Specifying any margin changes only the autoscaling; for example, if *xmargin* is not None, then *xmargin* times the X data interval will be added to each end of that interval before it is used in autoscaling.

New in version 1.1.0.

`mouse_init`(*self*, *rotate_btn=1*, *zoom_btn=3*)

Set the mouse buttons for 3D rotation and zooming.

Parameters

rotate_btn

[int or list of int, default: 1] The mouse button or buttons to use for 3D rotation of the axes.

zoom_btn

[int or list of int, default: 3] The mouse button or buttons to use to zoom the 3D axes.

`name = '3d'`

`plot`(*self*, *xs*, *ys*, **args*, *zdir='z'*, ***kwargs*)

Plot 2D or 3D data.

Parameters

xs

[1D array-like] x coordinates of vertices.

ys

[1D array-like] y coordinates of vertices.

zs

[float or 1D array-like] z coordinates of vertices; either one for all points or one for each point.

zdir

[{'x', 'y', 'z'}, default: 'z'] When plotting 2D data, the direction to use as z ('x', 'y' or 'z').

****kwargs**

Other arguments are forwarded to *matplotlib.axes.Axes.plot*.

`plot3D`(*self*, *xs*, *ys*, **args*, *zdir='z'*, ***kwargs*)

Plot 2D or 3D data.

Parameters

xs

[1D array-like] x coordinates of vertices.

ys

[1D array-like] y coordinates of vertices.

zs

[float or 1D array-like] z coordinates of vertices; either one for all points or one for each point.

zdir

[{'x', 'y', 'z'}, default: 'z'] When plotting 2D data, the direction to use as z ('x', 'y' or 'z').

****kwargs**

Other arguments are forwarded to *matplotlib.axes.Axes.plot*.

`plot_surface`(*self*, *X*, *Y*, *Z*, **args*, *norm=None*, *vmin=None*, *vmax=None*, *lightsource=None*, ***kwargs*)

Create a surface plot.

By default it will be colored in shades of a solid color, but it also supports color mapping by supplying the *cmap* argument.

Note: The *rcount* and *ccount* kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points.

Note: To maximize rendering speed consider setting *rstride* and *cstride* to divisors of the number of rows minus 1 and columns minus 1 respectively. For example, given 51 rows rstride can be any of the divisors of 50.

Similarly, a setting of *rstride* and *cstride* equal to 1 (or *rcount* and *ccount* equal the number of rows and columns) can use the optimized path.

Parameters

X, Y, Z

[2d arrays] Data values.

rcount, ccount

[int] Maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points. Defaults to 50.

New in version 2.0.

rstride, cstride

[int] Downsampling stride in each direction. These arguments are mutually exclusive with *rcount* and *ccount*. If only one of *rstride* or *cstride* is set, the other defaults to 10.

'classic' mode uses a default of `rstride = cstride = 10` instead of the new default of `rcount = ccount = 50`.

color

[color-like] Color of the surface patches.

cmap

[Colormap] Colormap of the surface patches.

facecolors

[array-like of colors.] Colors of each individual patch.

norm

[Normalize] Normalization for the colormap.

vmin, vmax

[float] Bounds for the normalization.

shade

[bool, default: True] Whether to shade the facecolors. Shading is always disabled when *cmap* is specified.

lightsource

[*LightSource*] The lightsource to use when *shade* is True.

****kwargs**

Other arguments are forwarded to *Poly3DCollection*.

`plot_trisurf`(*self*, **args*, *color=None*, *norm=None*, *vmin=None*, *vmax=None*, *lightsource=None*, ***kwargs*)

Plot a triangulated surface.

The (optional) triangulation can be specified in one of two ways; either:

```
plot_trisurf(triangulation, ...)
```

where triangulation is a *Triangulation* object, or:

```
plot_trisurf(X, Y, ...)
plot_trisurf(X, Y, triangles, ...)
plot_trisurf(X, Y, triangles=triangles, ...)
```

in which case a Triangulation object will be created. See *Triangulation* for a explanation of these possibilities.

The remaining arguments are:

```
plot_trisurf(..., Z)
```

where *Z* is the array of values to contour, one per point in the triangulation.

Parameters

X, Y, Z

[array-like] Data values as 1D arrays.

color

Color of the surface patches.

cmap

A colormap for the surface patches.

norm

[Normalize] An instance of Normalize to map values to colors.

vmin, vmax

[float, default: None] Minimum and maximum value to map.

shade

[bool, default: True] Whether to shade the facecolors. Shading is always disabled when *cmap* is specified.

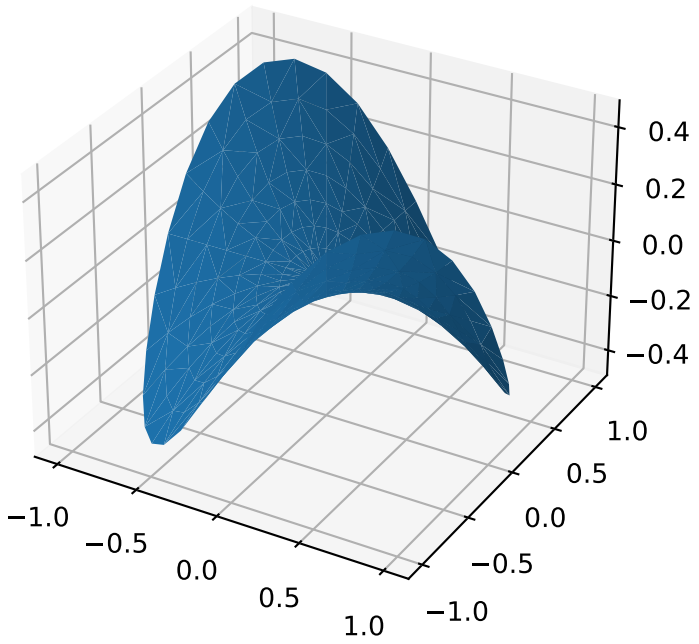
lightsource

[*LightSource*] The lightsource to use when *shade* is True.

****kwargs**

All other arguments are passed on to *Poly3DCollection*

Examples



New in version 1.2.0.

`plot_wireframe`(*self*, *X*, *Y*, *Z*, **args*, ***kwargs*)

Plot a 3D wireframe.

Note: The *rcount* and *ccount* kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points.

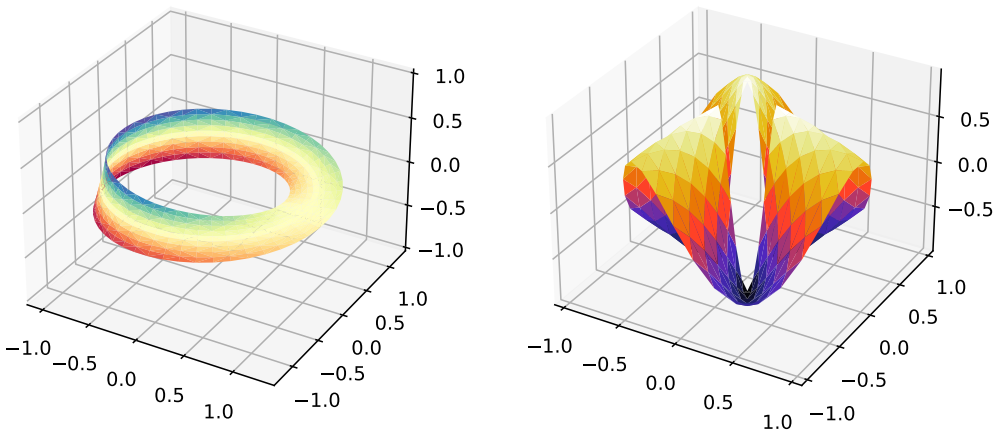
Parameters

X, Y, Z

[2d arrays] Data values.

rcount, ccount

[int] Maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points. Setting a count to zero causes the data to



be not sampled in the corresponding direction, producing a 3D line plot rather than a wireframe plot. Defaults to 50.

New in version 2.0.

rstride, cstride

[int] Downsampling stride in each direction. These arguments are mutually exclusive with *rcount* and *ccount*. If only one of *rstride* or *cstride* is set, the other defaults to 1. Setting a stride to zero causes the data to be not sampled in the corresponding direction, producing a 3D line plot rather than a wireframe plot.

'classic' mode uses a default of `rstride = cstride = 1` instead of the new default of `rcount = ccount = 50`.

****kwargs**

Other arguments are forwarded to *Line3DCollection*.

`quiver`(*X*, *Y*, *Z*, *U*, *V*, *W*, */*, *length=1*, *arrow_length_ratio=0.3*, *pivot='tail'*, *normalize=False*, ***kwargs*)

Plot a 3D field of arrows.

The arguments could be array-like or scalars, so long as they they can be broadcast together. The arguments can also be masked arrays. If an element in any of argument is masked, then that corresponding quiver element will not be plotted.

Parameters

X, Y, Z

[array-like] The x, y and z coordinates of the arrow locations (default is tail of arrow; see *pivot* kwarg).

U, V, W

[array-like] The x, y and z components of the arrow vectors.

length

[float, default: 1] The length of each quiver.

arrow_length_ratio

[float, default: 0.3] The ratio of the arrow head with respect to the quiver.

pivot

[{'tail', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is at the grid point; the arrow rotates about this point, hence the name *pivot*.

normalize

[bool, default: False] Whether all arrows are normalized to have the same length, or keep the lengths defined by *u*, *v*, and *w*.

****kwargs**

Any additional keyword arguments are delegated to *LineCollection*

`quiver3D`(*X*, *Y*, *Z*, *U*, *V*, *W*, */*, *length=1*, *arrow_length_ratio=0.3*, *pivot='tail'*, *normalize=False*, ***kwargs*)

Plot a 3D field of arrows.

The arguments could be array-like or scalars, so long as they they can be broadcast together. The arguments can also be masked arrays. If an element in any of argument is masked, then that corresponding quiver element will not be plotted.

Parameters

X, Y, Z

[array-like] The x, y and z coordinates of the arrow locations (default is tail of arrow; see *pivot* kwarg).

U, V, W

[array-like] The x, y and z components of the arrow vectors.

length

[float, default: 1] The length of each quiver.

arrow_length_ratio

[float, default: 0.3] The ratio of the arrow head with respect to the quiver.

pivot

[{'tail', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is at the grid point; the arrow rotates about this point, hence the name *pivot*.

normalize

[bool, default: False] Whether all arrows are normalized to have the same length, or keep the lengths defined by *u*, *v*, and *w*.

****kwargs**

Any additional keyword arguments are delegated to *LineCollection*

`scatter`(*self*, *xs*, *ys*, *zs=0*, *zdir='z'*, *s=20*, *c=None*, *depthshade=True*, **args*, ***kwargs*)

Create a scatter plot.

Parameters

xs, ys

[array-like] The data positions.

zs

[float or array-like, default: 0] The z-positions. Either an array of the same length as *xs* and *ys* or a single value to place all points in the same plane.

zdir

[{'x', 'y', 'z', '-x', '-y', '-z'}, default: 'z'] The axis direction for the *zs*. This is useful when plotting 2D data on a 3D Axes. The data must be passed as *xs*, *ys*. Setting *zdir* to 'y' then plots the data to the x-z-plane.

See also /gallery/mplot3d/2dcollections3d.

s

[float or array-like, default: 20] The marker size in points**2. Either an array of the same length as *xs* and *ys* or a single value to make all markers the same size.

c

[color, sequence, or sequence of colors, optional] The marker color. Possible values:

- A single color format string.
- A sequence of colors of length n.
- A sequence of n numbers to be mapped to colors using *cmap* and *norm*.
- A 2-D array in which the rows are RGB or RGBA.

For more details see the *c* argument of *scatter*.

depthshade

[bool, default: True] Whether to shade the scatter markers to give the appearance of depth. Each call to `scatter()` will perform its depthshading independently.

****kwargs**

All other arguments are passed on to *scatter*.

Returns

paths

[*PathCollection*]

`scatter3D`(*self*, *xs*, *ys*, *zs=0*, *zdir='z'*, *s=20*, *c=None*, *depthshade=True*, **args*, ***kwargs*)

Create a scatter plot.

Parameters

xs, ys

[array-like] The data positions.

zs

[float or array-like, default: 0] The z-positions. Either an array of the same length as *xs* and *ys* or a single value to place all points in the same plane.

zdir

[{'x', 'y', 'z', '-x', '-y', '-z'}, default: 'z'] The axis direction for the *zs*. This is useful when plotting 2D data on a 3D Axes. The data must be passed as *xs*, *ys*. Setting *zdir* to 'y' then plots the data to the x-z-plane.

See also /gallery/mplot3d/2dcollections3d.

s

[float or array-like, default: 20] The marker size in points**2. Either an array of the same length as *xs* and *ys* or a single value to make all markers the same size.

c

[color, sequence, or sequence of colors, optional] The marker color. Possible values:

- A single color format string.
- A sequence of colors of length n.
- A sequence of n numbers to be mapped to colors using *cmap* and *norm*.
- A 2-D array in which the rows are RGB or RGBA.

For more details see the *c* argument of *scatter*.

depthshade

[bool, default: True] Whether to shade the scatter markers to give the appearance of depth. Each call to `scatter()` will perform its depthshading independently.

****kwargs**

All other arguments are passed on to *scatter*.

Returns

paths

[*PathCollection*]

`set_anchor`(*self*, *anchor*, *share=False*)

Define the anchor location.

The actual drawing area (active position) of the Axes may be smaller than the Bbox (original position) when a fixed aspect is required. The anchor defines where the drawing area will be located within the available space.

Parameters

anchor

[2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}] The anchor position may be either:

- a sequence (*cx*, *cy*). *cx* and *cy* may range from 0 to 1, where 0 is left or bottom and 1 is right or top.
- a string using cardinal directions as abbreviation:
  - 'C' for centered
  - 'S' (south) for bottom-center
  - 'SW' (south west) for bottom-left
  - etc.

Here is an overview of the possible positions:

'NW'	'N'	'NE'
'W'	'C'	'E'
'SW'	'S'	'SE'

share

[bool, default: False] If `True`, apply the settings to all shared Axes.

See also:

matplotlib.axes.Axes.set_aspect

for a description of aspect handling.

`set_aspect`(*self*, *aspect*, *adjustable=None*, *anchor=None*, *share=False*)
Set the aspect ratios.

Axes 3D does not current support any aspect but 'auto' which fills the axes with the data limits.

To simulate having equal aspect in data space, set the ratio of your data limits to match the value of *get_box_aspect*. To control box aspect ratios use *set_box_aspect*.

Parameters

aspect

[{'auto'}] Possible values:

value	description
'auto'	automatic; fill the position rectangle with data.

adjustable

[None] Currently ignored by Axes3D

If not *None*, this defines which parameter will be adjusted to meet the required aspect. See *set_adjustable* for further details.

anchor

[None or str or 2-tuple of float, optional] If not *None*, this defines where the Axes will be drawn if there is extra space due to aspect constraints. The most common way to to specify the anchor are abbreviations of cardinal directions:

value	description
'C'	centered
'SW'	lower left corner
'S'	middle of bottom edge
'SE'	lower right corner
etc.	

See *set_anchor* for further details.

share

[bool, default: False] If `True`, apply the settings to all shared Axes.

See also:

mpl_toolkits.mplot3d.axes3d.Axes3D.set_box_aspect

`set_autoscale_on`(*self*, *b*)
Set whether autoscaling is applied on plot commands

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

Parameters

b

[bool]

`set_autoscalez_on`(*self*, *b*)
Set whether autoscaling for the z-axis is applied on plot commands

New in version 1.1.0.

Parameters

b

[bool]

`set_axis_off`(*self*)
Turn the x- and y-axis off.

This affects the axis lines, ticks, ticklabels, grid and axis labels.

`set_axis_on`(*self*)
Turn the x- and y-axis on.

This affects the axis lines, ticks, ticklabels, grid and axis labels.

`set_box_aspect`(*self*, *aspect*, *, *zoom=1*)
Set the axes box aspect.

The box aspect is the ratio of height to width in display units for each face of the box when viewed perpendicular to that face. This is not to be confused with the data aspect (which for Axes3D is always 'auto'). The default ratios are 4:4:3 (x:y:z).

To simulate having equal aspect in data space, set the box aspect to match your data range in each dimension.

zoom controls the overall size of the Axes3D in the figure.

Parameters

aspect

[3-tuple of floats or None] Changes the physical dimensions of the Axes3D, such that the ratio of the axis lengths in display units is x:y:z.

If None, defaults to 4:4:3

zoom

[float] Control overall size of the Axes3D in the figure.

`set_frame_on`(*self*, *b*)
Set whether the 3D axes panels are drawn.

Parameters

b

[bool]

`set_proj_type`(*self*, *proj_type*)
Set the projection type.

Parameters

proj_type

[{'persp', 'ortho'}]

`set_title`(*self*, *label*, *fontdict=None*, *loc='center'*, ***kwargs*)
Set a title for the axes.

Set one of the three available axes titles. The available titles are positioned above the axes in the center, flush with the left edge, and flush with the right edge.

Parameters

label

[str] Text to use for the title

fontdict

[dict] A dictionary controlling the appearance of the title text, the default *fontdict* is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'color': rcParams['axes.titlecolor'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

loc

[{'center', 'left', 'right'}, default: `rcParams["axes.titlelocation"]` (default: `'center'`)] Which title to set.

y

[float, default: `rcParams["axes.titley"]` (default: `None`)] Vertical axes loation for the title (1.0 is the top). If None (the default), y is determined automatically to avoid decorators on the axes.

pad

[float, default: `rcParams["axes.titlepad"]` (default: `6.0`)] The offset of the title from the top of the axes, in points.

Returns

Text

The matplotlib text instance representing the title

Other Parameters

****kwargs**

[*Text* properties] Other keyword arguments are text properties, see *Text* for a list of valid text properties.

`set_top_view`(*self*)

`set_xlim`(*self*, *left=None*, *right=None*, *emit=True*, *auto=False*, *, *xmin=None*, *xmax=None*)

Alias for *set_xlim3d*.

`set_xlim3d`(*self*, *left=None*, *right=None*, *emit=True*, *auto=False*, *, *xmin=None*, *xmax=None*)

Set 3D x limits.

See *matplotlib.axes.Axes.set_xlim()* for full documentation.

set_xscale(*self*, *value*, ***kwargs*)
Set the x-axis scale.

Parameters

value

[{"linear"}] The axis scale type to apply. 3D axes currently only support linear scales; other scales yield nonsensical results.

****kwargs**

Keyword arguments are nominally forwarded to the scale class, but none of them is applicable for linear scales.

set_ylim(*self*, *bottom=None*, *top=None*, *emit=True*, *auto=False*, *, *ymin=None*, *ymax=None*)
Alias for *set_ylim3d*.

set_ylim3d(*self*, *bottom=None*, *top=None*, *emit=True*, *auto=False*, *, *ymin=None*, *ymax=None*)
Set 3D y limits.

See *matplotlib.axes.Axes.set_ylim()* for full documentation.

set_yscale(*self*, *value*, ***kwargs*)
Set the y-axis scale.

Parameters

value

[{"linear"}] The axis scale type to apply. 3D axes currently only support linear scales; other scales yield nonsensical results.

****kwargs**

Keyword arguments are nominally forwarded to the scale class, but none of them is applicable for linear scales.

set_zbound(*self*, *lower=None*, *upper=None*)
Set the lower and upper numerical bounds of the z-axis.

This method will honor axes inversion regardless of parameter order. It will not change the autoscaling setting (*get_autoscalez_on()*).

New in version 1.1.0.

set_zlabel(*self*, *zlabel*, *fontdict=None*, *labelpad=None*, ***kwargs*)
Set zlabel. See doc for *set_ylabel* for description.

set_zlim(*self*, *bottom=None*, *top=None*, *emit=True*, *auto=False*, *, *zmin=None*, *zmax=None*)
Alias for *set_zlim3d*.

`set_zlim3d`(*self*, *bottom=None*, *top=None*, *emit=True*, *auto=False*, ***, *zmin=None*, *zmax=None*)
Set 3D z limits.

See *matplotlib.axes.Axes.set_ylim()* for full documentation

`set_zmargin`(*self*, *m*)
Set padding of Z data limits prior to autoscaling.

m times the data interval will be added to each end of that interval before it is used in autoscaling.

accepts: float in range 0 to 1

New in version 1.1.0.

`set_zscale`(*self*, *value*, ***kwargs*)
Set the z-axis scale.

Parameters

value

[{"linear"}] The axis scale type to apply. 3D axes currently only support linear scales; other scales yield nonsensical results.

****kwargs**

Keyword arguments are nominally forwarded to the scale class, but none of them is applicable for linear scales.

`set_zticklabels`(*self*, *labels*, ***, *fontdict=None*, *minor=False*, ***kwargs*)
Set the zaxis' labels with list of string labels.

Warning: This method should only be used after fixing the tick positions using *Axes3D.set_zticks*. Otherwise, the labels may end up in unexpected positions.

Parameters

labels

[list of str] The label texts.

fontdict

[dict, optional] A dictionary controlling the appearance of the ticklabels. The default *fontdict* is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

minor

[bool, default: False] Whether to set the minor ticklabels rather than the major ones.

Returns

list of *Text*

The labels.

Other Parameters

****kwargs**

[*Text* properties.]

`set_zticks`(*self*, *ticks*, *, *minor=False*)
Set the zaxis' tick locations.

Parameters

ticks

[list of floats] List of tick locations.

minor

[bool, default: False] If `False`, set the major ticks; if `True`, the minor ticks.

`text`(*self*, *x*, *y*, *z*, *s*, *zdir=None*, ***kwargs*)
Add text to the plot. kwargs will be passed on to Axes.text, except for the *zdir* keyword, which sets the direction to be used as the z direction.

`text2D`(*self*, *x*, *y*, *s*, *fontdict=None*, ***kwargs*)
Add text to the axes.

Add the text *s* to the axes at location *x*, *y* in data coordinates.

Parameters

x, y

[float] The position to place the text. By default, this is in data coordinates. The coordinate system can be changed using the *transform* parameter.

s

[str] The text.

fontdict

[dict, default: None] A dictionary to override the default text properties. If fontdict is None, the defaults are determined by *rcParams*.

Returns

Text

The created *Text* instance.

Other Parameters

****kwargs**

[*Text* properties.] Other miscellaneous text parameters.

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array an
alpha	float or None
animated	bool
backgroundcolor	color
bbox	dict with properties for *patches.FancyBboxPatch*
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
figure	*Figure*
fontfamily or family	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', '
fontproperties or font or font_properties	*font_manager.FontProperties* or `str` or `pathlib.Path`
fontsize or size	float or {'xx-small', 'x-small', 'small', 'medium', 'large',
fontstretch or stretch	{a numeric value in range 0-1000, 'ultra-condensed',
fontstyle or style	{'normal', 'italic', 'oblique'}
fontvariant or variant	{'normal', 'small-caps'}
fontweight or weight	{a numeric value in range 0-1000, 'ultralight', 'light',
gid	str
horizontalalignment or ha	{'center', 'right', 'left'}
in_layout	bool
label	object
linespacing	float (multiple of font size)
multialignment or ma	{'left', 'right', 'center'}
path_effects	*AbstractPathEffect*
picker	None or bool or callable
position	(float, float)
rasterized	bool or None

Tab

Property	Description
rotation	float or {'vertical', 'horizontal'}
rotation_mode	{None, 'default', 'anchor'}
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
text	object
transform	*Transform*
url	str
usetex	bool or None
verticalalignment or va	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
visible	bool
wrap	bool
x	float
y	float
zorder	float

Examples

Individual keyword arguments can be used to override any given parameter:

```
>>> text(x, y, s, fontsize=12)
```

The default transform specifies that text is in data coords, alternatively, you can specify text in axis coords ((0, 0) is lower-left and (1, 1) is upper-right). The example below places text in the center of the axes:

```
>>> text(0.5, 0.5, 'matplotlib', horizontalalignment='center',
...      verticalalignment='center', transform=ax.transAxes)
```

You can put a rectangular box around the text instance (e.g., to set a background color) by using the keyword *bbox*. *bbox* is a dictionary of *Rectangle* properties. For example:

```
>>> text(x, y, s, bbox=dict(facecolor='red', alpha=0.5))
```

`text3D`(*self*, *x*, *y*, *z*, *s*, *zdir=None*, ***kwargs*)
Add text to the plot. kwargs will be passed on to Axes.text, except for the *zdir* keyword, which sets the direction to be used as the z direction.

`tick_params`(*self*, *axis='both'*, ***kwargs*)
Convenience method for changing the appearance of ticks and tick labels.

See *matplotlib.axes.Axes.tick_params()* for more complete documentation.

The only difference is that setting *axis* to 'both' will mean that the settings are applied to all three axes. Also, the *axis* parameter also accepts a value of 'z', which would mean to apply to only the z-axis.

Also, because of how Axes3D objects are drawn very differently from regular 2D axes, some of these settings may have ambiguous meaning. For simplicity, the 'z' axis will accept settings as if it was like the 'y' axis.

Note: Axes3D currently ignores some of these settings.

New in version 1.1.0.

`tricontour`(*self*, **args*, *extend3d=False*, *stride=5*, *zdir='z'*, *offset=None*, ***kwargs*)

Create a 3D contour plot.

Changed in version 1.3.0: Added support for custom triangulations

---

Note: This method currently produces incorrect output due to a longstanding bug in 3D PolyCollection rendering.

Parameters

X, Y, Z

[array-like] Input data.

extend3d

[bool, default: False] Whether to extend contour in 3D.

stride

[int] Step size for extending contour.

zdir

[{'x', 'y', 'z'}, default: 'z'] The direction to use.

offset

[float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

***args, **kwargs**

Other arguments are forwarded to *matplotlib.axes.Axes.tricontour*.

Returns

matplotlib.tri.tricontour.TriContourSet

`tricontourf`(*self*, **args*, *zdir='z'*, *offset=None*, ***kwargs*)

Create a 3D filled contour plot.

Note: This method currently produces incorrect output due to a longstanding bug in 3D PolyCollection rendering.

Parameters

X, Y, Z

[array-like] Input data.

zdir

[{'x', 'y', 'z'}, default: 'z'] The direction to use.

offset

[float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

***args, **kwargs**

Other arguments are forwarded to *matplotlib.axes.Axes.tricontourf*.

Returns

matplotlib.tri.tricontour.TriContourSet

Notes

New in version 1.1.0: The *zdir* and *offset* parameters.

Changed in version 1.3.0: Added support for custom triangulations

`tunit_cube`(*self*, *vals=None*, *M=None*)

`tunit_edges`(*self*, *vals=None*, *M=None*)

`unit_cube`(*self*, *vals=None*)

`update_datalim`(*self*, *xys*, ***kwargs*)

Extend the `dataLim` Bbox to include the given points.

If no data is set currently, the Bbox will ignore its limits and set the bound to be the bounds of the xydata (*xys*). Otherwise, it will compute the bounds of the union of its current data and the data in *xys*.

Parameters

xys

[2D array-like] The points to include in the data limits Bbox. This can be either a list of (x, y) tuples or a Nx2 array.

updatex, updatey

[bool, default: True] Whether to update the x/y limits.

`view_init`(*self*, *elev=None*, *azim=None*)
Set the elevation and azimuth of the axes in degrees (not radians).

This can be used to rotate the axes programmatically.

'elev' stores the elevation angle in the z plane (in degrees). 'azim' stores the azimuth angle in the (x, y) plane (in degrees).

if 'elev' or 'azim' are None (default), then the initial value is used which was specified in the *Axes3D* constructor.

`voxels`([*x*, *y*, *z*], */*, *filled*, *facecolors=None*, *edgecolors=None*, ***kwargs*)
Plot a set of filled voxels

All voxels are plotted as 1x1x1 cubes on the axis, with `filled[0, 0, 0]` placed with its lower corner at the origin. Occluded faces are not plotted.

New in version 2.1.

Parameters

filled

[3D np.array of bool] A 3d array of values, with truthy values indicating which voxels to fill

x, y, z

[3D np.array, optional] The coordinates of the corners of the voxels. This should broadcast to a shape one larger in every dimension than the shape of *filled*. These can be used to plot non-cubic voxels.

If not specified, defaults to increasing integers along each axis, like those returned by `indices()`. As indicated by the `/` in the function signature, these arguments can only be passed positionally.

facecolors, edgecolors

[array-like, optional] The color to draw the faces and edges of the voxels. Can only be passed as keyword arguments. This parameter can be:

- A single color value, to color all voxels the same color. This can be either a string, or a 1D rgb/rgba array
- `None`, the default, to use a single color for the faces, and the style default for the edges.
- A 3D ndarray of color names, with each item the color for the corresponding voxel. The size must match the voxels.

- A 4D ndarray of rgb/rgba data, with the components along the last axis.

shade

[bool, default: True] Whether to shade the facecolors. Shading is always disabled when *cmap* is specified.

New in version 3.1.

lightsource

[*LightSource*] The lightsource to use when *shade* is True.

New in version 3.1.

****kwargs**

Additional keyword arguments to pass onto *Poly3DCollection*.

Returns

faces

[dict] A dictionary indexed by coordinate, where `faces[i, j, k]` is a *Poly3DCollection* of the faces drawn for the voxel `filled[i, j, k]`. If no faces were drawn for a given voxel, either because it was not asked to be drawn, or it is fully occluded, then `(i, j, k) not in faces`.

Examples

`property w_xaxis`

`property w_yaxis`

`property w_zaxis`

`zaxis_date`(*self*, *tz=None*)

Sets up axis ticks and labels to treat data along the zaxis as dates.

Parameters

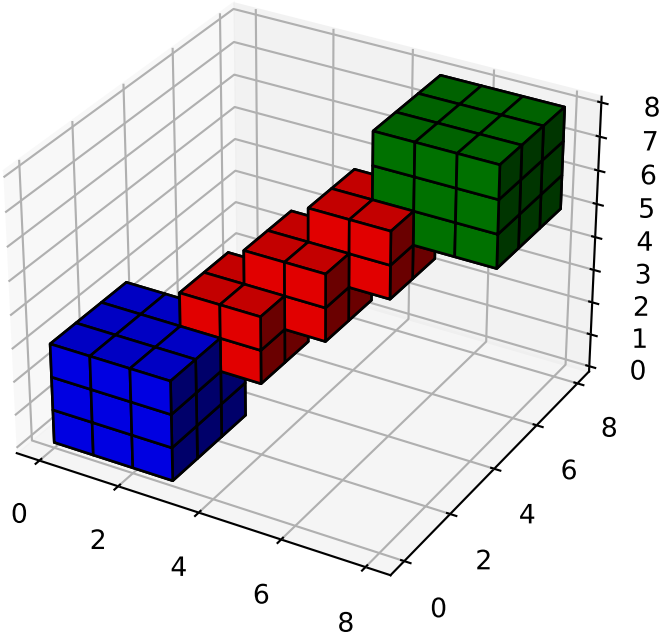
tz

[str or `datetime.tzinfo`, default: `rcParams["timezone"]` (default: `'UTC'`)] The timezone used to create date labels.

`zaxis_inverted`(*self*)

Returns True if the z-axis is inverted.

New in version 1.1.0.



Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D`

19.2.2 axis3d

Note: See `mpl_toolkits.mplot3d.axis3d._axinfo` for a dictionary containing constants that may be modified for controlling the look and feel of mplot3d axes (e.g., label spacing, font colors and panel colors). Historically, axis3d has suffered from having hard-coded constants that precluded user adjustments, and this dictionary was implemented in version 1.1 as a stop-gap measure.

axis3d.Axis(adir, v_intervalx, d_intervalx, ...)	An Axis class for the 3D plots.

mpl_toolkits.mplot3d.axis3d.Axis

class mpl_toolkits.mplot3d.axis3d.**Axis**(*adir*, *v_intervalx*, *d_intervalx*, *axes*, **args*, *rotate_label=None*, ***kwargs*)

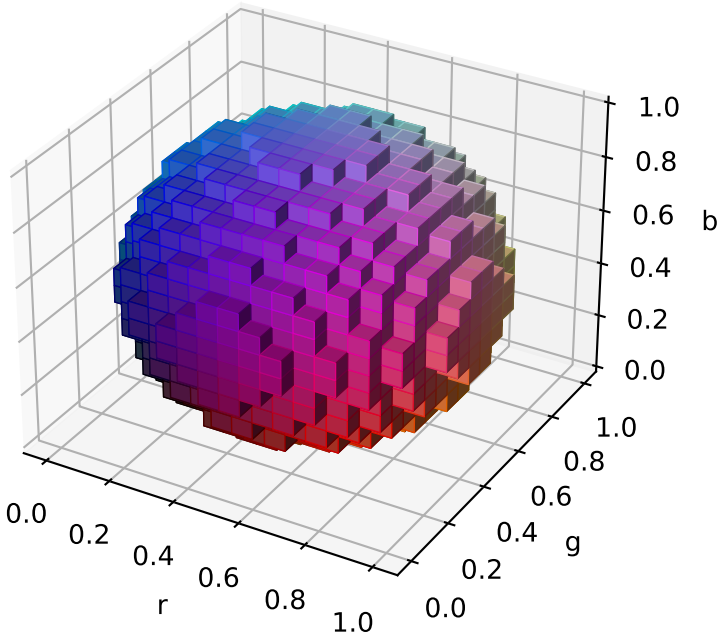
Bases: *matplotlib.axis.XAxis*

An Axis class for the 3D plots.

Parameters

axes

[*matplotlib.axes.Axes*] The *Axes* to which the created Axis be-



`__module__ = 'mpl_toolkits.mplot3d.axis3d'`

`property d_interval`

`draw`(*self*, *renderer*)

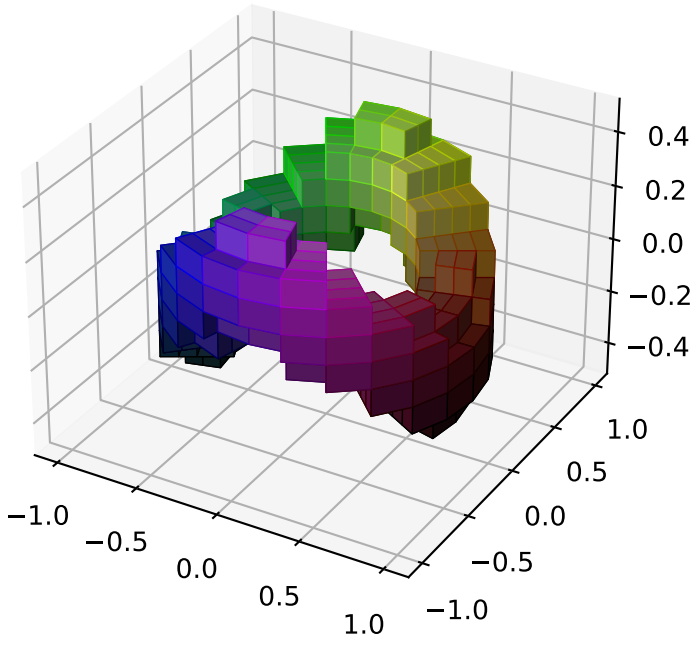
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]



Notes

This method is overridden in the Artist subclasses.

`draw_pane`(*self*, *renderer*)

`get_major_ticks`(*self*, *numticks=None*)
Return the list of major *Tick*s.

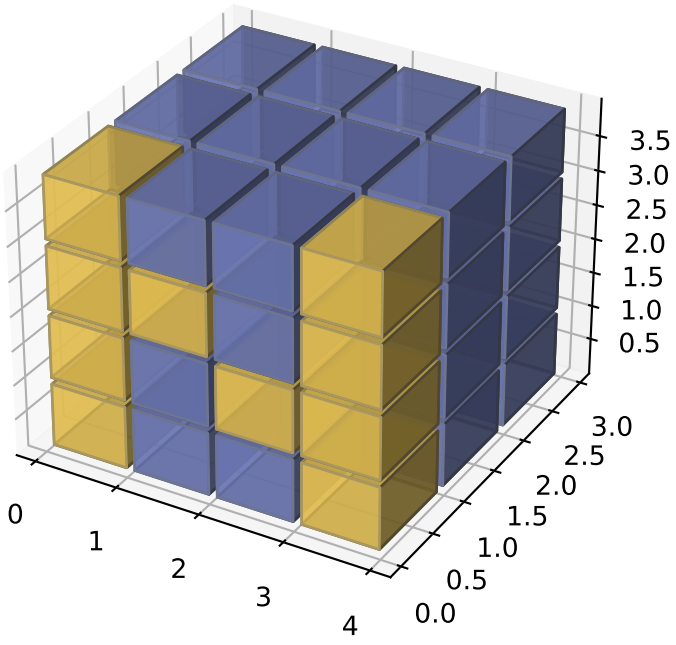
`get_minor_ticks`(*self*, *numticks=None*)
Return the list of minor *Tick*s.

`get_rotate_label`(*self*, *text*)

`get_tightbbox`(*self*, *renderer*, *, *for_layout_only=False*)
Return a bounding box that encloses the axis. It only accounts tick labels, axis label, and offsetText.

If *for_layout_only* is True, then the width of the label (if this is an x-axis) or the height of the label (if this is a y-axis) is collapsed to near zero. This allows tight/constrained_layout to ignore too-long labels when doing their layout.

`init3d`(*self*)



`set_pane_color`(*self*, *color*)
Set pane color to a RGBA tuple.

`set_pane_pos`(*self*, *xys*)

`set_rotate_label`(*self*, *val*)
Whether to rotate the axis label: True, False or None. If set to None the label will be rotated if longer than 4 chars.

`property v_interval`

Examples using `mpl_toolkits.mplot3d.axis3d.Axis`

19.2.3 art3d

art3d.Line3D(xs, ys, zs, *args, **kwargs)	3D line object.
art3d.Line3DCollection(segments[, ...])	A collection of 3D lines.
art3d.Patch3D(*args[, zs, zdir])	3D patch object.
art3d.Patch3DCollection(*args[, zs, zdir, ...])	A collection of 3D patches.

continues on next page

Table 50 – continued from previous page

art3d.Path3DCollection(*args[, zs, zdir, ...])	A collection of 3D paths.
art3d.PathPatch3D(path, *[, zs, zdir])	3D PathPatch object.
art3d.Poly3DCollection(verts, *args[, zsort])	A collection of 3D polygons.
art3d.Text3D([x, y, z, text, zdir])	Text object with 3D position and direction.
art3d.get_dir_vector(zdir)	Return a direction vector.
art3d.juggle_axes(xs, ys, zs, zdir)	Reorder coordinates so that 2D xs, ys can be plotted in the plane orthogonal to zdir.
art3d.line_2d_to_3d(line[, zs, zdir])	Convert a 2D line to 3D.
art3d.line_collection_2d_to_3d(col[, zs, zdir])	Convert a LineCollection to a Line3DCollection object.
art3d.patch_2d_to_3d(patch[, z, zdir])	Convert a Patch to a Patch3D object.
art3d.patch_collection_2d_to_3d(col[, zs, ...])	Convert a *PatchCollection* into a `Patch3DCollection` object (or a *PathCollection* into a `Path3DCollection` object).
art3d.pathpatch_2d_to_3d(pathpatch[, z, zdir])	Convert a PathPatch to a PathPatch3D object.
art3d.poly_collection_2d_to_3d(col[, zs, zdir])	Convert a PolyCollection to a Poly3DCollection object.
art3d.rotate_axes(xs, ys, zs, zdir)	Reorder coordinates so that the axes are rotated with zdir along the original z axis.
art3d.text_2d_to_3d(obj[, z, zdir])	Convert a Text to a Text3D object.

mpl_toolkits.mplot3d.art3d.Line3D

`class mpl_toolkits.mplot3d.art3d.Line3D(`*xs*, *ys*, *zs*, **args*, ***kwargs*`)`

Bases: *matplotlib.lines.Line2D*

3D line object.

