User's Guide

CHAPTER

ONE

INSTALLATION GUIDE

Note: If you wish to contribute to the project, it's recommended you *install the latest development version*.

Contents

1.1 Installing an official release

Matplotlib and its dependencies are available as wheel packages for macOS, Windows and Linux distributions:

```
python -m pip install -U pip
python -m pip install -U matplotlib
```

If this command results in Matplotlib being compiled from source and there's trouble with the compilation, you can add `--prefer-binary` to select the newest version of Matplotlib for which there is a precompiled wheel for your OS and Python.

Note: The following backends work out of the box: Agg, ps, pdf, svg

Python is typically shipped with tk bindings which are used by TkAgg.

For support of other GUI frameworks, LaTeX rendering, saving animations and a larger selection of file formats, you need to install *additional dependencies*.

Although not required, we suggest also installing `IPython` for interactive use. To easily install a complete Scientific Python stack, see *Scientific Python Distributions* below.

1.1.1 Test data

The wheels (`*.whl`) on the PyPI download page do not contain test data or example code.

If you want to try the many demos that come in the Matplotlib source distribution, download the `*.tar.gz` file and look in the `examples` subdirectory.

To run the test suite:

- extract the `lib/matplotlib/tests` or `lib/mpl_toolkits/tests` directories from the source distribution.
- install test dependencies: pytest, MiKTeX, GhostScript, ffmpeg, avconv, ImageMagick, and Inkscape.
- run `python -mpytest`.

1.2 Third-party distributions of Matplotlib

1.2.1 Scientific Python Distributions

Anaconda and ActiveState are excellent choices that "just work" out of the box for Windows, macOS and common Linux platforms. WinPython is an option for Windows users. All of these distributions include Matplotlib and *lots* of other useful (data) science tools.

1.2.2 Linux: using your package manager

If you are on Linux, you might prefer to use your package manager. Matplotlib is packaged for almost every major Linux distribution.

- Debian / Ubuntu: `sudo apt-get install python3-matplotlib`
- Fedora: `sudo dnf install python3-matplotlib`
- Red Hat: `sudo yum install python3-matplotlib`
- Arch: `sudo pacman -S python-matplotlib`

1.3 Installing from source

If you are interested in contributing to Matplotlib development, running the latest source code, or just like to build everything yourself, it is not difficult to build Matplotlib from source. Grab the latest *tar.gz* release file from the PyPI files page, or if you want to develop Matplotlib or just need the latest bugfixed version, grab the latest git version, and see *Install from source*.

Matplotlib can be installed from the source directory with a simple

```
python -m pip install .
```

We provide a setup.cfg file which you can use to customize the build process. For example, which default backend to use, whether some of the optional libraries that Matplotlib ships with are installed, and so on. This file will be particularly useful to those packaging Matplotlib.

1.3.1 Dependencies

Matplotlib requires the following dependencies:

- Python (>= 3.6)
- NumPy (>= 1.15)
- setuptools
- cycler (>= 0.10.0)
- dateutil (>= 2.1)
- kiwisolver (>= 1.0.0)
- Pillow (>= 6.2)
- pyparsing (>=2.0.3)

Optionally, you can also install a number of packages to enable better user interface toolkits. See *What is a backend?* for more details on the optional Matplotlib backends and the capabilities they provide.

- Tk (>= 8.3, != 8.6.0 or 8.6.1): for the Tk-based backends.
- PyQt4 (>= 4.6) or PySide (>= 1.0.3)[1]: for the Qt4-based backends.
- PyQt5 or PySide2: for the Qt5-based backends.
- PyGObject: for the GTK3-based backends[2].
- wxPython (>= 4)[3]: for the wx-based backends.
- pycairo (>= 1.11.0) or cairocffi (>= 0.8): for the GTK3 and/or cairo-based backends.
- Tornado: for the WebAgg backend.

For better support of animation output format and image file formats, LaTeX, etc., you can install the following:

- ffmpeg: for saving movies.
- ImageMagick: for saving animated gifs.
- LaTeX (with cm-super) and GhostScript (>=9.0) : for rendering text with LaTeX.
- fontconfig (>= 2.7): for detection of system fonts on Linux.

1.3.2 FreeType and Qhull

Matplotlib depends on FreeType (>= 2.3), a font rendering library, and on Qhull (>= 2015.2), a library for computing triangulations. By default (except on AIX) Matplotlib downloads and builds its own copy of FreeType (this is necessary to run the test suite, because different versions of FreeType rasterize characters differently), and uses its own copy of Qhull.

To force Matplotlib to use a copy of FreeType or Qhull already installed in your system, create a `setup.cfg` file with the following contents:

```
[libs]
system_freetype = true
system_qhull = true
```

before running `python -m pip install .`.

In this case, you need to install the FreeType and Qhull library and headers. This can be achieved using a package manager, e.g. for FreeType:

[1] PySide cannot be pip-installed on Linux (but can be conda-installed).

[2] If using pip (and not conda), PyGObject must be built from source; see https://pygobject.readthedocs.io/en/latest/devguide/dev_environ.html.

[3] If using pip (and not conda) on Linux, wxPython wheels must be manually downloaded from https://wxpython.org/pages/downloads/.

```
# Pick ONE of the following:
sudo apt install libfreetype6-dev  # Debian/Ubuntu
sudo dnf install freetype-devel  # Fedora
brew install freetype  # macOS with Homebrew
conda install freetype  # conda, any OS
```

(adapt accordingly for Qhull).