Keyword arguments are passed onto *Line2D()*.

`__init__(`*self*, *xs*, *ys*, *zs*, **args*, ***kwargs*`)`

Keyword arguments are passed onto *Line2D()*.

`__module__ = 'mpl_toolkits.mplot3d.art3d'`

`draw(`*self*, *renderer*`)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`get_data_3d`(*self*)
Get the current data

Returns

verts3d

[length-3 tuple or array-like] The current data as a tuple or array-like.

`set_3d_properties`(*self*, *zs=0*, *zdir='z'*)

`set_data_3d`(*self*, **args*)
Set the x, y and z data

Parameters

x

[array-like] The x-data to be plotted.

y

[array-like] The y-data to be plotted.

z

[array-like] The z-data to be plotted.

Notes

Accepts x, y, z arguments or a single array-like (x, y, z)

Examples using `mpl_toolkits.mplot3d.art3d.Line3D`

mpl_toolkits.mplot3d.art3d.Line3DCollection

class mpl_toolkits.mplot3d.art3d.**Line3DCollection**(*segments*, *linewidths=None*, *colors=None*, *antialiaseds=None*, *linestyles='solid'*, *offsets=None*, *transOffset=None*, *norm=None*, *cmap=None*, *pickradius=5*, *zorder=2*, *facecolors='none'*, ***kwargs*)

Bases: *matplotlib.collections.LineCollection*

A collection of 3D lines.

Parameters

segments: list of array-like

A sequence of (*line0*, *line1*, *line2*), where:

```
linen = (x0, y0), (x1, y1), ... (xm, ym)
```

or the equivalent numpy array with two columns. Each line can have a different number of segments.

linewidths

[float or list of float, default: `rcParams["lines.linewidth"]` (default: `1.5`)] The width of each line in points.

colors

[color or list of color, default: `rcParams["lines.color"]` (default: `'C0'`)] A sequence of RGBA tuples (e.g., arbitrary color strings, etc, not allowed).

antialiaseds

[bool or list of bool, default: `rcParams["lines.antialiased"]` (default: `True`)] Whether to use antialiasing for each line.

zorder

[int, default: 2] zorder of the lines once drawn.

facecolors

[color or list of color, default: 'none'] The facecolors of the LineCollection. Setting to a value other than 'none' will lead to each line being "filled in" as if there was an implicit line segment

joining the last and first points of that line back around to each other. In order to manually specify what should count as the "interior" of each line, please use *PathCollection* instead, where the "interior" can be specified by appropriate usage of *CLOSEPOLY*.

****kwargs**

Forwareded to *Collection*.

`__module__ = 'mpl_toolkits.mplot3d.art3d'`

`do_3d_projection`(*self*, *renderer*)
Project the points according to renderer matrix.

`draw`(*self*, *renderer*, *project=False*)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

`set_segments`(*self*, *segments*)
Set 3D segments.

`set_sort_zpos`(*self*, *val*)
Set the position to use for z-sorting.

Examples using `mpl_toolkits.mplot3d.art3d.Line3DCollection`

mpl_toolkits.mplot3d.art3d.Patch3D

`class mpl_toolkits.mplot3d.art3d.Patch3D`(**args*, *zs=()*, *zdir='z'*, ***kwargs*)
Bases: *matplotlib.patches.Patch*

3D patch object.

The following kwarg properties are supported

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur

Table 51 – continued from previous page

Property	Description

`__module__ = 'mpl_toolkits.mplot3d.art3d'`

`do_3d_projection`(*self*, *renderer*)

`get_facecolor`(*self*)
Return the face color.

`get_path`(*self*)
Return the path of this patch.

`set_3d_properties`(*self*, *verts*, *zs=0*, *zdir='z'*)

Examples using `mpl_toolkits.mplot3d.art3d.Patch3D`

mpl_toolkits.mplot3d.art3d.Patch3DCollection

`class mpl_toolkits.mplot3d.art3d.Patch3DCollection`(**args*, *zs=0*, *zdir='z'*, *depthshade=True*, ***kwargs*)

Bases: *matplotlib.collections.PatchCollection*

A collection of 3D patches.

Create a collection of flat 3D patches with its normal vector pointed in *zdir* direction, and located at *zs* on the *zdir* axis. 'zs' can be a scalar or an array-like of

the same length as the number of patches in the collection.

Constructor arguments are the same as for *PatchCollection*. In addition, keywords *zs=0* and *zdir='z'* are available.

Also, the keyword argument "depthshade" is available to indicate whether or not to shade the patches in order to give the appearance of depth (default is *True*). This is typically desired in scatter plots.

`__init__`(*self*, **args*, *zs=0*, *zdir='z'*, *depthshade=True*, ***kwargs*)

Create a collection of flat 3D patches with its normal vector pointed in *zdir* direction, and located at *zs* on the *zdir* axis. 'zs' can be a scalar or an array-like of the same length as the number of patches in the collection.

Constructor arguments are the same as for *PatchCollection*. In addition, keywords *zs=0* and *zdir='z'* are available.

Also, the keyword argument "depthshade" is available to indicate whether or not to shade the patches in order to give the appearance of depth (default is *True*). This is typically desired in scatter plots.

`__module__ = 'mpl_toolkits.mplot3d.art3d'`

`do_3d_projection`(*self*, *renderer*)

`set_3d_properties`(*self*, *zs*, *zdir*)

`set_sort_zpos`(*self*, *val*)

Set the position to use for z-sorting.

Examples using `mpl_toolkits.mplot3d.art3d.Patch3DCollection`

mpl_toolkits.mplot3d.art3d.Path3DCollection

`class mpl_toolkits.mplot3d.art3d.Path3DCollection`(**args*, *zs=0*, *zdir='z'*, *depthshade=True*, ***kwargs*)

Bases: *matplotlib.collections.PathCollection*

A collection of 3D paths.

Create a collection of flat 3D paths with its normal vector pointed in *zdir* direction, and located at *zs* on the *zdir* axis. 'zs' can be a scalar or an array-like of the same length as the number of paths in the collection.

Constructor arguments are the same as for *PathCollection*. In addition, keywords *zs=0* and *zdir='z'* are available.

Also, the keyword argument "depthshade" is available to indicate whether or not to shade the patches in order to give the appearance of depth (default is *True*). This is typically desired in scatter plots.

`__init__`(*self*, **args*, *zs=0*, *zdir='z'*, *depthshade=True*, ***kwargs*)
Create a collection of flat 3D paths with its normal vector pointed in *zdir* direction, and located at *zs* on the *zdir* axis. 'zs' can be a scalar or an array-like of the same length as the number of paths in the collection.

Constructor arguments are the same as for *PathCollection*. In addition, keywords *zs=0* and *zdir='z'* are available.

Also, the keyword argument "depthshade" is available to indicate whether or not to shade the patches in order to give the appearance of depth (default is *True*). This is typically desired in scatter plots.

`__module__ = 'mpl_toolkits.mplot3d.art3d'`

`do_3d_projection`(*self*, *renderer*)

`set_3d_properties`(*self*, *zs*, *zdir*)

`set_sort_zpos`(*self*, *val*)
Set the position to use for z-sorting.

Examples using `mpl_toolkits.mplot3d.art3d.Path3DCollection`

mpl_toolkits.mplot3d.art3d.PathPatch3D

`class mpl_toolkits.mplot3d.art3d.PathPatch3D`(*path*, ***, *zs=()*, *zdir='z'*, ***kwargs*)
Bases: *mpl_toolkits.mplot3d.art3d.Patch3D*

3D PathPatch object.

The following kwarg properties are supported

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}

Table 53 – continued from previous page

Property	Description
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

`__init__`(*self*, *path*, *, *zs=()*, *zdir='z'*, ***kwargs*)

The following kwarg properties are supported

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None
animated	bool
antialiased or aa	unknown

__module__ = 'mpl_toolkits.mplot3d.art3d'

do_3d_projection(*self*, *renderer*)

set_3d_properties(*self*, *path*, *zs=0*, *zdir='z'*)

Examples using mpl_toolkits.mplot3d.art3d.PathPatch3D

- sphx_glr_gallery_mplot3d_pathpatch3d.py

mpl_toolkits.mplot3d.art3d.Poly3DCollection

class mpl_toolkits.mplot3d.art3d.Poly3DCollection(*verts*, **args*, *zsort='average'*, ***kwargs*)

Bases: *matplotlib.collections.PolyCollection*

A collection of 3D polygons.

Note: Filling of 3D polygons

There is no simple definition of the enclosed surface of a 3D polygon unless the polygon is planar.

In practice, Matplotlib fills the 2D projection of the polygon. This gives a correct filling appearance only for planar polygons. For all other polygons, you'll find orientations in which the edges of the polygon intersect in the projection. This will lead to an incorrect visualization of the 3D area.

If you need filled areas, it is recommended to create them via *plot_trisurf*, which creates a triangulation and thus generates consistent surfaces.

Parameters

verts

[list of array-like Nx3] Each element describes a polygon as a sequence of `N_i` points `(x, y, z)`.

zsort

[{'average', 'min', 'max'}, default: 'average'] The calculation method for the z-order. See *set_zsort* for details.

***args, **kwargs**

All other parameters are forwarded to *PolyCollection*.

Notes

Note that this class does a bit of magic with the _facecolors and _edgecolors properties.

`__init__`(*self*, *verts*, **args*, *zsort='average'*, ***kwargs*)

Parameters

verts

[list of array-like Nx3] Each element describes a polygon as a sequence of `N_i` points `(x, y, z)`.

zsort

[{'average', 'min', 'max'}, default: 'average'] The calculation method for the z-order. See *set_zsort* for details.

***args, **kwargs**

All other parameters are forwarded to *PolyCollection*.

Notes

Note that this class does a bit of magic with the _facecolors and _edgecolors properties.

`__module__ = 'mpl_toolkits.mplot3d.art3d'`

`do_3d_projection`(*self*, *renderer*)
Perform the 3D projection for this object.

`get_edgecolor`(*self*)

`get_facecolor`(*self*)

`get_vector`(*self*, *segments3d*)
Optimize points for projection.

`set_3d_properties`(*self*)

`set_alpha`(*self*, *alpha*)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[float or None]

`set_edgecolor`(*self*, *colors*)
Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_facecolor`(*self*, *colors*)
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

`set_sort_zpos`(*self*, *val*)
Set the position to use for z-sorting.

`set_verts`(*self*, *verts*, *closed=True*)
Set 3D vertices.

`set_verts_and_codes`(*self*, *verts*, *codes*)
Set 3D vertices with path codes.

`set_zsort`(*self*, *zsort*)
Set the calculation method for the z-order.

Parameters

zsort

[{'average', 'min', 'max'}] The function applied on the z-coordinates of the vertices in the viewer's coordinate system, to determine the z-order.

Examples using `mpl_toolkits.mplot3d.art3d.Poly3DCollection`

- sphx_glr_gallery_pyplots_whats_new_1_subplot3d.py
- sphx_glr_gallery_frontpage_3D.py
- sphx_glr_gallery_mplot3d_custom_shaded_3d_surface.py
- sphx_glr_gallery_mplot3d_mixed_subplots.py
- sphx_glr_gallery_mplot3d_polys3d.py
- sphx_glr_gallery_mplot3d_subplot3d.py
- sphx_glr_gallery_mplot3d_surface3d.py
- sphx_glr_gallery_mplot3d_surface3d_3.py

mpl_toolkits.mplot3d.art3d.Text3D

class mpl_toolkits.mplot3d.art3d.**Text3D**(*x=0*, *y=0*, *z=0*, *text=''*, *zdir='z'*, ***kwargs*)

Bases: *matplotlib.text.Text*

Text object with 3D position and direction.

Parameters

x, y, z

The position of the text.

text

[str] The text string to display.

zdir

[{'x', 'y', 'z', None, 3-tuple}] The direction of the text. See *get_dir_vector* for a description of the values.

Other Parameters

****kwargs**

All other parameters are passed on to *Text*.

Create a *Text* instance at *x*, *y* with string *text*.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array an

Tab

Property	Description
alpha	float or None
animated	bool
backgroundcolor	color
bbox	dict with properties for *patches.FancyBboxPatch*
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
figure	*Figure*
fontfamily or family	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', '
fontproperties or font or font_properties	*font_manager.FontProperties* or `str` or `pathlib.Path`

Tab

Property	Description
zorder	float

__module__ = 'mpl_toolkits.mplot3d.art3d'

draw(*self*, *renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_tightbbox(*self*, *renderer*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

set_3d_properties(*self*, *z=0*, *zdir='z'*)

Examples using `mpl_toolkits.mplot3d.art3d.Text3D`

mpl_toolkits.mplot3d.art3d.get_dir_vector

`mpl_toolkits.mplot3d.art3d.get_dir_vector(zdir)`

Return a direction vector.

Parameters

zdir

[{'x', 'y', 'z', None, 3-tuple}] The direction. Possible values are: - 'x': equivalent to (1, 0, 0) - 'y': equivalent to (0, 1, 0) - 'z': equivalent to (0, 0, 1) - *None*: equivalent to (0, 0, 0) - an iterable (x, y, z) is returned unchanged.

Returns

x, y, z

[array-like] The direction vector. This is either a numpy.array or *zdir* itself if *zdir* is already a length-3 iterable.

Examples using `mpl_toolkits.mplot3d.art3d.get_dir_vector`

mpl_toolkits.mplot3d.art3d.juggle_axes

`mpl_toolkits.mplot3d.art3d.juggle_axes(xs, ys, zs, zdir)`

Reorder coordinates so that 2D xs, ys can be plotted in the plane orthogonal to zdir. zdir is normally x, y or z. However, if zdir starts with a '-' it is interpreted as a compensation for rotate_axes.

Examples using `mpl_toolkits.mplot3d.art3d.juggle_axes`

mpl_toolkits.mplot3d.art3d.line_2d_to_3d

`mpl_toolkits.mplot3d.art3d.line_2d_to_3d(line, zs=0, zdir='z')`

Convert a 2D line to 3D.

Examples using `mpl_toolkits.mplot3d.art3d.line_2d_to_3d`

mpl_toolkits.mplot3d.art3d.line_collection_2d_to_3d

`mpl_toolkits.mplot3d.art3d.line_collection_2d_to_3d`(*col*, *zs=0*, *zdir='z'*)

Convert a LineCollection to a Line3DCollection object.

Examples using `mpl_toolkits.mplot3d.art3d.line_collection_2d_to_3d`

mpl_toolkits.mplot3d.art3d.patch_2d_to_3d

`mpl_toolkits.mplot3d.art3d.patch_2d_to_3d`(*patch*, *z=0*, *zdir='z'*)

Convert a Patch to a Patch3D object.

Examples using `mpl_toolkits.mplot3d.art3d.patch_2d_to_3d`

mpl_toolkits.mplot3d.art3d.patch_collection_2d_to_3d

`mpl_toolkits.mplot3d.art3d.patch_collection_2d_to_3d`(*col*, *zs=0*, *zdir='z'*, *depthshade=True*)

Convert a *PatchCollection* into a *Patch3DCollection* object (or a *PathCollection* into a *Path3DCollection* object).

Parameters

za

The location or locations to place the patches in the collection along the *zdir* axis. Default: 0.

zdir

The axis in which to place the patches. Default: "z".

depthshade

Whether to shade the patches to give a sense of depth. Default: *True*.

Examples using `mpl_toolkits.mplot3d.art3d.patch_collection_2d_to_3d`

mpl_toolkits.mplot3d.art3d.pathpatch_2d_to_3d

`mpl_toolkits.mplot3d.art3d.`**`pathpatch_2d_to_3d`**(*pathpatch*, *z=0*, *zdir='z'*)
Convert a PathPatch to a PathPatch3D object.

Examples using `mpl_toolkits.mplot3d.art3d.pathpatch_2d_to_3d`

- sphx_glr_gallery_mplot3d_pathpatch3d.py

mpl_toolkits.mplot3d.art3d.poly_collection_2d_to_3d

`mpl_toolkits.mplot3d.art3d.`**`poly_collection_2d_to_3d`**(*col*, *zs=0*, *zdir='z'*)
Convert a PolyCollection to a Poly3DCollection object.

Examples using `mpl_toolkits.mplot3d.art3d.poly_collection_2d_to_3d`

mpl_toolkits.mplot3d.art3d.rotate_axes

`mpl_toolkits.mplot3d.art3d.`**`rotate_axes`**(*xs*, *ys*, *zs*, *zdir*)
Reorder coordinates so that the axes are rotated with zdir along the original z axis. Prepending the axis with a '-' does the inverse transform, so zdir can be x, -x, y, -y, z or -z

Examples using `mpl_toolkits.mplot3d.art3d.rotate_axes`

mpl_toolkits.mplot3d.art3d.text_2d_to_3d

`mpl_toolkits.mplot3d.art3d.`**`text_2d_to_3d`**(*obj*, *z=0*, *zdir='z'*)
Convert a Text to a Text3D object.

Examples using `mpl_toolkits.mplot3d.art3d.text_2d_to_3d`

19.2.4 proj3d

proj3d.inv_transform(xs, ys, zs, M)	
proj3d.persp_transformation(zfront, zback)	

continues on next page

Table 57 – continued from previous page

proj3d.proj_points(points, M)	
proj3d.proj_trans_points(points, M)	
proj3d.proj_transform(xs, ys, zs, M)	Transform the points by the projection matrix
proj3d.proj_transform_clip(xs, ys, zs, M)	Transform the points by the projection matrix and return the clipping result returns txs, tys, tzs, tis
proj3d.rot_x(V, alpha)	
proj3d.transform(xs, ys, zs, M)	Transform the points by the projection matrix
proj3d.view_transformation(E, R, V)	
proj3d.world_transformation(xmin, xmax, ...)	Produce a matrix that scales homogeneous coords in the specified ranges to [0, 1], or [0, pb_aspect[i]] if the plotbox aspect ratio is specified.

mpl_toolkits.mplot3d.proj3d.inv_transform

mpl_toolkits.mplot3d.proj3d.**inv_transform**(*xs*, *ys*, *zs*, *M*)

Examples using `mpl_toolkits.mplot3d.proj3d.inv_transform`

mpl_toolkits.mplot3d.proj3d.persp_transformation

mpl_toolkits.mplot3d.proj3d.**persp_transformation**(*zfront*, *zback*)

Examples using `mpl_toolkits.mplot3d.proj3d.persp_transformation`

mpl_toolkits.mplot3d.proj3d.proj_points

mpl_toolkits.mplot3d.proj3d.**proj_points**(*points*, *M*)

Examples using `mpl_toolkits.mplot3d.proj3d.proj_points`

mpl_toolkits.mplot3d.proj3d.proj_trans_points

mpl_toolkits.mplot3d.proj3d.**proj_trans_points**(*points*, *M*)

Examples using `mpl_toolkits.mplot3d.proj3d.proj_trans_points`

mpl_toolkits.mplot3d.proj3d.proj_transform

mpl_toolkits.mplot3d.proj3d.**proj_transform**(*xs*, *ys*, *zs*, *M*)
Transform the points by the projection matrix

Examples using `mpl_toolkits.mplot3d.proj3d.proj_transform`

mpl_toolkits.mplot3d.proj3d.proj_transform_clip

mpl_toolkits.mplot3d.proj3d.**proj_transform_clip**(*xs*, *ys*, *zs*, *M*)
Transform the points by the projection matrix and return the clipping result returns txs, tys, tzs, tis

Examples using `mpl_toolkits.mplot3d.proj3d.proj_transform_clip`

mpl_toolkits.mplot3d.proj3d.rot_x

mpl_toolkits.mplot3d.proj3d.**rot_x**(*V*, *alpha*)

Examples using `mpl_toolkits.mplot3d.proj3d.rot_x`

mpl_toolkits.mplot3d.proj3d.transform

mpl_toolkits.mplot3d.proj3d.**transform**(*xs*, *ys*, *zs*, *M*)
Transform the points by the projection matrix

Examples using `mpl_toolkits.mplot3d.proj3d.transform`

mpl_toolkits.mplot3d.proj3d.view_transformation

mpl_toolkits.mplot3d.proj3d.**view_transformation**(*E*, *R*, *V*)

Examples using `mpl_toolkits.mplot3d.proj3d.view_transformation`

mpl_toolkits.mplot3d.proj3d.world_transformation

`mpl_toolkits.mplot3d.proj3d.`**`world_transformation`**(*xmin*, *xmax*, *ymin*, *ymax*, *zmin*, *zmax*, *pb_aspect=None*)

Produce a matrix that scales homogeneous coords in the specified ranges to [0, 1], or [0, pb_aspect[i]] if the plotbox aspect ratio is specified.

Examples using `mpl_toolkits.mplot3d.proj3d.world_transformation`

19.3 Matplotlib axes_grid Toolkit

Note: AxesGrid toolkit has been a part of matplotlib since v 0.99. Originally, the toolkit had a single namespace of *axes_grid*. In more recent version, the toolkit has divided into two separate namespace (*axes_grid1* and *axisartist*). While *axes_grid* namespace is maintained for the backward compatibility, use of *axes_grid1* and *axisartist* is recommended. For the documentation on `axes_grid`, see the previous version of the docs.

Part V

Third party packages

Several external packages that extend or build on Matplotlib functionality are listed below. They are maintained and distributed separately from Matplotlib and thus need to be installed individually.

Please submit an issue or pull request on GitHub if you have created a package that you would like to have included. We are also happy to host third party packages within the Matplotlib GitHub Organization.

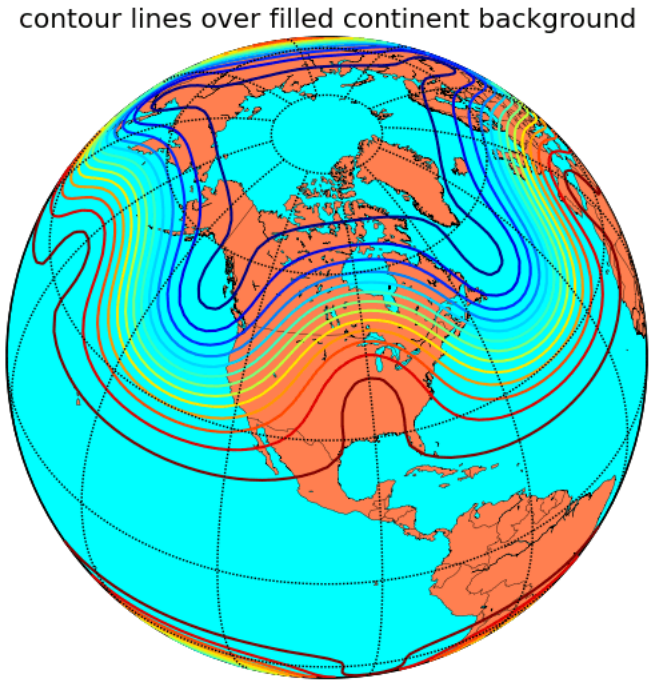
CHAPTER

TWENTYTHREE

MAPPING TOOLKITS

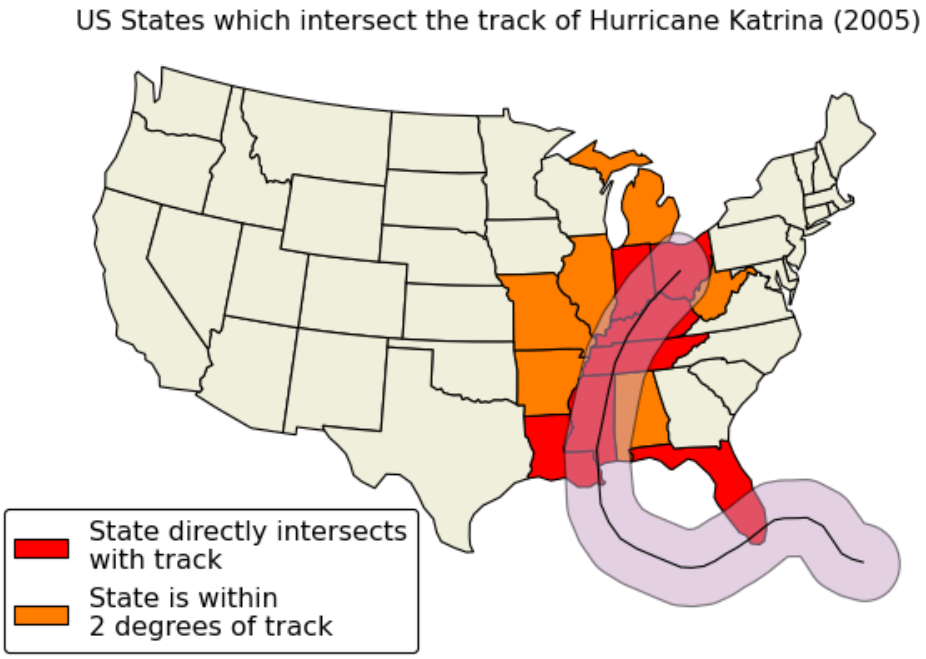
23.1 Basemap

Basemap plots data on map projections, with continental and political boundaries.



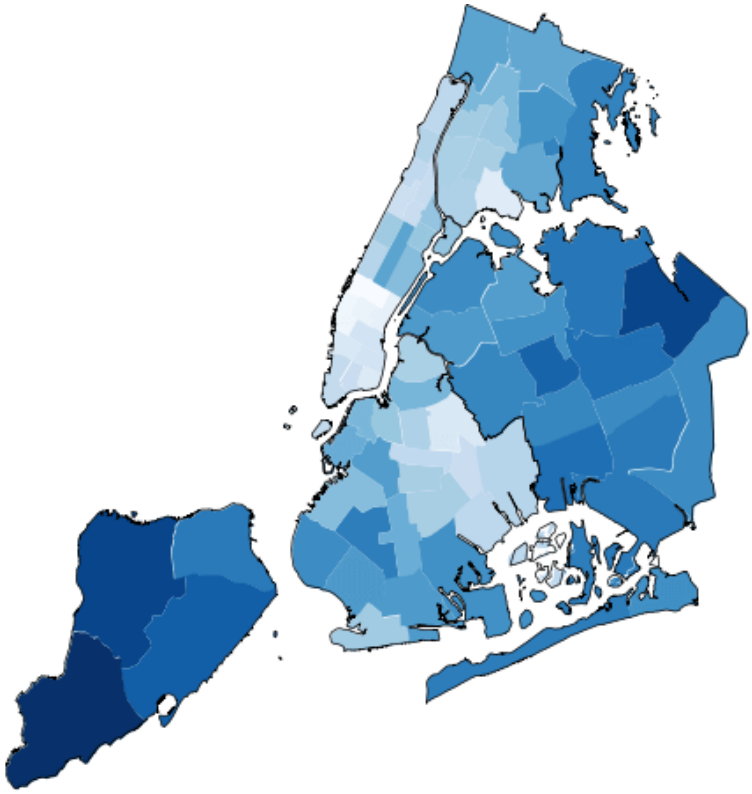
23.2 Cartopy

Cartopy builds on top of Matplotlib to provide object oriented map projection definitions and close integration with Shapely for powerful yet easy-to-use vector data processing tools. An example plot from the Cartopy gallery:



23.3 Geoplot

Geoplot builds on top of Matplotlib and Cartopy to provide a "standard library" of simple, powerful, and customizable plot types. An example plot from the Geoplot gallery:



23.4 Ridge Map

ridge_map uses Matplotlib, SRTM.py, NumPy, and scikit-image to make ridge plots of your favorite ridges.

THE WHITE
MOUNTAINS

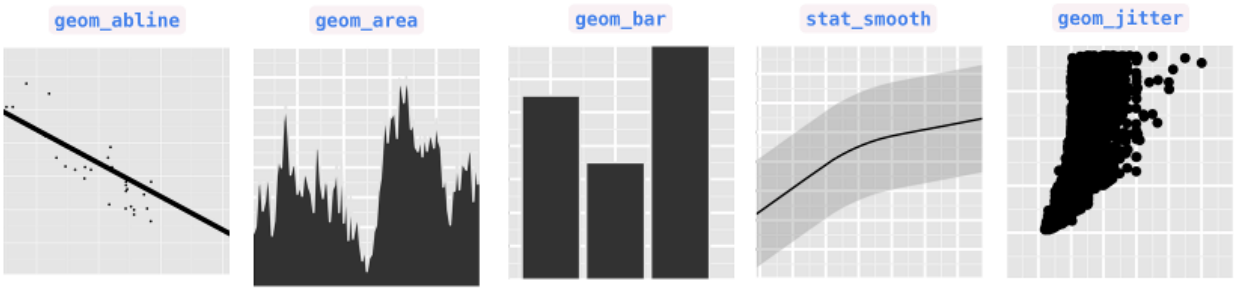
CHAPTER

TWENTYFOUR

DECLARATIVE LIBRARIES

24.1 ggplot

ggplot is a port of the R ggplot2 package to python based on Matplotlib.

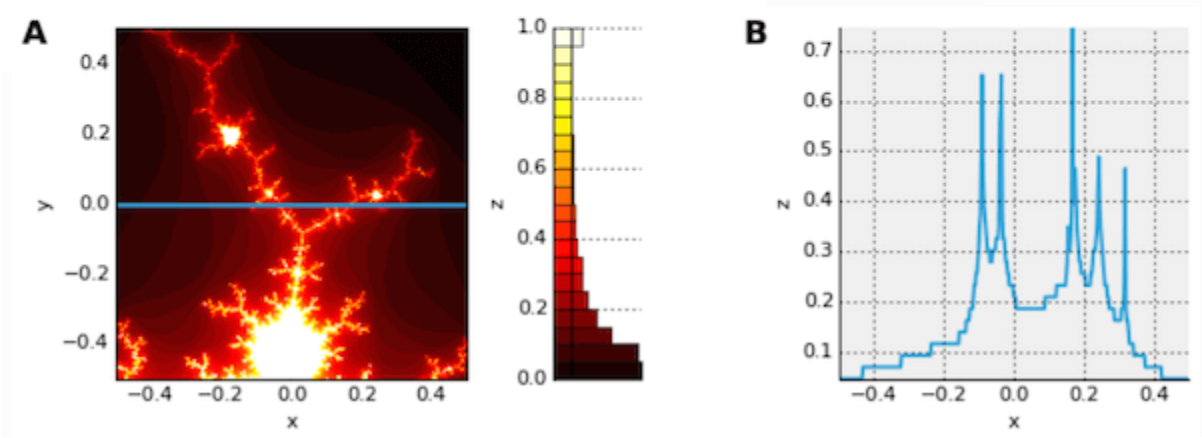


24.2 holoviews

holoviews makes it easier to visualize data interactively, especially in a Jupyter notebook, by providing a set of declarative plotting objects that store your data and associated metadata. Your data is then immediately visualizable alongside or overlaid with other data, either statically or with automatically provided widgets for parameter exploration.

```
import numpy as np
import holoviews as hv
hv.notebook_extension('matplotlib')
fractal = hv.Image(np.load('mandelbrot.npy'))

((fractal * hv.HLine(y=0)).hist() + fractal.sample(y=0))
```



24.3 plotnine

plotnine implements a grammar of graphics, similar to R's ggplot2. The grammar allows users to compose plots by explicitly mapping data to the visual objects that make up the plot.

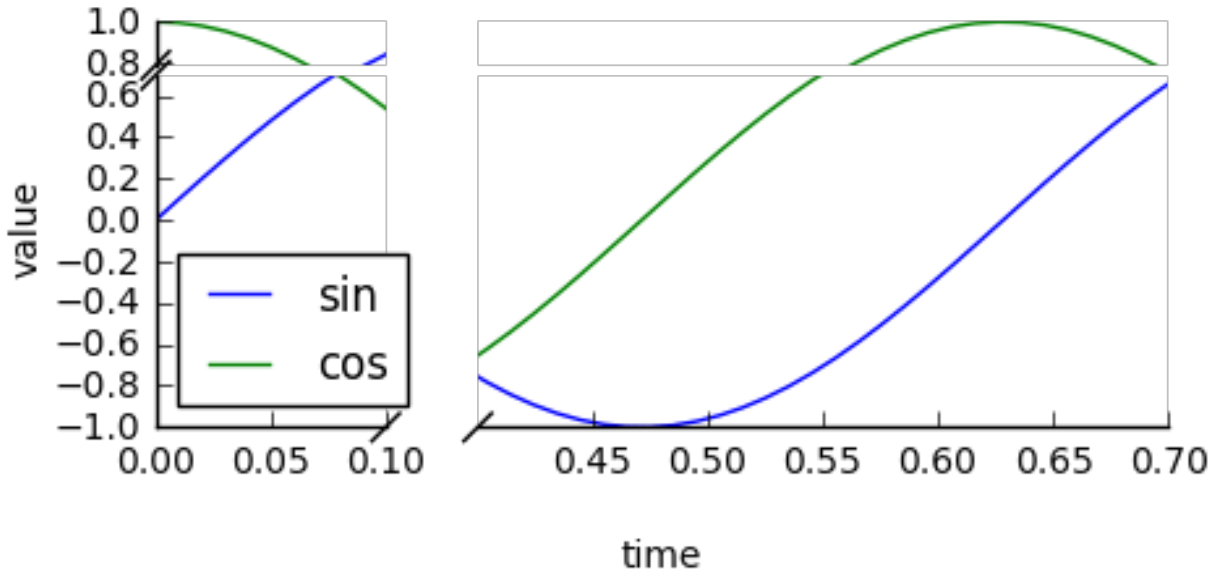
CHAPTER

TWENTYFIVE

SPECIALTY PLOTS

25.1 Broken Axes

brokenaxes supplies an axes class that can have a visual break to indicate a discontinuous range.

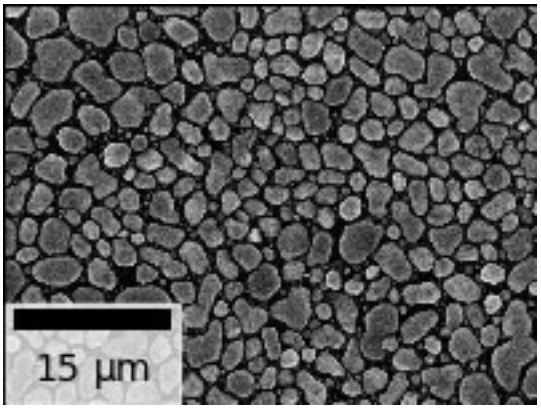


25.2 DeCiDa

DeCiDa is a library of functions and classes for electron device characterization, electronic circuit design and general data visualization and analysis.

25.3 matplotlib-scalebar

matplotlib-scalebar provides a new artist to display a scale bar, aka micron bar. It is particularly useful when displaying calibrated images plotted using `plt.imshow(...)`.

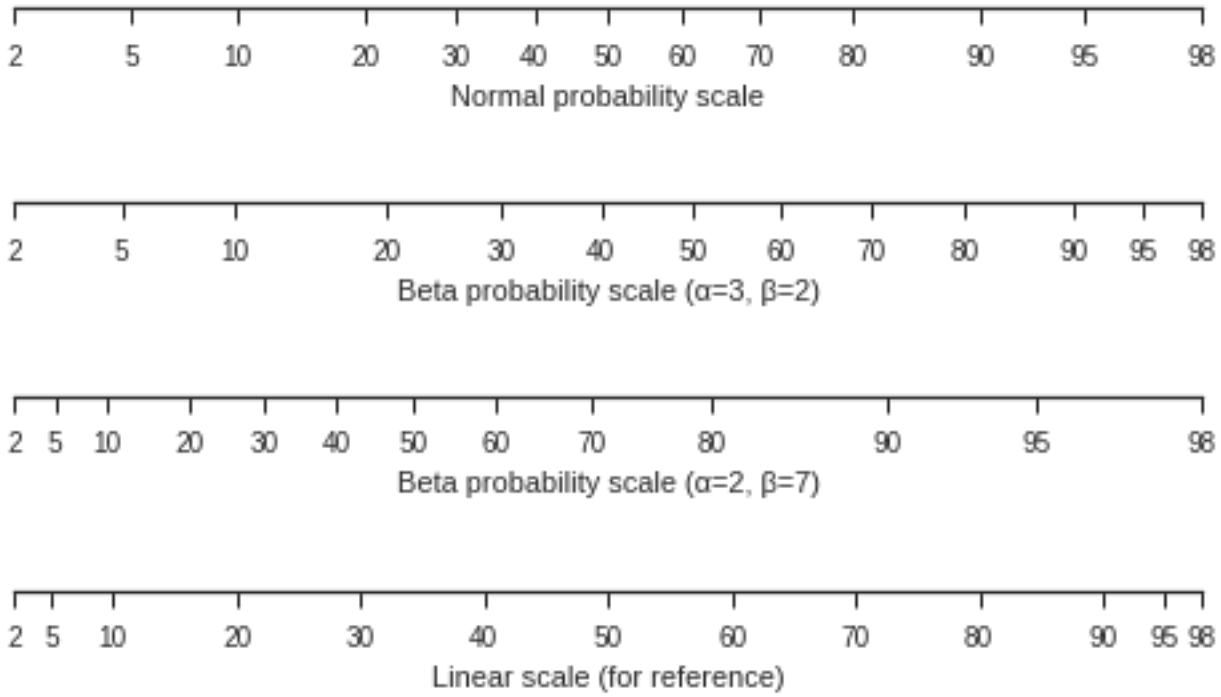


25.4 Matplotlib-Venn

Matplotlib-Venn provides a set of functions for plotting 2- and 3-set area-weighted (or unweighted) Venn diagrams.

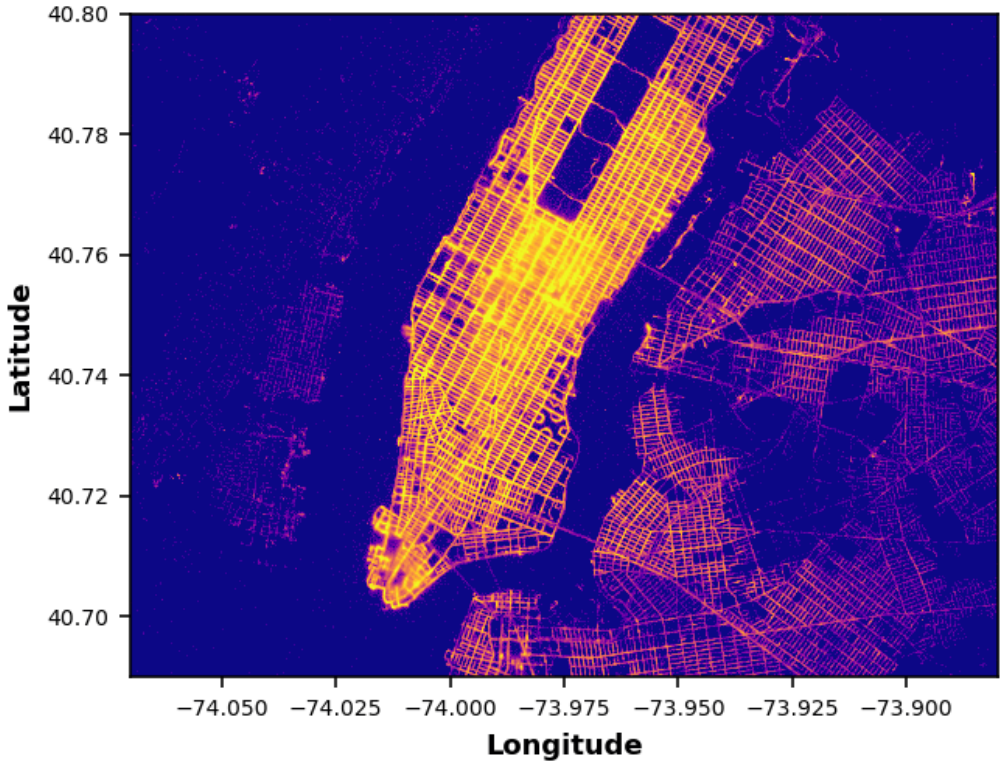
25.5 mpl-probscale

mpl-probscale is a small extension that allows Matplotlib users to specify probability scales. Simply importing the `probscale` module registers the scale with Matplotlib, making it accessible via e.g., `ax.set_xscale('prob')` or `plt.yscale('prob')`.



25.6 mpl-scatter-density

mpl-scatter-density is a small package that makes it easy to make scatter plots of large numbers of points using a density map. The following example contains around 13 million points and the plotting (excluding reading in the data) took less than a second on an average laptop:



When used in interactive mode, the density map is downsampled on-the-fly while panning/zooming in order to provide a smooth interactive experience.

25.7 mplstereonet

mplstereonet provides stereonets for plotting and analyzing orientation data in Matplotlib.

25.8 Natgrid

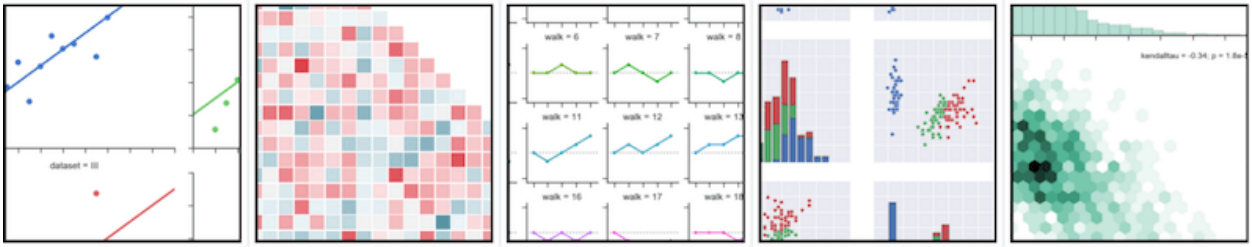
mpl_toolkits.natgrid is an interface to the natgrid C library for gridding irregularly spaced data.

25.9 pyUpSet

pyUpSet is a static Python implementation of the UpSet suite by Lex et al. to explore complex intersections of sets and data frames.

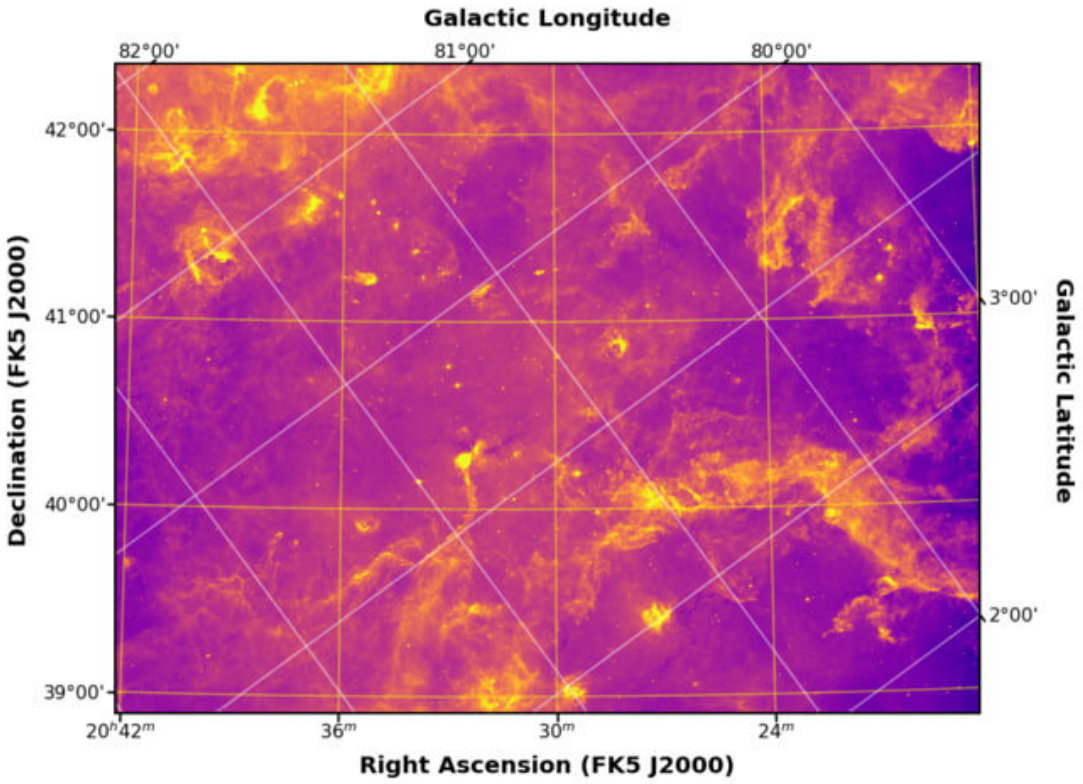
25.10 seaborn

seaborn is a high level interface for drawing statistical graphics with Matplotlib. It aims to make visualization a central part of exploring and understanding complex datasets.



25.11 WCSAxes

The Astropy core package includes a submodule called WCSAxes (available at astropy.visualization.wcsaxes) which adds Matplotlib projections for Astronomical image data. The following is an example of a plot made with WCSAxes which includes the original coordinate system of the image and an overlay of a different coordinate system:



25.12 Windrose

Windrose is a Python Matplotlib, Numpy library to manage wind data, draw windroses (also known as polar rose plots), draw probability density functions and fit Weibull distributions.

25.13 Yellowbrick

Yellowbrick is a suite of visual diagnostic tools for machine learning that enables human steering of the model selection process. Yellowbrick combines scikit-learn with matplotlib using an estimator-based API called the `Visualizer`, which wraps both sklearn models and matplotlib Axes. `Visualizer` objects fit neatly into the machine learning workflow allowing data scientists to integrate visual diagnostic and model interpretation tools into experimentation without extra steps.

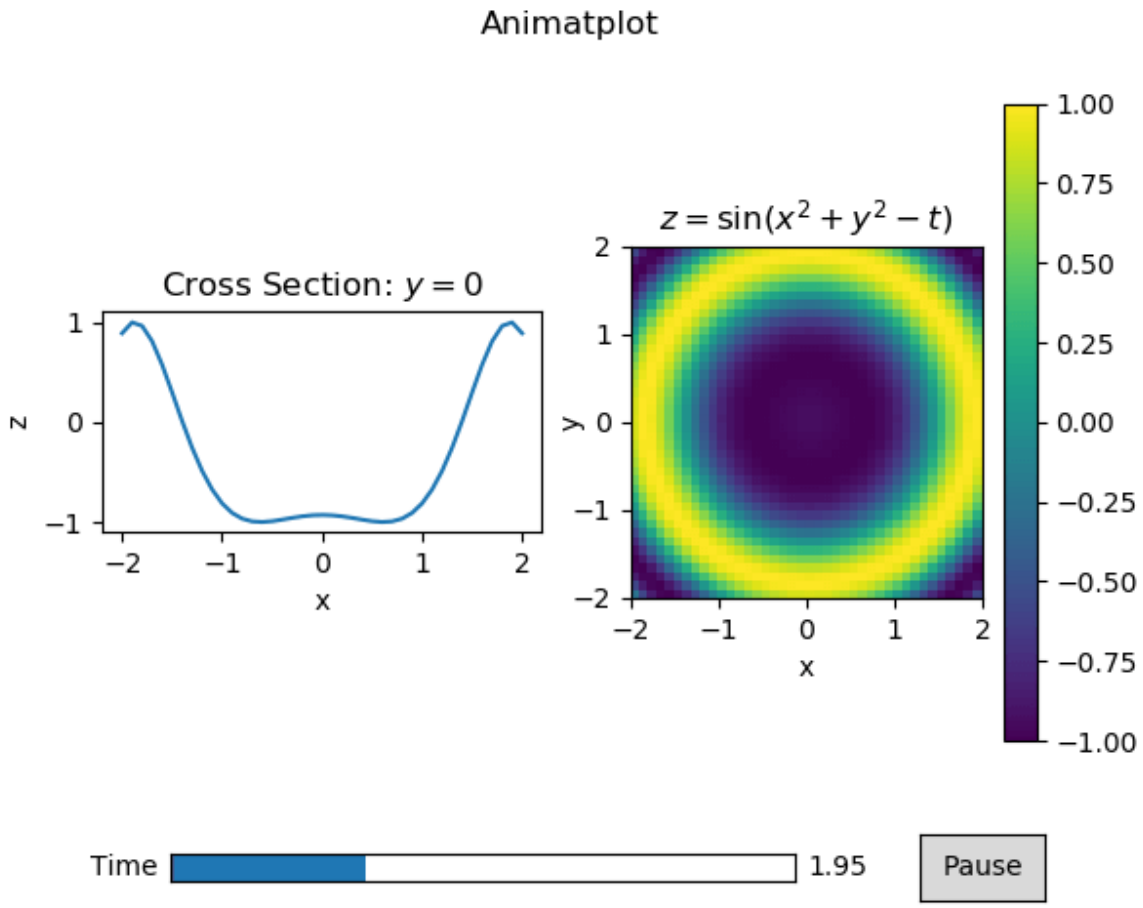
TWENTYSIX

ANIMATIONS

26.1 animatplot

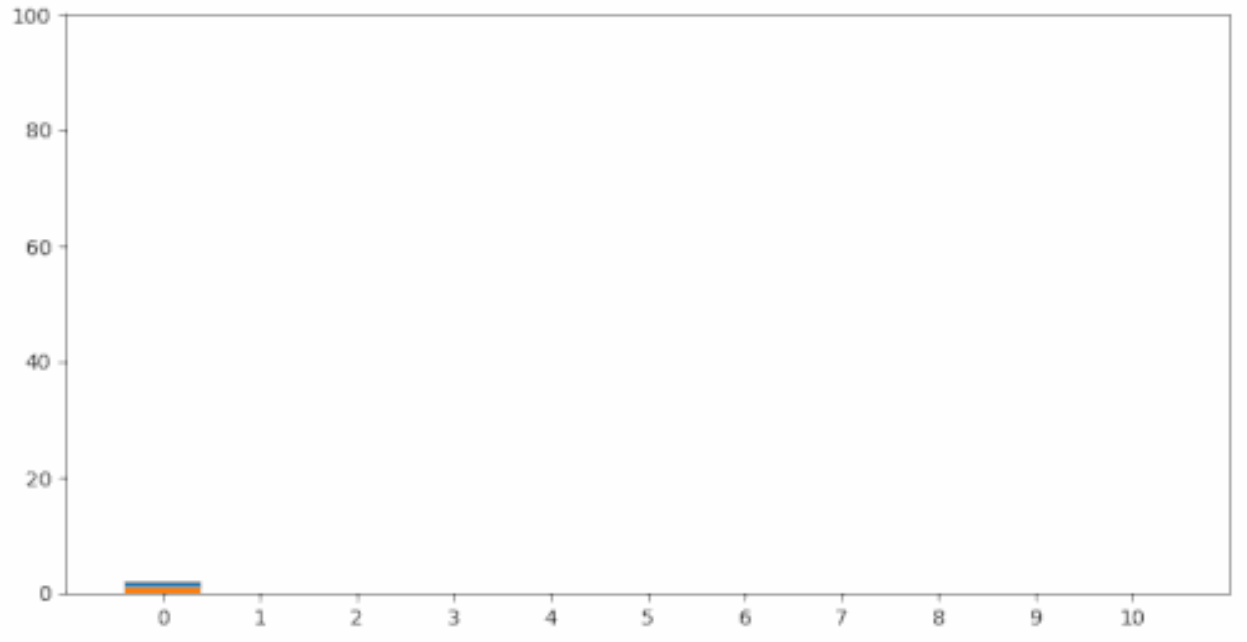
animatplot is a library for producing interactive animated plots with the goal of making production of animated plots almost as easy as static ones.



For an animated version of the above picture and more examples, see the animatplot gallery.

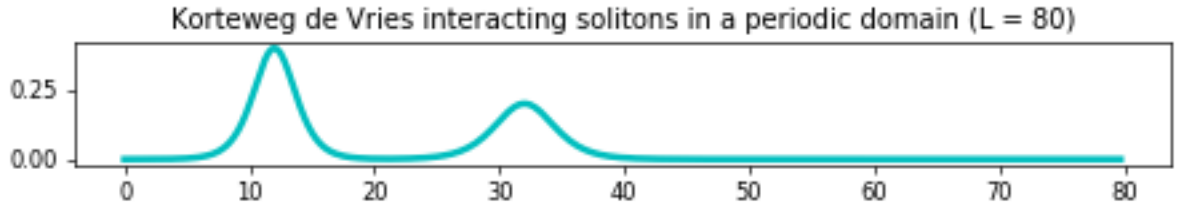
26.2 gif

gif is an ultra lightweight animated gif API.



26.3 numpngw

numpngw provides functions for writing NumPy arrays to PNG and animated PNG files. It also includes the class `AnimatedPNGWriter` that can be used to save a Matplotlib animation as an animated PNG file. See the example on the PyPI page or at the `numpngw` github repository.



CHAPTER

TWENTYSEVEN

INTERACTIVITY

27.1 mplcursors

mplcursors provides interactive data cursors for Matplotlib.

27.2 MplDataCursor

MplDataCursor is a toolkit written by Joe Kington to provide interactive "data cursors" (clickable annotation boxes) for Matplotlib.

27.3 mpl_interactions

mpl_interactions makes it easy to create interactive plots controlled by sliders and other widgets. It also provides several handy capabilties such as manual image segmentation, comparing cross-sections of arrays, and using the scroll wheel to zoom.

CHAPTER

TWENTYEIGHT

RENDERING BACKENDS

28.1 mplcairo

mplcairo is a cairo backend for Matplotlib, with faster and more accurate marker drawing, support for a wider selection of font formats and complex text layout, and various other features.

28.2 gr

gr is a framework for cross-platform visualisation applications, which can be used as a high-performance Matplotlib backend.

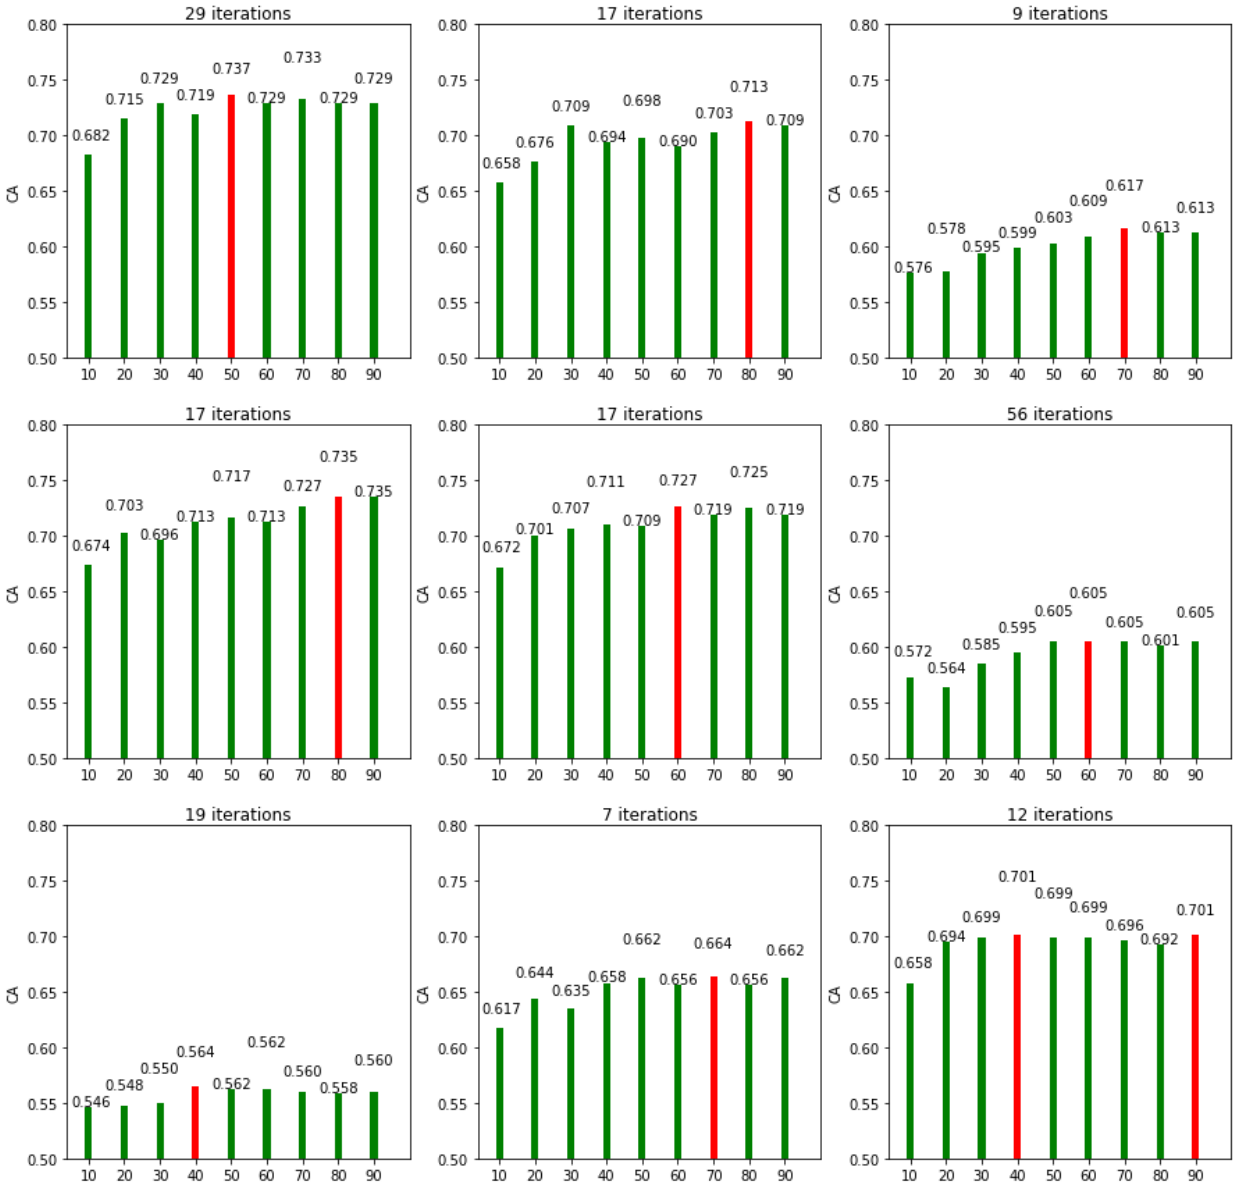
CHAPTER

TWENTYNINE

MISCELLANEOUS

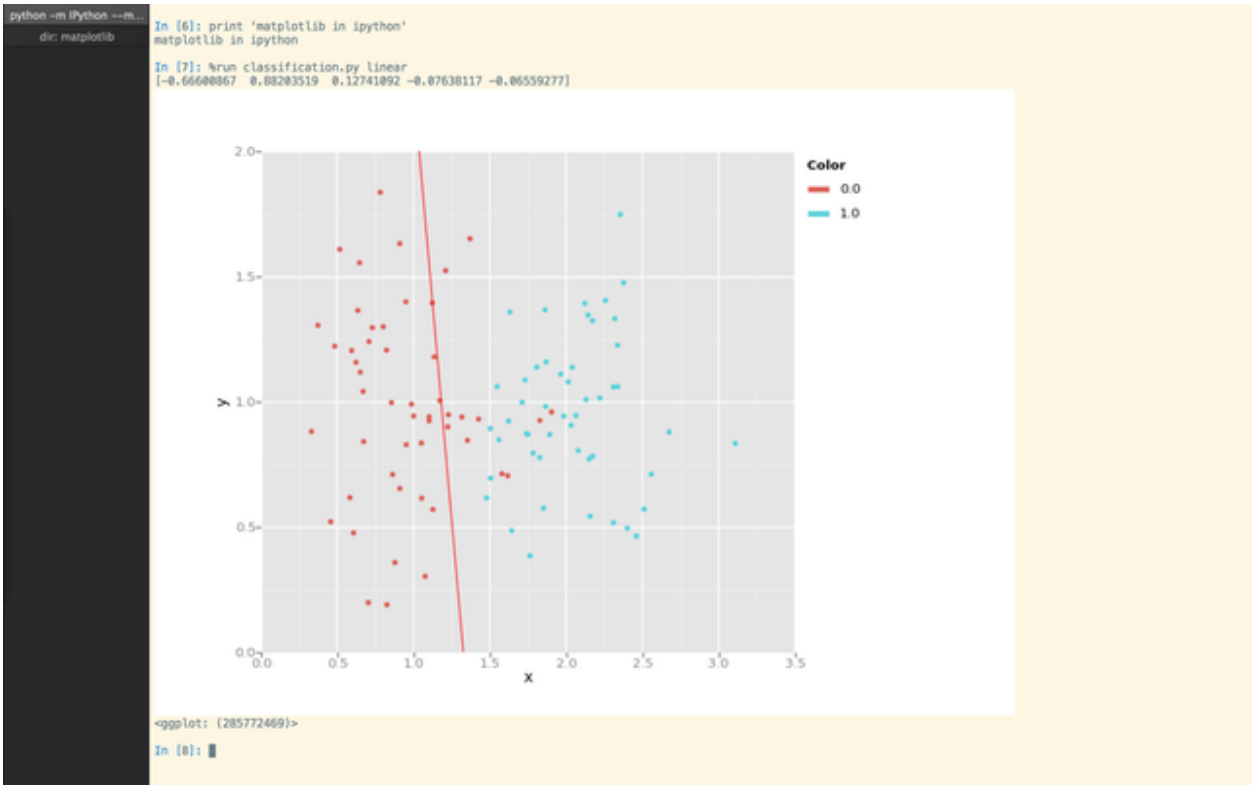
29.1 adjustText

adjustText is a small library for automatically adjusting text position in Matplotlib plots to minimize overlaps between them, specified points and other objects.



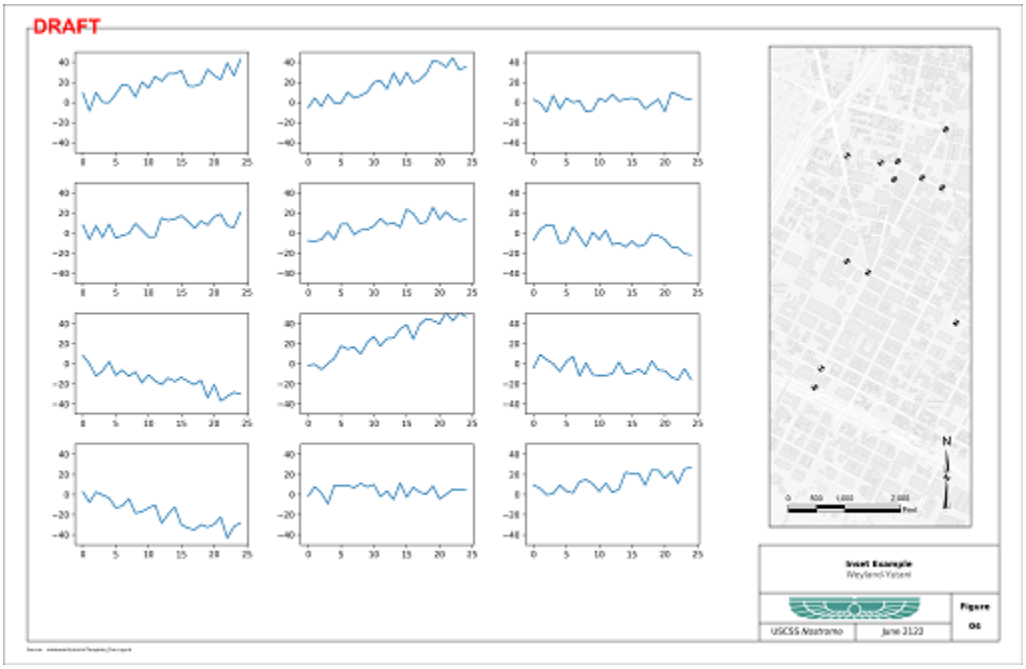
29.2 iTerm2 terminal backend

matplotlib_iterm2 is an external Matplotlib backend using the iTerm2 nightly build inline image display feature.



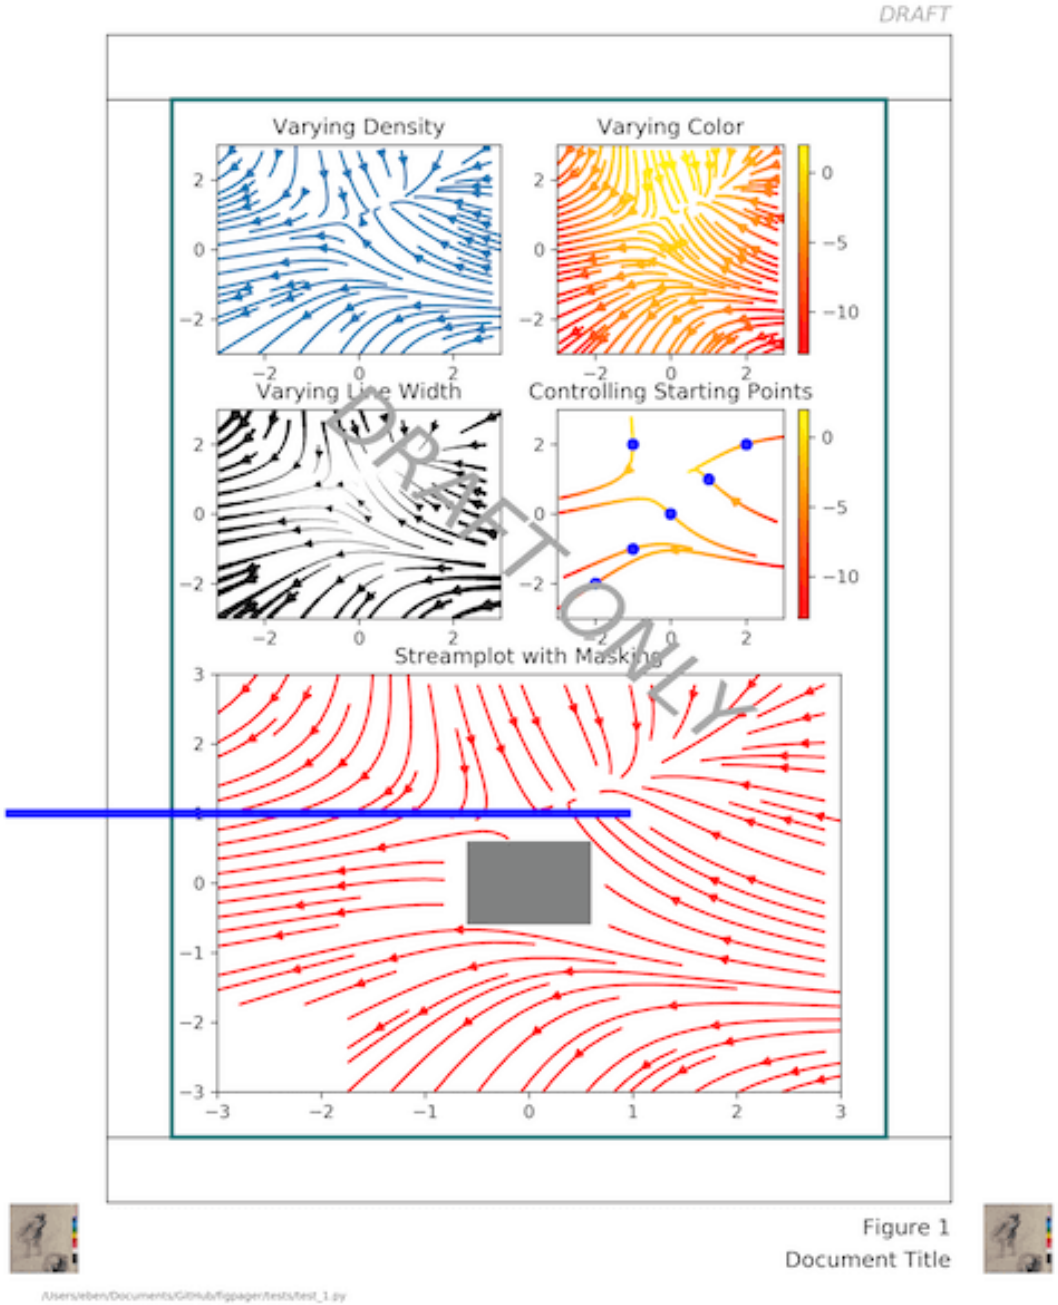
29.3 mpl-template

mpl-template provides a customizable way to add engineering figure elements such as a title block, border, and logo.



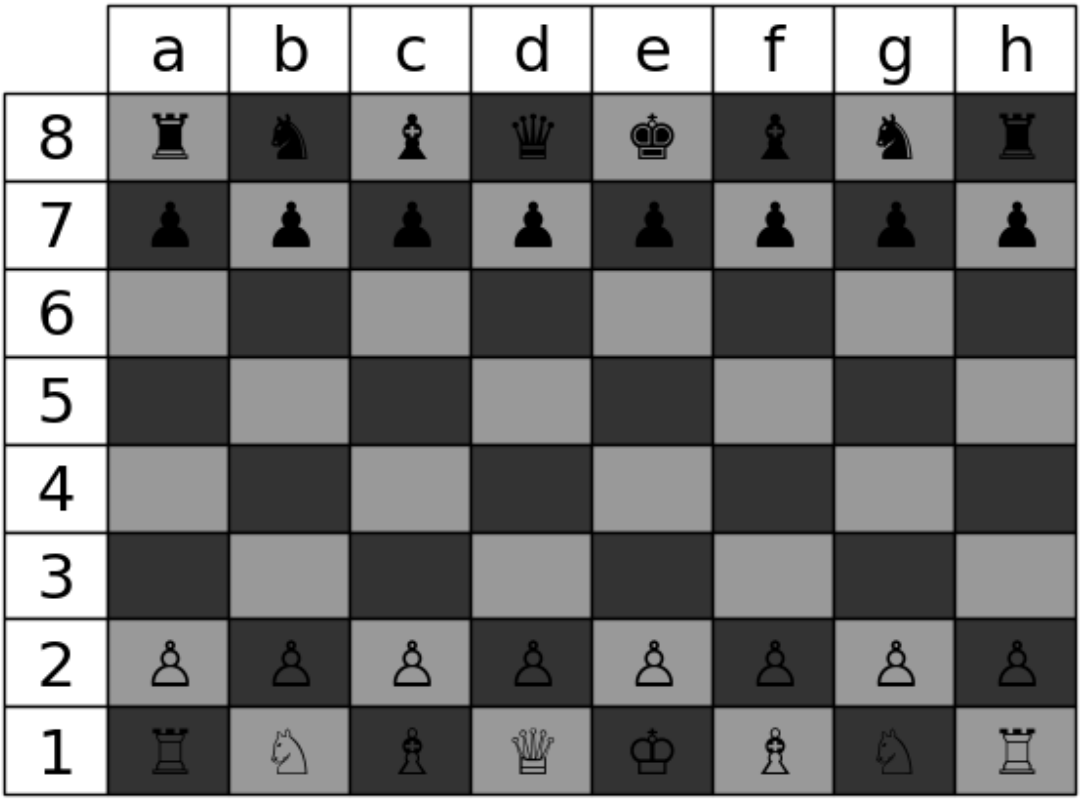
29.4 figpager

figpager provides customizable figure elements such as text, lines and images and subplot layout control for single or multi page output.



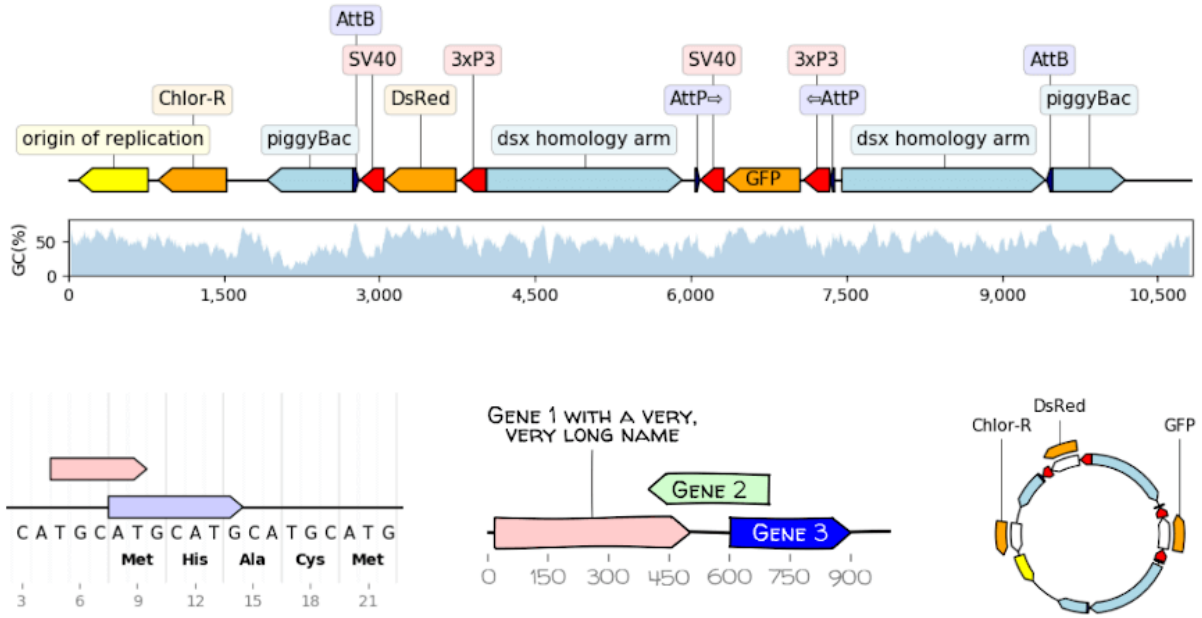
29.5 blume

blume provides a replacement for the Matplotlib `table` module. It fixes a number of issues with the existing table. See the blume github repository for more details.



29.6 DNA Features Viewer

DNA Features Viewer provides methods to plot annotated DNA sequence maps (possibly along other Matplotlib plots) for Bioinformatics and Synthetic Biology applications.



CHAPTER

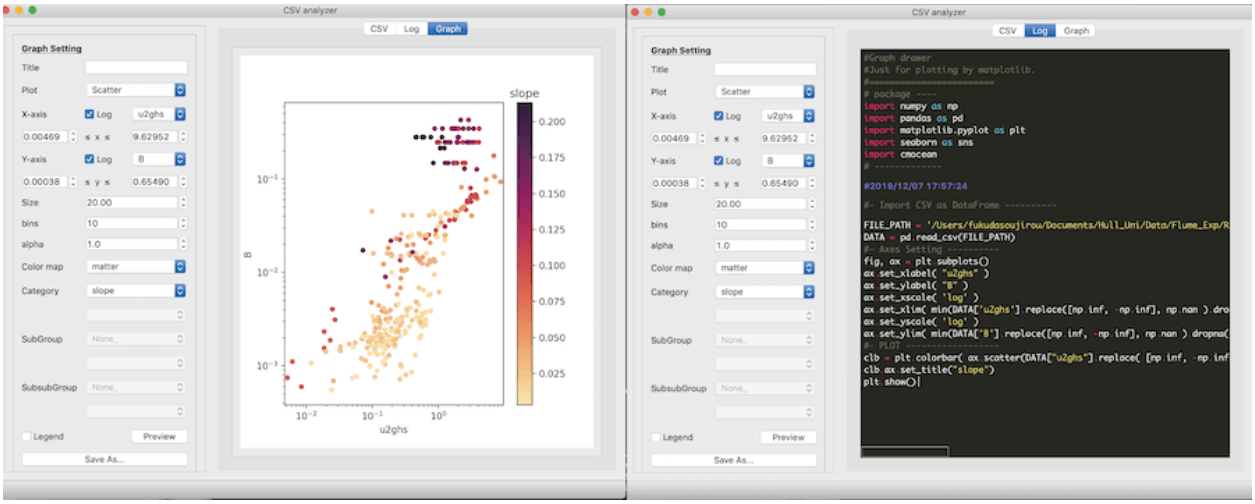
THIRTY

GUI APPLICATIONS

30.1 sviewgui

sviewgui is a PyQt-based GUI for visualisation of data from csv files or `pandas.DataFrame`s. Main features:

- Scatter, line, density, histogram, and box plot types
- Settings for the marker size, line width, number of bins of histogram, color map (from cmocean)
- Save figure as editable PDF
- Code of the plotted graph is available so that it can be reused and modified outside of sviewgui



Part VI

The Matplotlib Developers' Guide

CHAPTER

THIRTYONE

CONTRIBUTING

This project is a community effort, and everyone is welcome to contribute. We follow the Python Software Foundation Code of Conduct in everything we do.

The project is hosted on https://github.com/matplotlib/matplotlib

31.1 Submitting a bug report

If you find a bug in the code or documentation, do not hesitate to submit a ticket to the Bug Tracker. You are also welcome to post feature requests or pull requests.

If you are reporting a bug, please do your best to include the following:

1. A short, top-level summary of the bug. In most cases, this should be 1-2 sentences.
2. A short, self-contained code snippet to reproduce the bug, ideally allowing a simple copy and paste to reproduce. Please do your best to reduce the code snippet to the minimum required.
3. The actual outcome of the code snippet.
4. The expected outcome of the code snippet.
5. The Matplotlib version, Python version and platform that you are using. You can grab the version with the following commands:

```
>>> import matplotlib
>>> matplotlib.__version__
'1.5.3'
>>> import platform
>>> platform.python_version()
'2.7.12'
```

We have preloaded the issue creation page with a Markdown template that you can use to organize this information.

Thank you for your help in keeping bug reports complete, targeted and descriptive.

31.2 Retrieving and installing the latest version of the code

When developing Matplotlib, sources must be downloaded, built, and installed into a local environment on your machine.

We use Git for version control and GitHub for hosting our main repository.

You can check out the latest sources with the command (see *Set up your fork* for more details):

```
git clone https://github.com/matplotlib/matplotlib.git
```

and navigate to the `matplotlib` directory. If you have the proper privileges, you can use `git@` instead of `https://`, which works through the ssh protocol and might be easier to use if you are using 2-factor authentication.

31.2.1 Installing Matplotlib in developer mode

It is strongly recommended to set up a clean virtual environment. Do not use on a preexisting environment!

A new environment can be set up with

```
python3 -mvenv /path/to/devel/env
```

and activated with one of the following:

```
source /path/to/devel/env/bin/activate  # Linux/macOS
/path/to/devel/env/Scripts/activate.bat  # Windows cmd.exe
/path/to/devel/env/Scripts/Activate.ps1  # Windows PowerShell
```

Whenever you plan to work on Matplotlib, remember to activate the development environment in your shell!