On Linux and macOS, it is also recommended to install pkg-config, a helper tool for locating FreeType:

```
# Pick ONE of the following:
sudo apt install pkg-config  # Debian/Ubuntu
sudo dnf install pkgconf  # Fedora
brew install pkg-config  # macOS with Homebrew
conda install pkg-config  # conda
# Or point the PKG_CONFIG environment variable to the path to pkg-config:
export PKG_CONFIG=...
```

If not using pkg-config (in particular on Windows), you may need to set the include path (to the library headers) and link path (to the libraries) explicitly, if they are not in standard locations. This can be done using standard environment variables -- on Linux and OSX:

```
export CFLAGS='-I/directory/containing/ft2build.h'
export LDFLAGS='-L/directory/containing/libfreetype.so'
```

and on Windows:

```
set CL=/IC:\directory\containing\ft2build.h
set LINK=/LIBPATH:C:\directory\containing\freetype.lib
```

Note: Matplotlib always uses its own copies of the following libraries:

- `Agg`: the Anti-Grain Geometry C++ rendering engine;
- `ttconv`: a TrueType font utility.

1.3.3 Building on Windows

Compiling Matplotlib (or any other extension module, for that matter) requires Visual Studio 2015 or later.

If you are building your own Matplotlib wheels (or sdists), note that any DLLs that you copy into the source tree will be packaged too.

1.3.4 Conda packages

The conda packaging scripts for Matplotlib are available at https://github.com/conda-forge/matplotlib-feedstock.

CHAPTER

TWO

TUTORIALS

This page contains more in-depth guides for using Matplotlib. It is broken up into beginner, intermediate, and advanced sections, as well as sections covering specific topics.

For shorter examples, see our examples page. You can also find external resources and a FAQ in our user guide.

2.1 Introductory

These tutorials cover the basics of creating visualizations with Matplotlib, as well as some best-practices in using the package effectively.

2.1.1 Usage Guide

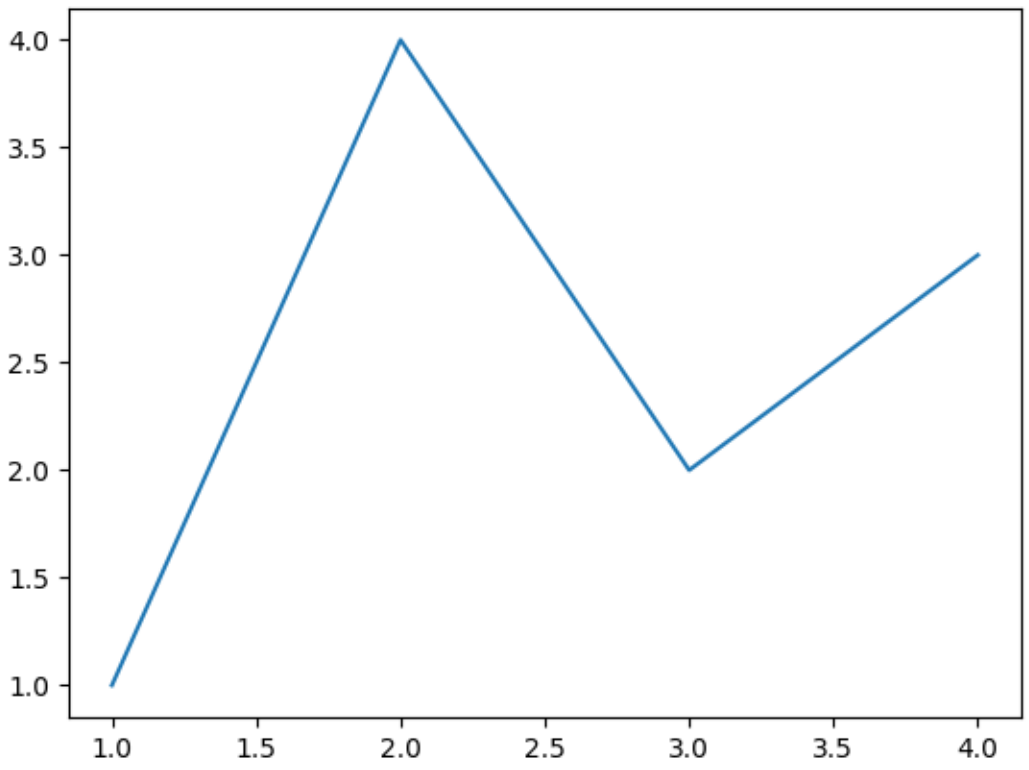
This tutorial covers some basic usage patterns and best-practices to help you get started with Matplotlib.

```
import matplotlib.pyplot as plt
import numpy as np
```

A simple example

Matplotlib graphs your data on *Figure*s (i.e., windows, Jupyter widgets, etc.), each of which can contain one or more *Axes* (i.e., an area where points can be specified in terms of x-y coordinates (or theta-r in a polar plot, or x-y-z in a 3D plot, etc.). The most simple way of creating a figure with an axes is using *pyplot.subplots*. We can then use *Axes.plot* to draw some data on the axes:

```
fig, ax = plt.subplots()  # Create a figure containing a single axes.
ax.plot([1, 2, 3, 4], [1, 4, 2, 3])  # Plot some data on the axes.
```