To install Matplotlib (and compile the C-extensions) run the following command from the top-level directory

```
python -mpip install -ve .
```

This installs Matplotlib in 'editable/develop mode', i.e., builds everything and places the correct link entries in the install directory so that python will be able to import Matplotlib from the source directory. Thus, any changes to the `*.py` files will be reflected the next time you import the library. If you change the C-extension source (which might happen if you change branches) you will need to run

```
python setup.py build_ext --inplace
```

or re-run `python -mpip install -ve .`.

You can then run the tests to check your work environment is set up properly:

```
python -mpytest
```

Note: **Additional dependencies for testing**: pytest (version 3.6 or later), Ghostscript, Inkscape

- *Developer's tips for testing*

31.3 Contributing code

31.3.1 How to contribute

The preferred way to contribute to Matplotlib is to fork the main repository on GitHub, then submit a "pull request" (PR).

The best practices for using GitHub to make PRs to Matplotlib are documented in the *Development workflow* section.

A brief overview is:

1. Create an account on GitHub if you do not already have one.
2. Fork the project repository: click on the 'Fork' button near the top of the page. This creates a copy of the code under your account on the GitHub server.
3. Clone this copy to your local disk:

   ```
   $ git clone https://github.com/YourLogin/matplotlib.git
   ```

4. Create a branch to hold your changes:

   ```
   $ git checkout -b my-feature origin/master
   ```

   and start making changes. Never work in the `master` branch!

5. Work on this copy, on your computer, using Git to do the version control. When you're done editing e.g., `lib/matplotlib/collections.py`, do:

   ```
   $ git add lib/matplotlib/collections.py
   $ git commit
   ```

   to record your changes in Git, then push them to GitHub with:

   ```
   $ git push -u origin my-feature
   ```

Finally, go to the web page of your fork of the Matplotlib repo, and click 'Pull request' to send your changes to the maintainers for review. You may want to consider sending an email to the mailing list for more visibility.

- *Working with Matplotlib source code*

31.3.2 Contributing pull requests

It is recommended to check that your contribution complies with the following rules before submitting a pull request:

- If your pull request addresses an issue, please use the title to describe the issue and mention the issue number in the pull request description to ensure that a link is created to the original issue.
- All public methods should have informative docstrings with sample usage when appropriate. Use the numpy docstring standard.
- Formatting should follow the recommendations of PEP8. You should consider installing/enabling automatic PEP8 checking in your editor. Part of the test suite is checking PEP8 compliance, things go smoother if the code is mostly PEP8 compliant to begin with.
- Each high-level plotting function should have a simple example in the `Example` section of the docstring. This should be as simple as possible to demonstrate the method. More complex examples should go in the `examples` tree.
- Changes (both new features and bugfixes) should be tested. See *Developer's tips for testing* for more details.
- Import the following modules using the standard scipy conventions:

```
import numpy as np
import numpy.ma as ma
import matplotlib as mpl
import matplotlib.pyplot as plt
import matplotlib.cbook as cbook
import matplotlib.patches as mpatches
```

  In general, Matplotlib modules should **not** import *rcParams* using `from matplotlib import rcParams`, but rather access it as `mpl.rcParams`. This is because some modules are imported very early, before the *rcParams* singleton is constructed.
- If your change is a major new feature, add an entry to the `What's new` section by adding a new file in `doc/users/next_whats_new` (see `doc/users/next_whats_new/README.rst` for more information).

- If you change the API in a backward-incompatible way, please document it in `doc/api/api_changes`, by adding to the relevant file (see `doc/api/api_changes.rst` for more information)
- See below for additional points about *Keyword argument processing*, if applicable for your pull request.

In addition, you can check for common programming errors with the following tools:

- Code with a good unittest coverage (at least 70%, better 100%), check with:

```
python -mpip install coverage
python -mpytest --cov=matplotlib --showlocals -v
```

- No pyflakes warnings, check with:

```
python -mpip install pyflakes
pyflakes path/to/module.py
```

Note: The current state of the Matplotlib code base is not compliant with all of those guidelines, but we expect that enforcing those constraints on all new contributions will move the overall code base quality in the right direction.

See also:

- *Coding guidelines*
- *Developer's tips for testing*
- *Writing documentation*

31.3.3 Issues for New Contributors

New contributors should look for the following tags when looking for issues. We strongly recommend that new contributors tackle issues labeled good first issue as they are easy, well documented issues, that do not require an understanding of the different submodules of Matplotlib. This helps the contributor become familiar with the contribution workflow, and for the core devs to become acquainted with the contributor; besides which, we frequently underestimate how easy an issue is to solve!

31.4 Contributing documentation

Code is not the only way to contribute to Matplotlib. For instance, documentation is also a very important part of the project and often doesn't get as much attention as it deserves. If you find a typo in the documentation, or have made improvements, do not hesitate to send an email to the mailing list or submit a GitHub pull request. To make a pull request, refer to the guidelines outlined in *How to contribute*.

Full documentation can be found under the `doc/`, `tutorials/`, and `examples/` directories.

See also:

- *Writing documentation*

31.5 Other ways to contribute

It also helps us if you spread the word: reference the project from your blog and articles or link to it from your website! If Matplotlib contributes to a project that leads to a scientific publication, please follow the *Citing Matplotlib* guidelines.

31.6 Coding guidelines

31.6.1 API changes

Changes to the public API must follow a standard deprecation procedure to prevent unexpected breaking of code that uses Matplotlib.

- Deprecations must be announced via an entry in the most recent `doc/api/api_changes_X.Y`
- Deprecations are targeted at the next point-release (i.e. 3.x.0).
- The deprecated API should, to the maximum extent possible, remain fully functional during the deprecation period. In cases where this is not possible, the deprecation must never make a given piece of code do something different than it was before; at least an exception should be raised.
- If possible, usage of an deprecated API should emit a *`MatplotlibDeprecationWarning`*. There are a number of helper tools for this:
  - Use `cbook.warn_deprecated()` for general deprecation warnings.
  - Use the decorator `@cbook.deprecated` to deprecate classes, functions, methods, or properties.
  - To warn on changes of the function signature, use the decorators `@cbook._delete_parameter`, `@cbook._rename_parameter`, and `@cbook._make_keyword_only`.

- Deprecated API may be removed two point-releases after they were deprecated.

31.6.2 Adding new API

Every new function, parameter and attribute that is not explicitly marked as private (i.e., starts with an underscore) becomes part of Matplotlib's public API. As discussed above, changing the existing API is cumbersome. Therefore, take particular care when adding new API:

- Mark helper functions and internal attributes as private by prefixing them with an underscore.
- Carefully think about good names for your functions and variables.
- Try to adopt patterns and naming conventions from existing parts of the Matplotlib API.
- Consider making as many arguments keyword-only as possible. See also API Evolution the Right Way -- Add Parameters Compatibly.

31.6.3 New modules and files: installation

- If you have added new files or directories, or reorganized existing ones, make sure the new files are included in the match patterns in `MANIFEST.in`, and/or in *package_data* in `setup.py`.

31.6.4 C/C++ extensions

- Extensions may be written in C or C++.
- Code style should conform to PEP7 (understanding that PEP7 doesn't address C++, but most of its admonitions still apply).
- Python/C interface code should be kept separate from the core C/C++ code. The interface code should be named `FOO_wrap.cpp` or `FOO_wrapper.cpp`.
- Header file documentation (aka docstrings) should be in Numpydoc format. We don't plan on using automated tools for these docstrings, and the Numpydoc format is well understood in the scientific Python community.

31.6.5 Keyword argument processing

Matplotlib makes extensive use of `**kwargs` for pass-through customizations from one function to another. A typical example is in *matplotlib.pyplot.text()*. The definition of the pylab text function is a simple pass-through to *matplotlib.axes.Axes.text()*:

```
# in pylab.py
def text(*args, **kwargs):
    ret =  gca().text(*args, **kwargs)
    draw_if_interactive()
    return ret
```

text() in simplified form looks like this, i.e., it just passes all `args` and `kwargs` on to `matplotlib.text.Text.__init__()`:

```
# in axes/_axes.py
def text(self, x, y, s, fontdict=None, withdash=False, **kwargs):
    t = Text(x=x, y=y, text=s, **kwargs)
```

and `__init__()` (again with liberties for illustration) just passes them on to the *matplotlib.artist.Artist.update()* method:

```
# in text.py
def __init__(self, x=0, y=0, text='', **kwargs):
    Artist.__init__(self)
    self.update(kwargs)
```

`update` does the work looking for methods named like `set_property` if `property` is a keyword argument. i.e., no one looks at the keywords, they just get passed through the API to the artist constructor which looks for suitably named methods and calls them with the value.

As a general rule, the use of `**kwargs` should be reserved for pass-through keyword arguments, as in the example above. If all the keyword args are to be used in the function, and not passed on, use the key/value keyword args in the function definition rather than the `**kwargs` idiom.

In some cases, you may want to consume some keys in the local function, and let others pass through. Instead of popping arguments to use off `**kwargs`, specify them as keyword-only arguments to the local function. This makes it obvious at a glance which arguments will be consumed in the function. For example, in *plot()*, `scalex` and `scaley` are local arguments and the rest are passed on as *Line2D()* keyword arguments:

```
# in axes/_axes.py
def plot(self, *args, scalex=True, scaley=True, **kwargs):
    lines = []
    for line in self._get_lines(*args, **kwargs):
        self.add_line(line)
        lines.append(line)
```

31.6.6 Using logging for debug messages

Matplotlib uses the standard python `logging` library to write verbose warnings, information, and debug messages. Please use it! In all those places you write `print()` statements to do your debugging, try using `log.debug()` instead!

To include `logging` in your module, at the top of the module, you need to `import logging`. Then calls in your code like:

```
_log = logging.getLogger(__name__)  # right after the imports

# code
# more code
_log.info('Here is some information')
_log.debug('Here is some more detailed information')
```

will log to a logger named `matplotlib.yourmodulename`.

If an end-user of Matplotlib sets up `logging` to display at levels more verbose than `logging.WARNING` in their code with the Matplotlib-provided helper:

```
plt.set_loglevel("debug")
```

or manually with

```
import logging
logging.basicConfig(level=logging.DEBUG)
import matplotlib.pyplot as plt
```

Then they will receive messages like:

```
DEBUG:matplotlib.backends:backend MacOSX version unknown
DEBUG:matplotlib.yourmodulename:Here is some information
DEBUG:matplotlib.yourmodulename:Here is some more detailed information
```

Which logging level to use?

There are five levels at which you can emit messages.

- `logging.critical` and `logging.error` are really only there for errors that will end the use of the library but not kill the interpreter.
- `logging.warning` and `cbook._warn_external` are used to warn the user, see below.
- `logging.info` is for information that the user may want to know if the program behaves oddly. They are not displayed by default. For instance, if an object isn't drawn because its position is `NaN`, that can usually be ignored, but a mystified user could call `logging.basicConfig(level=logging.INFO)` and get an error message that says why.

- `logging.debug` is the least likely to be displayed, and hence can be the most verbose. "Expected" code paths (e.g., reporting normal intermediate steps of layouting or rendering) should only log at this level.

By default, `logging` displays all log messages at levels higher than `logging.WARNING` to `sys.stderr`.

The logging tutorial suggests that the difference between `logging.warning` and `cbook._warn_external` (which uses `warnings.warn`) is that `cbook._warn_external` should be used for things the user must change to stop the warning (typically in the source), whereas `logging.warning` can be more persistent. Moreover, note that `cbook._warn_external` will by default only emit a given warning *once* for each line of user code, whereas `logging.warning` will display the message every time it is called.

By default, `warnings.warn` displays the line of code that has the `warn` call. This usually isn't more informative than the warning message itself. Therefore, Matplotlib uses `cbook._warn_external` which uses `warnings.warn`, but goes up the stack and displays the first line of code outside of Matplotlib. For example, for the module:

```
# in my_matplotlib_module.py
import warnings

def set_range(bottom, top):
    if bottom == top:
        warnings.warn('Attempting to set identical bottom==top')
```

running the script:

```
from matplotlib import my_matplotlib_module
my_matplotlib_module.set_range(0, 0)  #set range
```

will display:

```
UserWarning: Attempting to set identical bottom==top
warnings.warn('Attempting to set identical bottom==top')
```

Modifying the module to use `cbook._warn_external`:

```
from matplotlib import cbook

def set_range(bottom, top):
    if bottom == top:
        cbook._warn_external('Attempting to set identical bottom==top')
```

and running the same script will display:

```
UserWarning: Attempting to set identical bottom==top
my_matplotlib_module.set_range(0, 0)  #set range
```

31.6.7 Writing examples

We have hundreds of examples in subdirectories of `matplotlib/examples`, and these are automatically generated when the website is built to show up in the `examples` section of the website.

Any sample data that the example uses should be kept small and distributed with Matplotlib in the `lib/matplotlib/mpl-data/sample_data/` directory. Then in your example code you can load it into a file handle with:

```
import matplotlib.cbook as cbook
fh = cbook.get_sample_data('mydata.dat')
```

CHAPTER

THIRTYTWO

DEVELOPER'S TIPS FOR TESTING

Matplotlib's testing infrastructure depends on pytest. The tests are in `lib/matplotlib/tests`, and customizations to the pytest testing infrastructure are in *matplotlib.testing*.

32.1 Requirements

Install the latest version of Matplotlib as documented in *Retrieving and installing the latest version of the code*.

The following software is required to run the tests:

- pytest (>=3.6)
- Ghostscript (>= 9.0, to render PDF files)
- Inkscape (to render SVG files)

Optionally you can install:

- pytest-cov (>=2.3.1) to collect coverage information
- pytest-flake8 to test coding standards using flake8
- pytest-timeout to limit runtime in case of stuck tests
- pytest-xdist to run tests in parallel

32.2 Running the tests

Running the tests is simple. Make sure you have pytest installed and run:

```
pytest
```

in the root directory of the repository.

pytest can be configured via a lot of command-line parameters. Some particularly useful ones are:

`-v` or `--verbose`	Be more verbose
`-n NUM`	Run tests in parallel over NUM processes (requires pytest-xdist)
`--timeout=SECONDS`	Set timeout for results from each test process (requires pytest-timeout)
`--capture=no` or `-s`	Do not capture stdout
`--flake8`	Check coding standards using flake8 (requires pytest-flake8)

To run a single test from the command line, you can provide a file path, optionally followed by the function separated by two colons, e.g., (tests do not need to be installed, but Matplotlib should be):

```
pytest lib/matplotlib/tests/test_simplification.py::test_clipping
```

or, if tests are installed, a dot-separated path to the module, optionally followed by the function separated by two colons, such as:

```
pytest --pyargs matplotlib.tests.test_simplification::test_clipping
```

If you want to run the full test suite, but want to save wall time try running the tests in parallel:

```
pytest --verbose -n 5
```

An alternative implementation that does not look at command line arguments and works from within Python is to run the tests from the Matplotlib library function `matplotlib.test()`:

```
import matplotlib
matplotlib.test()
```

32.3 Writing a simple test

Many elements of Matplotlib can be tested using standard tests. For example, here is a test from `matplotlib.tests.test_basic`:

```
def test_simple():
    """
    very simple example test
    """
    assert 1 + 1 == 2
```

Pytest determines which functions are tests by searching for files whose names begin with `"test_"` and then within those files for functions beginning with `"test"` or classes beginning with `"Test"`.

Some tests have internal side effects that need to be cleaned up after their execution (such as created figures or modified *rcParams*). The pytest fixture `mpl_test_settings()` will automatically clean these up; there is no need to do anything further.

32.4 Random data in tests

Random data is a very convenient way to generate data for examples, however the randomness is problematic for testing (as the tests must be deterministic!). To work around this set the seed in each test. For numpy use:

```
import numpy as np
np.random.seed(19680801)
```

and Python's random number generator:

```
import random
random.seed(19680801)
```

The seed is John Hunter's birthday.

32.5 Writing an image comparison test

Writing an image-based test is only slightly more difficult than a simple test. The main consideration is that you must specify the "baseline", or expected, images in the *image_comparison* decorator. For example, this test generates a single image and automatically tests it:

```
from matplotlib.testing.decorators import image_comparison
import matplotlib.pyplot as plt

@image_comparison(baseline_images=['line_dashes'], remove_text=True,
                  extensions=['png'])
def test_line_dashes():
    fig, ax = plt.subplots()
    ax.plot(range(10), linestyle=(0, (3, 3)), lw=5)
```

The first time this test is run, there will be no baseline image to compare against, so the test will fail. Copy the output images (in this case `result_images/test_lines/test_line_dashes.png`) to the correct subdirectory of `baseline_images` tree in the source directory (in this case `lib/matplotlib/tests/baseline_images/test_lines`). Put this new file under source code revision control (with `git add`). When rerunning the tests, they should now pass.

Baseline images take a lot of space in the Matplotlib repository. An alternative approach for image comparison tests is to use the *check_figures_equal* decorator, which should be used to decorate a function taking two *Figure* parameters and draws the same images on the figures using two different methods (the tested method and the

baseline method). The decorator will arrange for setting up the figures and then collect the drawn results and compare them.

See the documentation of *image_comparison* and *check_figures_equal* for additional information about their use.

32.6 Known failing tests

If you're writing a test, you may mark it as a known failing test with the `pytest.mark.xfail()` decorator. This allows the test to be added to the test suite and run on the buildbots without causing undue alarm. For example, although the following test will fail, it is an expected failure:

```
import pytest

@pytest.mark.xfail
def test_simple_fail():
    '''very simple example test that should fail'''
    assert 1 + 1 == 3
```

Note that the first argument to the `xfail()` decorator is a fail condition, which can be a value such as True, False, or may be a dynamically evaluated expression. If a condition is supplied, then a reason must also be supplied with the `reason='message'` keyword argument.

32.7 Creating a new module in matplotlib.tests

We try to keep the tests categorized by the primary module they are testing. For example, the tests related to the `mathtext.py` module are in `test_mathtext.py`.

32.8 Using Travis CI

Travis CI is a hosted CI system "in the cloud".

Travis is configured to receive notifications of new commits to GitHub repos (via GitHub "service hooks") and to run builds or tests when it sees these new commits. It looks for a YAML file called `.travis.yml` in the root of the repository to see how to test the project.

Travis CI is already enabled for the main Matplotlib GitHub repository -- for example, see its Travis page.

If you want to enable Travis CI for your personal Matplotlib GitHub repo, simply enable the repo to use Travis CI in either the Travis CI UI or the GitHub UI (Admin | Service Hooks). For details, see the Travis CI Getting Started page. This generally

isn't necessary, since any pull request submitted against the main Matplotlib repository will be tested.

Once this is configured, you can see the Travis CI results at https://travis-ci.org/your_GitHub_user_name/matplotlib -- here's an example.

32.9 Using tox

Tox is a tool for running tests against multiple Python environments, including multiple versions of Python (e.g., 3.6, 3.7) and even different Python implementations altogether (e.g., CPython, PyPy, Jython, etc.), as long as all these versions are available on your system's $PATH (consider using your system package manager, e.g. apt-get, yum, or Homebrew, to install them).

tox makes it easy to determine if your working copy introduced any regressions before submitting a pull request. Here's how to use it:

```
$ pip install tox
$ tox
```

You can also run tox on a subset of environments:

```
$ tox -e py36,py37
```

Tox processes everything serially so it can take a long time to test several environments. To speed it up, you might try using a new, parallelized version of tox called `detox`. Give this a try:

```
$ pip install -U -i http://pypi.testrun.org detox
$ detox
```

Tox is configured using a file called `tox.ini`. You may need to edit this file if you want to add new environments to test (e.g., `py33`) or if you want to tweak the dependencies or the way the tests are run. For more info on the `tox.ini` file, see the Tox Configuration Specification.

32.10 Building old versions of Matplotlib

When running a `git bisect` to see which commit introduced a certain bug, you may (rarely) need to build very old versions of Matplotlib. The following constraints need to be taken into account:

- Matplotlib 1.3 (or earlier) requires numpy 1.8 (or earlier).

CHAPTER

THIRTYTHREE

WRITING DOCUMENTATION

Contents

33.1 Getting started

33.1.1 General file structure

All documentation is built from the `doc/`, `tutorials/`, and `examples/` directories. The `doc/` directory contains configuration files for Sphinx and reStructuredText (ReST; `.rst`) files that are rendered to documentation pages.

The main entry point is `doc/index.rst`, which pulls in the `index.rst` file for the users guide (`doc/users`), developers guide (`doc/devel`), api reference (`doc/api`), and FAQs (`doc/faq`). The documentation suite is built as a single document in order to make the most effective use of cross referencing.

Sphinx also creates `.rst` files that are staged in `doc/api` from the docstrings of the classes in the Matplotlib library. Except for `doc/api/api_changes/`, these `.rst` files are created when the documentation is built.

Similarly, the contents of `doc/gallery` and `doc/tutorials` are generated by the Sphinx Gallery from the sources in `examples/` and `tutorials/`. These sources consist of python scripts that have ReST documentation built into their comments.

Note: Don't directly edit the `.rst` files in `doc/gallery`, `doc/tutorials`, and `doc/api` (excepting `doc/api/api_changes/`). Sphinx regenerates files in these directories when building documentation.

33.1.2 Installing dependencies

The documentation for Matplotlib is generated from reStructuredText (ReST) using the Sphinx documentation generation tool. To build the documentation you will need to (1) set up an appropriate Python environment and (2) separately install LaTeX and Graphviz.

To (1) set up an appropriate Python environment for building the documentation, you should:

- create a clean virtual environment with no existing Matplotlib installation
- install the Python packages required for Matplotlib
- install the additional Python packages required to build the documentation

There are several extra python packages that are needed to build the documentation. They are listed in `doc-requirements.txt`, which is shown below:

```
# Requirements for building docs
#
# You will first need a matching Matplotlib installation
# e.g (from the Matplotlib root directory)
#     pip install -e .
#
# Install the documentation requirements with:
#     pip install -r requirements/doc/doc-requirements.txt
#
sphinx>=1.8.1,!=2.0.0
colorspacious
ipython
ipywidgets
numpydoc>=0.8
sphinxcontrib-svg2pdfconverter>=1.1.0
sphinx-gallery>=0.7
sphinx-copybutton
scipy
```

To (2) set up LaTeX and Graphviz dependencies you should:

- install a minimal working LaTeX distribution
- install the LaTeX packages cm-super and dvipng
- install Graphviz

Note: The documentation will not build without LaTeX and Graphviz. These are not Python packages and must be installed separately.

33.1.3 Building the docs

The documentation sources are found in the `doc/` directory in the trunk. The configuration file for Sphinx is `doc/conf.py`. It controls which directories Sphinx parses, how the docs are built, and how the extensions are used. To build the documentation in html format, cd into `doc/` and run:

```
make html
```

Other useful invocations include

```
# Delete built files.  May help if you get errors about missing paths or
# broken links.
make clean

# Build pdf docs.
make latexpdf
```

The `SPHINXOPTS` variable is set to `-W --keep-going` by default to build the complete docs but exit with exit status 1 if there are warnings. To unset it, use

```
make SPHINXOPTS= html
```

On Windows the arguments must be at the end of the statement:

```
make html SPHINXOPTS=
```

You can use the `O` variable to set additional options:

- `make O=-j4 html` runs a parallel build with 4 processes.
- `make O=-Dplot_formats=png:100 html` saves figures in low resolution.
- `make O=-Dplot_gallery=0 html` skips the gallery build.

Multiple options can be combined using e.g. `make O='-j4 -Dplot_gallery=0' html`.

On Windows, either use the format shown above or set options as environment variables, e.g.:

```
set O=-W --keep-going -j4
make html
```

33.2 Writing ReST pages

Most documentation is either in the docstring of individual classes and methods, in explicit `.rst` files, or in examples and tutorials. All of these use the ReST syntax. Users should look at the ReST documentation for a full description. But some specific hints and conventions Matplotlib uses are useful for creating documentation.

33.2.1 Formatting and style conventions

It is useful to strive for consistency in the Matplotlib documentation. Here are some formatting and style conventions that are used.

Section name formatting

For everything but top-level chapters, use `Upper lower` for section titles, e.g., `Possible hangups` rather than `Possible Hangups`

Function arguments

Function arguments and keywords within docstrings should be referred to using the `*emphasis*` role. This will keep Matplotlib's documentation consistent with Python's documentation:

```
Here is a description of *argument*
```

Do not use the `` `default role` ``:

```
Do not describe `argument` like this.  As per the next section,
this syntax will (unsuccessfully) attempt to resolve the argument as a
link to a class or method in the library.
```

nor the ``` ``literal`` ``` role:

```
Do not describe ``argument`` like this.
```

33.2.2 Referring to other documents and sections

Sphinx allows internal references between documents.

Documents can be linked with the `:doc:` directive:

```
See the :doc:`/faq/installing_faq`

See the tutorial :doc:`/tutorials/introductory/sample_plots`

See the example :doc:`/gallery/lines_bars_and_markers/simple_plot`
```

will render as:

> See the *Installation*
>
> See the tutorial *Sample plots in Matplotlib*
>
> See the example /gallery/lines_bars_and_markers/simple_plot

Sections can also be given reference names. For instance from the *Installation* link:

```
.. _clean-install:

How to completely remove Matplotlib
===================================

Occasionally, problems with Matplotlib can be solved with a clean...
```

and refer to it using the standard reference syntax:

```
See :ref:`clean-install`
```

will give the following link: *How to completely remove Matplotlib*

To maximize internal consistency in section labeling and references, use hyphen separated, descriptive labels for section references. Keep in mind that contents may be reorganized later, so avoid top level names in references like `user` or `devel` or `faq` unless necessary, because for example the FAQ "what is a backend?" could later become part of the users guide, so the label:

```
.. _what-is-a-backend:
```

is better than:

```
.. _faq-backend:
```

In addition, since underscores are widely used by Sphinx itself, use hyphens to separate words.

33.2.3 Referring to other code

To link to other methods, classes, or modules in Matplotlib you can use back ticks, for example:

```
`matplotlib.collections.LineCollection`
```

generates a link like this: *matplotlib.collections.LineCollection*.

Note: We use the sphinx setting `default_role = 'obj'` so that you don't have to use qualifiers like `:class:`, `:func:`, `:meth:` and the likes.

Often, you don't want to show the full package and module name. As long as the target is unanbigous you can simply leave them out:

```
`.LineCollection`
```

and the link still works: *LineCollection*.

If there are multiple code elements with the same name (e.g. `plot()` is a method in multiple classes), you'll have to extend the definition:

```
`.pyplot.plot` or `.Axes.plot`
```

These will show up as *pyplot.plot* or *Axes.plot*. To still show only the last segment you can add a tilde as prefix:

```
`~.pyplot.plot` or `~.Axes.plot`
```

will render as *plot* or *plot*.

Other packages can also be linked via intersphinx:

```
`numpy.mean`
```

will return this link: numpy.mean. This works for Python, Numpy, Scipy, and Pandas (full list is in `doc/conf.py`). If external linking fails, you can check the full list of referenceable objects with the following commands:

```
python -m sphinx.ext.intersphinx 'https://docs.python.org/3/objects.inv'
python -m sphinx.ext.intersphinx 'https://docs.scipy.org/doc/numpy/objects.inv'
python -m sphinx.ext.intersphinx 'https://docs.scipy.org/doc/scipy/reference/objects.inv'
python -m sphinx.ext.intersphinx 'https://pandas.pydata.org/pandas-docs/stable/objects.
↪inv'
```

33.2.4 Including figures and files

Image files can directly included in pages with the `image::` directive. e.g., `thirdpartypackages/index.rst` displays the images for the third-party packages as static images:

```
.. image:: /_static/toolbar.png
```

as rendered on the page: *Third party packages*.

Files can be included verbatim. For instance the `matplotlibrc` file is important for customizing Matplotlib, and is included verbatim in the tutorial in *Customizing Matplotlib with style sheets and rcParams*:

```
.. literalinclude:: ../../_static/matplotlibrc
```

This is rendered at the bottom of *Customizing Matplotlib with style sheets and rcParams*. Note that this is in a tutorial; see *Writing examples and tutorials* below.

The examples directory is also copied to `doc/gallery` by sphinx-gallery, so plots from the examples directory can be included using

```
.. plot:: gallery/lines_bars_and_markers/simple_plot.py
```

Note that the python script that generates the plot is referred to, rather than any plot that is created. Sphinx-gallery will provide the correct reference when the documentation is built.

33.3 Writing docstrings

Most of the API documentation is written in docstrings. These are comment blocks in source code that explain how the code works.

Note: Some parts of the documentation do not yet conform to the current documentation style. If in doubt, follow the rules given here and not what you may see in the source code. Pull requests updating docstrings to the current style are very welcome.

All new or edited docstrings should conform to the numpydoc docstring guide. Much of the ReST syntax discussed above (*Writing ReST pages*) can be used for links and references. These docstrings eventually populate the `doc/api` directory and form the reference documentation for the library.

33.3.1 Example docstring

An example docstring looks like:

```
def hlines(self, y, xmin, xmax, colors='k', linestyles='solid',
           label='', **kwargs):
    """
    Plot horizontal lines at each *y* from *xmin* to *xmax*.

    Parameters
    ----------
    y : float or array-like
        y-indexes where to plot the lines.

    xmin, xmax : float or array-like
        Respective beginning and end of each line. If scalars are
        provided, all lines will have the same length.

    colors : array-like of colors, default: 'k'

    linestyles : {'solid', 'dashed', 'dashdot', 'dotted'}, default: 'solid'

    label : str, default: ''

    Returns
    -------
    lines : `~matplotlib.collections.LineCollection`

    Other Parameters
    ----------------
    **kwargs : `~matplotlib.collections.LineCollection` properties

    See also
    --------
    vlines : vertical lines
    axhline: horizontal line across the axes
    """
```

See the *hlines* documentation for how this renders.

The Sphinx website also contains plenty of documentation concerning ReST markup and working with Sphinx in general.

33.3.2 Formatting conventions

The basic docstring conventions are covered in the numpydoc docstring guide and the Sphinx documentation. Some Matplotlib-specific formatting conventions to keep in mind:

Quote positions

The quotes for single line docstrings are on the same line (pydocstyle D200):

```
def get_linewidth(self):
    """Return the line width in points."""
```

The quotes for multi-line docstrings are on separate lines (pydocstyle D213):

```
def set_linestyle(self, ls):
"""
Set the linestyle of the line.

[...]
"""
```

Function arguments

Function arguments and keywords within docstrings should be referred to using the `*emphasis*` role. This will keep Matplotlib's documentation consistent with Python's documentation:

```
If *linestyles* is *None*, the default is 'solid'.
```

Do not use the `` `default role` `` or the ``` ``literal`` ``` role:

```
Neither `argument` nor ``argument`` should be used.
```

Quotes for strings

Matplotlib does not have a convention whether to use single-quotes or double-quotes. There is a mixture of both in the current code.

Use simple single or double quotes when giving string values, e.g.

```
If 'tight', try to figure out the tight bbox of the figure.

No ``'extra'`` literal quotes.
```

The use of extra literal quotes around the text is discouraged. While they slightly improve the rendered docs, they are cumbersome to type and difficult to read in plain-text docs.

Parameter type descriptions

The main goal for parameter type descriptions is to be readable and understandable by humans. If the possible types are too complex use a simplification for the type description and explain the type more precisely in the text.

Generally, the numpydoc docstring guide conventions apply. The following rules expand on them where the numpydoc conventions are not specific.

Use `float` for a type that can be any number.

Use `(float, float)` to describe a 2D position. The parentheses should be included to make the tuple-ness more obvious.

Use `array-like` for homogeneous numeric sequences, which could typically be a numpy.array. Dimensionality may be specified using `2D`, `3D`, `n-dimensional`. If you need to have variables denoting the sizes of the dimensions, use capital letters in brackets (`array-like (M, N)`). When referring to them in the text they are easier read and no special formatting is needed.

`float` is the implicit default dtype for array-likes. For other dtypes use `array-like of int`.

Some possible uses:

```
2D array-like
array-like (N)
array-like (M, N)
array-like (M, N, 3)
array-like of int
```

Non-numeric homogeneous sequences are described as lists, e.g.:

```
list of str
list of `.Artist`
```

Referencing types

Generally, the rules from *referring-to-other-code* apply. More specifically:

Use full references `` `~matplotlib.colors.Normalize` `` with an abbreviation tilde in parameter types. While the full name helps the reader of plain text docstrings, the HTML does not need to show the full name as it links to it. Hence, the ~-shortening keeps it more readable.

Use abbreviated links `` `.Normalize` `` in the text.

```
norm : `~matplotlib.colors.Normalize`, optional
     A `.Normalize` instance is used to scale luminance data to 0, 1.
```

Default values

As opposed to the numpydoc guide, parameters need not be marked as *optional* if they have a simple default:

- use `{name} : {type}, default: {val}` when possible.
- use `{name} : {type}, optional` and describe the default in the text if it cannot be explained sufficiently in the recommended manner.

The default value should provide semantic information targeted at a human reader. In simple cases, it restates the value in the function signature. If applicable, units should be added.

```
Prefer:
    interval : int, default: 1000ms
over:
    interval : int, default: 1000
```

If *None* is only used as a sentinel value for "parameter not specified", do not document it as the default. Depending on the context, give the actual default, or mark the parameter as optional if not specifying has no particular effect.

```
Prefer:
    dpi : float, default: :rc:`figure.dpi`
over:
    dpi : float, default: None

Prefer:
    textprops : dict, optional
        Dictionary of keyword parameters to be passed to the
        `~matplotlib.text.Text` instance contained inside TextArea.
over:
    textprops : dict, default: None
        Dictionary of keyword parameters to be passed to the
        `~matplotlib.text.Text` instance contained inside TextArea.
```

`See also` sections

Sphinx automatically links code elements in the definition blocks of `See also` sections. No need to use backticks there:

```
See also
--------
vlines : vertical lines
axhline: horizontal line across the axes
```

Wrapping parameter lists

Long parameter lists should be wrapped using a \ for continuation and starting on the new line without any indent (no indent because pydoc will parse the docstring and strip the line continuation so that indent would result in a lot of whitespace within the line):

```
def add_axes(self, *args, **kwargs):
    """
    ...

    Parameters
    ----------
    projection : {'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', \
'rectilinear'}, optional
        The projection type of the axes.

    ...
    """
```

Alternatively, you can describe the valid parameter values in a dedicated section of the docstring.

rcParams

rcParams can be referenced with the custom `:rc:` role: `:rc:`foo`` yields `rcParams["foo"] = 'default'`, which is a link to the `matplotlibrc` file description.

33.3.3 Setters and getters

Artist properties are implemented using setter and getter methods (because Matplotlib predates the introductions of the `property` decorator in Python). By convention, these setters and getters are named `set_PROPERTYNAME` and `get_PROPERTYNAME`; the list of properties thusly defined on an artist and their values can be listed by the *setp* and *getp* functions.

The Parameters block of property setter methods is parsed to document the accepted values, e.g. the docstring of *Line2D.set_linestyle* starts with

```
def set_linestyle(self, ls):
    """
    Set the linestyle of the line.

    Parameters
    ----------
    ls : {'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
        etc.
    """
```

which results in the following line in the output of `plt.setp(line)` or `plt.setp(line, "linestyle")`:

```
linestyle or ls: {'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
```

In some rare cases (mostly, setters which accept both a single tuple and an unpacked tuple), the accepted values cannot be documented in such a fashion; in that case, they can be documented as an `.. ACCEPTS:` block, e.g. for *axes.Axes.set_xlim*:

```
def set_xlim(self, ...):
    """
    Set the x-axis view limits.

    Parameters
    ----------
    left : float, optional
        The left xlim in data coordinates. Passing *None* leaves the
        limit unchanged.

        The left and right xlims may also be passed as the tuple
        (*left*, *right*) as the first positional argument (or as
        the *left* keyword argument).

        .. ACCEPTS: (bottom: float, top: float)

    right : float, optional
        etc.
    """
```

Note that the leading `..` makes the `.. ACCEPTS:` block a reST comment, hiding it from the rendered docs.

33.3.4 Keyword arguments

Note: The information in this section is being actively discussed by the development team, so use the docstring interpolation only if necessary. This section has been left in place for now because this interpolation is part of the existing documentation.

Since Matplotlib uses a lot of pass-through `kwargs`, e.g., in every function that creates a line (*plot*, *semilogx*, *semilogy*, etc...), it can be difficult for the new user to know which `kwargs` are supported. Matplotlib uses a docstring interpolation scheme to support documentation of every function that takes a `**kwargs`. The requirements are:

1. single point of configuration so changes to the properties don't require multiple docstring edits.
2. as automated as possible so that as properties change, the docs are updated automatically.

The function *matplotlib.artist.kwdoc* and the decorator `matplotlib.docstring.dedent_interpd` facilitate this. They combine Python string interpolation in the docstring with the Matplotlib artist introspection facility that underlies `setp` and `getp`. The `kwdoc` function gives the list of properties as a docstring. In order to use this in another docstring, first update the `matplotlib.docstring.interpd` object, as seen in this example from *matplotlib.lines*:

```
# in lines.py
docstring.interpd.update(Line2D=artist.kwdoc(Line2D))
```

Then in any function accepting *Line2D* pass-through `kwargs`, e.g., *matplotlib.axes.Axes.plot*:

```
# in axes.py
@docstring.dedent_interpd
def plot(self, *args, **kwargs):
    """
    Some stuff omitted

    The kwargs are Line2D properties:
    %(_Line2D_docstr)s

    kwargs scalex and scaley, if defined, are passed on
    to autoscale_view to determine whether the x and y axes are
    autoscaled; default True.  See Axes.autoscale_view for more
    information
    """
```

Note there is a problem for *Artist* `__init__` methods, e.g., *matplotlib.patches.Patch.__init__*, which supports `Patch` `kwargs`, since the artist inspector cannot work until the class is fully defined and we can't modify the `Patch.__init__.__doc__` docstring outside the class definition. There are some some manual hacks in this case, violating the "single entry point" requirement above -- see the `docstring.interpd.update` calls in *matplotlib.patches*.

33.3.5 Inheriting docstrings

If a subclass overrides a method but does not change the semantics, we can reuse the parent docstring for the method of the child class. Python does this automatically, if the subclass method does not have a docstring.

Use a plain comment `# docstring inherited` to denote the intention to reuse the parent docstring. That way we do not accidentally create a docstring in the future:

```
class A:
    def foo():
        """The parent docstring."""
        pass
```

(continues on next page)

(continued from previous page)

```
class B(A):
    def foo():
        # docstring inherited
        pass
```

33.3.6 Adding figures

As above (see *Including figures and files*), figures in the examples gallery can be referenced with a `:plot:` directive pointing to the python script that created the figure. For instance the *legend* docstring references the file `examples/text_labels_and_annotations/legend.py`:

```
"""
...

Examples
--------

.. plot:: gallery/text_labels_and_annotations/legend.py
"""
```

Note that `examples/text_labels_and_annotations/legend.py` has been mapped to `gallery/text_labels_and_annotations/legend.py`, a redirection that may be fixed in future re-organization of the docs.

Plots can also be directly placed inside docstrings. Details are in *matplotlib.sphinxext.plot_directive*. A short example is:

```
"""
...

Examples
--------

.. plot::
   import matplotlib.image as mpimg
   img = mpimg.imread('_static/stinkbug.png')
   imgplot = plt.imshow(img)
"""
```

An advantage of this style over referencing an example script is that the code will also appear in interactive docstrings.