Out:

```
[<matplotlib.lines.Line2D object at 0x7f53fb3ae670>]
```

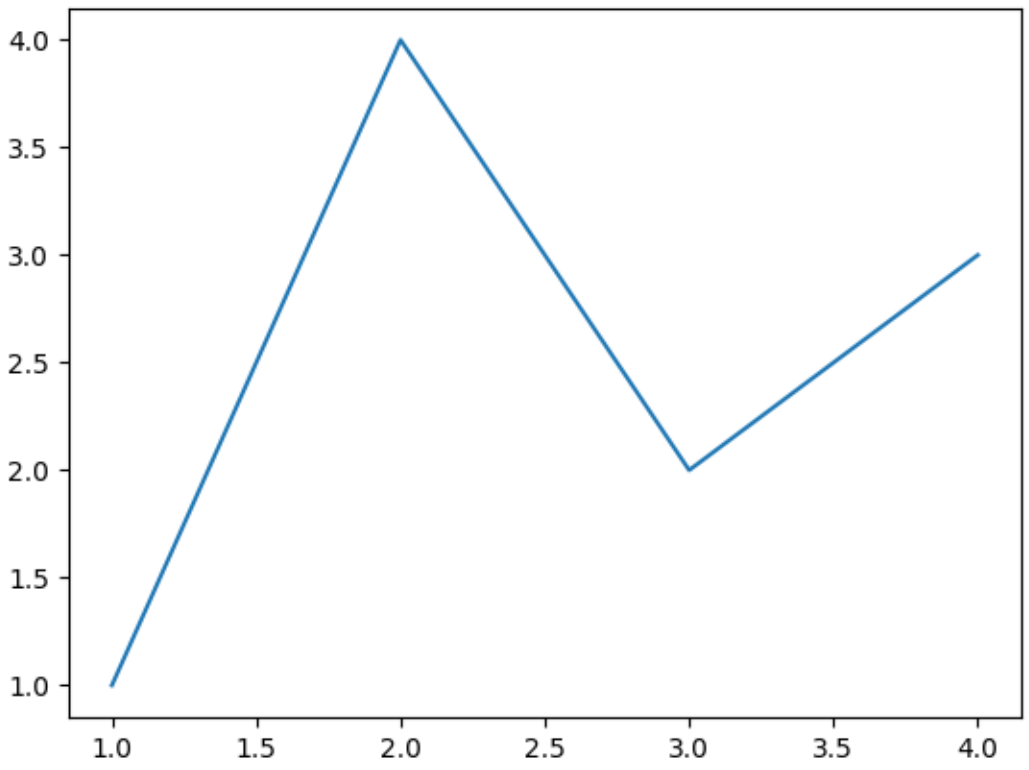
Many other plotting libraries or languages do not require you to explicitly create an axes. For example, in MATLAB, one can just do

```
plot([1, 2, 3, 4], [1, 4, 2, 3])  % MATLAB plot.
```

and get the desired graph.

In fact, you can do the same in Matplotlib: for each *Axes* graphing method, there is a corresponding function in the *matplotlib.pyplot* module that performs that plot on the "current" axes, creating that axes (and its parent figure) if they don't exist yet. So the previous example can be written more shortly as

```
plt.plot([1, 2, 3, 4], [1, 4, 2, 3])  # Matplotlib plot.
```