33.4 Writing examples and tutorials

Examples and tutorials are python scripts that are run by Sphinx Gallery to create a gallery of images in the `/doc/gallery` and `/doc/tutorials` directories respectively. To exclude an example from having an plot generated insert "sgskip" somewhere in the filename.

The format of these files is relatively straightforward. Properly formatted comment blocks are treated as ReST text, the code is displayed, and figures are put into the built page.

For instance the example /gallery/lines_bars_and_markers/simple_plot example is generated from `/examples/lines_bars_and_markers/simple_plot.py`, which looks like:

```
"""
===========
Simple Plot
===========

Create a simple plot.
"""
import matplotlib.pyplot as plt
import numpy as np

# Data for plotting
t = np.arange(0.0, 2.0, 0.01)
s = 1 + np.sin(2 * np.pi * t)

# Note that using plt.subplots below is equivalent to using
# fig = plt.figure and then ax = fig.add_subplot(111)
fig, ax = plt.subplots()
ax.plot(t, s)

ax.set(xlabel='time (s)', ylabel='voltage (mV)',
       title='About as simple as it gets, folks')
ax.grid()
plt.show()
```

The first comment block is treated as ReST text. The other comment blocks render as comments in /gallery/lines_bars_and_markers/simple_plot.

Tutorials are made with the exact same mechanism, except they are longer, and typically have more than one comment block (i.e. *Usage Guide*). The first comment block can be the same as the example above. Subsequent blocks of ReST text are delimited by a line of `###` characters:

```
"""
===========
Simple Plot
===========

```

(continues on next page)

(continued from previous page)

```
Create a simple plot.
"""
...
ax.grid()
plt.show()

########################################################################
# Second plot
# ===========
#
# This is a second plot that is very nice

fig, ax = plt.subplots()
ax.plot(np.sin(range(50)))
```

In this way text, code, and figures are output in a "notebook" style.

33.4.1 Order of examples in the gallery

The order of the sections of the *Tutorials* and the gallery, as well as the order of the examples within each section are determined in a two step process from within the `/doc/sphinxext/gallery_order.py`:

- *Explicit order*: This file contains a list of folders for the section order and a list of examples for the subsection order. The order of the items shown in the doc pages is the order those items appear in those lists.
- *Implicit order*: If a folder or example is not in those lists, it will be appended after the explicitly ordered items and all of those additional items will be ordered by pathname (for the sections) or by filename (for the subsections).

As a consequence, if you want to let your example appear in a certain position in the gallery, extend those lists with your example. In case no explicit order is desired or necessary, still make sure to name your example consistently, i.e. use the main function or subject of the example as first word in the filename; e.g. an image example should ideally be named similar to `imshow_mynewexample.py`.

33.5 Miscellaneous

33.5.1 Adding animations

Animations are scraped automatically by Sphinx-gallery. If this is not desired, there is also a Matplotlib Google/Gmail account with username `mplgithub` which was used to setup the github account but can be used for other purposes, like hosting Google docs or Youtube videos. You can embed a Matplotlib animation in the docs by first saving the animation as a movie using *matplotlib.animation.Animation.save()*, and

then uploading to Matplotlib's Youtube channel and inserting the embedding string youtube provides like:

```
.. raw:: html

   <iframe width="420" height="315"
     src="http://www.youtube.com/embed/32cjc6V0OZY"
     frameborder="0" allowfullscreen>
   </iframe>
```

An example save command to generate a movie looks like this

```
ani = animation.FuncAnimation(fig, animate, np.arange(1, len(y)),
    interval=25, blit=True, init_func=init)

ani.save('double_pendulum.mp4', fps=15)
```

Contact Michael Droettboom for the login password to upload youtube videos of google docs to the mplgithub account.

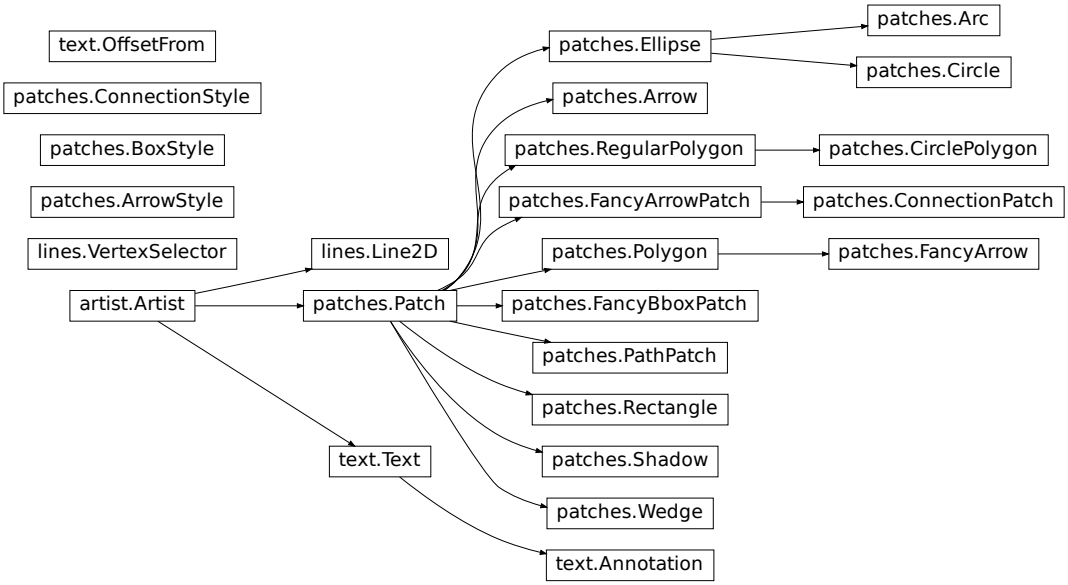
33.5.2 Generating inheritance diagrams

Class inheritance diagrams can be generated with the `inheritance-diagram` directive. To use it, provide the directive with a number of class or module names (separated by whitespace). If a module name is provided, all classes in that module will be used. All of the ancestors of these classes will be included in the inheritance diagram.

A single option is available: *parts* controls how many of parts in the path to the class are shown. For example, if *parts* == 1, the class `matplotlib.patches.Patch` is shown as `Patch`. If *parts* == 2, it is shown as `patches.Patch`. If *parts* == 0, the full path is shown.

Example:

```
.. inheritance-diagram:: matplotlib.patches matplotlib.lines matplotlib.text
   :parts: 2
```



33.5.3 Emacs helpers

There is an emacs mode rst.el which automates many important ReST tasks like building and updating table-of-contents, and promoting or demoting section headings. Here is the basic `.emacs` configuration:

```
(require 'rst)
(setq auto-mode-alist
      (append '(("\\.txt$" . rst-mode)
                ("\\.rst$" . rst-mode)
                ("\\.rest$" . rst-mode)) auto-mode-alist))
```

Some helpful functions:

```
C-c TAB - rst-toc-insert

  Insert table of contents at point

C-c C-u - rst-toc-update

    Update the table of contents at point

C-c C-l rst-shift-region-left

    Shift region to the left
```

(continues on next page)

(continued from previous page)

```
C-c C-r rst-shift-region-right

    Shift region to the right
```

CHAPTER

THIRTYFOUR

DEVELOPER'S GUIDE FOR CREATING SCALES AND TRANSFORMATIONS

Matplotlib supports the addition of custom procedures that transform the data before it is displayed.

There is an important distinction between two kinds of transformations. Separable transformations, working on a single dimension, are called "scales", and non-separable transformations, that handle data in two or more dimensions at a time, are called "projections".

From the user's perspective, the scale of a plot can be set with *Axes.set_xscale* and *Axes.set_yscale*. Projections can be chosen using the *projection* keyword argument of functions that create Axes, such as *pyplot.subplot* or *pyplot.axes*, e.g.

```
plt.subplot(projection="custom")
```

This document is intended for developers and advanced users who need to create new scales and projections for Matplotlib. The necessary code for scales and projections can be included anywhere: directly within a plot script, in third-party code, or in the Matplotlib source tree itself.

34.1 Creating a new scale

Adding a new scale consists of defining a subclass of *matplotlib.scale.ScaleBase*, that includes the following elements:

- A transformation from data coordinates into display coordinates.
- An inverse of that transformation. This is used, for example, to convert mouse positions from screen space back into data space.
- A function to limit the range of the axis to acceptable values (`limit_range_for_scale()`). A log scale, for instance, would prevent the range from including values less than or equal to zero.
- Locators (major and minor) that determine where to place ticks in the plot, and optionally, how to adjust the limits of the plot to some "good" values. Unlike

`limit_range_for_scale()`, which is always enforced, the range setting here is only used when automatically setting the range of the plot.

- Formatters (major and minor) that specify how the tick labels should be drawn.

Once the class is defined, it must be registered with Matplotlib so that the user can select it.

A full-fledged and heavily annotated example is in /gallery/scales/custom_scale. There are also some classes in *matplotlib.scale* that may be used as starting points.

34.2 Creating a new projection

Adding a new projection consists of defining a projection axes which subclasses *matplotlib.axes.Axes* and includes the following elements:

- A transformation from data coordinates into display coordinates.
- An inverse of that transformation. This is used, for example, to convert mouse positions from screen space back into data space.
- Transformations for the gridlines, ticks and ticklabels. Custom projections will often need to place these elements in special locations, and Matplotlib has a facility to help with doing so.
- Setting up default values (overriding *cla()*), since the defaults for a rectilinear axes may not be appropriate.
- Defining the shape of the axes, for example, an elliptical axes, that will be used to draw the background of the plot and for clipping any data elements.
- Defining custom locators and formatters for the projection. For example, in a geographic projection, it may be more convenient to display the grid in degrees, even if the data is in radians.
- Set up interactive panning and zooming. This is left as an "advanced" feature left to the reader, but there is an example of this for polar plots in *matplotlib.projections.polar*.
- Any additional methods for additional convenience or features.

Once the projection axes is defined, it can be used in one of two ways:

- By defining the class attribute `name`, the projection axes can be registered with *matplotlib.projections.register_projection()* and subsequently simply invoked by name:

```
plt.axes(projection='my_proj_name')
```

- For more complex, parameterisable projections, a generic "projection" object may be defined which includes the method `_as_mpl_axes`. `_as_mpl_axes` should take no arguments and return the projection's axes subclass and a dictionary of

additional arguments to pass to the subclass' `__init__` method. Subsequently a parameterised projection can be initialised with:

```
plt.axes(projection=MyProjection(param1=param1_value))
```

where MyProjection is an object which implements a `_as_mpl_axes` method.

A full-fledged and heavily annotated example is in /gallery/misc/custom_projection. The polar plot functionality in *matplotlib.projections.polar* may also be of interest.

34.3 API documentation

- *matplotlib.scale*
- *matplotlib.projections*
- *matplotlib.projections.polar*

CHAPTER

THIRTYFIVE

WORKING WITH *MATPLOTLIB* SOURCE CODE

Contents:

35.1 Introduction

These pages describe a git and github workflow for the Matplotlib project.

There are several different workflows here, for different ways of working with *Matplotlib*.

This is not a comprehensive git reference, it's just a workflow for our own project. It's tailored to the github hosting service. You may well find better or quicker ways of getting stuff done with git, but these should get you started.

For general resources for learning git, see *git resources*.

35.2 Install git

35.2.1 Overview

Debian / Ubuntu	`sudo apt-get install git`
Fedora	`sudo yum install git`
Windows	Download and install msysGit
OS X	Use the git-osx-installer

35.2.2 In detail

See the git page for the most recent information.

Have a look at the github install help pages available from github help

There are good instructions here: https://git-scm.com/book/en/v2/Getting-Started-Installing-Git

35.3 Following the latest source

These are the instructions if you just want to follow the latest *Matplotlib* source, but you don't need to do any development for now.

The steps are:

- *Install git*
- get local copy of the Matplotlib github git repository
- update local copy from time to time

35.3.1 Get the local copy of the code

From the command line:

```
git clone git://github.com/matplotlib/matplotlib.git
```

You now have a copy of the code tree in the new `matplotlib` directory.

35.3.2 Updating the code

From time to time you may want to pull down the latest code. Do this with:

```
cd matplotlib
git pull
```

The tree in `matplotlib` will now have the latest changes from the initial repository.

35.4 Making a patch

You've discovered a bug or something else you want to change in Matplotlib .. — excellent!

You've worked out a way to fix it — even better!

You want to tell us about it — best of all!

The easiest way is to make a *patch* or set of patches. Here we explain how. Making a patch is the simplest and quickest, but if you're going to be doing anything more than simple quick things, please consider following the *Git for development* model instead.

35.4.1 Making patches

Overview

```
# tell git who you are
git config --global user.email you@yourdomain.example.com
git config --global user.name "Your Name Comes Here"
# get the repository if you don't have it
git clone git://github.com/matplotlib/matplotlib.git
# make a branch for your patching
cd matplotlib
git branch the-fix-im-thinking-of
git checkout the-fix-im-thinking-of
# hack, hack, hack
# Tell git about any new files you've made
git add somewhere/tests/test_my_bug.py
# commit work in progress as you go
git commit -am 'BF - added tests for Funny bug'
# hack hack, hack
git commit -am 'BF - added fix for Funny bug'
# make the patch files
git format-patch -M -C master
```

Then, send the generated patch files to the Matplotlib mailing list — where we will thank you warmly.

In detail

1. Tell git who you are so it can label the commits you've made:

```
git config --global user.email you@yourdomain.example.com
git config --global user.name "Your Name Comes Here"
```

2. If you don't already have one, clone a copy of the Matplotlib repository:

```
git clone git://github.com/matplotlib/matplotlib.git
cd matplotlib
```

3. Make a 'feature branch'. This will be where you work on your bug fix. It's nice and safe and leaves you with access to an unmodified copy of the code in the main branch:

```
git branch the-fix-im-thinking-of
git checkout the-fix-im-thinking-of
```

4. Do some edits, and commit them as you go:

```
# hack, hack, hack
# Tell git about any new files you've made
git add somewhere/tests/test_my_bug.py
# commit work in progress as you go
git commit -am 'BF - added tests for Funny bug'
# hack hack, hack
git commit -am 'BF - added fix for Funny bug'
```

   Note the `-am` options to `commit`. The `m` flag just signals that you're going to type a message on the command line. The `a` flag — you can just take on faith — or see why the -a flag?.

5. When you have finished, check you have committed all your changes:

```
git status
```

6. Finally, make your commits into patches. You want all the commits since you branched from the `master` branch:

```
git format-patch -M -C master
```

   You will now have several files named for the commits:

```
0001-BF-added-tests-for-Funny-bug.patch
0002-BF-added-fix-for-Funny-bug.patch
```

   Send these files to the Matplotlib mailing list.

When you are done, to switch back to the main copy of the code, just return to the `master` branch:

```
git checkout master
```

35.4.2 Moving from patching to development

If you find you have done some patches, and you have one or more feature branches, you will probably want to switch to development mode. You can do this with the repository you have.

Fork the Matplotlib repository on github — *Making your own copy (fork) of Matplotlib*. Then:

```
# checkout and refresh master branch from main repo
git checkout master
git pull origin master
# rename pointer to main repository to 'upstream'
git remote rename origin upstream
# point your repo to default read / write to your fork on github
git remote add origin git@github.com:your-user-name/matplotlib.git
# push up any branches you've made and want to keep
git push origin the-fix-im-thinking-of
```

Then you can, if you want, follow the *Development workflow*.

35.5 Git for development

Contents:

35.5.1 Making your own copy (fork) of Matplotlib

You need to do this only once. The instructions here are very similar to the instructions at https://help.github.com/forking/ — please see that page for more detail. We're repeating some of it here just to give the specifics for the Matplotlib project, and to suggest some default names.

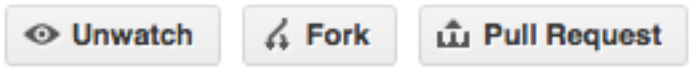
Set up and configure a github account

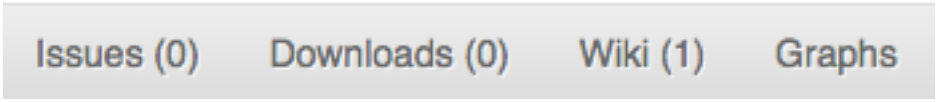
If you don't have a github account, go to the github page, and make one.

You then need to configure your account to allow write access — see the `Generating SSH keys` help on github help.

Create your own forked copy of Matplotlib

1. Log into your github account.
2. Go to the Matplotlib github home at Matplotlib github.
3. Click on the *fork* button:





Now, after a short pause, you should find yourself at the home page for your own forked copy of Matplotlib.

35.5.2 Set up your fork

First you follow the instructions for *Making your own copy (fork) of Matplotlib*.

Overview

```
git clone https://github.com/your-user-name/matplotlib.git
cd matplotlib
git remote add upstream git://github.com/matplotlib/matplotlib.git
```

In detail

Clone your fork

1. Clone your fork to the local computer with `git clone https://github.com/your-user-name/matplotlib.git`
2. Investigate. Change directory to your new repo: `cd matplotlib`. Then `git branch -a` to show you all branches. You'll get something like:

```
* master
remotes/origin/master
```

This tells you that you are currently on the `master` branch, and that you also have a `remote` connection to `origin/master`. What remote repository is `remote/origin`? Try `git remote -v` to see the URLs for the remote. They will point to your github fork.

Now you want to connect to the upstream Matplotlib github repository, so you can merge in changes from trunk.

Linking your repository to the upstream repo

```
cd matplotlib
git remote add upstream git://github.com/matplotlib/matplotlib.git
```

`upstream` here is just the arbitrary name we're using to refer to the main Matplotlib repository at Matplotlib github.

Note that we've used `git://` for the URL rather than `https://` or `git@`. The `git://` URL is read only. This means that we can't accidentally (or deliberately) write to the upstream repo, and we are only going to use it to merge into our own code.

Just for your own satisfaction, show yourself that you now have a new 'remote', with `git remote -v show`, giving you something like:

```
upstream     git://github.com/matplotlib/matplotlib.git (fetch)
upstream     git://github.com/matplotlib/matplotlib.git (push)
origin       https://github.com/your-user-name/matplotlib.git (fetch)
origin       https://github.com/your-user-name/matplotlib.git (push)
```

35.5.3 Configure git

Overview

Your personal git configurations are saved in the `.gitconfig` file in your home directory.

Here is an example `.gitconfig` file:

```
[user]
        name = Your Name
        email = you@yourdomain.example.com

[alias]
        ci = commit -a
        co = checkout
        st = status
        stat = status
        br = branch
        wdiff = diff --color-words

[core]
        editor = vim

[merge]
        summary = true
```

You can check what is already in your config file using the `git config --list` command. You can edit the `.gitconfig` file directly or you can use the `git config --global` command.:

```
git config --global user.name "Your Name"
git config --global user.email you@yourdomain.example.com
git config --global alias.ci "commit -a"
git config --global alias.co checkout
git config --global alias.st "status -a"
git config --global alias.stat "status -a"
git config --global alias.br branch
git config --global alias.wdiff "diff --color-words"
git config --global core.editor vim
git config --global merge.summary true
```

To set up on another computer, you can copy your `~/.gitconfig` file, or run the commands above.

In detail

user.name and user.email

It is good practice to tell git who you are, for labeling any changes you make to the code. The simplest way to do this is from the command line:

```
git config --global user.name "Your Name"
git config --global user.email you@yourdomain.example.com
```

This will write the settings into your git configuration file, which should now contain a user section with your name and email:

```
[user]
      name = Your Name
      email = you@yourdomain.example.com
```

You'll need to replace `Your Name` and `you@yourdomain.example.com` with your actual name and email address.

Aliases

You might well benefit from some aliases to common commands.

For example, you might well want to be able to shorten `git checkout` to `git co`. Or you may want to alias `git diff --color-words` (which gives a nicely formatted output of the diff) to `git wdiff`

The following `git config --global` commands:

```
git config --global alias.ci "commit -a"
git config --global alias.co checkout
git config --global alias.st "status -a"
git config --global alias.stat "status -a"
git config --global alias.br branch
git config --global alias.wdiff "diff --color-words"
```

will create an `alias` section in your `.gitconfig` file with contents like this:

```
[alias]
        ci = commit -a
        co = checkout
        st = status -a
        stat = status -a
        br = branch
        wdiff = diff --color-words
```

Editor

You may also want to make sure that your editor of choice is used

```
git config --global core.editor vim
```

Merging

To enforce summaries when doing merges (`~/.gitconfig` file again):

```
[merge]
   log = true
```

Or from the command line:

```
git config --global merge.log true
```

Fancy log output

This is a very nice alias to get a fancy log output; it should go in the `alias` section of your `.gitconfig` file:

```
lg = log --graph --pretty=format:'%Cred%h%Creset -%C(yellow)%d%Creset %s %Cgreen(%cr)
↪%C(bold blue)[%an]%Creset' --abbrev-commit --date=relative
```

You use the alias with:

```
git lg
```

and it gives graph / text output something like this (but with color!):

```
* 6d8e1ee - (HEAD, origin/my-fancy-feature, my-fancy-feature) NF - a fancy file (45␣
↪minutes ago) [Matthew Brett]
*   d304a73 - (origin/placeholder, placeholder) Merge pull request #48 from hhuuggoo/
↪master (2 weeks ago) [Jonathan Terhorst]
|\
| * 4aff2a8 - fixed bug 35, and added a test in test_bugfixes (2 weeks ago) [Hugo]
|/
* a7ff2e5 - Added notes on discussion/proposal made during Data Array Summit. (2 weeks␣
↪ago) [Corran Webster]
* 68f6752 - Initial implementation of AxisIndexer - uses 'index_by' which needs to be␣
↪changed to a call on an Axes object - this is all very sketchy right now. (2 weeks␣
↪ago) [Corr
*   376adbd - Merge pull request #46 from terhorst/master (2 weeks ago) [Jonathan␣
↪Terhorst]
|\
| * b605216 - updated joshu example to current api (3 weeks ago) [Jonathan Terhorst]
| * 2e991e8 - add testing for outer ufunc (3 weeks ago) [Jonathan Terhorst]
| * 7beda5a - prevent axis from throwing an exception if testing equality with non-axis␣
↪object (3 weeks ago) [Jonathan Terhorst]
| * 65af65e - convert unit testing code to assertions (3 weeks ago) [Jonathan Terhorst]
| *   956fbab - Merge remote-tracking branch 'upstream/master' (3 weeks ago) [Jonathan␣
↪Terhorst]
| |\
| |/
```

Thanks to Yury V. Zaytsev for posting it.

35.5.4 Development workflow

You already have your own forked copy of the Matplotlib repository, by following *Making your own copy (fork) of Matplotlib*. You have *Set up your fork*. You have configured git by following *Configure git*. Now you are ready for some real work.

Workflow summary

In what follows we'll refer to the upstream Matplotlib `master` branch, as "trunk".

- Don't use your `master` branch for anything. Consider deleting it.
- When you are starting a new set of changes, fetch any changes from trunk, and start a new *feature branch* from that.
- Make a new branch for each separable set of changes — "one task, one branch" (ipython git workflow).
- Name your branch for the purpose of the changes - e.g. `bugfix-for-issue-14` or `refactor-database-code`.

- If you can possibly avoid it, avoid merging trunk or any other branches into your feature branch while you are working.
- If you do find yourself merging from trunk, consider *Rebasing on trunk*
- Ask on the Matplotlib mailing list if you get stuck.
- Ask for code review!

This way of working helps to keep work well organized, with readable history. This in turn makes it easier for project maintainers (that might be you) to see what you've done, and why you did it.

See linux git workflow and ipython git workflow for some explanation.

Consider deleting your master branch

It may sound strange, but deleting your own `master` branch can help reduce confusion about which branch you are on. See deleting master on github for details.

Update the mirror of trunk

First make sure you have done *Linking your repository to the upstream repo*.

From time to time you should fetch the upstream (trunk) changes from github:

```
git fetch upstream
```

This will pull down any commits you don't have, and set the remote branches to point to the right commit. For example, 'trunk' is the branch referred to by (remote/branchname) `upstream/master` - and if there have been commits since you last checked, `upstream/master` will change after you do the fetch.

Make a new feature branch

When you are ready to make some changes to the code, you should start a new branch. Branches that are for a collection of related edits are often called 'feature branches'.

Making an new branch for each set of related changes will make it easier for someone reviewing your branch to see what you are doing.

Choose an informative name for the branch to remind yourself and the rest of us what the changes in the branch are for. For example `add-ability-to-fly`, or `buxfix-for-issue-42`.

```
# Update the mirror of trunk
git fetch upstream
# Make new feature branch starting at current trunk
git branch my-new-feature upstream/master
git checkout my-new-feature
```

Generally, you will want to keep your feature branches on your public github fork of Matplotlib. To do this, you git push this new branch up to your github repo. Generally (if you followed the instructions in these pages, and by default), git will have a link to your github repo, called `origin`. You push up to your own repo on github with:

```
git push origin my-new-feature
```

In git >= 1.7 you can ensure that the link is correctly set by using the `--set-upstream` option:

```
git push --set-upstream origin my-new-feature
```

From now on git will know that `my-new-feature` is related to the `my-new-feature` branch in the github repo.

The editing workflow

Overview

```
# hack hack
git add my_new_file
git commit -am 'NF - some message'
git push
```

In more detail

1. Make some changes
2. See which files have changed with `git status` (see git status). You'll see a listing like this one:

   ```
   # On branch ny-new-feature
   # Changed but not updated:
   #   (use "git add <file>..." to update what will be committed)
   #   (use "git checkout -- <file>..." to discard changes in working directory)
   #
   #  modified:   README
   #
   # Untracked files:
   #   (use "git add <file>..." to include in what will be committed)
   #
   #  INSTALL
   no changes added to commit (use "git add" and/or "git commit -a")
   ```

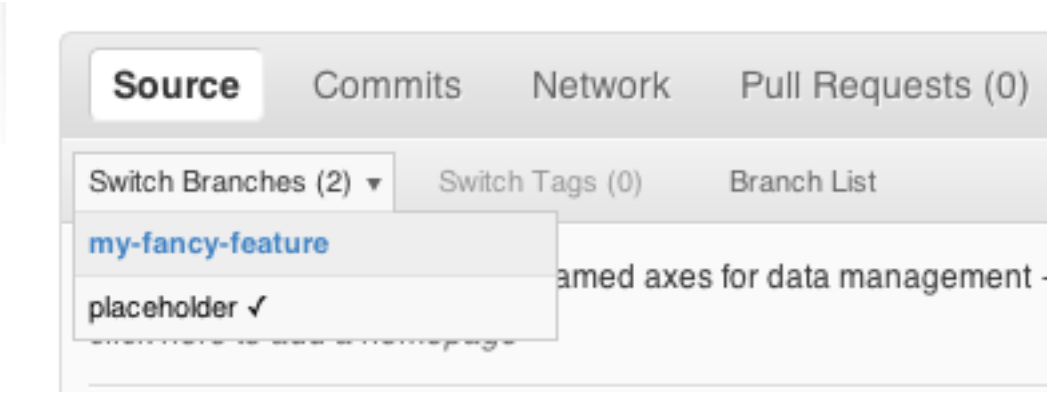
3. Check what the actual changes are with `git diff` (git diff).
4. Add any new files to version control `git add new_file_name` (see git add).

5. To commit all modified files into the local copy of your repo,, do `git commit -am 'A commit message'`. Note the `-am` options to `commit`. The `m` flag just signals that you're going to type a message on the command line. The `a` flag — you can just take on faith — or see why the -a flag? — and the helpful use-case description in the tangled working copy problem. The git commit manual page might also be useful.
6. To push the changes up to your forked repo on github, do a `git push` (see git push).

Ask for your changes to be reviewed or merged

When you are ready to ask for someone to review your code and consider a merge:

1. Go to the URL of your forked repo, say `https://github.com/your-user-name/matplotlib`.
2. Use the 'Switch Branches' dropdown menu near the top left of the page to select the branch with your changes:



3. Click on the 'Pull request' button:

Enter a title for the set of changes, and some explanation of what you've done. Say if there is anything you'd like particular attention for - like a complicated change or some code you are not happy with.

If you don't think your request is ready to be merged, just say so in your pull request message. This is still a good way of getting some preliminary code review.

Some other things you might want to do

Delete a branch on github

```
git checkout master
# delete branch locally
git branch -D my-unwanted-branch
# delete branch on github
git push origin :my-unwanted-branch
```

Note the colon : before `my-unwanted-branch`. See also: https://help.github.com/articles/pushing-to-a-remote/#deleting-a-remote-branch-or-tag

Several people sharing a single repository

If you want to work on some stuff with other people, where you are all committing into the same repository, or even the same branch, then just share it via github.

First fork Matplotlib into your account, as from *Making your own copy (fork) of Matplotlib*.

Then, go to your forked repository github page, say `https://github.com/your-user-name/matplotlib`

Click on the 'Admin' button, and add anyone else to the repo as a collaborator:

Now all those people can do:

```
git clone https://github.com/your-user-name/matplotlib.git
```

Remember that links starting with `https` or `git@` are read-write, and that `git@` uses the ssh protocol; links starting with `git://` are read-only.

Your collaborators can then commit directly into that repo with the usual:

```
git commit -am 'ENH - much better code'
git push origin master # pushes directly into your repo
```

Explore your repository

To see a graphical representation of the repository branches and commits:

```
gitk --all
```

To see a linear list of commits for this branch:

```
git log
```

You can also look at the network graph visualizer for your github repo.

Finally the *Fancy log output* `lg` alias will give you a reasonable text-based graph of the repository.

Rebasing on trunk

Let's say you thought of some work you'd like to do. You *Update the mirror of trunk* and *Make a new feature branch* called `cool-feature`. At this stage trunk is at some commit, let's call it E. Now you make some new commits on your `cool-feature` branch, let's call them A, B, C. Maybe your changes take a while, or you come back to them after a while. In the meantime, trunk has progressed from commit E to commit (say) G:

```
      A---B---C cool-feature
     /
D---E---F---G trunk
```

At this stage you consider merging trunk into your feature branch, and you remember that this here page sternly advises you not to do that, because the history will get messy. Most of the time you can just ask for a review, and not worry that trunk has got a little ahead. But sometimes, the changes in trunk might affect your changes, and you need to harmonize them. In this situation you may prefer to do a rebase.

rebase takes your changes (A, B, C) and replays them as if they had been made to the current state of `trunk`. In other words, in this case, it takes the changes represented by A, B, C and replays them on top of G. After the rebase, your history will look like this:

```
              A'--B'--C' cool-feature
             /
D---E---F---G trunk
```

See rebase without tears for more detail.

To do a rebase on trunk:

```
# Update the mirror of trunk
git fetch upstream
```

(continues on next page)

(continued from previous page)

```
# go to the feature branch
git checkout cool-feature
# make a backup in case you mess up
git branch tmp cool-feature
# rebase cool-feature onto trunk
git rebase --onto upstream/master upstream/master cool-feature
```

In this situation, where you are already on branch `cool-feature`, the last command can be written more succinctly as:

```
git rebase upstream/master
```

When all looks good you can delete your backup branch:

```
git branch -D tmp
```

If it doesn't look good you may need to have a look at *Recovering from mess-ups*.

If you have made changes to files that have also changed in trunk, this may generate merge conflicts that you need to resolve - see the git rebase man page for some instructions at the end of the "Description" section. There is some related help on merging in the git user manual - see resolving a merge.

Recovering from mess-ups

Sometimes, you mess up merges or rebases. Luckily, in git it is relatively straightforward to recover from such mistakes.

If you mess up during a rebase:

```
git rebase --abort
```

If you notice you messed up after the rebase:

```
# reset branch back to the saved point
git reset --hard tmp
```

If you forgot to make a backup branch:

```
# look at the reflog of the branch
git reflog show cool-feature

8630830 cool-feature@{0}: commit: BUG: io: close file handles immediately
278dd2a cool-feature@{1}: rebase finished: refs/heads/my-feature-branch onto␣
↪11ee694744f2552d
26aa21a cool-feature@{2}: commit: BUG: lib: make seek_gzip_factory not leak gzip obj
...

# reset the branch to where it was before the botched rebase
git reset --hard cool-feature@{2}
```

Rewriting commit history

Note: Do this only for your own feature branches.

There's an embarrassing typo in a commit you made? Or perhaps the you made several false starts you would like the posterity not to see.

This can be done via *interactive rebasing*.

Suppose that the commit history looks like this:

```
git log --oneline
eadc391 Fix some remaining bugs
a815645 Modify it so that it works
2dec1ac Fix a few bugs + disable
13d7934 First implementation
6ad92e5 * masked is now an instance of a new object, MaskedConstant
29001ed Add pre-nep for a copule of structured_array_extensions.
...
```

and `6ad92e5` is the last commit in the `cool-feature` branch. Suppose we want to make the following changes:

- Rewrite the commit message for `13d7934` to something more sensible.
- Combine the commits `2dec1ac`, `a815645`, `eadc391` into a single one.

We do as follows:

```
# make a backup of the current state
git branch tmp HEAD
# interactive rebase
git rebase -i 6ad92e5
```

This will open an editor with the following text in it:

```
pick 13d7934 First implementation
pick 2dec1ac Fix a few bugs + disable
pick a815645 Modify it so that it works
pick eadc391 Fix some remaining bugs

# Rebase 6ad92e5..eadc391 onto 6ad92e5
#
# Commands:
#  p, pick = use commit
#  r, reword = use commit, but edit the commit message
#  e, edit = use commit, but stop for amending
#  s, squash = use commit, but meld into previous commit
#  f, fixup = like "squash", but discard this commit's log message
#
# If you remove a line here THAT COMMIT WILL BE LOST.
```

(continues on next page)

(continued from previous page)

```
# However, if you remove everything, the rebase will be aborted.
#
```

To achieve what we want, we will make the following changes to it:

```
r 13d7934 First implementation
pick 2dec1ac Fix a few bugs + disable
f a815645 Modify it so that it works
f eadc391 Fix some remaining bugs
```

This means that (i) we want to edit the commit message for `13d7934`, and (ii) collapse the last three commits into one. Now we save and quit the editor.

Git will then immediately bring up an editor for editing the commit message. After revising it, we get the output:

```
[detached HEAD 721fc64] FOO: First implementation
 2 files changed, 199 insertions(+), 66 deletions(-)
[detached HEAD 0f22701] Fix a few bugs + disable
 1 files changed, 79 insertions(+), 61 deletions(-)
Successfully rebased and updated refs/heads/my-feature-branch.
```

and the history looks now like this:

```
0f22701 Fix a few bugs + disable
721fc64 ENH: Sophisticated feature
6ad92e5 * masked is now an instance of a new object, MaskedConstant
```

If it went wrong, recovery is again possible as explained *above*.

35.5.5 Maintainer workflow

This page is for maintainers — those of us who merge our own or other peoples' changes into the upstream repository.

Being as how you're a maintainer, you are completely on top of the basic stuff in *Development workflow*.

The instructions in *Linking your repository to the upstream repo* add a remote that has read-only access to the upstream repo. Being a maintainer, you've got read-write access.

It's good to have your upstream remote have a scary name, to remind you that it's a read-write remote:

```
git remote add upstream-rw git@github.com:matplotlib/matplotlib.git
git fetch upstream-rw
```

Integrating changes

Let's say you have some changes that need to go into trunk (`upstream-rw/master`).

The changes are in some branch that you are currently on. For example, you are looking at someone's changes like this:

```
git remote add someone git://github.com/someone/matplotlib.git
git fetch someone
git branch cool-feature --track someone/cool-feature
git checkout cool-feature
```

So now you are on the branch with the changes to be incorporated upstream. The rest of this section assumes you are on this branch.

A few commits

If there are only a few commits, consider rebasing to upstream:

```
# Fetch upstream changes
git fetch upstream-rw
# rebase
git rebase upstream-rw/master
```

Remember that, if you do a rebase, and push that, you'll have to close any github pull requests manually, because github will not be able to detect the changes have already been merged.

A long series of commits

If there are a longer series of related commits, consider a merge instead:

```
git fetch upstream-rw
git merge --no-ff upstream-rw/master
```

The merge will be detected by github, and should close any related pull requests automatically.

Note the `--no-ff` above. This forces git to make a merge commit, rather than doing a fast-forward, so that these set of commits branch off trunk then rejoin the main history with a merge, rather than appearing to have been made directly on top of trunk.

Check the history

Now, in either case, you should check that the history is sensible and you have the right commits:

```
git log --oneline --graph
git log -p upstream-rw/master..
```

The first line above just shows the history in a compact way, with a text representation of the history graph. The second line shows the log of commits excluding those that can be reached from trunk (`upstream-rw/master`), and including those that can be reached from current HEAD (implied with the `..` at the end). So, it shows the commits unique to this branch compared to trunk. The `-p` option shows the diff for these commits in patch form.

Push to trunk

```
git push upstream-rw my-new-feature:master
```

This pushes the `my-new-feature` branch in this repository to the `master` branch in the `upstream-rw` repository.

35.6 git resources

35.6.1 Tutorials and summaries

- github help has an excellent series of how-to guides.
- The pro git book is a good in-depth book on git.
- A git cheat sheet is a page giving summaries of common commands.
- The git user manual
- The git tutorial
- The git community book
- git ready — a nice series of tutorials
- git magic — extended introduction with intermediate detail
- The git parable is an easy read explaining the concepts behind git.
- git foundation expands on the git parable.
- Fernando Perez' git page — Fernando's git page — many links and tips
- A good but technical page on git concepts

- git svn crash course: git for those of us used to subversion

35.6.2 Advanced git workflow

There are many ways of working with git; here are some posts on the rules of thumb that other projects have come up with:

- Linus Torvalds on git management
- Linus Torvalds on linux git workflow . Summary; use the git tools to make the history of your edits as clean as possible; merge from upstream edits as little as possible in branches where you are doing active development.

35.6.3 Manual pages online

You can get these on your own machine with (e.g) `git help push` or (same thing) `git push --help`, but, for convenience, here are the online manual pages for some common commands:

- git add
- git branch
- git checkout
- git clone
- git commit
- git config
- git diff
- git log
- git pull
- git push
- git remote
- git status

35.7 Two and three dots in difference specs

Thanks to Yarik Halchenko for this explanation.

Imagine a series of commits A, B, C, D... Imagine that there are two branches, *topic* and *master*. You branched *topic* off *master* when *master* was at commit 'E'. The graph of the commits looks like this:

```
     A---B---C topic
     /
D---E---F---G master
```

Then:

```
git diff master..topic
```

will output the difference from G to C (i.e. with effects of F and G), while:

```
git diff master...topic
```

would output just differences in the topic branch (i.e. only A, B, and C).

CHAPTER

THIRTYSIX

PULL REQUEST GUIDELINES

Pull requests (PRs) are the mechanism for contributing to Matplotlibs code and documentation.

36.1 Summary for PR authors

Note:

- We value contributions from people with all levels of experience. In particular if this is your first PR not everything has to be perfect. We'll guide you through the PR process.
- Nevertheless, try to follow the guidelines below as well as you can to help make the PR process quick and smooth.
- Be patient with reviewers. We try our best to respond quickly, but we have limited bandwidth. If there is no feedback within a couple of days, please ping us by posting a comment to your PR.