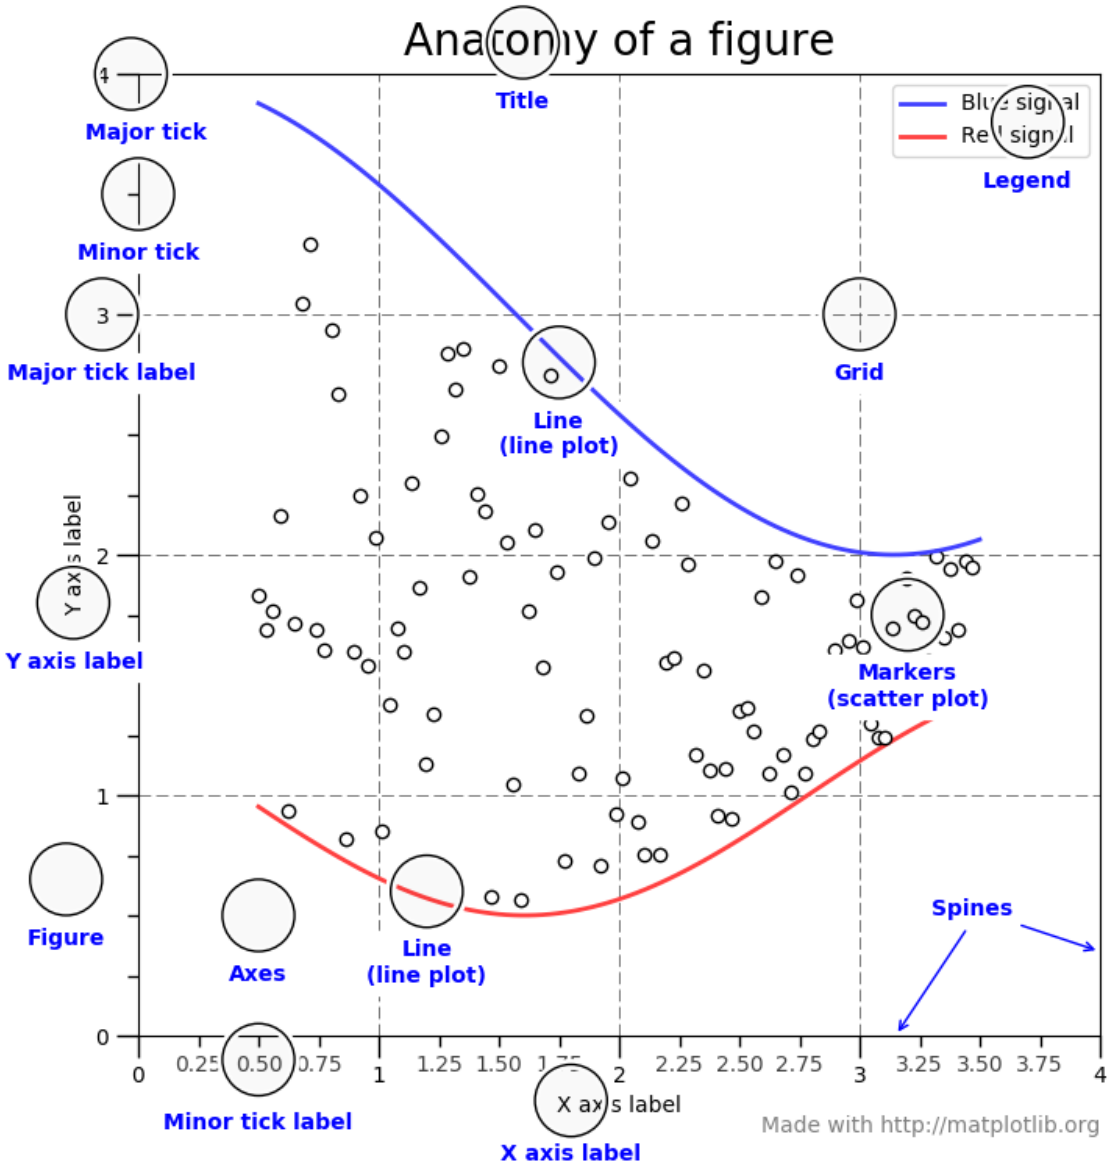


Out:

```
[<matplotlib.lines.Line2D object at 0x7f53ff82dc70>]
```

Parts of a Figure

Now, let's have a deeper look at the components of a Matplotlib figure.



`Figure`

The **whole** figure. The figure keeps track of all the child *`Axes`*, a smattering of 'special' artists (titles, figure legends, etc), and the **canvas**. (Don't worry too much about the canvas, it is crucial as it is the object that actually does the drawing to get you your plot, but as the user it is more-or-less invisible to you). A figure can contain any number of *`Axes`*, but will typically have at least one.

The easiest way to create a new figure is with pyplot:

```
fig = plt.figure()  # an empty figure with no Axes
fig, ax = plt.subplots()  # a figure with a single Axes
fig, axs = plt.subplots(2, 2)  # a figure with a 2x2 grid of Axes
```

It's convenient to create the axes together with the figure, but you can also add axes later on, allowing for more complex axes layouts.

Axes

This is what you think of as 'a plot', it is the region of the image with the data space. A given figure can contain many Axes, but a given *Axes* object can only be in one *Figure*. The Axes contains two (or three in the case of 3D) *Axis* objects (be aware of the difference between **Axes** and **Axis**) which take care of the data limits (the data limits can also be controlled via the *axes.Axes.set_xlim()* and *axes.Axes.set_ylim()* methods). Each *Axes* has a title (set via *set_title()*), an x-label (set via *set_xlabel()*), and a y-label set via *set_ylabel()*).

The *Axes* class and its member functions are the primary entry point to working with the OO interface.

Axis

These are the number-line-like objects. They take care of setting the graph limits and generating the ticks (the marks on the axis) and ticklabels (strings labeling the ticks). The location of the ticks is determined by a *Locator* object and the ticklabel strings are formatted by a *Formatter*. The combination of the correct *Locator* and *Formatter* gives very fine control over the tick locations and labels.

Artist

Basically everything you can see on the figure is an artist (even the *Figure*, *Axes*, and *Axis* objects). This includes *Text* objects, *Line2D* objects, *collections* objects, *Patch* objects ... (you get the idea). When the figure is rendered, all of the artists are drawn to the **canvas**. Most Artists are tied to an Axes; such an Artist cannot be shared by multiple Axes, or moved from one to another.

Types of inputs to plotting functions

All of plotting functions expect `numpy.array` or `numpy.ma.masked_array` as input. Classes that are 'array-like' such as `pandas` data objects and `numpy.matrix` may or may not work as intended. It is best to convert these to `numpy.array` objects prior to plotting.

For example, to convert a `pandas.DataFrame`

```
a = pandas.DataFrame(np.random.rand(4, 5), columns = list('abcde'))
a_asarray = a.values
```

and to convert a `numpy.matrix`

```
b = np.matrix([[1, 2], [3, 4]])
b_asarray = np.asarray(b)
```

The object-oriented interface and the pyplot interface

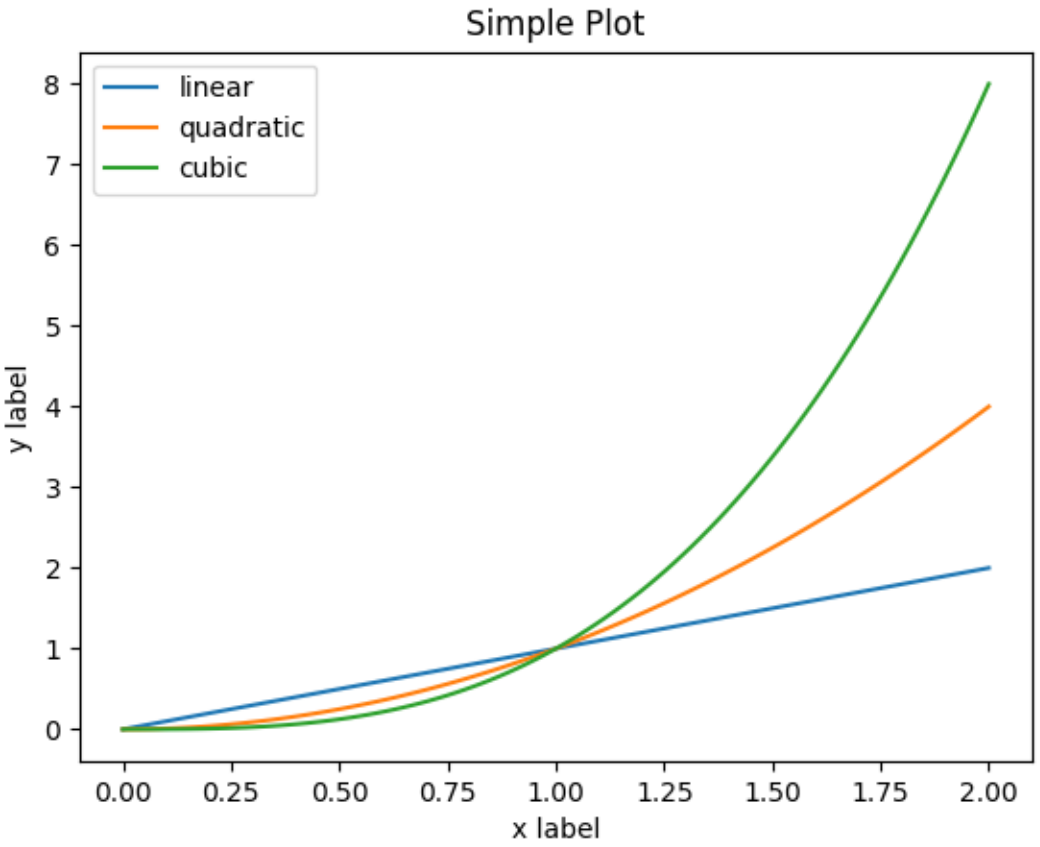
As noted above, there are essentially two ways to use Matplotlib:

- Explicitly create figures and axes, and call methods on them (the "object-oriented (OO) style").
- Rely on pyplot to automatically create and manage the figures and axes, and use pyplot functions for plotting.

So one can do (OO-style)

```
x = np.linspace(0, 2, 100)

# Note that even in the OO-style, we use `.pyplot.figure` to create the figure.
fig, ax = plt.subplots()  # Create a figure and an axes.
ax.plot(x, x, label='linear')  # Plot some data on the axes.
ax.plot(x, x**2, label='quadratic')  # Plot more data on the axes...
ax.plot(x, x**3, label='cubic')  # ... and some more.
ax.set_xlabel('x label')  # Add an x-label to the axes.
ax.set_ylabel('y label')  # Add a y-label to the axes.
ax.set_title("Simple Plot")  # Add a title to the axes.
ax.legend()  # Add a legend.
```



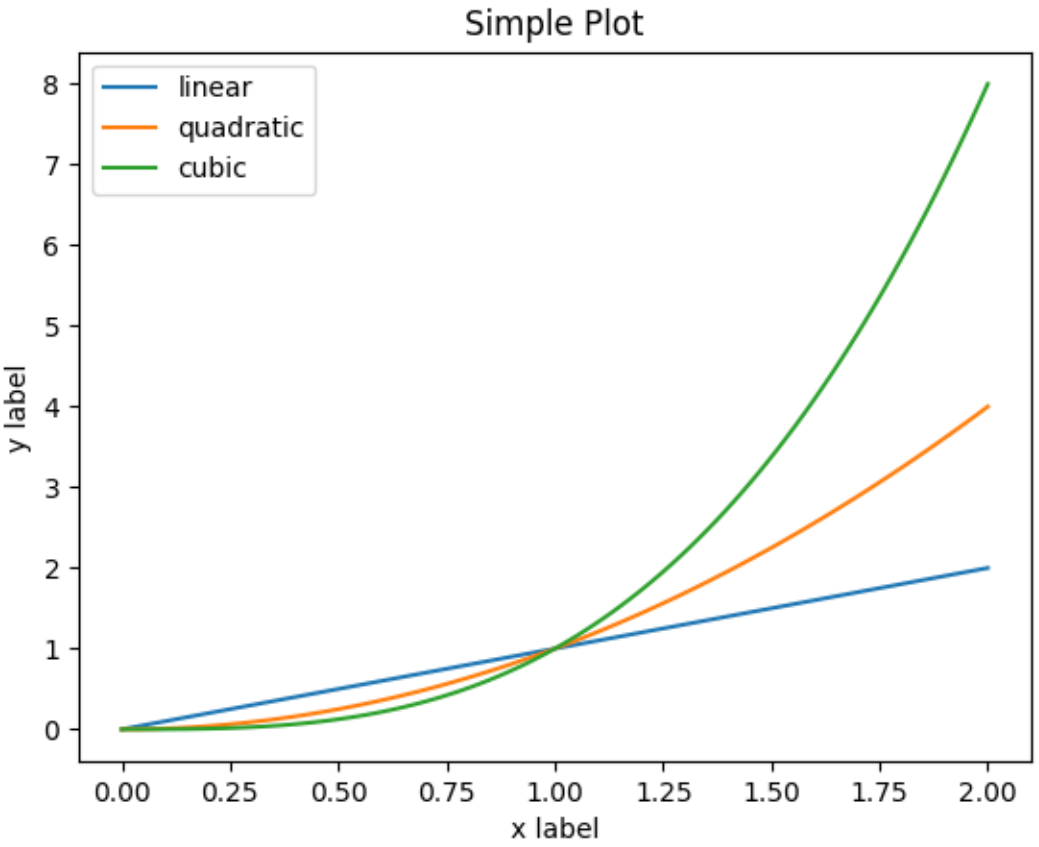
Out:

```
<matplotlib.legend.Legend object at 0x7f53fec96bb0>
```

or (pyplot-style)

```
x = np.linspace(0, 2, 100)

plt.plot(x, x, label='linear')  # Plot some data on the (implicit) axes.
plt.plot(x, x**2, label='quadratic')  # etc.
plt.plot(x, x**3, label='cubic')
plt.xlabel('x label')
plt.ylabel('y label')
plt.title("Simple Plot")
plt.legend()
```



Out:

```
<matplotlib.legend.Legend object at 0x7f53fedee070>
```

Actually there is a third approach, for the case where you are embedding Matplotlib in a GUI application, which completely drops pyplot, even for figure creation. We won't discuss it here; see the corresponding section in the gallery for more info (user_interfaces).