When making a PR, pay attention to:

- *Target the master branch*.
- Adhere to the *Coding guidelines*.
- Update the *documentation* if necessary.
- Aim at making the PR as "ready-to-go" as you can. This helps to speed up the review process.
- It is ok to open incomplete or work-in-progress PRs if you need help or feedback from the developers. You may mark these as draft pull requests on GitHub.
- When updating your PR, instead of adding new commits to fix something, please consider amending your initial commit(s) to keep the history clean. You can achieve this using:

```
git commit --amend --no-edit
git push [your-remote-repo] [your-branch] --force-with-lease
```

See also *Contributing* for how to make a PR.

36.2 Summary for PR reviewers

Note:

- If you have commit rights, then you are trusted to use them. **Please help review and merge PRs!**
- Be patient and kind with contributors.

Content topics:

- Is the feature / bugfix reasonable?
- Does the PR conform with the *Coding guidelines*?
- Is the *documentation* (docstrings, examples, what's new, API changes) updated?

Organizational topics:

- Make sure all *automated tests* pass.
- The PR should *target the master branch*.
- Tag with descriptive *labels*.
- Set the *milestone*.
- Keep an eye on the *number of commits*.
- Approve if all of the above topics handled.
- *Merge* if a sufficient number of approvals is reached.

36.3 Detailed Guidelines

36.3.1 Documentation

- Every new feature should be documented. If it's a new module, don't forget to add a new rst file to the API docs.
- Each high-level plotting function should have a small example in the `Examples` section of the docstring. This should be as simple as possible to demonstrate the method. More complex examples should go into a dedicated example file

in the `examples` directory, which will be rendered to the examples gallery in the documentation.

- Build the docs and make sure all formatting warnings are addressed.
- See *Writing documentation* for our documentation style guide.
- If your change is a major new feature, add an entry to `doc/users/whats_new.rst`.
- If you change the API in a backward-incompatible way, please document it in the relevant file in most recent `doc/api/api_changes_X.Y`.

36.3.2 Labels

- If you have the rights to set labels, tag the PR with descriptive labels. See the list of labels.

36.3.3 Milestones

- Set the milestone according to these rules:
  - *New features and API changes* are milestoned for the next minor release `v3.X.0`.
  - *Bugfixes and docstring changes* are milestoned for the next patch release `v3.X.Y`
  - *Documentation changes* (all .rst files and examples) are milestoned `v3.X-doc`

  If multiple rules apply, choose the first matching from the above list.

  Setting a milestone does not imply or guarantee that a PR will be merged for that release, but if it were to be merged what release it would be in.

  All of these PRs should target the master branch. The milestone tag triggers an *automatic backport* for milestones which have a corresponding branch.

36.3.4 Merging

- Documentation and examples may be merged by the first reviewer. Use the threshold "is this better than it was?" as the review criteria.
- For code changes (anything in `src` or `lib`) at least two core developers (those with commit rights) should review all pull requests. If you are the first to review a PR and approve of the changes use the GitHub 'approve review' tool to mark it as such. If you are a subsequent reviewer please approve the review and if you think no more review is needed, merge the PR.

  Ensure that all API changes are documented in the relevant file in the most recent `doc/api/api_changes_X.Y` and significant new features have an entry in `doc/user/whats_new`.

  - If a PR already has a positive review, a core developer (e.g. the first reviewer, but not necessarily) may champion that PR for merging. In order to do so, they should ping all core devs both on GitHub and on the dev mailing list, and label the PR with the "Merge with single review?" label. Other core devs can then either review the PR and merge or reject it, or simply request that it gets a second review before being merged. If no one asks for such a second review within a week, the PR can then be merged on the basis of that single review.

    A core dev should only champion one PR at a time and we should try to keep the flow of championed PRs reasonable.

- Do not self merge, except for 'small' patches to un-break the CI or when another reviewer explicitly allows it (ex, "Approve modulo CI passing, may self merge when green").

36.3.5 Automated tests

Whenever a pull request is created or updated, various automated test tools will run on all supported platforms and versions of Python.

- Make sure the Linting, Travis, AppVeyor, CircleCI, and Azure pipelines are passing before merging (All checks are listed at the bottom of the GitHub page of your pull request). Here are some tips for finding the cause of the test failure:
  - If *Linting* fails, you have a code style issue, which will be listed as annotations on the pull request's diff.
  - If a Travis or AppVeyor run fails, search the log for `FAILURES`. The subsequent section will contain information on the failed tests.
  - If CircleCI fails, likely you have some reStructuredText style issue in the docs. Search the CircleCI log for `WARNING`.
  - If Azure pipelines fail with an image comparison error, you can find the images as *artifacts* of the Azure job:
    * Click *Details* on the check on the GitHub PR page.
    * Click *View more details on Azure Pipelines* to go to Azure.
    * On the overview page *artifacts* are listed in the section *Related*.
- Codecov and LGTM are currently for information only. Their failure is not necessarily a blocker.
- tox is not used in the automated testing. It is supported for testing locally.

36.3.6 Number of commits and squashing

- Squashing is case-by-case. The balance is between burden on the contributor, keeping a relatively clean history, and keeping a history usable for bisecting. The only time we are really strict about it is to eliminate binary files (ex multiple test image re-generations) and to remove upstream merges.
- Do not let perfect be the enemy of the good, particularly for documentation or example PRs. If you find yourself making many small suggestions, either open a PR against the original branch, push changes to the contributor branch, or merge the PR and then open a new PR against upstream.
- If you push to a contributor branch leave a comment explaining what you did, ex "I took the liberty of pushing a small clean-up PR to your branch, thanks for your work.". If you are going to make substantial changes to the code or intent of the PR please check with the contributor first.

36.4 Branches and Backports

36.4.1 Current branches

The current active branches are

master

The current development version. Future minor releases (*v3.N.0*) will be branched from this. Supports Python 3.6+.

v3.N.x

Maintenance branch for Matplotlib 3.N. Future patch releases will be branched from this. Supports Python 3.6+.

v3.N.M-doc

Documentation for the current release. On a patch release, this will be replaced by a properly named branch for the new release.

v2.2.x

Maintenance branch for Matplotlib 2.2 LTS. Supports Python 2.7, 3.4+.

v2.2.N-doc

Documentation for the current release. On a patch release, this will be replaced by a properly named branch for the new release.

36.4.2 Branch selection for pull requests

Generally, all pull requests should target the master branch.

Other branches are fed through *automatic* or *manual*. Directly targeting other branches is only rarely necessary for special maintenance work.

36.4.3 Backport strategy

We will always backport to the patch release branch (*v3.N.x*):

- critical bug fixes (segfault, failure to import, things that the user can not work around)
- fixes for regressions against the last two releases.

Everything else (regressions against older releases, bugs/api inconsistencies the user can work around in their code) are on a case-by-case basis, should be low-risk, and need someone to advocate for and shepherd through the backport.

The only changes to be backported to the documentation branch (*v3.N.M-doc*) are changes to `doc`, `examples`, or `tutorials`. Any changes to `lib` or `src` including docstring-only changes should not be backported to this branch.

36.4.4 Automated backports

We use meeseeksdev bot to automatically backport merges to the correct maintenance branch base on the milestone. To work properly the milestone must be set before merging. If you have commit rights, the bot can also be manually triggered after a merge by leaving a message `@meeseeksdev backport to BRANCH` on the PR. If there are conflicts meeseekdevs will inform you that the backport needs to be done manually.

The target branch is configured by putting `on-merge: backport to TARGETBRANCH` in the milestone description on it's own line.

If the bot is not working as expected, please report issues to Meeseeksdev.

36.4.5 Manual backports

When doing backports please copy the form used by meeseekdev, `Backport PR #XXXX: TITLE OF PR`. If you need to manually resolve conflicts make note of them and how you resolved them in the commit message.

We do a backport from master to v2.2.x assuming:

- `matplotlib` is a read-only remote branch of the matplotlib/matplotlib repo

The TARGET_SHA is the hash of the merge commit you would like to backport. This can be read off of the GitHub PR page (in the UI with the merge notification) or through the git CLI tools.

Assuming that you already have a local branch v2.2.x (if not, then git checkout -b v2.2.x), and that your remote pointing to https://github.com/matplotlib/matplotlib is called upstream:

```
git fetch upstream
git checkout v2.2.x  # or include -b if you don't already have this.
git reset --hard upstream/v2.2.x
git cherry-pick -m 1 TARGET_SHA
# resolve conflicts and commit if required
```

Files with conflicts can be listed by git status, and will have to be fixed by hand (search on >>>>>). Once the conflict is resolved, you will have to re-add the file(s) to the branch and then continue the cherry pick:

```
git add lib/matplotlib/conflicted_file.py
git add lib/matplotlib/conflicted_file2.py
git cherry-pick --continue
```

Use your discretion to push directly to upstream or to open a PR; be sure to push or PR against the v2.2.x upstream branch, not master!

CHAPTER

THIRTYSEVEN

RELEASE GUIDE

This document is only relevant for Matplotlib release managers.

A guide for developers who are doing a Matplotlib release.

Note: This assumes that a read-only remote for the canonical repository is `remote` and a read/write remote is `DANGER`

37.1 All Releases

37.1.1 Testing

We use Travis CI for continuous integration. When preparing for a release, the final tagged commit should be tested locally before it is uploaded:

```
pytest -n 8 .
```

In addition the following test should be run and manually inspected:

```
python tools/memleak.py agg 1000 agg.pdf
```

In addition the following should be run and manually inspected, but is currently broken:

```
pushd examples/tests/
python backend_driver_sgskip.py
popd
```

37.1.2 GitHub Stats

We automatically extract GitHub issue, PRs, and authors from GitHub via the API. Copy the current `doc/users/github_stats.rst` to `doc/users/prev_whats_new/github_stats_X.Y.Z.rst`, changing the link target at the top of the file, and removing the "Previous GitHub Stats" section at the end.

For example, when updating from v3.2.0 to v3.2.1:

```
cp doc/users/github_stats.rst doc/users/prev_whats_new/github_stats_3.2.0.rst
$EDITOR doc/users/prev_whats_new/github_stats_3.2.0.rst
# Change contents as noted above.
git add doc/users/prev_whats_new/github_stats_3.2.0.rst
```

Then re-generate the updated stats:

```
python tools/github_stats.py --since-tag v3.2.0 --milestone=v3.2.1 --project 'matplotlib/
↪matplotlib' --links > doc/users/github_stats.rst
```

Review and commit changes. Some issue/PR titles may not be valid reST (the most common issue is * which is interpreted as unclosed markup).

Note: Make sure you authenticate against the GitHub API. If you do not you will get blocked by GitHub for going over the API rate limits. You can authenticate in one of two ways:

- using the `keyring` package; `pip install keyring` and then when running the stats script, you will be prompted for user name and password, that will be stored in your system keyring, or,
- using a personal access token; generate a new token on this GitHub page with the `repo:public_repo` scope and place the token in `~/.ghoauth`.

37.1.3 Update and Validate the Docs

Merge `*-doc` branch

Merge the most recent 'doc' branch (e.g., `v3.2.0-doc`) into the branch you are going to tag on and delete the doc branch on GitHub.

Update "What's New" and "API changes"

Before tagging major and minor releases, the "what's new" and "API changes" listings should be updated. This is not needed for micro releases.

For the "what's new",

1. copy the current content to a file in `doc/users/prev_whats_new`
2. merge all of the files in `doc/users/next_whats_new/` into `doc/users/whats_new.rst` and delete the individual files
3. comment out the next what's new glob at the top

Similarly for the "API changes",

1. copy the current api changes to a file is `doc/api/prev_api_changes`
2. merge all of the files in the most recent `doc/api/api_changes_X.Y` into `doc/api/api_changes.rst`
3. comment out the most recent API changes at the top.

In both cases step 3 will have to be un-done right after the release.

Verify that docs build

Finally, make sure that the docs build cleanly

```
make -Cdoc O=-j$(nproc) html latexpdf
```

After the docs are built, check that all of the links, internal and external, are still valid. We use `linkchecker` for this, which has not been ported to Python3 yet. You will need to create a Python2 environment with `requests==2.9.0` and linkchecker

```
conda create -p /tmp/lnkchk python=2 requests==2.9.0
source activate /tmp/lnkchk
pip install linkchecker
pushd doc/build/html
linkchecker index.html --check-extern
popd
```

Address any issues which may arise. The internal links are checked on Circle CI, this should only flag failed external links.

37.1.4 Create release commit and tag

To create the tag, first create an empty commit with a very terse set of the release notes in the commit message

```
git commit --allow-empty
```

and then create a signed, annotated tag with the same text in the body message

```
git tag -a -s v2.0.0
```

which will prompt you for your GPG key password and an annotation. For pre releases it is important to follow **PEP 440** so that the build artifacts will sort correctly in PyPI.

To prevent issues with any down-stream builders which download the tarball from GitHub it is important to move all branches away from the commit with the tag[1]:

```
git commit --allow-empty
```

Finally, push the tag to GitHub:

```
git push DANGER master v2.0.0
```

Congratulations, the scariest part is done!

If this is a final release, also create a 'doc' branch (this is not done for pre-releases):

```
git branch v2.0.0-doc
git push DANGER v2.0.0-doc
```

and if this is a major or minor release, also create a bug-fix branch (a micro release will be cut from this branch):

```
git branch v2.0.x
```

On this branch un-comment the globs from *Update and Validate the Docs*. And then

```
git push DANGER v2.0.x
```

[1] The tarball that is provided by GitHub is produced using git archive. We use versioneer which uses a format string in `lib/matplotlib/_version.py` to have `git` insert a list of references to exported commit (see `.gitattributes` for the configuration). This string is then used by `versioneer` to produce the correct version, based on the git tag, when users install from the tarball. However, if there is a branch pointed at the tagged commit, then the branch name will also be included in the tarball. When the branch eventually moves, anyone how checked the hash of the tarball before the branch moved will have an incorrect hash.

To generate the file that GitHub does use

```
git archive v2.0.0 -o matplotlib-2.0.0.tar.gz --prefix=matplotlib-2.0.0/
```

37.1.5 Release Management / DOI

Via the GitHub UI, turn the newly pushed tag into a release. If this is a pre-release remember to mark it as such.

For final releases, also get the DOI from zenodo (which will automatically produce one once the tag is pushed). Add the doi post-fix and version to the dictionary in `tools/cache_zenodo_svg.py` and run the script.

This will download the new svg to the `_static` directory in the docs and edit `doc/citing.rst`. Commit the new svg, the change to `tools/cache_zenodo_svg.py`, and the changes to `doc/citing.rst` to the VER-doc branch and push to GitHub.

```
git checkout v2.0.0-doc
$EDITOR tools/cache_zenodo_svg.py
python tools/cache_zenodo_svg.py
$EDITOR doc/citing.html
git commit -a
git push DANGER v2.0.0-doc:v2.0.0-doc
```

37.1.6 Building binaries

We distribute macOS, Windows, and many Linux wheels as well as a source tarball via PyPI. Most builders should trigger automatically once the tag is pushed to GitHub:

- Mac and manylinux wheels are built on Travis CI. Builds are triggered by the GitHub Action defined in `.github/workflows/wheels.yml`, and wheels will be available at the site defined in the matplotlib-wheels repo.
- Windows wheels are built by Christoph Gohlke automatically and will be available at his site once built.
- The auto-tick bot should open a pull request into the conda-forge feedstock. Review and merge (if you have the power to).

Warning: Because this is automated, it is extremely important to bump all branches away from the tag as discussed in *Create release commit and tag*.

If this is a final release the following downstream packagers should be contacted:

- Debian
- Fedora
- Arch
- Gentoo
- Macports
- Homebrew

- Continuum
- Enthought

This can be done ahead of collecting all of the binaries and uploading to pypi.

37.1.7 Make distribution and upload to PyPI

Once you have collected all of the wheels (expect this to take about a day), generate the tarball

```
git checkout v2.0.0
git clean -xfd
python setup.py sdist
```

and copy all of the wheels into `dist` directory. First, check that the dist files are OK

```
twine check dist/*
```

and then use `twine` to upload all of the files to pypi

```
twine upload -s dist/matplotlib*tar.gz
twine upload dist/*whl
```

Congratulations, you have now done the second scariest part!

37.1.8 Build and Deploy Documentation

To build the documentation you must have the tagged version installed, but build the docs from the `ver-doc` branch. An easy way to arrange this is:

```
pip install matplotlib
pip install -r requirements/doc/doc-requirements.txt
git checkout v2.0.0-doc
git clean -xfd
make -Cdoc O=-j$(nproc) html latexpdf LATEXMKOPTS="-silent -f"
```

which will build both the html and pdf version of the documentation.

The built documentation exists in the matplotlib.github.com repository. Pushing changes to master automatically updates the website.

The documentation is organized by version. At the root of the tree is always the documentation for the latest stable release. Under that, there are directories containing the documentation for older versions. The documentation for current master is built on Circle CI and pushed to the devdocs repository. These are available at matplotlib.org/devdocs.

Assuming you have this repository checked out in the same directory as matplotlib

```
cd ../matplotlib.github.com
mkdir 2.0.0
rsync -a ../matplotlib/doc/build/html/* 2.0.0
cp ../matplotlib/doc/build/latex/Matplotlib.pdf 2.0.0
```

which will copy the built docs over. If this is a final release, also replace the top-level docs

```
rsync -a 2.0.0/* ./
```

You will need to manually edit `versions.html` to show the last 3 tagged versions. Now commit and push everything to GitHub

```
git add *
git commit -a -m 'Updating docs for v2.0.0'
git push DANGER master
```

Congratulations you have now done the third scariest part!

If you have access, clear the Cloudflare caches.

It typically takes about 5-10 minutes for GitHub to process the push and update the live web page (remember to clear your browser cache).

37.1.9 Announcing

The final step is to announce the release to the world. A short version of the release notes along with acknowledgments should be sent to

- matplotlib-users@python.org
- matplotlib-devel@python.org
- matplotlib-announce@python.org

For final releases announcements should also be sent to the numpy/scipy/scikit-image mailing lists.

In addition, announcements should be made on social networks (twitter via the `@matplotlib` account, any other via personal accounts). NumFOCUS should be contacted for inclusion in their newsletter.

CHAPTER

THIRTYEIGHT

MINIMUM VERSION OF DEPENDENCIES POLICY

For the purpose of this document, 'minor version' is in the sense of SemVer (major, minor, patch) and includes both major and minor releases. For projects that use date-based versioning, every release is a 'minor version'.

Matplotlib follows NEP 29.

38.1 Python and NumPy

Matplotlib supports:

- All minor versions of Python released 42 months prior to the project, and at minimum the two latest minor versions.
- All minor versions of `numpy` released in the 24 months prior to the project, and at minimum the last three minor versions.

In `setup.py`, the `python_requires` variable should be set to the minimum supported version of Python. All supported minor versions of Python should be in the test matrix and have binary artifacts built for the release.

Minimum Python and NumPy version support should be adjusted upward on every major and minor release, but never on a patch release.

See also the *List of dependency versions*.

38.2 Python Dependencies

For Python dependencies we should support at least:

with compiled extensions

minor versions initially released in the 24 months prior to our planned release date or the oldest that support our minimum Python + NumPy

without complied extensions

minor versions initially released in the 12 months prior to our planned release date or the oldest that supports our minimum Python.

We will only bump these dependencies as we need new features or the old versions no longer support our minimum NumPy or Python.

38.3 Test and Documentation Dependencies

As these packages are only needed for testing or building the docs and not needed by end-users, we can be more aggressive about dropping support for old versions. However, we need to be careful to not over-run what down-stream packagers support (as most of the run the tests and build the documentation as part of the packaging process).

We will support at least minor versions of the development dependencies released in the 12 months prior to our planned release.

We will only bump these as needed or versions no longer support our minimum Python and numpy.

38.4 System and C-dependencies

For system or C-dependencies (FreeType, GUI frameworks, LaTeX, Ghostscript, FFmpeg) support as old as practical. These can be difficult to install for end-users and we want to be usable on as many systems as possible. We will bump these on a case-by-case basis.

38.5 List of dependency versions

The following list shows the minimal versions of Python and NumPy dependencies for different versions of Matplotlib. Follow the links for the full specification of the dependencies.

Matplotlib	Python	NumPy
3.3	3.6	1.15.0
3.2	3.6	1.11.0
3.1	3.6	1.11.0

CHAPTER

THIRTYNINE

MATPLOTLIB ENHANCEMENT PROPOSALS

Matplotlib Enhancement Proposals (MEP), inspired by cpython's PEP's but less formal, are design documents for large or controversial changes to Matplotilb. These documents should provide a discussion of both why and how the changes should be made.

To create a new MEP open a pull request (PR) adding a file based on *the template* to this the MEP directory. For the initial PR only a rough description is required and it should be merged quickly. Further detailed discussion can happen in follow on PRs.

39.1 MEP Template

This MEP template is a guideline of the sections that a MEP should contain. Extra sections may be added if appropriate, and unnecessary sections may be noted as such.

39.1.1 Status

MEPs go through a number of phases in their lifetime:

- **Discussion**: The MEP is being actively discussed on the mailing list and it is being improved by its author. The mailing list discussion of the MEP should include the MEP number (MEPxxx) in the subject line so they can be easily related to the MEP.
- **Progress**: Consensus was reached and implementation work has begun.
- **Completed**: The implementation has been merged into master.
- **Superseded**: This MEP has been abandoned in favor of another approach.
- **Rejected**: There are currently no plans to implement the proposal.

39.1.2 Branches and Pull requests

All development branches containing work on this MEP should be linked to from here.

All pull requests submitted relating to this MEP should be linked to from here. (A MEP does not need to be implemented in a single pull request if it makes sense to implement it in discrete phases).

39.1.3 Abstract

The abstract should be a short description of what the MEP will achieve.

39.1.4 Detailed description

This section describes the need for the MEP. It should describe the existing problem that it is trying to solve and why this MEP makes the situation better. It should include examples of how the new functionality would be used and perhaps some use cases.

39.1.5 Implementation

This section lists the major steps required to implement the MEP. Where possible, it should be noted where one step is dependent on another, and which steps may be optionally omitted. Where it makes sense, each step should include a link related pull requests as the implementation progresses.

39.1.6 Backward compatibility

This section describes the ways in which the MEP breaks backward incompatibility.

39.1.7 Alternatives

If there were any alternative solutions to solving the same problem, they should be discussed here, along with a justification for the chosen approach.

39.2 MEP8: PEP8

39.2.1 Status

Completed

We are currently enforcing a sub-set of pep8 on new code contributions.

39.2.2 Branches and Pull requests

None so far.

39.2.3 Abstract

The matplotlib codebase predates PEP8, and therefore is less than consistent style-wise in some areas. Bringing the codebase into compliance with PEP8 would go a long way to improving its legibility.

39.2.4 Detailed description

Some files use four space indentation, some use three. Some use different levels in the same file.

For the most part, class/function/variable naming follows PEP8, but it wouldn't hurt to fix where necessary.

39.2.5 Implementation

The implementation should be fairly mechanical: running the pep8 tool over the code and fixing where appropriate.

This should be merged in after the 2.0 release, since the changes will likely make merging any pending pull requests more difficult.

Additionally, and optionally, PEP8 compliance could be tracked by an automated build system.

39.2.6 Backward compatibility

Public names of classes and functions that require change (there shouldn't be many of these) should first be deprecated and then removed in the next release cycle.

39.2.7 Alternatives

PEP8 is a popular standard for Python code style, blessed by the Python core developers, making any alternatives less desirable.

39.3 MEP9: Global interaction manager

Add a global manager for all user interactivity with artists; make any artist resizeable, moveable, highlightable, and selectable as desired by the user.

39.3.1 Status

Discussion

39.3.2 Branches and Pull requests

https://github.com/dhyams/matplotlib/tree/MEP9

39.3.3 Abstract

The goal is to be able to interact with matplotlib artists in a very similar way as drawing programs do. When appropriate, the user should be able to move, resize, or select an artist that is already on the canvas. Of course, the script writer is ultimately in control of whether an artist is able to be interacted with, or whether it is static.

This code to do this has already been privately implemented and tested, and would need to be migrated from its current "mixin" implementation, to a bona-fide part of matplotlib.

The end result would be to have four new keywords available to matplotlib.artist.Artist: _moveable_, _resizeable_, _selectable_, and _highlightable_. Setting any one of these keywords to True would activate interactivity for that artist.

In effect, this MEP is a logical extension of event handling in matplotlib; matplotlib already supports "low level" interactions like left mouse presses, a key press, or similar. The MEP extends the support to the logical level, where callbacks are performed on the artists when certain interactive gestures from the user are detected.

39.3.4 Detailed description

This new functionality would be used to allow the end-user to better interact with the graph. Many times, a graph is almost what the user wants, but a small repositioning and/or resizing of components is necessary. Rather than force the user to go back to the script to trial-and-error the location, and simple drag and drop would be appropriate.

Also, this would better support applications that use matplotlib; here, the end-user has no reasonable access or desire to edit the underlying source in order to fine-tune a plot. Here, if matplotlib offered the capability, one could move or resize artists on the canvas to suit their needs. Also, the user should be able to highlight (with a mouse over) an artist, and select it with a double-click, if the application supports that sort of thing. In this MEP, we also want to support the highlighting and selection natively; it is up to application to handle what happens when the artist is selected. A typical handling would be to display a dialog to edit the properties of the artist.

In the future, as well (this is not part of this MEP), matplotlib could offer backend-specific property dialogs for each artist, which are raised on artist selection. This MEP would be a necessary stepping stone for that sort of capability.

There are currently a few interactive capabilities in matplotlib (e.g. legend.draggable()), but they tend to be scattered and are not available for all artists. This MEP seeks to unify the interactive interface and make it work for all artists.

The current MEP also includes grab handles for resizing artists, and appropriate boxes drawn when artists are moved or resized.

39.3.5 Implementation

- Add appropriate methods to the "tree" of artists so that the interactivity manager has a consistent interface for the interactivity manager to deal with. The proposed methods to add to the artists, if they are to support interactivity, are:
  - get_pixel_position_ll(self): get the pixel position of the lower left corner of the artist's bounding box
  - get_pixel_size(self): get the size of the artist's bounding box, in pixels
  - set_pixel_position_and_size(self,x,y,dx,dy): set the new size of the artist, such that it fits within the specified bounding box.
- add capability to the backends to 1) provide cursors, since these are needed for visual indication of moving/resizing, and 2) provide a function that gets the current mouse position
- Implement the manager. This has already been done privately (by dhyams) as a mixin, and has been tested quite a bit. The goal would be to move the functionality of the manager into the artists so that it is in matplotlib properly, and not as a "monkey patch" as I currently have it coded.

39.3.6 Current summary of the mixin

(Note that this mixin is for now just private code, but can be added to a branch obviously)

InteractiveArtistMixin:

Mixin class to make any generic object that is drawn on a matplotlib canvas moveable and possibly resizeable. The Powerpoint model is followed as closely as possible; not because I'm enamoured with Powerpoint, but because that's what most people understand. An artist can also be selectable, which means that the artist will receive the on_activated() callback when double clicked. Finally, an artist can be highlightable, which means that a highlight is drawn on the artist whenever the mouse passes over. Typically, highlightable artists will also be selectable, but that is left up to the user. So, basically there are four attributes that can be set by the user on a per-artist basis:

- highlightable
- selectable
- moveable
- resizeable

To be moveable (draggable) or resizeable, the object that is the target of the mixin must support the following protocols:

- get_pixel_position_ll(self)
- get_pixel_size(self)
- set_pixel_position_and_size(self,x,y,sx,sy)

Note that nonresizeable objects are free to ignore the sx and sy parameters. To be highlightable, the object that is the target of the mixin must also support the following protocol:

- get_highlight(self)

Which returns a list of artists that will be used to draw the highlight.

If the object that is the target of the mixin is not an matplotlib artist, the following protocols must also be implemented. Doing so is usually fairly trivial, as there has to be an artist *somewhere* that is being drawn. Typically your object would just route these calls to that artist.

- get_figure(self)
- get_axes(self)
- contains(self,event)
- set_animated(self,flag)
- draw(self,renderer)
- get_visible(self)

The following notifications are called on the artist, and the artist can optionally implement these.

- on_select_begin(self)
- on_select_end(self)
- on_drag_begin(self)
- on_drag_end(self)
- on_activated(self)
- on_highlight(self)
- on_right_click(self,event)
- on_left_click(self,event)
- on_middle_click(self,event)
- on_context_click(self,event)
- on_key_up(self,event)
- on_key_down(self,event)

The following notifications are called on the canvas, if no interactive artist handles the event:

- on_press(self,event)
- on_left_click(self,event)
- on_middle_click(self,event)
- on_right_click(self,event)
- on_context_click(self,event)
- on_key_up(self,event)
- on_key_down(self,event)

The following functions, if present, can be used to modify the behavior of the interactive object:

- press_filter(self,event) # determines if the object wants to have the press event routed to it
- handle_unpicked_cursor() # can be used by the object to set a cursor as the cursor passes over the object when it is unpicked.

Supports multiple canvases, maintaining a drag lock, motion notifier, and a global "enabled" flag per canvas. Supports fixed aspect ratio resizings by holding the shift key during the resize.

Known problems:

- Zorder is not obeyed during the selection/drag operations. Because of the blit technique used, I do not believe this can be fixed. The only way I can think of is to search for all artists that have a zorder greater then me, set them all to animated, and then redraw them all on top during each drag refresh. This might be very slow; need to try.
- the mixin only works for wx backends because of two things: 1) the cursors are hardcoded, and 2) there is a call to wx.GetMousePosition() Both of these shortcomings are reasonably fixed by having each backend supply these things.

39.3.7 Backward compatibility

No problems with backward compatibility, although once this is in place, it would be appropriate to obsolete some of the existing interactive functions (like legend.draggable())

39.3.8 Alternatives

None that I know of.

39.4 MEP10: Docstring consistency

39.4.1 Status

Progress

This is still an on-going effort

39.4.2 Branches and Pull requests

39.4.3 Abstract

matplotlib has a great deal of inconsistency between docstrings. This not only makes the docs harder to read, but it is harder on contributors, because they don't know which specifications to follow. There should be a clear docstring convention that is followed consistently.

The organization of the API documentation is difficult to follow. Some pages, such as pyplot and axes, are enormous and hard to browse. There should instead be short summary tables that link to detailed documentation. In addition, some of the docstrings themselves are quite long and contain redundant information.

Building the documentation takes a long time and uses a `make.py` script rather than a Makefile.

39.4.4 Detailed description

There are number of new tools and conventions available since matplotlib started using Sphinx that make life easier. The following is a list of proposed changes to docstrings, most of which involve these new features.

Numpy docstring format

Numpy docstring format: This format divides the docstring into clear sections, each having different parsing rules that make the docstring easy to read both as raw text and as HTML. We could consider alternatives, or invent our own, but this is a strong choice, as it's well used and understood in the Numpy/Scipy community.

Cross references

Most of the docstrings in matplotlib use explicit "roles" when linking to other items, for example: `:func:`myfunction``. As of Sphinx 0.4, there is a "default_role" that can be set to "obj", which will polymorphically link to a Python object of any type. This allows one to write `` `myfunction` `` instead. This makes docstrings much easier to read and edit as raw text. Additionally, Sphinx allows for setting a current module, so links like `` `~matplotlib.axes.Axes.set_xlim` `` could be written as `` `~axes.Axes.set_xlim` ``.

Overriding signatures

Many methods in matplotlib use the `*args` and `**kwargs` syntax to dynamically handle the keyword arguments that are accepted by the function, or to delegate on to another function. This, however, is often not useful as a signature in the documentation. For this reason, many matplotlib methods include something like:

```
def annotate(self, *args, **kwargs):
    """
    Create an annotation: a piece of text referring to a data
    point.

    Call signature::

      annotate(s, xy, xytext=None, xycoords='data',
               textcoords='data', arrowprops=None, **kwargs)
    """
```

This can't be parsed by Sphinx, and is rather verbose in raw text. As of Sphinx 1.1, if the `autodoc_docstring_signature` config value is set to True, Sphinx will extract a replacement signature from the first line of the docstring, allowing this:

```
def annotate(self, *args, **kwargs):
    """
    annotate(s, xy, xytext=None, xycoords='data',
               textcoords='data', arrowprops=None, **kwargs)

    Create an annotation: a piece of text referring to a data
    point.
    """
```

The explicit signature will replace the actual Python one in the generated documentation.

Linking rather than duplicating

Many of the docstrings include long lists of accepted keywords by interpolating things into the docstring at load time. This makes the docstrings very long. Also, since these tables are the same across many docstrings, it inserts a lot of redundant information in the docs -- particularly a problem in the printed version.

These tables should be moved to docstrings on functions whose only purpose is for help. The docstrings that refer to these tables should link to them, rather than including them verbatim.

autosummary extension

The Sphinx autosummary extension should be used to generate summary tables, that link to separate pages of documentation. Some classes that have many methods (e.g. *Axes*) should be documented with one method per page, whereas smaller classes should have all of their methods together.

Examples linking to relevant documentation

The examples, while helpful at illustrating how to use a feature, do not link back to the relevant docstrings. This could be addressed by adding module-level docstrings to the examples, and then including that docstring in the parsed content on the example page. These docstrings could easily include references to any other part of the documentation.

Documentation using help() vs. a browser

Using Sphinx markup in the source allows for good-looking docs in your browser, but the markup also makes the raw text returned using help() look terrible. One of the aims of improving the docstrings should be to make both methods of accessing the docs look good.

39.4.5 Implementation

1. The numpydoc extensions should be turned on for matplotlib. There is an important question as to whether these should be included in the matplotlib source tree, or used as a dependency. Installing Numpy is not sufficient to get the numpydoc extensions -- it's a separate install procedure. In any case, to the extent that they require customization for our needs, we should endeavor to submit those changes upstream and not fork them.
2. Manually go through all of the docstrings and update them to the new format and conventions. Updating the cross references (from `` `:func:`myfunc` `` to `` `func` ``) may be able to be semi-automated. This is a lot of busy work, and perhaps this labor should be divided on a per-module basis so no single developer is over-burdened by it.
3. Reorganize the API docs using autosummary and `sphinx-autogen`. This should hopefully have minimal impact on the narrative documentation.
4. Modify the example page generator (`gen_rst.py`) so that it extracts the module docstring from the example and includes it in a non-literal part of the example page.
5. Use `sphinx-quickstart` to generate a new-style Sphinx Makefile. The following features in the current `make.py` will have to be addressed in some other way:

- Copying of some static content
- Specifying a "small" build (only low-resolution PNG files for examples)

Steps 1, 2, and 3 are interdependent. 4 and 5 may be done independently, though 5 has some dependency on 3.

39.4.6 Backward compatibility

As this mainly involves docstrings, there should be minimal impact on backward compatibility.

39.4.7 Alternatives

None yet discussed.

39.5 MEP11: Third-party dependencies

This MEP attempts to improve the way in which third-party dependencies in matplotlib are handled.

39.5.1 Status

Completed -- needs to be merged

39.5.2 Branches and Pull requests

#1157: Use automatic dependency resolution

#1290: Debundle pyparsing

#1261: Update six to 1.2

39.5.3 Abstract

One of the goals of matplotlib has been to keep it as easy to install as possible. To that end, some third-party dependencies are included in the source tree and, under certain circumstances, installed alongside matplotlib. This MEP aims to resolve some problems with that approach, bring some consistency, while continuing to make installation convenient.

At the time that was initially done, setuptools, easy_install and PyPI were not mature enough to be relied on. However, at present, we should be able to safely leverage the "modern" versions of those tools, distribute and pip.

While matplotlib has dependencies on both Python libraries and C/C++ libraries, this MEP addresses only the Python libraries so as to not confuse the issue. C libraries represent a larger and mostly orthogonal set of problems.

39.5.4 Detailed description

matplotlib depends on the following third-party Python libraries:

- Numpy
- dateutil (pure Python)
- pytz (pure Python)
- six -- required by dateutil (pure Python)
- pyparsing (pure Python)
- PIL (optional)
- GUI frameworks: pygtk, gobject, tkinter, PySide, PyQt4, wx (all optional, but one is required for an interactive GUI)

Current behavior

When installing from source, a `git` checkout or pip:

- `setup.py` attempts to `import numpy`. If this fails, the installation fails.
- For each of dateutil, pytz and six, `setup.py` attempts to import them (from the top-level namespace). If that fails, matplotlib installs its local copy of the library into the top-level namespace.
- pyparsing is always installed inside of the matplotlib namespace.

This behavior is most surprising when used with pip, because no pip dependency resolution is performed, even though it is likely to work for all of these packages.

The fact that pyparsing is installed in the matplotlib namespace has reportedly (#1290) confused some users into thinking it is a matplotlib-related module and import it from there rather than the top-level.

When installing using the Windows installer, dateutil, pytz and six are installed at the top-level *always*, potentially overwriting already installed copies of those libraries.

TODO: Describe behavior with the OS-X installer.

When installing using a package manager (Debian, RedHat, MacPorts etc.), this behavior actually does the right thing, and there are no special patches in the matplotlib packages to deal with the fact that we handle dateutil, pytz and six in this way. However, care should be taken that whatever approach we move to continues to work in that context.

Maintaining these packages in the matplotlib tree and making sure they are up-to-date is a maintenance burden. Advanced new features that may require a third-party pure Python library have a higher barrier to inclusion because of this burden.

Desired behavior

Third-party dependencies are downloaded and installed from their canonical locations by leveraging pip, distribute and PyPI.

dateutil, pytz, and pyparsing should be made into optional dependencies -- though obviously some features would fail if they aren't installed. This will allow the user to decide whether they want to bother installing a particular feature.

39.5.5 Implementation

For installing from source, and assuming the user has all of the C-level compilers and dependencies, this can be accomplished fairly easily using distribute and following the instructions here. The only anticipated change to the matplotlib library code will be to import pyparsing from the top-level namespace rather than from within matplotlib. Note that distribute will also allow us to remove the direct dependency on six, since it is, strictly speaking, only a direct dependency of dateutil.

For binary installations, there are a number of alternatives (here ordered from best/hardest to worst/easiest):

1. The distutils wininst installer allows a post-install script to run. It might be possible to get this script to run pip to install the other dependencies. (See this thread for someone who has trod that ground before).
2. Continue to ship dateutil, pytz, six and pyparsing in our installer, but use the post-install-script to install them *only* if they can not already be found.
3. Move all of these packages inside a (new) `matplotlib.extern` namespace so it is clear for outside users that these are external packages. Add some conditional imports in the core matplotlib codebase so dateutil (at the top-level) is tried first, and failing that `matplotlib.extern.dateutil` is used.

2 and 3 are undesirable as they still require maintaining copies of these packages in our tree -- and this is exacerbated by the fact that they are used less -- only in the binary installers. None of these 3 approaches address Numpy, which will still have to be manually installed using an installer.

TODO: How does this relate to the Mac OS-X installer?

39.5.6 Backward compatibility

At present, matplotlib can be installed from source on a machine without the third party dependencies and without an internet connection. After this change, an internet connection (and a working PyPI) will be required to install matplotlib for the first time. (Subsequent matplotlib updates or development work will run without accessing the network).

39.5.7 Alternatives

Distributing binary eggs doesn't feel like a usable solution. That requires getting easy_install installed first, and Windows users generally prefer the well known `.exe` or `.msi` installer that works out of the box.

39.6 MEP12: Improve Gallery and Examples

39.6.1 Status

Progress

Initial changes added in 1.3. Conversion of the gallery is on-going. 29 September 2015 - The last `pylab_examples` where *`pylab`* is imported has been converted over to use *`matplotlib.pyplot`* and `numpy`.