Matplotlib's documentation and examples use both the OO and the pyplot approaches (which are equally powerful), and you should feel free to use either (however, it is preferable pick one of them and stick to it, instead of mixing them). In general, we suggest to restrict pyplot to interactive plotting (e.g., in a Jupyter notebook), and to prefer the OO-style for non-interactive plotting (in functions and scripts that are intended to be reused as part of a larger project).

Note: In older examples, you may find examples that instead used the so-called `pylab` interface, via `from pylab import *`. This star-import imports everything both from pyplot and from `numpy`, so that one could do

```
x = linspace(0, 2, 100)
```

(continues on next page)

(continued from previous page)

```
plot(x, x, label='linear')
...
```

for an even more MATLAB-like style. This approach is strongly discouraged nowadays and deprecated; it is only mentioned here because you may still encounter it in the wild.

Typically one finds oneself making the same plots over and over again, but with different data sets, which leads to needing to write specialized functions to do the plotting. The recommended function signature is something like:

```
def my_plotter(ax, data1, data2, param_dict):
    """
    A helper function to make a graph

    Parameters
    ----------
    ax : Axes
        The axes to draw to

    data1 : array
       The x data

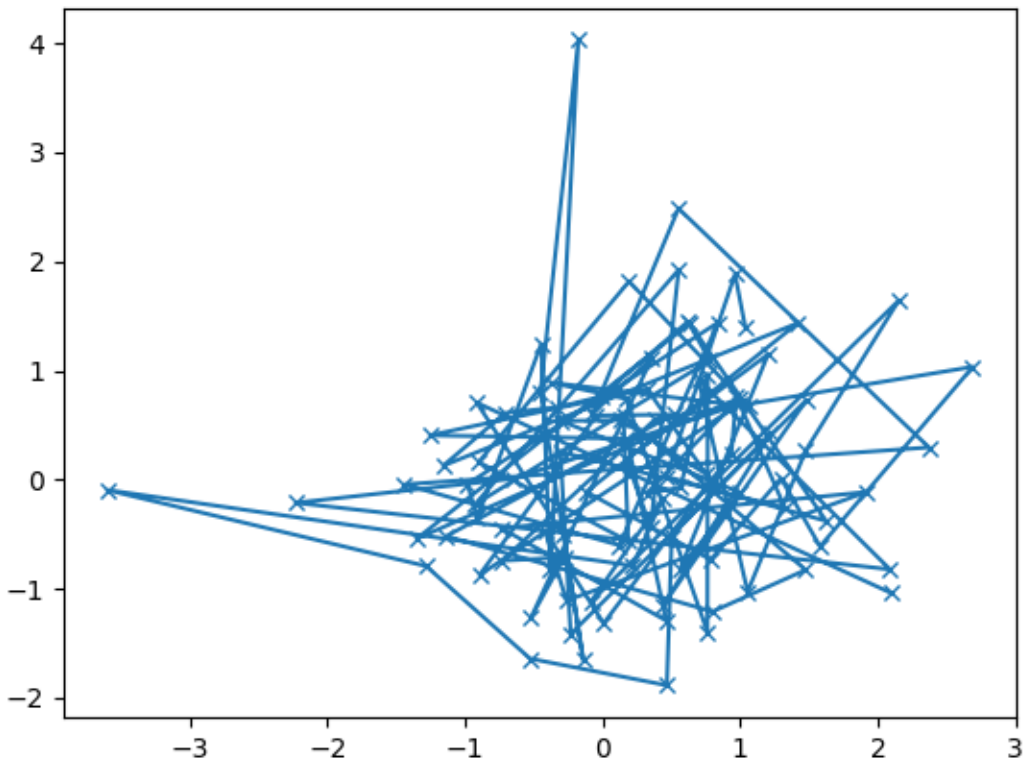
    data2 : array
       The y data

    param_dict : dict
       Dictionary of kwargs to pass to ax.plot

    Returns
    -------
    out : list
        list of artists added
    """
    out = ax.plot(data1, data2, **param_dict)
    return out
```

which you would then use as:

```
data1, data2, data3, data4 = np.random.randn(4, 100)
fig, ax = plt.subplots(1, 1)
my_plotter(ax, data1, data2, {'marker': 'x'})
```