39.6.2 Branches and Pull requests

#1623, #1924, #2181

PR #2474 demonstrates a single example being cleaned up and moved to the appropriate section.

39.6.3 Abstract

Reorganizing the matplotlib plot gallery would greatly simplify navigation of the gallery. In addition, examples should be cleaned-up and simplified for clarity.

39.6.4 Detailed description

The matplotlib gallery was recently set up to split examples up into sections. As discussed in that PR[1], the current example sections (`api`, `pylab_examples`) aren't terribly useful to users: New sections in the gallery would help users find relevant examples.

These sections would also guide a cleanup of the examples: Initially, all the current examples would remain and be listed under their current directories. Over time, these examples could be cleaned up and moved into one of the new sections.

This process allows users to easily identify examples that need to be cleaned up; i.e. anything in the `api` and `pylab_examples` directories.

39.6.5 Implementation

1. Create new gallery sections. [Done]
2. Clean up examples and move them to the new gallery sections (over the course of many PRs and with the help of many users/developers). [In progress]

Gallery sections

The naming of sections is critical and will guide the clean-up effort. The current sections are:

- Lines, bars, and markers (more-or-less 1D data)
- Shapes and collections
- Statistical plots
- Images, contours, and fields
- Pie and polar charts: Round things
- Color
- Text, labels, and annotations
- Ticks and spines
- Subplots, axes, and figures
- Specialty plots (e.g., sankey, radar, tornado)
- Showcase (plots with tweaks to make them publication-quality)
- separate sections for toolboxes (already exists: 'mplot3d', 'axes_grid', 'units', 'widgets')

These names are certainly up for debate. As these sections grow, we should reevaluate them and split them up as necessary.

[1] https://github.com/matplotlib/matplotlib/pull/714

Clean up guidelines

The current examples in the `api` and `pylab_examples` sections of the gallery would remain in those directories until they are cleaned up. After clean-up, they would be moved to one of the new gallery sections described above. "Clean-up" should involve:

- sphinx-gallery docstrings: a title and a description of the example formatted as follows, at the top of the example:

```
"""
==============================
Colormaps alter your perception
==============================

Here I plot the function

.. math:: f(x, y) = \sin(x) + \cos(y)

with different colormaps. Look at how colormaps alter your perception!
"""
```

- PEP8 clean-ups (running flake8, or a similar checker, is highly recommended)
- Commented-out code should be removed.
- Replace uses of *pylab* interface with *pyplot* (+ `numpy`, etc.). See c25ef1e
- Remove shebang line, e.g.:

  #!/usr/bin/env python

- Use consistent imports. In particular:

  import numpy as np

  import matplotlib.pyplot as plt

  Avoid importing specific functions from these modules (e.g. `from numpy import sin`)

- Each example should focus on a specific feature (excluding `showcase` examples, which will show more "polished" plots). Tweaking unrelated to that feature should be removed. See f7b2217, e57b5fc, and 1458aa8

Use of *pylab* should be demonstrated/discussed on a dedicated help page instead of the gallery examples.

Note: When moving an existing example, you should search for references to that example. For example, the API documentation for `axes.py` and `pyplot.py` may use these examples to generate plots. Use your favorite search tool (e.g., grep, ack, grin, pss) to search the matplotlib package. See 2dc9a46 and aa6b410

Additional suggestions

- Provide links (both ways) between examples and API docs for the methods/objects used. (issue #2222)
- Use `plt.subplots` (note trailing "s") in preference over `plt.subplot`.
- Rename the example to clarify it's purpose. For example, the most basic demo of `imshow` might be `imshow_demo.py`, and one demonstrating different interpolation settings would be `imshow_demo_interpolation.py` (*not* `imshow_demo2.py`).
- Split up examples that try to do too much. See 5099675 and fc2ab07
- Delete examples that don't show anything new.
- Some examples exercise esoteric features for unit testing. These tweaks should be moved out of the gallery to an example in the `unit` directory located in the root directory of the package.
- Add plot titles to clarify intent of the example. See bd2b13c

39.6.6 Backward compatibility

The website for each Matplotlib version is readily accessible, so users who want to refer to old examples can still do so.

39.6.7 Alternatives

Tags

Tagging examples will also help users search the example gallery. Although tags would be a big win for users with specific goals, the plot gallery will remain the entry point to these examples, and sections could really help users navigate the gallery. Thus, tags are complementary to this reorganization.

39.7 MEP13: Use properties for Artists

39.7.1 Status

- **Discussion**

39.7.2 Branches and Pull requests

None

39.7.3 Abstract

Wrap all of the matplotlib getter and setter methods with python properties, allowing them to be read and written like class attributes.

39.7.4 Detailed description

Currently matplotlib uses getter and setter functions (usually prefixed with get_ and set_, respectively) for reading and writing data related to classes. However, since 2.6 python supports properties, which allow such setter and getter functions to be accessed as though they were attributes. This proposal would implement all existing setter and getter methods as properties.

39.7.5 Implementation

1. All existing getter and setter methods will need to have two aliases, one with the get_ or set_ prefix and one without. Getter methods that currently lack prefixes should be recording in a text file.
2. Classes should be reorganized so setter and getter methods are sequential in the code, with getter methods first.

3. Getter and setter methods the provide additional optional optional arguments should have those arguments accessible in another manner, either as additional getter or setter methods or attributes of other classes. If those classes are not accessible, getters for them should be added.
4. Property decorators will be added to the setter and getter methods without the prefix. Those with the prefix will be marked as deprecated.
5. Docstrings will need to be rewritten so the getter with the prefix has the current docstring and the getter without the prefix has a generic docstring appropriate for an attribute.
6. Automatic alias generation will need to be modified so it will also create aliases for the properties.
7. All instances of getter and setter method calls will need to be changed to attribute access.
8. All setter and getter aliases with prefixes will be removed

The following steps can be done simultaneously: 1, 2, and 3; 4 and 5; 6 and 7.

Only the following steps must be done in the same release: 4, 5, and 6. All other changes can be done in separate releases. 8 should be done several major releases after everything else.

39.7.6 Backward compatibility

All existing getter methods that do not have a prefix (such as get_) will need to be changed from function calls to attribute access. In most cases this will only require removing the parenthesis.

setter and getter methods that have additional optional arguments will need to have those arguments implemented in another way, either as a separate property in the same class or as attributes or properties of another class.

Cases where the setter returns a value will need to be changed to using the setter followed by the getter.

Cases where there are set_ATTR_on() and set_ATTR_off() methods will be changed to ATTR_on properties.

39.7.7 Examples

axes.Axes.set_axis_off/set_axis_on

Current implementation:

```
axes.Axes.set_axis_off()
axes.Axes.set_axis_on()
```

New implementation:

```
True = axes.Axes.axis_on
False = axes.Axes.axis_on
axes.Axes.axis_on = True
axes.Axes.axis_on = False
```

axes.Axes.get_xlim/set_xlim and get_autoscalex_on/set_autoscalex_on

Current implementation:

```
[left, right] = axes.Axes.get_xlim()
auto = axes.Axes.get_autoscalex_on()

[left, right] = axes.Axes.set_xlim(left=left, right=right, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(left=left, right=None, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(left=None, right=right, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(left=left, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(right=right, emit=emit, auto=auto)

axes.Axes.set_autoscalex_on(auto)
```

New implementation:

```
[left, right] = axes.Axes.axes_xlim
auto = axes.Axes.autoscalex_on

axes.Axes.axes_xlim = [left, right]
axes.Axes.axes_xlim = [left, None]
axes.Axes.axes_xlim = [None, right]
axes.Axes.axes_xlim[0] = left
axes.Axes.axes_xlim[1] = right

axes.Axes.autoscalex_on = auto

axes.Axes.emit_xlim = emit
```

axes.Axes.get_title/set_title

Current implementation:

```
string = axes.Axes.get_title()
axes.Axes.set_title(string, fontdict=fontdict, **kwargs)
```

New implementation:

```
string = axes.Axes.title
string = axes.Axes.title_text.text

```

(continues on next page)

(continued from previous page)

```
text.Text = axes.Axes.title_text
text.Text.<attribute> = attribute
text.Text.fontdict = fontdict

axes.Axes.title = string
axes.Axes.title = text.Text
axes.Axes.title_text = string
axes.Axes.title_text = text.Text
```

axes.Axes.get_xticklabels/set_xticklabels

Current implementation:

```
[text.Text] = axes.Axes.get_xticklabels()
[text.Text] = axes.Axes.get_xticklabels(minor=False)
[text.Text] = axes.Axes.get_xticklabels(minor=True)
[text.Text] = axes.Axes.([string], fontdict=None, **kwargs)
[text.Text] = axes.Axes.([string], fontdict=None, minor=False, **kwargs)
[text.Text] = axes.Axes.([string], fontdict=None, minor=True, **kwargs)
```

New implementation:

```
[text.Text] = axes.Axes.xticklabels
[text.Text] = axes.Axes.xminorticklabels
axes.Axes.xticklabels = [string]
axes.Axes.xminorticklabels = [string]
axes.Axes.xticklabels = [text.Text]
axes.Axes.xminorticklabels = [text.Text]
```

39.7.8 Alternatives

Instead of using decorators, it is also possible to use the property function. This would change the procedure so that all getter methods that lack a prefix will need to be renamed or removed. This makes handling docstrings more difficult and harder to read.

It is not necessary to deprecate the setter and getter methods, but leaving them in will complicate the code.

This could also serve as an opportunity to rewrite or even remove automatic alias generation.

Another alternate proposal:

Convert `set_xlim`, `set_xlabel`, `set_title`, etc. to `xlim`, `xlabel`, `title`,... to make the transition from `plt` functions to `axes` methods significantly simpler. These would still be methods, not properties, but it's still a great usability enhancement while retaining the interface.

39.8 MEP14: Text handling

39.8.1 Status

- **Discussion**

39.8.2 Branches and Pull requests

Issue #253 demonstrates a bug where using the bounding box rather than the advance width of text results in misaligned text. This is a minor point in the grand scheme of things, but it should be addressed as part of this MEP.

39.8.3 Abstract

By reorganizing how text is handled, this MEP aims to:

- improve support for Unicode and non-ltr languages
- improve text layout (especially multi-line text)
- allow support for more fonts, especially non-Apple-format TrueType fonts and OpenType fonts.
- make the font configuration easier and more transparent

39.8.4 Detailed description

Text layout

At present, matplotlib has two different ways to render text: "built-in" (based on FreeType and our own Python code), and "usetex" (based on calling out to a TeX installation). Adjunct to the "built-in" renderer there is also the Python-based "mathtext" system for rendering mathematical equations using a subset of the TeX language without having a TeX installation available. Support for these two engines in strewn about many source files, including every backend, where one finds clauses like

```
if rcParams['text.usetex']: # do one thing else: # do another
```

Adding a third text rendering approach (more on that later) would require editing all of these places as well, and therefore doesn't scale.

Instead, this MEP proposes adding a concept of "text engines", where the user could select one of many different approaches for rendering text. The implementations of each of these would be localized to their own set of modules, and not have little pieces around the whole source tree.

Why add more text rendering engines? The "built-in" text rendering has a number of shortcomings.

- It only handles right-to-left languages, and doesn't handle many special features of Unicode, such as combining diacriticals.
- The multiline support is imperfect and only supports manual line-breaking -- it can not break up a paragraph into lines of a certain length.
- It also does not handle inline formatting changes in order to support something like Markdown, reStructuredText or HTML. (Though rich-text formatting is contemplated in this MEP, since we want to make sure this design allows it, the specifics of a rich-text formatting implementation is outside of the scope of this MEP.)

Supporting these things is difficult, and is the "full-time job" of a number of other projects:

- pango/harfbuzz
- QtTextLayout
- Microsoft DirectWrite
- Apple Core Text

Of the above options, it should be noted that harfbuzz is designed from the start as a cross platform option with minimal dependencies, so therefore is a good candidate for a single option to support.

Additionally, for supporting rich text, we could consider using WebKit, and possibly whether than represents a good single cross-platform option. Again, however, rich text formatting is outside of the scope of this project.

Rather than trying to reinvent the wheel and add these features to matplotlib's "built-in" text renderer, we should provide a way to leverage these projects to get more powerful text layout. The "built-in" renderer will still need to exist for reasons of ease of installation, but its feature set will be more limited compared to the others. [TODO: This MEP should clearly decide what those limited features are, and fix any bugs to bring the implementation into a state of working correctly in all cases that we want it to work. I know @leejjoon has some thoughts on this.]

Font selection

Going from an abstract description of a font to a file on disk is the task of the font selection algorithm -- it turns out to be much more complicated than it seems at first.

The "built-in" and "usetex" renderers have very different ways of handling font selection, given their different technologies. TeX requires the installation of TeX-specific font packages, for example, and can not use TrueType fonts directly. Unfortunately, despite the different semantics for font selection, the same set of font properties are used for each. This is true of both the *FontProperties* class and the font-related *rcParams* (which basically share the same code underneath). Instead, we should define a core set of font selection parameters that will work across all text engines, and have engine-specific configuration to allow the user to do engine-specific things when required. For example, it is possible to directly select a font by name in the "built-in" using `rcParams["font.family"]` (default: `['sans-serif']`), but the same is not possible with "usetex". It may be possible to make it easier to use TrueType fonts by using XeTeX, but users will still want to use the traditional metafonts through TeX font packages. So the issue still stands that different text engines will need engine-specific configuration, and it should be more obvious to the user which configuration will work across text engines and which are engine-specific.

Note that even excluding "usetex", there are different ways to find fonts. The default is to use the font list cache in *font_manager* which matches fonts using our own algorithm based on the CSS font matching algorithm. It doesn't always do the same thing as the native font selection algorithms on Linux (fontconfig), Mac and Windows, and it doesn't always find all of the fonts on the system that the OS would normally pick up. However, it is cross-platform, and always finds the fonts that ship with matplotlib. The Cairo and MacOSX backends (and presumably a future HTML5-based backend) currently bypass this mechanism and use the OS-native ones. The same is true when not embedding fonts in SVG, PS or PDF files and opening them in a third-party viewer. A downside there is that (at least with Cairo, need to confirm with MacOSX) they don't always find the fonts we ship with matplotlib. (It may be possible to add the fonts to their search path, though, or we may need to find a way to install our fonts to a location the OS expects to find them).

There are also special modes in the PS and PDF to only use the core fonts that are always available to those formats. There, the font lookup mechanism must only match against those fonts. It is unclear whether the OS-native font lookup systems can handle this case.

There is also experimental support for using fontconfig for font selection in matplotlib, turned off by default. fontconfig is the native font selection algorithm on Linux, but is also cross platform and works well on the other platforms (though obviously is an

additional dependency there).

Many of the text layout libraries proposed above (pango, QtTextLayout, DirectWrite and CoreText etc.) insist on using the font selection library from their own ecosystem.

All of the above seems to suggest that we should move away from our self-written font selection algorithm and use the native APIs where possible. That's what Cairo and MacOSX backends already want to use, and it will be a requirement of any complex text layout library. On Linux, we already have the bones of a fontconfig implementation (which could also be accessed through pango). On Windows and Mac we may need to write custom wrappers. The nice thing is that the API for font lookup is relatively small, and essentially consist of "given a dictionary of font properties, give me a matching font file".

Font subsetting

Font subsetting is currently handled using ttconv. ttconv was a standalone commandline utility for converting TrueType fonts to subsetted Type 3 fonts (among other features) written in 1995, which matplotlib (well, I) forked in order to make it work as a library. It only handles Apple-style TrueType fonts, not ones with the Microsoft (or other vendor) encodings. It doesn't handle OpenType fonts at all. This means that even though the STIX fonts come as .otf files, we have to convert them to .ttf files to ship them with matplotlib. The Linux packagers hate this -- they'd rather just depend on the upstream STIX fonts. ttconv has also been shown to have a few bugs that have been difficult to fix over time.

Instead, we should be able to use FreeType to get the font outlines and write our own code (probably in Python) to output subsetted fonts (Type 3 on PS and PDF and paths on SVG). Freetype, as a popular and well-maintained project, handles a wide variety of fonts in the wild. This would remove a lot of custom C code, and remove some code duplication between backends.

Note that subsetting fonts this way, while the easiest route, does lose the hinting in the font, so we will need to continue, as we do now, provide a way to embed the entire font in the file where possible.

Alternative font subsetting options include using the subsetting built-in to Cairo (not clear if it can be used without the rest of Cairo), or using fontforge (which is a heavy and not terribly cross-platform dependency).

Freetype wrappers

Our FreeType wrapper could really use a reworking. It defines its own image buffer class (when a Numpy array would be easier). While FreeType can handle a huge diversity of font files, there are limitations to our wrapper that make it much harder to support non-Apple-vendor TrueType files, and certain features of OpenType files. (See #2088 for a terrible result of this, just to support the fonts that ship with Windows 7 and 8). I think a fresh rewrite of this wrapper would go a long way.

Text anchoring and alignment and rotation

The handling of baselines was changed in 1.3.0 such that the backends are now given the location of the baseline of the text, not the bottom of the text. This is probably

the correct behavior, and the MEP refactoring should also follow this convention.

In order to support alignment on multi-line text, it should be the responsibility of the (proposed) text engine to handle text alignment. For a given chunk of text, each engine calculates a bounding box for that text and the offset of the anchor point within that box. Therefore, if the va of a block was "top", the anchor point would be at the top of the box.

Rotating of text should always be around the anchor point. I'm not sure that lines up with current behavior in matplotlib, but it seems like the sanest/least surprising choice. [This could be revisited once we have something working]. Rotation of text should not be handled by the text engine -- that should be handled by a layer between the text engine and the rendering backend so it can be handled in a uniform way. [I don't see any advantage to rotation being handled by the text engines individually...]

There are other problems with text alignment and anchoring that should be resolved as part of this work. [TODO: enumerate these].

Other minor problems to fix

The mathtext code has backend-specific code -- it should instead provide its output as just another text engine. However, it's still desirable to have mathtext layout inserted as part of a larger layout performed by another text engine, so it should be possible to do this. It's an open question whether embedding the text layout of an arbitrary text engine in another should be possible.

The text mode is currently set by a global rcParam ("text.usetex") so it's either all on or all off. We should continue to have a global rcParam to choose the text engine ("text.layout_engine"), but it should under the hood be an overridable property on the *Text* object, so the same figure can combine the results of multiple text layout engines if necessary.

39.8.5 Implementation

A concept of a "text engine" will be introduced. Each text engine will implement a number of abstract classes. The `TextFont` interface will represent text for a given set of font properties. It isn't necessarily limited to a single font file -- if the layout engine supports rich text, it may handle a number of font files in a family. Given a `TextFont` instance, the user can get a `TextLayout` instance, which represents the layout for a given string of text in a given font. From a `TextLayout`, an iterator over `TextSpans` is returned so the engine can output raw editable text using as few spans as possible. If the engine would rather get individual characters, they can be obtained from the `TextSpan` instance:

```
class TextFont(TextFontBase):
    def __init__(self, font_properties):
        """
        Create a new object for rendering text using the given font properties.
        """
        pass
```

(continues on next page)

(continued from previous page)

```
    def get_layout(self, s, ha, va):
        """
        Get the TextLayout for the given string in the given font and
        the horizontal (left, center, right) and verticalalignment (top,
        center, baseline, bottom)
        """
        pass

class TextLayout(TextLayoutBase):
    def get_metrics(self):
        """
        Return the bounding box of the layout, anchored at (0, 0).
        """
        pass

    def get_spans(self):
        """
        Returns an iterator over the spans of different in the layout.
        This is useful for backends that want to editable raw text as
        individual lines.  For rich text where the font may change,
        each span of different font type will have its own span.
        """
        pass

    def get_image(self):
        """
        Returns a rasterized image of the text.  Useful for raster backends,
        like Agg.

        In all likelihood, this will be overridden in the backend, as it can
        be created from get_layout(), but certain backends may want to
        override it if their library provides it (as freetype does).
        """
        pass

    def get_rectangles(self):
        """
        Returns an iterator over the filled black rectangles in the layout.
        Used by TeX and mathtext for drawing, for example, fraction lines.
        """
        pass

    def get_path(self):
        """
        Returns a single Path object of the entire laid out text.

        [Not strictly necessary, but might be useful for textpath
        functionality]
        """
        pass
```

(continues on next page)

(continued from previous page)

```
class TextSpan(TextSpanBase):
    x, y      # Position of the span -- relative to the text layout as a whole
              # where (0, 0) is the anchor.  y is the baseline of the span.
    fontfile  # The font file to use for the span
    text      # The text content of the span

    def get_path(self):
        pass  # See TextLayout.get_path

    def get_chars(self):
        """
        Returns an iterator over the characters in the span.
        """
        pass

class TextChar(TextCharBase):
    x, y      # Position of the character -- relative to the text layout as
              # a whole, where (0, 0) is the anchor.  y is in the baseline
              # of the character.
    codepoint # The unicode code point of the character -- only for informational
              # purposes, since the mapping of codepoint to glyph_id may have been
              # handled in a complex way by the layout engine.  This is an int
              # to avoid problems on narrow Unicode builds.
    glyph_id  # The index of the glyph within the font
    fontfile  # The font file to use for the char

    def get_path(self):
        """
        Get the path for the character.
        """
pass
```

Graphic backends that want to output subset of fonts would likely build up a file-global dictionary of characters where the keys are (fontname, glyph_id) and the values are the paths so that only one copy of the path for each character will be stored in the file.

Special casing: The "usetex" functionality currently is able to get Postscript directly from TeX to insert directly in a Postscript file, but for other backends, parses a DVI file and generates something more abstract. For a case like this, `TextLayout` would implement `get_spans` for most backends, but add `get_ps` for the Postscript backend, which would look for the presence of this method and use it if available, or fall back to `get_spans`. This kind of special casing may also be necessary, for example, when the graphics backend and text engine belong to the same ecosystem, e.g. Cairo and Pango, or MacOSX and CoreText.

There are three main pieces to the implementation:

1) Rewriting the freetype wrapper, and removing ttconv.

a) Once (1) is done, as a proof of concept, we can move to the upstream STIX .otf

fonts

b) Add support for web fonts loaded from a remote URL. (Enabled by using freetype for font subsetting).

2) Refactoring the existing "builtin" and "usetex" code into separate text engines and to follow the API outlined above.

3) Implementing support for advanced text layout libraries.

(1) and (2) are fairly independent, though having (1) done first will allow (2) to be simpler. (3) is dependent on (1) and (2), but even if it doesn't get done (or is postponed), completing (1) and (2) will make it easier to move forward with improving the "builtin" text engine.

39.8.6 Backward compatibility

The layout of text with respect to its anchor and rotation will change in hopefully small, but improved, ways. The layout of multiline text will be much better, as it will respect horizontal alignment. The layout of bidirectional text or other advanced Unicode features will now work inherently, which may break some things if users are currently using their own workarounds.

Fonts will be selected differently. Hacks that used to sort of work between the "builtin" and "usetex" text rendering engines may no longer work. Fonts found by the OS that weren't previously found by matplotlib may be selected.

39.8.7 Alternatives

TBD

39.9 MEP15 - Fix axis autoscaling when limits are specified for one axis only

39.9.1 Status

Discussion

39.9.2 Branches and Pull requests

None so far.

39.9.3 Abstract

When one axis of a 2-dimensional plot if overridden via *set_xlim* or *set_ylim*, automatic scaling of the remaining axis should be based on the data that falls within the specified limits of the first axis.

39.9.4 Detailed description

When axis limits for a 2-D plot are specified for one axis only (via *set_xlim* or *set_ylim*), matplotlib currently does not currently rescale the other axis. The result is that the displayed curves or symbols may be compressed into a tiny portion of the available area, so that the final plot conveys much less information than it would with appropriate axis scaling.

The proposed change of behavior would make matplotlib choose the scale for the remaining axis using only the data that falls within the limits for the axis where limits were specified.

39.9.5 Implementation

I don't know enough about the internals of matplotlib to be able to suggest an implementation.

39.9.6 Backward compatibility

From the standpoint of software interfaces, there would be no break in backward compatibility. Some outputs would be different, but if the user truly desires the previous behavior, he/she can achieve this by overriding the axis scaling for both axes.

39.9.7 Alternatives

The only alternative that I can see is to maintain the status quo.

39.10 MEP19: Continuous Integration

39.10.1 Status

Completed

39.10.2 Branches and Pull requests

39.10.3 Abstract

matplotlib could benefit from better and more reliable continuous integration, both for testing and building installers and documentation.

39.10.4 Detailed description

Current state-of-the-art

Testing

matplotlib currently uses Travis-CI for automated tests. While Travis-CI should be praised for how much it does as a free service, it has a number of shortcomings:

- It often fails due to network timeouts when installing dependencies.
- It often fails for inexplicable reasons.
- build or test products can only be saved from build off of branches on the main repo, not pull requests, so it is often difficult to "post mortem" analyse what went wrong. This is particularly frustrating when the failure can not be subsequently reproduced locally.
- It is not extremely fast. matplotlib's cpu and memory requirements for testing are much higher than the average Python project.
- It only tests on Ubuntu Linux, and we have only minimal control over the specifics of the platform. It can be upgraded at any time outside of our control, causing unexpected delays at times that may not be convenient in our release schedule.

On the plus side, Travis-CI's integration with github -- automatically testing all pending pull requests -- is exceptional.

Builds

There is no centralized effort for automated binary builds for matplotlib. However, the following disparate things are being done [If the authors mentioned here could fill in detail, that would be great!]:

- @sandrotosi: builds Debian packages
- @takluyver: Has automated Ubuntu builds on Launchpad
- @cgohlke: Makes Windows builds (don't know how automated that is)
- @r-owen: Makes OS-X builds (don't know how automated that is)

Documentation

Documentation of master is now built by travis and uploaded to http://matplotlib.org/devdocs/index.html

@NelleV, I believe, generates the docs automatically and posts them on the web to chart MEP10 progress.

Peculiarities of matplotlib

matplotlib has complex requirements that make testing and building more taxing than many other Python projects.

- The CPU time to run the tests is quite high. It puts us beyond the free accounts of many CI services (e.g. ShiningPanda)
- It has a large number of dependencies, and testing the full matrix of all combinations is impractical. We need to be clever about what space we test and guarantee to support.

Requirements

This section outlines the requirements that we would like to have.

1. Testing all pull requests by hooking into the GitHub API, as Travis-CI does
2. Testing on all major platforms: Linux, Mac OS-X, MS Windows (in that order of priority, based on user survey)
3. Retain the last n days worth of build and test products, to aid in post-mortem debugging.
4. Automated nightly binary builds, so that users can test the bleeding edge without installing a complete compilation environment.
5. Automated benchmarking. It would be nice to have a standard benchmark suite (separate from the tests) whose performance could be tracked over time, in different backends and platforms. While this is separate from building and testing, ideally it would run on the same infrastructure.

6. Automated nightly building and publishing of documentation (or as part of testing, to ensure PRs don't introduce documentation bugs). (This would not replace the static documentation for stable releases as a default).
7. The test systems should be manageable by multiple developers, so that no single person becomes a bottleneck. (Travis-CI's design does this well -- storing build configuration in the git repository, rather than elsewhere, is a very good design.)
8. Make it easy to test a large but sparse matrix of different versions of matplotlib's dependencies. The matplotlib user survey provides some good data as to where to focus our efforts: https://docs.google.com/spreadsheet/ccc?key=0AjrPjlTMRTwTdHpQS25pcTZIRWdqX0pNckNSU01sMHc
9. Nice to have: A decentralized design so that those with more obscure platforms can publish build results to a central dashboard.

39.10.5 Implementation

This part is yet-to-be-written.

However, ideally, the implementation would be a third-party service, to avoid adding system administration to our already stretched time. As we have some donated funds, this service may be a paid one if it offers significant time-saving advantages over free offerings.

39.10.6 Backward compatibility

Backward compatibility is not a major concern for this MEP. We will replace current tools and procedures with something better and throw out the old.

39.10.7 Alternatives

39.10.8 Hangout Notes

CI Infrastructure

- We like Travis and it will probably remain part of our arsenal in any event. The reliability issues are being looked into.
- Enable Amazon S3 uploads of testing products on Travis. This will help with post-mortem of failures (@mdboom is looking into this now).
- We want Mac coverage. The best bet is probably to push Travis to enable it for our project by paying them for a Pro account (since they don't otherwise allow testing on both Linux and Mac).
- We want Windows coverage. Shining Panda is an option there.

- Investigate finding or building a tool that would collect and synthesize test results from a number of sources and post it to GitHub using the GitHub API. This may be of general use to the Scipy community.
- For both Windows and Mac, we should document (or better yet, script) the process of setting up the machine for a build, and how to build binaries and installers. This may require getting information from Russel Owen and Christoph Gohlke. This is a necessary step for doing automated builds, but would also be valuable for a number of other reasons.

The test framework itself

- We should investigate ways to make it take less time
  - Eliminating redundant tests, if possible
  - General performance improvements to matplotlib will help
- We should be covering more things, particularly more backends
- We should have more unit tests, fewer integration tests, if possible

39.11 MEP21: color and cm refactor

39.11.1 Status

- **Discussion**: This MEP has not commenced yet, but here are some ongoing ideas which may become a part of this MEP:

39.11.2 Branches and Pull requests

39.11.3 Abstract

- color
  - tidy up the namespace
  - Define a "Color" class
  - make it easy to convert from one color type to another `` `hex -> RGB` ``, `` `RGB -> hex` ``, `` `HSV -> RGB` `` etc.
  - improve the construction of a colormap - the dictionary approach is archaic and overly complex (though incredibly powerful)
  - make it possible to interpolate between two or more color types in different modes, especially useful for construction of colormaps in HSV space for instance
- cm
  - rename the module to something more descriptive - mappables?

Overall, there are a lot of improvements that can be made with matplotlib color handling - managing backwards compatibility will be difficult as there are some badly named variables/modules which really shouldn't exist - but a clear path and message for migration should be available, with a large amount of focus on this in the API changes documentation.

- Navigation by events: https://github.com/matplotlib/matplotlib/pull/3652

39.12.3 Abstract

The main goal of this MEP is to make it easier to modify (add, change, remove) the way the user interacts with the figures.

The user interaction with the figure is deeply integrated within the Canvas and Toolbar. Making extremely difficult to do any modification.

This MEP proposes the separation of this interaction into Toolbar, Navigation and Tools to provide independent access and reconfiguration.

This approach will make easier to create and share tools among users. In the far future, we can even foresee a kind of Marketplace for `Tools` where the most popular can be added into the main distribution.

39.12.4 Detailed description

The reconfiguration of the Toolbar is complex, most of the time it requires a custom backend.

The creation of custom Tools sometimes interferes with the Toolbar, as example see https://github.com/matplotlib/matplotlib/issues/2694 also the shortcuts are hardcoded and again not easily modifiable https://github.com/matplotlib/matplotlib/issues/2699

The proposed solution is to take the actions out of the `Toolbar` and the shortcuts out of the `Canvas`. This actions and shortcuts will be in the form of `Tools`.

A new class `Navigation` will be the bridge between the events from the `Canvas` and `Toolbar` and redirect them to the appropriate `Tool`.

At the end the user interaction will be divided into three classes:

- NavigationBase: This class is instantiated for each FigureManager and connect the all user interactions with the Tools
- ToolbarBase: This existing class is relegated only as a GUI access to Tools.
- ToolBase: Is the basic definition of Tools.

39.12.5 Implementation

ToolBase(object)

Tools can have a graphical representation as the `SubplotTool` or not even be present in the Toolbar as `Quit`

The *`ToolBase`* has the following class attributes for configuration at definition time

- keymap = None: Key(s) to be used to trigger the tool
- description = '': Small description of the tool
- image = None: Image that is used in the toolbar

The following instance attributes are set at instantiation:

- name
- navigation

Methods

- trigger(self, event): This is the main method of the Tool, it is called when the Tool is triggered by: * Toolbar button click * keypress associated with the Tool Keymap * Call to navigation.trigger_tool(name)
- set_figure(self, figure): Set the figure and navigation attributes
- `destroy(self, *args)`: Destroy the `Tool` graphical interface (if exists)

Available Tools

- ToolQuit
- ToolEnableAllNavigation
- ToolEnableNavigation
- ToolToggleGrid
- ToolToggleFullScreen
- ToolToggleYScale
- ToolToggleXScale
- ToolHome
- ToolBack
- ToolForward
- SaveFigureBase
- ConfigureSubplotsBase

ToolToggleBase(ToolBase)

The *ToolToggleBase* has the following class attributes for configuration at definition time

- radio_group = None: Attribute to group 'radio' like tools (mutually exclusive)
- cursor = None: Cursor to use when the tool is active

The **Toggleable** Tools, can capture keypress, mouse moves, and mouse button press

It defines the following methods

- enable(self, event): Called by *ToolToggleBase.trigger* method
- disable(self, event): Called when the tool is untoggled
- toggled : **Property** True or False

Available Tools

- ToolZoom
- ToolPan

NavigationBase

Defines the following attributes

- canvas:
- **keypresslock: Lock to know if the `canvas` key_press_event` is**

  available and process it
- messagelock: Lock to know if the message is available to write

Public methods for User use:

- nav_connect(self, s, func): Connect to to navigation for events
- nav_disconnect(self, cid): Disconnect from navigation event
- message_event(self, message, sender=None): Emit a tool_message_event event
- active_toggle(self): **Property** The currently toggled tools or None
- get_tool_keymap(self, name): Return a list of keys that are associated with the tool
- set_tool_keymap(self, name, `*keys`): Set the keys for the given tool
- remove_tool(self, name): Removes tool from the navigation control.
- add_tools(self, tools): Add multiple tools to `Navigation`
- add_tool(self, name, tool, group=None, position=None): Add a tool to the Navigation
- tool_trigger_event(self, name, sender=None, canvasevent=None, data=None): Trigger a tool and fire the event
- tools(self) **Property**: Return a dict with available tools with corresponding keymaps, descriptions and objects
- get_tool(self, name): Return the tool object

ToolbarBase

Methods for Backend implementation

- add_toolitem(self, name, group, position, image, description, toggle): Add a toolitem to the toolbar. This method is a callback from `tool_added_event` (emitted by navigation)
- set_message(self, s): Display a message on toolbar or in status bar
- toggle_toolitem(self, name): Toggle the toolitem without firing event.
- remove_toolitem(self, name): Remove a toolitem from the `Toolbar`

39.12.6 Backward compatibility

For backward compatibility added 'navigation' to the list of values supported by `rcParams["toolbar"]` (default: `'toolbar2'`), that is used for Navigation classes instantiation instead of the NavigationToolbar classes

With this parameter, it makes it transparent to anyone using the existing backends.

[@pelson comment: This also gives us an opportunity to avoid needing to implement all of this in the same PR - some backends can potentially exist without the new functionality for a short while (but it must be done at some point).]

39.13 MEP23: Multiple Figures per GUI window

39.13.1 Status

Discussion

39.13.2 Branches and Pull requests

Previous work - https://github.com/matplotlib/matplotlib/pull/2465 **To-delete**

39.13.3 Abstract

Add the possibility to have multiple figures grouped under the same `FigureManager`

39.13.4 Detailed description

Under the current structure, every canvas has its own window.

This is and may continue to be the desired method of operation for most use cases.

Sometimes when there are too many figures open at the same time, it is desirable to be able to group these under the same window [see](https://github.com/matplotlib/matplotlib/issues/2194).

The proposed solution modifies *`FigureManagerBase`* to contain and manage more than one `canvas`. The settings parameter `rcParams["backend.multifigure"]` control when the **MultiFigure** behaviour is desired.

Note

It is important to note, that the proposed solution, assumes that the [MEP22](https://github.com/matplotlib/matplotlib/wiki/Mep22) is already in place. This is simply because the actual implementation of the `Toolbar` makes it pretty hard to switch between canvases.

39.13.5 Implementation

The first implementation will be done in GTK3 using a Notebook as canvas container.

FigureManagerBase

will add the following new methods

- `add_canvas`: To add a canvas to an existing `FigureManager` object
- `remove_canvas`: To remove a canvas from a `FigureManager` object, if it is the last one, it will be destroyed
- `move_canvas`: To move a canvas from one `FigureManager` to another.
- `set_canvas_title`: To change the title associated with a specific canvas container
- `get_canvas_title`: To get the title associated with a specific canvas container
- `get_active_canvas`: To get the canvas that is in the foreground and is subject to the gui events. There is no `set_active_canvas` because the active canvas, is defined when `show` is called on a `Canvas` object.

new_figure_manager

To control which `FigureManager` will contain the new figures, an extra optional parameter *figuremanager* will be added, this parameter value will be passed to `new_figure_manager_given_figure`

new_figure_manager_given_figure

- If *figuremanager* parameter is given, this `FigureManager` object will be used instead of creating a new one.
- If `rcParams['backend.multifigure']` is True: The last `FigureManager` object will be used instead of creating a new one.

NavigationBase

Modifies the `NavigationBase` to keep a list of canvases, directing the actions to the active one

39.13.6 Backward compatibility

For the **MultiFigure** properties to be visible, the user has to activate them directly setting `rcParams['backend.multifigure'] = True`

It should be backwards compatible for backends that adhere to the current *`FigureManagerBase`* structure even if they have not implemented the **MultiFigure** magic yet.

39.13.7 Alternatives

Instead of modifying the *FigureManagerBase* it could be possible to add a parallel class, that handles the cases where `rcParams['backend.multifigure'] = True`. This will warranty that there won't be any problems with custom made backends, but also makes bigger the code, and more things to maintain.

39.14 MEP24: negative radius in polar plots

39.14.1 Status

Discussion

39.14.2 Branches and Pull requests

None

39.14.3 Abstract

It is clear that polar plots need to be able to gracefully handle negative r values (not by clipping or reflection).

39.14.4 Detailed description

One obvious application that we should support is bB plots (see https://github.com/matplotlib/matplotlib/issues/1730#issuecomment-40815837), but this seems more generally useful (for example growth rate as a function of angle). The assumption in the current code (as I understand it) is that the center of the graph is `r==0`, however it would be good to be able to set the center to be at any `r` (with any value less than the offset clipped).

39.14.5 Implementation

39.15 MEP25: Serialization

39.15.1 Status

Rejected

This work is important, but this particular effort has stalled.

39.15.2 Branches and Pull requests

- development branches:
- related pull requests:

39.15.3 Abstract

This MEP aims at adding a serializable `Controller` objects to act as an `Artist` managers. Users would then communicate changes to an `Artist` via a `Controller`. In this way, functionality of the `Controller` objects may be added incrementally since each `Artist` is still responsible for drawing everything. The goal is to create an API that is usable both by graphing libraries requiring high-level descriptions of figures and libraries requiring low-level interpretations.

39.15.4 Detailed description

Matplotlib is a core plotting engine with an API that many users already understand. It's difficult/impossible for other graphing libraries to (1) get a complete figure description, (2) output raw data from the figure object as the user has provided it, (3) understand the semantics of the figure objects without heuristics, and (4) give matplotlib a complete figure description to visualize. In addition, because an `Artist` has no conception of its own semantics within the figure, it's difficult to interact with them in a natural way.

In this sense, matplotlib will adopt a standard Model-View-Controller (MVC) framework. The *Model* will be the user defined data, style, and semantics. The *Views* are the ensemble of each individual `Artist`, which are responsible for producing the final image based on the *model*. The *Controller* will be the `Controller` object managing its set of `Artist` objects.

The `Controller` must be able to export the information that it's carrying about the figure on command, perhaps via a `to_json` method or similar. Because it would be extremely extraneous to duplicate all of the information in the model with the controller, only user-specified information (data + style) are explicitly kept. If a user wants more information (defaults) from the view/model, it should be able to query for it.

- This might be annoying to do, non-specified kwargs are pulled from the rcParams object which is in turn created from reading a user specified file and can be dynamically changed at run time. I suppose we could keep a dict of default

defaults and compare against that. Not clear how this will interact with the style sheet [[MEP26]] - @tacaswell

Additional Notes:

- The "raw data" does not necessarily need to be a `list`, `ndarray`, etc. Rather, it can more abstractly just have a method to yield data when needed.
- Because the `Controller` will contain extra information that users may not want to keep around, it should *not* be created by default. You should be able to both (a) instantiate a `Controller` with a figure and (b) build a figure with a `Controller`.

Use Cases:

- Export all necessary informat
- Serializing a matplotlib figure, saving it, and being able to rerun later.
- Any other source sending an appropriately formatted representation to matplotlib to open

39.15.5 Examples

Here are some examples of what the controllers should be able to do.

1. Instantiate a matplotlib figure from a serialized representation (e.g., JSON):

```
import json
from matplotlib.controllers import Controller
with open('my_figure') as f:
    o = json.load(f)
c = Controller(o)
fig = c.figure
```

2. Manage artists from the controller (e.g., Line2D):

```
# not really sure how this should look
c.axes[0].lines[0].color = 'b'
# ?
```

3. Export serializable figure representation:

```
o = c.to_json()
# or... we should be able to throw a figure object in there too
o = Controller.to_json(mpl_fig)
```

39.15.6 Implementation

1. Create base `Controller` objects that are able to manage `Artist` objects (e.g., `Hist`)

   Comments:

   - initialization should happen via unpacking `**`, so we need a copy of call signature parameter for the `Artist` we're ultimately trying to control. Unfortunate hard-coded repetition...
   - should the additional `**kwargs` accepted by each `Artist` be tracked at the `Controller`
   - how does a `Controller` know which artist belongs where? E.g., do we need to pass `axes` references?

   Progress:

   - A simple NB demonstrating some functionality for `Line2DController` objects: https://nbviewer.jupyter.org/gist/theengineear/f0aa8d79f64325e767c0

2. Write in protocols for the `Controller` to *update* the model.

   Comments:

   - how should containers be dealt with? E.g., what happens to old patches when we re-bin a histogram?
   - in the link from (1), the old line is completely destroyed and re-drawn, what if something is referencing it?

3. Create method by which a json object can be assembled from the `Controllers`
4. Deal with serializing the unserializable aspects of a figure (e.g., non-affine transforms?)
5. Be able to instantiate from a serialized representation
6. Reimplement the existing pyplot and Axes method, e.g. `pyplot.hist` and `Axes.hist` in terms of the new controller class.

> @theengineer: in #2 above, what do you mean by *get updates* from each `Artist`?

^ Yup. The `Controller` *shouldn't* need to get updated. This just happens in #3. Delete comments when you see this.

39.15.7 Backward compatibility

- pickling will change
- non-affine transformations will require a defined pickling method

39.15.8 Alternatives

PR #3150 suggested adding semantics by parasitically attaching extra containers to axes objects. This is a more complete solution with what should be a more developed/flexible/powerful framework.

39.16 MEP26: Artist styling

39.16.1 Status

Rejected

39.16.2 Branches and Pull requests

39.16.3 Abstract

This MEP proposes a new stylesheet implementation to allow more comprehensive and dynamic styling of artists.

The current version of matplotlib (1.4.0) allows stylesheets based on the rcParams syntax to be applied before creation of a plot. The methodology below proposes a new syntax, based on CSS, which would allow styling of individual artists and properties, which can be applied dynamically to existing objects.

This is related to (and makes steps toward) the overall goal of moving to a DOM/tree-like architecture.

39.16.4 Detailed description

Currently, the look and appearance of existing artist objects (figure, axes, Line2D etc...) can only be updated via `set_` and `get_` methods on the artist object, which is quite laborious, especially if no reference to the artist(s) has been stored. The new style sheets introduced in 1.4 allow styling before a plot is created, but do not offer any means to dynamically update plots or distinguish between artists of the same type (i.e. to specify the `line color` and `line style` separately for differing *Line2D* objects).

The initial development should concentrate on allowing styling of artist primitives (those *Artist*s that do not contain other *Artist*s), and further development could expand the CSS syntax rules and parser to allow more complex styling. See the appendix for a list of primitives.

The new methodology would require development of a number of steps:

- A new stylesheet syntax (likely based on CSS) to allow selection of artists by type, class, id etc...
- A mechanism by which to parse a stylesheet into a tree
- A mechanism by which to translate the parse-tree into something which can be used to update the properties of relevant artists. Ideally this would implement a method by which to traverse the artists in a tree-like structure.
- A mechanism by which to generate a stylesheet from existing artist properties. This would be useful to allow a user to export a stylesheet from an existing figure (where the appearance may have been set using the matplotlib API)...

39.16.5 Implementation

It will be easiest to allow a '3rd party' to modify/set the style of an artist if the 'style' is created as a separate class and store against the artist as a property. The `GraphicsContext` class already provides a the basis of a `Style` class and an artist's *`draw`* method can be refactored to use the `Style` class rather than setting up it's own `GraphicsContext` and transferring it's style-related properties to it. A minimal example of how this could be implemented is shown here: https://github.com/JamesRamm/mpl_experiment

IMO, this will also make the API and code base much neater as individual get/set methods for artist style properties are now redundant... Indirectly related would be a general drive to replace get/set methods with properties. Implementing the style class with properties would be a big stride toward this...

For initial development, I suggest developing a syntax based on a much (much much) simplified version of CSS. I am in favour of dubbing this Artist Style Sheets :+1: :

BNF Grammar

I propose a very simple syntax to implement initially (like a proof of concept), which can be expanded upon in the future. The BNF form of the syntax is given below and then explained

```
RuleSet ::= SelectorSequence "{"Declaration"}"

SelectorSequence :: = Selector {"," Selector}

Declaration ::= propName":" propValue";"

Selector ::= ArtistIdent{"#"Ident}

propName ::= Ident

propValue ::= Ident | Number | Colour | "None"
```

`ArtistIdent`, `Ident`, `Number` and `Colour` are tokens (the basic building blocks of the expression) which are defined by regular expressions.

Syntax

A CSS stylesheet consists of a series of **rule sets** in hierarchical order (rules are applied from top to bottom). Each rule follows the syntax

```
selector {attribute: value;}
```

Each rule can have any number of `attribute: value` pairs, and a stylesheet can have any number of rules.

The initial syntax is designed only for *Artist* primitives. It does not address the question of how to set properties on *Container* types (whose properties may themselves be *Artist*s with settable properties), however, a future solution to this could simply be nested `RuleSet`s

Selectors

Selectors define the object to which the attribute updates should be applied. As a starting point, I propose just 2 selectors to use in initial development:

Artist Type Selector

Select an *Artist* by it's type. E.g *Line2D* or *Text*:

```
Line2D {attribute: value}
```

The regex for matching the artist type selector (`ArtistIdent` in the BNF grammar) would be:

```
ArtistIdent = r'(?P<ArtistIdent>\bLine2D\b|\bText\b|\bAxesImage\b|\bFigureImage\b|\
↪bPatch\b)'
```

GID selector

Select an *Artist* by its `gid`:

```
Line2D#myGID {attribute: value}
```

A `gid` can be any string, so the regex could be as follows:

```
Ident = r'(?P<Ident>[a-zA-Z_][a-zA-Z_0-9]*)'
```

The above selectors roughly correspond to their CSS counterparts (http://www.w3.org/TR/CSS21/selector.html)

Attributes and values

- `Attributes` are any valid (settable) property for the *Artist* in question.
- `Values` are any valid value for the property (Usually a string, or number).

Parsing

Parsing would consist of breaking the stylesheet into tokens (the python cookbook gives a nice tokenizing recipe on page 66), applying the syntax rules and constructing a `Tree`. This requires defining the grammar of the stylesheet (again, we can borrow from CSS) and writing a parser. Happily, there is a recipe for this in the python cookbook as well.

Visitor pattern for matplotlib figure

In order to apply the stylesheet rules to the relevant artists, we need to 'visit' each artist in a figure and apply the relevant rule. Here is a visitor class (again, thanks to python cookbook), where each `node` would be an artist in the figure. A `visit_` method would need to be implemented for each mpl artist, to handle the different properties for each

```
class Visitor:
    def visit(self, node):
        name = 'visit_' + type(node).__name__
        meth = getattr(self, name, None)
        if meth is None:
            raise NotImplementedError
        return meth(node)
```

An `evaluator` class would then take the stylesheet rules and implement the visitor on each one of them.

39.16.6 Backward compatibility

Implementing a separate `Style` class would break backward compatibility as many get/set methods on an artist would become redundant. While it would be possible to alter these methods to hook into the `Style` class (stored as a property against the artist), I would be in favor of simply removing them to both neaten/simplify the code-base and to provide a simple, uncluttered API...

39.16.7 Alternatives

No alternatives, but some of the ground covered here overlaps with MEP25, which may assist in this development

39.16.8 Appendix

Matplotlib primitives

This will form the initial selectors which stylesheets can use.

- Line2D
- Text
- AxesImage
- FigureImage
- Patch

39.17 MEP27: decouple pyplot from backends

39.17.1 Status

Progress

39.17.2 Branches and Pull requests

Main PR (including GTK3): + https://github.com/matplotlib/matplotlib/pull/4143

Backend specific branch diffs: + https://github.com/OceanWolf/matplotlib/compare/backend-refactor...OceanWolf:backend-refactor-tkagg + https://github.com/OceanWolf/matplotlib/compare/backend-refactor...OceanWolf:backend-refactor-qt + https://github.com/OceanWolf/matplotlib/compare/backend-refactor...backend-refactor-wx

39.17.3 Abstract

This MEP refactors the backends to give a more structured and consistent API, removing generic code and consolidate existing code. To do this we propose splitting:

1. `FigureManagerBase` and its derived classes into the core functionality class `FigureManager` and a backend specific class `WindowBase` and
2. `ShowBase` and its derived classes into `Gcf.show_all` and `MainLoopBase`.

39.17.4 Detailed description

This MEP aims to consolidate the backends API into one single uniform API, removing generic code out of the backend (which includes `_pylab_helpers` and `Gcf`), and push code to a more appropriate level in matplotlib. With this we automatically remove inconsistencies that appear in the backends, such as `FigureManagerBase.resize(w, h)` which sometimes sets the canvas, and other times set the entire window to the dimensions given, depending on the backend.

Two main places for generic code appear in the classes derived from `FigureManagerBase` and `ShowBase`.

1. `FigureManagerBase` has **three** jobs at the moment:
    1. The documentation describes it as a ``*Helper class for pyplot mode, wraps everything up into a neat bundle*''
    2. But it doesn't just wrap the canvas and toolbar, it also does all of the windowing tasks itself. The conflation of these two tasks gets seen the best in the following line: `` `python self.set_window_title("Figure %d" % num) ` `` This combines backend specific code `self.set_window_title(title)` with matplotlib generic code `title = "Figure %d" % num`.
    3. Currently the backend specific subclass of `FigureManager` decides when to end the mainloop. This also seems very wrong as the figure should have no control over the other figures.
2. `ShowBase` has two jobs:

1. It has the job of going through all figure managers registered in `_pylab_helpers.Gcf` and telling them to show themselves.
2. And secondly it has the job of performing the backend specific `mainloop` to block the main programme and thus keep the figures from dying.

39.17.5 Implementation

The description of this MEP gives us most of the solution:

1. To remove the windowing aspect out of `FigureManagerBase` letting it simply wrap this new class along with the other backend classes. Create a new `WindowBase` class that can handle this functionality, with pass-through methods (:arrow_right:) to `WindowBase`. Classes that subclass `WindowBase` should also subclass the GUI specific window class to ensure backward compatibility (`manager.window == manager.window`).
2. Refactor the mainloop of `ShowBase` into `MainLoopBase`, which encapsulates the end of the loop as well. We give an instance of `MainLoop` to `FigureManager` as a key unlock the exit method (requiring all keys returned before the loop can die). Note this opens the possibility for multiple backends to run concurrently.
3. Now that `FigureManagerBase` has no backend specifics in it, to rename it to `FigureManager`, and move to a new file `backend_managers.py` noting that:
    1. This allows us to break up the conversion of backends into separate PRs as we can keep the existing `FigureManagerBase` class and its dependencies intact.
    2. and this also anticipates MEP22 where the new `NavigationBase` has morphed into a backend independent `ToolManager`.

FigureManagerBase(canvas, num)	FigureManager(figure, num)	`WindowBase(title)`	Notes
show		show	
destroy	calls destroy on all components	destroy	
full_screen_toggle	handles logic	set_fullscreen	
resize		resize	
key_press	key_press		
get_window_title		get_window_title	
set_window_title		set_window_title	
	_get_toolbar		A common method to all subclasses of FigureManagerBase
		set_default_size	
		add_element_to_window	

Show-Base	MainLoop-Base	Notes
main-loop	begin	
	end	Gets called automagically when no more instances of the subclass exist
__call__		Method moved to Gcf.show_all

39.17.6 Future compatibility

As eluded to above when discussing MEP 22, this refactor makes it easy to add in new generic features. At the moment, MEP 22 has to make ugly hacks to each class extending from `FigureManagerBase`. With this code, this only needs to get made in the single `FigureManager` class. This also makes the later deprecation of `NavigationToolbar2` very straightforward, only needing to touch the single `FigureManager` class

MEP 23 makes for another use case where this refactored code will come in very handy.

39.17.7 Backward compatibility

As we leave all backend code intact, only adding missing methods to existing classes, this should work seamlessly for all use cases. The only difference will lie for backends that used `FigureManager.resize` to resize the canvas and not the window, due to the standardisation of the API.

I would envision that the classes made obsolete by this refactor get deprecated and removed on the same timetable as `NavigationToolbar2`, also note that the change in call signature to the `FigureCanvasWx` constructor, while backward compatible, I think the old (imho ugly style) signature should get deprecated and removed in the same manner as everything else.

back-end	man-ager.resize(w,h)	Extra
gtk3	window	
Tk	canvas	
Qt	window	
Wx	canvas	FigureManagerWx had `frame` as an alias to window, so this also breaks BC.

39.17.8 Alternatives

If there were any alternative solutions to solving the same problem, they should be discussed here, along with a justification for the chosen approach.

39.17.9 Questions

Mdehoon: Can you elaborate on how to run multiple backends concurrently?

OceanWolf: @mdehoon, as I say, not for this MEP, but I see this MEP opens it up as a future possibility. Basically the `MainLoopBase` class acts a per backend Gcf, in this MEP it tracks the number of figures open per backend, and manages the mainloops for those backends. It closes the backend specific mainloop when it detects that no figures remain open for that backend. Because of this I imagine that with only a small amount of tweaking that we can do full-multi-backend matplotlib. No idea yet why one would want to, but I leave the possibility there in MainLoopBase. With all the backend-code specifics refactored out of `FigureManager` also aids in this, one manager to rule them (the backends) all.

Mdehoon: @OceanWolf, OK, thanks for the explanation. Having a uniform API for the backends is very important for the maintainability of matplotlib. I think this MEP is a step in the right direction.

39.18 MEP28: Remove Complexity from Axes.boxplot

39.18.1 Status

Discussion

39.18.2 Branches and Pull requests

The following lists any open PRs or branches related to this MEP:

1. Deprecate redundant statistical kwargs in `Axes.boxplot`: https://github.com/phobson/matplotlib/tree/MEP28-initial-deprecations
2. Deprecate redundant style options in `Axes.boxplot`: https://github.com/phobson/matplotlib/tree/MEP28-initial-deprecations
3. Deprecate passings 2D NumPy arrays as input: None
4. Add pre- & post-processing options to `cbook.boxplot_stats`: https://github.com/phobson/matplotlib/tree/boxplot-stat-transforms
5. Exposing `cbook.boxplot_stats` through `Axes.boxplot` kwargs: None
6. Remove redundant statistical kwargs in `Axes.boxplot`: None
7. Remove redundant style options in `Axes.boxplot`: None
8. Remaining items that arise through discussion: None

39.18.3 Abstract

Over the past few releases, the `Axes.boxplot` method has grown in complexity to support fully customizable artist styling and statistical computation. This lead to `Axes.boxplot` being split off into multiple parts. The statistics needed to draw a boxplot are computed in `cbook.boxplot_stats`, while the actual artists are drawn by `Axes.bxp`. The original method, `Axes.boxplot` remains as the most public API that handles passing the user-supplied data to `cbook.boxplot_stats`, feeding the results to `Axes.bxp`, and pre-processing style information for each facet of the boxplot plots.

This MEP will outline a path forward to rollback the added complexity and simplify the API while maintaining reasonable backwards compatibility.

39.18.4 Detailed description

Currently, the `Axes.boxplot` method accepts parameters that allow the users to specify medians and confidence intervals for each box that will be drawn in the plot. These were provided so that avdanced users could provide statistics computed in a different fashion that the simple method provided by matplotlib. However, handling this input requires complex logic to make sure that the forms of the data structure match what needs to be drawn. At the moment, that logic contains 9 separate if/else statements nested up to 5 levels deep with a for loop, and may raise up to 2 errors. These parameters were added prior to the creation of the `Axes.bxp` method, which draws boxplots from a list of dictionaries containing the relevant statistics. Matplotlib also provides a function that computes these statistics via `cbook.boxplot_stats`. Note that advanced users can now either a) write their own function to compute the stats required by `Axes.bxp`, or b) modify the output returned by `cbook.boxplots_stats` to fully customize the position of the artists of the plots. With this flexibility, the parameters to manually specify only the medians and their confidences intervals remain for backwards compatibility.

Around the same time that the two roles of `Axes.boxplot` were split into `cbook.boxplot_stats` for computation and `Axes.bxp` for drawing, both `Axes.boxplot` and `Axes.bxp` were written to accept parameters that individually toggle the drawing of all components of the boxplots, and parameters that individually configure the style of those artists. However, to maintain backwards compatibility, the `sym` parameter (previously used to specify the symbol of the fliers) was retained. This parameter itself requires fairly complex logic to reconcile the `sym` parameters with the newer `flierprops` parameter at the default style specified by `matplotlibrc`.

This MEP seeks to dramatically simplify the creation of boxplots for novice and advanced users alike. Importantly, the changes proposed here will also be available to downstream packages like seaborn, as seaborn smartly allows users to pass arbitrary dictionaries of parameters through the seaborn API to the underlying matplotlib functions.

This will be achieved in the following way:

1. `cbook.boxplot_stats` will be modified to allow pre- and post- computation transformation functions to be passed in (e.g., `np.log` and `np.exp` for lognormally distributed data)
2. `Axes.boxplot` will be modified to also accept and naïvely pass them to `cbook.boxplots_stats` (Alt: pass the stat function and a dict of its optional parameters).
3. Outdated parameters from `Axes.boxplot` will be deprecated and later removed.

Importance

Since the limits of the whiskers are computed arithmetically, there is an implicit assumption of normality in box and whisker plots. This primarily affects which data points are classified as outliers.

Allowing transformations to the data and the results used to draw boxplots will allow users to opt-out of that assumption if the data are known to not fit a normal distribution.

Below is an example of how `Axes.boxplot` classifies outliers of lognormal data differently depending one these types of transforms.

```
import numpy as np
import matplotlib.pyplot as plt
from matplotlib import cbook
np.random.seed(0)

fig, ax = plt.subplots(figsize=(4, 6))
ax.set_yscale('log')
data = np.random.lognormal(-1.75, 2.75, size=37)

stats = cbook.boxplot_stats(data, labels=['arithmetic'])
logstats = cbook.boxplot_stats(np.log(data), labels=['log-transformed'])

for lsdict in logstats:
    for key, value in lsdict.items():
        if key != 'label':
            lsdict[key] = np.exp(value)

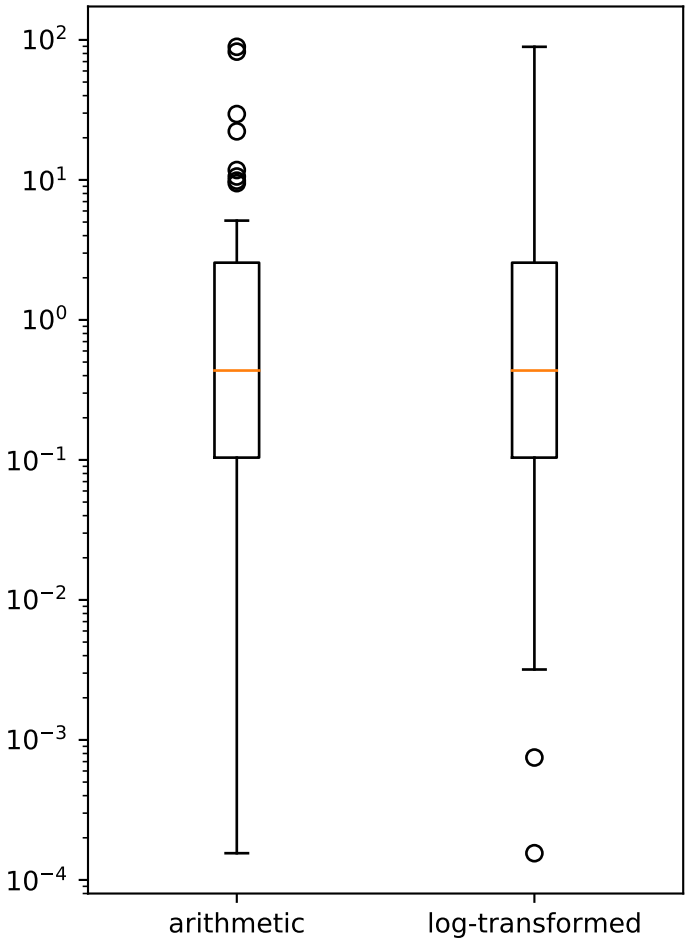
stats.extend(logstats)
ax.bxp(stats)
fig.show()
```

39.18.5 Implementation

Passing transform functions to `cbook.boxplots_stats`

This MEP proposes that two parameters (e.g., `transform_in` and `transform_out` be added to the cookbook function that computes the statistics for the boxplot function. These will be optional keyword-only arguments and can easily be set to `lambda x: x` as a no-op when omitted by the user. The `transform_in` function will be applied to the data as the `boxplot_stats` function loops through each subset of the data passed to it. After the list of statistics dictionaries are computed the `transform_out` function is applied to each value in the dictionaries.

These transformations can then be added to the call signature of `Axes.boxplot` with little impact to that method's complexity. This is because they can be directly passed to `cbook.boxplot_stats`. Alternatively, `Axes.boxplot` could be modified to accept an op-



10^2
10^1
10^0
10^{-1}
10^{-2}
10^{-3}
10^{-4}
arithmetic
log-transformed

tional statistical function kwarg and a dictionary of parameters to be directly passed to it.

At this point in the implementation users and external libraries like seaborn would have complete control via the `Axes.boxplot` method. More importantly, at the very least, seaborn would require no changes to its API to allow users to take advantage of these new options.

Simplifications to the `Axes.boxplot` API and other functions

Simplifying the boxplot method consists primarily of deprecating and then removing the redundant parameters. Optionally, a next step would include rectifying minor terminological inconsistencies between `Axes.boxplot` and `Axes.bxp`.

The parameters to be deprecated and removed include:

1. `usermedians` - processed by 10 SLOC, 3 `if` blocks, a `for` loop
2. `conf_intervals` - handled by 15 SLOC, 6 `if` blocks, a `for` loop
3. `sym` - processed by 12 SLOC, 4 `if` blocks

Removing the `sym` option allows all code in handling the remaining styling parameters to be moved to `Axes.bxp`. This doesn't remove any complexity, but does reinforce the single responsibility principle among `Axes.bxp`, `cbook.boxplot_stats`, and `Axes.boxplot`.

Additionally, the `notch` parameter could be renamed `shownotches` to be consistent with `Axes.bxp`. This kind of cleanup could be taken a step further and the `whis`, `bootstrap`, `autorange` could be rolled into the kwargs passed to the new `statfxn` parameter.

39.18.6 Backward compatibility

Implementation of this MEP would eventually result in the backwards incompatible deprecation and then removal of the keyword parameters `usermedians`, `conf_intervals`, and `sym`. Cursory searches on GitHub indicated that `usermedians`, `conf_intervals` are used by few users, who all seem to have a very strong knowledge of matplotlib. A robust deprecation cycle should provide sufficient time for these users to migrate to a new API.

Deprecation of `sym` however, may have a much broader reach into the matplotlib user-base.

Schedule

An accelerated timeline could look like the following:

1. v2.0.1 add transforms to `cbook.boxplots_stats`, expose in `Axes.boxplot`
2. v2.1.0 Initial Deprecations , and using 2D NumPy arrays as input
    a. Using 2D NumPy arrays as input. The semantics around 2D arrays are generally confusing.
    b. `usermedians`, `conf_intervals`, `sym` parameters
3. v2.2.0
    a. remove `usermedians`, `conf_intervals`, `sym` parameters
    b. deprecate `notch` in favor of `shownotches` to be consistent with other parameters and `Axes.bxp`
4. **v2.3.0**
    a. remove `notch` parameter
    b. move all style and artist toggling logic to `Axes.bxp` such `Axes.boxplot` is little more than a broker between `Axes.bxp` and `cbook.boxplots_stats`

Anticipated Impacts to Users

As described above deprecating `usermedians` and `conf_intervals` will likely impact few users. Those who will be impacted are almost certainly advanced users who will be able to adapt to the change.

Deprecating the `sym` option may import more users and effort should be taken to collect community feedback on this.

Anticipated Impacts to Downstream Libraries

The source code (GitHub master as of 2016-10-17) was inspected for seaborn and python-ggplot to see if these changes would impact their use. None of the parameters nominated for removal in this MEP are used by seaborn. The seaborn APIs that use matplotlib's boxplot function allow user's to pass arbitrary `**kwargs` through to matplotlib's API. Thus seaborn users with modern matplotlib installations will be able to take full advantage of any new features added as a result of this MEP.

Python-ggplot has implemented its own function to draw boxplots. Therefore, no impact can come to it as a result of implementing this MEP.

39.18.7 Alternatives

Variations on the theme

This MEP can be divided into a few loosely coupled components:

1. Allowing pre- and post-computation transformation function in `cbook.boxplot_stats`
2. Exposing that transformation in the `Axes.boxplot` API
3. Removing redundant statistical options in `Axes.boxplot`
4. Shifting all styling parameter processing from `Axes.boxplot` to `Axes.bxp`.

With this approach, #2 depends and #1, and #4 depends on #3.

There are two possible approaches to #2. The first and most direct would be to mirror the new `transform_in` and `transform_out` parameters of `cbook.boxplot_stats` in `Axes.boxplot` and pass them directly.

The second approach would be to add `statfxn` and `statfxn_args` parameters to `Axes.boxplot`. Under this implementation, the default value of `statfxn` would be `cbook.boxplot_stats`, but users could pass their own function. Then `transform_in` and `transform_out` would then be passed as elements of the `statfxn_args` parameter.

```
def boxplot_stats(data, ..., transform_in=None, transform_out=None):
    if transform_in is None:
        transform_in = lambda x: x

    if transform_out is None:
        transform_out = lambda x: x

    output = []
    for _d in data:
        d = transform_in(_d)
        stat_dict = do_stats(d)
        for key, value in stat_dict.item():
            if key != 'label':
                stat_dict[key] = transform_out(value)
        output.append(d)
    return output

class Axes(...):
    def boxplot_option1(data, ..., transform_in=None, transform_out=None):
        stats = cbook.boxplot_stats(data, ...,
                                    transform_in=transform_in,
                                    transform_out=transform_out)
        return self.bxp(stats, ...)

    def boxplot_option2(data, ..., statfxn=None, **statopts):
        if statfxn is None:
```

(continues on next page)

(continued from previous page)

```
            statfxn = boxplot_stats
        stats = statfxn(data, **statopts)
        return self.bxp(stats, ...)
```

Both cases would allow users to do the following:

```
fig, ax1 = plt.subplots()
artists1 = ax1.boxplot_optionX(data, transform_in=np.log,
                               transform_out=np.exp)
```

But Option Two lets a user write a completely custom stat function (e.g., `my_box_stats`) with fancy BCA confidence intervals and the whiskers set differently depending on some attribute of the data.

This is available under the current API:

```
fig, ax1 = plt.subplots()
my_stats = my_box_stats(data, bootstrap_method='BCA',
                        whisker_method='dynamic')
ax1.bxp(my_stats)
```

And would be more concise with Option Two

```
fig, ax = plt.subplots()
statopts = dict(transform_in=np.log, transform_out=np.exp)
ax.boxplot(data, ..., **statopts)
```

Users could also pass their own function to compute the stats:

```
fig, ax1 = plt.subplots()
ax1.boxplot(data, statfxn=my_box_stats, bootstrap_method='BCA',
            whisker_method='dynamic')
```

From the examples above, Option Two seems to have only marginal benefit, but in the context of downstream libraries like seaborn, its advantage is more apparent as the following would be possible without any patches to seaborn:

```
import seaborn
tips = seaborn.load_data('tips')
g = seaborn.factorplot(x="day", y="total_bill", hue="sex", data=tips,
                       kind='box', palette="PRGn", shownotches=True,
                       statfxn=my_box_stats, bootstrap_method='BCA',
                       whisker_method='dynamic')
```

This type of flexibility was the intention behind splitting the overall boxplot API in the current three functions. In practice however, downstream libraries like seaborn support versions of matplotlib dating back well before the split. Thus, adding just a bit more flexibility to the `Axes.boxplot` could expose all the functionality to users of the downstream libraries with modern matplotlib installation without intervention from the downstream library maintainers.

Doing less

Another obvious alternative would be to omit the added pre- and post- computation transform functionality in `cbook.boxplot_stats` and `Axes.boxplot`, and simply remove the redundant statistical and style parameters as described above.

Doing nothing

As with many things in life, doing nothing is an option here. This means we simply advocate for users and downstream libraries to take advantage of the split between `cbook.boxplot_stats` and `Axes.bxp` and let them decide how to provide an interface to that.

39.19 MEP29: Text light markup

39.19.1 Status

Discussion

39.19.2 Branches and Pull requests

None at the moment, proof of concept only.

39.19.3 Abstract

This MEP proposes to add lightweight markup to the text artist.

39.19.4 Detailed description

Using different size/color/family in a text annotation is difficult because the *text* method accepts argument for size/color/family/weight/etc. that are used for the whole text. But, if one wants, for example, to have different colors, one has to look at the gallery where one such example is provided: http://matplotlib.org/examples/text_labels_and_annotations/rainbow_text.html

This example takes a list of strings as well as a list of colors which makes it cumbersome to use. An alternative would be to use a restricted set of pango-like markup and to interpret this markup.

Some markup examples:

```
Hello <b>world!</b>`
Hello <span color="blue">world!</span>
```

39.19.5 Implementation

A proof of concept is provided in markup_example.py but it currently only handles the horizontal direction.

Improvements

- This proof of concept uses regex to parse the text but it may be better to use the html.parser from the standard library.
- Computation of text fragment positions could benefit from the OffsetFrom class. See for example item 5 in Using Complex Coordinates with Annotations

Problems

- One serious problem is how to deal with text having both latex and html-like tags. For example, consider the following:

```
$<b>Bold$</b>
```

  Recommendation would be to have mutual exclusion.

39.19.6 Backward compatibility

None at the moment since it is only a proof of concept

39.19.7 Alternatives

As proposed by @anntzer, this could be also implemented as improvements to mathtext. For example:

```
r"$\text{Hello \textbf{world}}$"
r"$\text{Hello \textcolor{blue}{world}}$"
r"$\text{Hello \textsf{\small world}}$"
```

CHAPTER

FORTY

LICENSES

Matplotlib only uses BSD compatible code. If you bring in code from another project make sure it has a PSF, BSD, MIT or compatible license (see the Open Source Initiative licenses page for details on individual licenses). If it doesn't, you may consider contacting the author and asking them to relicense it. GPL and LGPL code are not acceptable in the main code base, though we are considering an alternative way of distributing L/GPL code through an separate channel, possibly a toolkit. If you include code, make sure you include a copy of that code's license in the license directory if the code's license requires you to distribute the license with it. Non-BSD compatible licenses are acceptable in Matplotlib toolkits (e.g., basemap), but make sure you clearly state the licenses you are using.

40.1 Why BSD compatible?

The two dominant license variants in the wild are GPL-style and BSD-style. There are countless other licenses that place specific restrictions on code reuse, but there is an important difference to be considered in the GPL and BSD variants. The best known and perhaps most widely used license is the GPL, which in addition to granting you full rights to the source code including redistribution, carries with it an extra obligation. If you use GPL code in your own code, or link with it, your product must be released under a GPL compatible license. i.e., you are required to give the source code to other people and give them the right to redistribute it as well. Many of the most famous and widely used open source projects are released under the GPL, including linux, gcc, emacs and sage.

The second major class are the BSD-style licenses (which includes MIT and the python PSF license). These basically allow you to do whatever you want with the code: ignore it, include it in your own open source project, include it in your proprietary product, sell it, whatever. python itself is released under a BSD compatible license, in the sense that, quoting from the PSF license page:

```
There is no GPL-like "copyleft" restriction. Distributing
binary-only versions of Python, modified or not, is allowed. There
is no requirement to release any of your source code. You can also
write extension modules for Python and provide them only in binary
form.
```

Famous projects released under a BSD-style license in the permissive sense of the last paragraph are the BSD operating system, python and TeX.

There are several reasons why early Matplotlib developers selected a BSD compatible license. Matplotlib is a python extension, and we choose a license that was based on the python license (BSD compatible). Also, we wanted to attract as many users and developers as possible, and many software companies will not use GPL code in software they plan to distribute, even those that are highly committed to open source development, such as enthought, out of legitimate concern that use of the GPL will "infect" their code base by its viral nature. In effect, they want to retain the right to release some proprietary code. Companies and institutions who use Matplotlib often make significant contributions, because they have the resources to get a job done, even a boring one. Two of the Matplotlib backends (FLTK and WX) were contributed by private companies. The final reason behind the licensing choice is compatibility with the other python extensions for scientific computing: ipython, numpy, scipy, the enthought tool suite and python itself are all distributed under BSD compatible licenses.

CHAPTER

FORTYONE

DEFAULT COLOR CHANGES

As discussed at length elsewhere [insert links], `jet` is an empirically bad color map and should not be the default color map. Due to the position that changing the appearance of the plot breaks backward compatibility, this change has been put off for far longer than it should have been. In addition to changing the default color map we plan to take the chance to change the default color-cycle on plots and to adopt a different color map for filled plots (`imshow`, `pcolor`, `contourf`, etc) and for scatter like plots.

41.1 Default Heat Map Colormap

The choice of a new color map is fertile ground to bike-shedding ("No, it should be _this_ color") so we have a proposed set criteria (via Nathaniel Smith) to evaluate proposed color maps.

- it should be a sequential colormap, because diverging colormaps are really misleading unless you know where the "center" of the data is, and for a default colormap we generally won't.
- it should be perceptually uniform, i.e., human subjective judgments of how far apart nearby colors are should correspond as linearly as possible to the difference between the numerical values they represent, at least locally.
- it should have a perceptually uniform luminance ramp, i.e. if you convert to greyscale it should still be uniform. This is useful both in practical terms (greyscale printers are still a thing!) and because luminance is a very strong and natural cue to magnitude.
- it should also have some kind of variation in hue, because hue variation is a really helpful additional cue to perception, having two cues is better than one, and there's no reason not to do it.
- the hue variation should be chosen to produce reasonable results even for viewers with the more common types of colorblindness. (Which rules out things like red-to-green.)
- For bonus points, it would be nice to choose a hue ramp that still works if you throw away the luminance variation, because then we could use the version with varying luminance for 2d plots, and the version with just hue variation for 3d

plots. (In 3d plots you really want to reserve the luminance channel for lighting/shading, because your brain is *really* good at extracting 3d shape from luminance variation. If the 3d surface itself has massively varying luminance then this screws up the ability to see shape.)

- Not infringe any existing IP

41.1.1 Example script

41.1.2 Proposed Colormaps

41.2 Default Scatter Colormap

For heat-map like applications it can be desirable to cover as much of the luminance scale as possible, however when color mapping markers, having markers too close to white can be a problem. For that reason we propose using a different (but maybe related) color map to the heat map for marker-based. The design parameters are the same as above, only with a more limited luminance variation.

41.2.1 Example script

```
import numpy as np
import matplotlib.pyplot as plt

np.random.seed(1234)

fig, (ax1, ax2) = plt.subplots(1, 2)

N = 50
x = np.random.rand(N)
y = np.random.rand(N)
colors = np.random.rand(N)
area = np.pi * (15 * np.random.rand(N))**2  # 0 to 15 point radiuses

ax1.scatter(x, y, s=area, c=colors, alpha=0.5)

X,Y = np.meshgrid(np.arange(0, 2*np.pi, .2),
                  np.arange(0, 2*np.pi, .2))
U = np.cos(X)
V = np.sin(Y)
Q = ax2.quiver(X, Y, U, V, units='width')
qd = np.random.rand(np.prod(X.shape))
Q.set_array(qd)
```

41.2.2 Proposed Colormaps

41.3 Color Cycle / Qualitative color map

When plotting lines it is frequently desirable to plot multiple lines or artists which need to be distinguishable, but there is no inherent ordering.

41.3.1 Example script

```
import numpy as np
import matplotlib.pyplot as plt

fig, (ax1, ax2) = plt.subplots(1, 2)

x = np.linspace(0, 1, 10)

for j in range(10):
    ax1.plot(x, x * j)

th = np.linspace(0, 2*np.pi, 1024)
for j in np.linspace(0, np.pi, 10):
    ax2.plot(th, np.sin(th + j))

ax2.set_xlim(0, 2*np.pi)
```

41.3.2 Proposed Color cycle

Part VII

Glossary

AGG

The Anti-Grain Geometry (Agg) rendering engine, capable of rendering high-quality images

Cairo

The Cairo graphics engine

FreeType

FreeType is a font rasterization library used by matplotlib which supports TrueType, Type 1, and OpenType fonts.

GTK

The GIMP Toolkit (GTK) graphical user interface library

PyGObject

PyGObject provides Python wrappers for the *GTK* widgets library

pyqt

pyqt provides python wrappers for the *Qt* widgets library and is required by the matplotlib Qt5Agg and Qt4Agg backends. Widely used on linux and windows; many linux distributions package this as 'python-qt5' or 'python-qt4'.

Qt

Qt is a cross-platform application framework for desktop and embedded development.

Qt4

Qt4 is the previous, but most widely used, version of Qt cross-platform application framework for desktop and embedded development.

Qt5

Qt5 is the current version of Qt cross-platform application framework for desktop and embedded development.

Tk

Tk is a graphical user interface for Tcl and many other dynamic languages. It can produce rich, native applications that run unchanged across Windows, Mac OS X, Linux and more.

wxpython

wxpython provides python wrappers for the *wxWidgets* library for use with the WX and WXAgg backends. Widely used on linux, OS-X and windows, it is often packaged by linux distributions as 'python-wxgtk'

wxWidgets

WX is cross-platform GUI and tools library for GTK, MS Windows, and MacOS. It uses native widgets for each operating system, so applications will have the look-and-feel that users on that operating system expect.