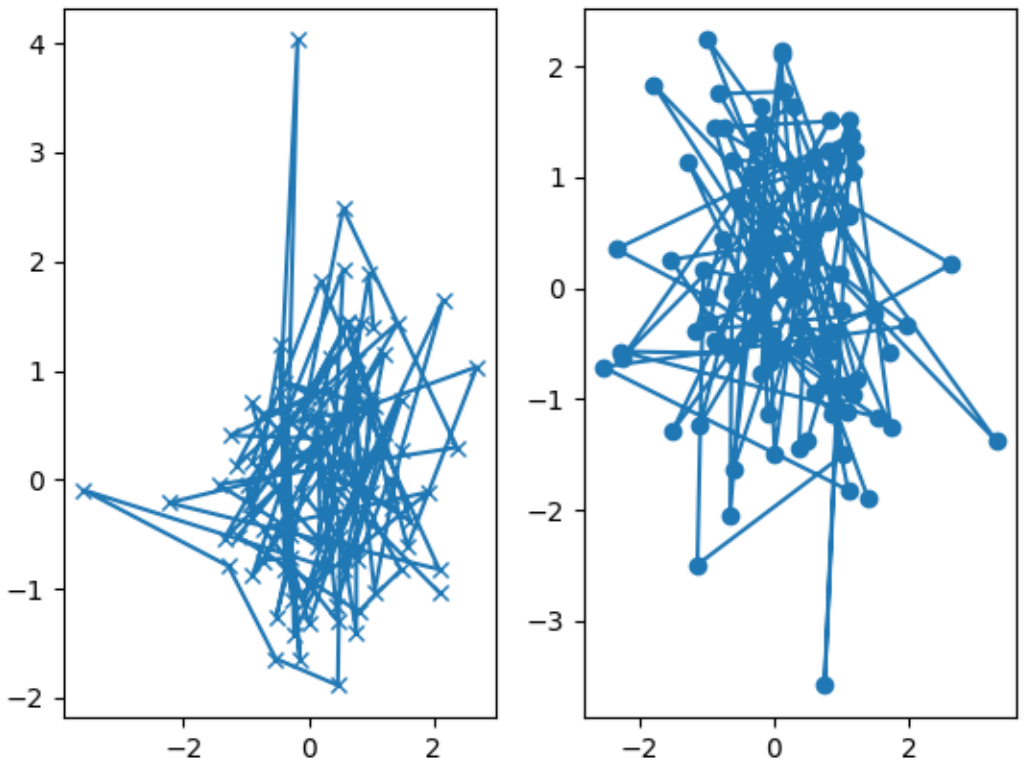


Out:

```
[<matplotlib.lines.Line2D object at 0x7f53fac8e730>]
```

or if you wanted to have 2 sub-plots:

```
fig, (ax1, ax2) = plt.subplots(1, 2)
my_plotter(ax1, data1, data2, {'marker': 'x'})
my_plotter(ax2, data3, data4, {'marker': 'o'})
```



Out:

```
[<matplotlib.lines.Line2D object at 0x7f540066d6d0>]
```

For these simple examples this style seems like overkill, however once the graphs get slightly more complex it pays off.

Backends

What is a backend?

A lot of documentation on the website and in the mailing lists refers to the "backend" and many new users are confused by this term. matplotlib targets many different use cases and output formats. Some people use matplotlib interactively from the python shell and have plotting windows pop up when they type commands. Some people run Jupyter notebooks and draw inline plots for quick data analysis. Others embed matplotlib into graphical user interfaces like wxpython or pygtk to build rich applications. Some people use matplotlib in batch scripts to generate postscript images from numerical simulations, and still others run web application servers to dynamically serve up graphs.

To support all of these use cases, matplotlib can target different outputs, and each of these capabilities is called a backend; the "frontend" is the user facing code, i.e., the plotting code, whereas the "backend" does all the hard work behind-the-scenes to make the figure. There are two types of backends: user interface backends (for use in pygtk, wxpython, tkinter, qt4, or macosx; also referred to as "interactive backends") and hardcopy backends to make image files (PNG, SVG, PDF, PS; also referred to as "non-interactive backends").

Selecting a backend

There are three ways to configure your backend:

1. The `rcParams["backend"]` (default: `'agg'`) parameter in your `matplotlibrc` file
2. The *MPLBACKEND* environment variable
3. The function *matplotlib.use()*

A more detailed description is given below.

If multiple of these are configurations are present, the last one from the list takes precedence; e.g. calling *matplotlib.use()* will override the setting in your `matplotlibrc`.

If no backend is explicitly set, Matplotlib automatically detects a usable backend based on what is available on your system and on whether a GUI event loop is already running. On Linux, if the environment variable *DISPLAY* is unset, the "event loop" is identified as "headless", which causes a fallback to a noninteractive backend (agg).

Here is a detailed description of the configuration methods:

1. Setting `rcParams["backend"]` (default: `'agg'`) in your `matplotlibrc` file:

   ```
   backend : qt5agg   # use pyqt5 with antigrain (agg) rendering
   ```

   See also *Customizing Matplotlib with style sheets and rcParams*.

2. Setting the *MPLBACKEND* environment variable:

   You can set the environment variable either for your current shell or for a single script.

   On Unix:

   ```
   > export MPLBACKEND=qt5agg
   > python simple_plot.py

   > MPLBACKEND=qt5agg python simple_plot.py
   ```

   On Windows, only the former is possible:

```
> set MPLBACKEND=qt5agg
> python simple_plot.py
```

Setting this environment variable will override the `backend` parameter in *any* `matplotlibrc`, even if there is a `matplotlibrc` in your current working directory. Therefore, setting *MPLBACKEND* globally, e.g. in your `.bashrc` or `.profile`, is discouraged as it might lead to counter-intuitive behavior.

3. If your script depends on a specific backend you can use the function *matplotlib.use()*:

```
import matplotlib
matplotlib.use('qt5agg')
```

This should be done before any figure is created; otherwise Matplotlib may fail to switch the backend and raise an ImportError.

Using *use* will require changes in your code if users want to use a different backend. Therefore, you should avoid explicitly calling *use* unless absolutely necessary.

The builtin backends

By default, Matplotlib should automatically select a default backend which allows both interactive work and plotting from scripts, with output to the screen and/or to a file, so at least initially you will not need to worry about the backend. The most common exception is if your Python distribution comes without `tkinter` and you have no other GUI toolkit installed; this happens on certain Linux distributions, where you need to install a Linux package named `python-tk` (or similar).

If, however, you want to write graphical user interfaces, or a web application server (*How to use Matplotlib in a web application server*), or need a better understanding of what is going on, read on. To make things a little more customizable for graphical user interfaces, matplotlib separates the concept of the renderer (the thing that actually does the drawing) from the canvas (the place where the drawing goes). The canonical renderer for user interfaces is `Agg` which uses the Anti-Grain Geometry C++ library to make a raster (pixel) image of the figure; it is used by the `Qt5Agg`, `Qt4Agg`, `GTK3Agg`, `wxAgg`, `TkAgg`, and `macosx` backends. An alternative renderer is based on the Cairo library, used by `Qt5Cairo`, `Qt4Cairo`, etc.

For the rendering engines, one can also distinguish between vector or raster renderers. Vector graphics languages issue drawing commands like "draw a line from this point to this point" and hence are scale free, and raster backends generate a pixel representation of the line whose accuracy depends on a DPI setting.

Here is a summary of the matplotlib renderers (there is an eponymous backend for each; these are *non-interactive backends*, capable of writing to a file):

Renderer	Filetypes	Description
AGG	png	raster graphics -- high quality images using the Anti-Grain Geometry engine
PDF	pdf	vector graphics -- Portable Document Format
PS	ps, eps	vector graphics -- Postscript output
SVG	svg	vector graphics -- Scalable Vector Graphics
PGF	pgf, pdf	vector graphics -- using the pgf package
Cairo	png, ps, pdf, svg	raster or vector graphics -- using the Cairo library

To save plots using the non-interactive backends, use the `matplotlib.pyplot.savefig('filename')` method.

And here are the user interfaces and renderer combinations supported; these are *interactive backends*, capable of displaying to the screen and of using appropriate renderers from the table above to write to a file:

Backend	Description
Qt5Agg	Agg rendering in a *Qt5* canvas (requires PyQt5). This backend can be activated in IPython with `%matplotlib qt5`.
ipympl	Agg rendering embedded in a Jupyter widget. (requires ipympl). This backend can be enabled in a Jupyter notebook with `%matplotlib ipympl`.
GTK3Agg	Agg rendering to a *GTK* 3.x canvas (requires PyGObject, and pycairo or cairocffi). This backend can be activated in IPython with `%matplotlib gtk3`.
macosx	Agg rendering into a Cocoa canvas in OSX. This backend can be activated in IPython with `%matplotlib osx`.
TkAgg	Agg rendering to a *Tk* canvas (requires TkInter). This backend can be activated in IPython with `%matplotlib tk`.
nbAgg	Embed an interactive figure in a Jupyter classic notebook. This backend can be enabled in Jupyter notebooks via `%matplotlib notebook`.
WebAgg	On `show()` will start a tornado server with an interactive figure.
GTK3Cairo	Cairo rendering to a *GTK* 3.x canvas (requires PyGObject, and pycairo or cairocffi).
Qt4Agg	Agg rendering to a *Qt4* canvas (requires PyQt4 or `pyside`). This backend can be activated in IPython with `%matplotlib qt4`.
wxAgg	Agg rendering to a *wxWidgets* canvas (requires wxPython 4). This backend can be activated in IPython with `%matplotlib wx`.

Note: The names of builtin backends case-insensitive; e.g., 'Qt5Agg' and 'qt5agg' are equivalent.

ipympl

The Jupyter widget ecosystem is moving too fast to support directly in Matplotlib. To install ipympl

```
pip install ipympl
jupyter nbextension enable --py --sys-prefix ipympl
```

or

```
conda install ipympl -c conda-forge
```

See jupyter-matplotlib for more details.

How do I select PyQt4 or PySide?

The *QT_API* environment variable can be set to either `pyqt` or `pyside` to use `PyQt4` or `PySide`, respectively.

Since the default value for the bindings to be used is `PyQt4`, Matplotlib first tries to import it, if the import fails, it tries to import `PySide`.

Using non-builtin backends

More generally, any importable backend can be selected by using any of the methods above. If `name.of.the.backend` is the module containing the backend, use `module://name.of.the.backend` as the backend name, e.g. `matplotlib.use('module://name.of.the.backend')`.

What is interactive mode?

Use of an interactive backend (see *What is a backend?*) permits--but does not by itself require or ensure--plotting to the screen. Whether and when plotting to the screen occurs, and whether a script or shell session continues after a plot is drawn on the screen, depends on the functions and methods that are called, and on a state variable that determines whether matplotlib is in "interactive mode". The default Boolean value is set by the `matplotlibrc` file, and may be customized like any other configuration parameter (see *Customizing Matplotlib with style sheets and rcParams*). It may also be set via *matplotlib.interactive()*, and its value may be queried via *matplotlib.is_interactive()*. Turning interactive mode on and off in the middle of a stream of plotting commands, whether in a script or in a shell, is rarely needed and potentially confusing, so in the following we will assume all plotting is done with interactive mode either on or off.

Note: Major changes related to interactivity, and in particular the role and behavior of *show()*, were made in the transition to matplotlib version 1.0, and bugs were fixed in 1.0.1. Here we describe the version 1.0.1 behavior for the primary interactive backends, with the partial exception of *macosx*.

Interactive mode may also be turned on via *matplotlib.pyplot.ion()*, and turned off via *matplotlib.pyplot.ioff()*.

Note: Interactive mode works with suitable backends in ipython and in the ordinary python shell, but it does *not* work in the IDLE IDE. If the default backend does not support interactivity, an interactive backend can be explicitly activated using any of the methods discussed in *What is a backend?*.

Interactive example

From an ordinary python prompt, or after invoking ipython with no options, try this:

```
import matplotlib.pyplot as plt
plt.ion()
plt.plot([1.6, 2.7])
```

This will pop up a plot window. Your terminal prompt will remain active, so that you can type additional commands such as:

```
plt.title("interactive test")
plt.xlabel("index")
```

On most interactive backends, the figure window will also be updated if you change it via the object-oriented interface. E.g. get a reference to the *Axes* instance, and call a method of that instance:

```
ax = plt.gca()
ax.plot([3.1, 2.2])
```

If you are using certain backends (like `macosx`), or an older version of matplotlib, you may not see the new line added to the plot immediately. In this case, you need to explicitly call *draw()* in order to update the plot:

```
plt.draw()
```

Non-interactive example

Start a fresh session as in the previous example, but now turn interactive mode off:

```
import matplotlib.pyplot as plt
plt.ioff()
plt.plot([1.6, 2.7])
```

Nothing happened--or at least nothing has shown up on the screen (unless you are using *macosx* backend, which is anomalous). To make the plot appear, you need to do this:

```
plt.show()
```

Now you see the plot, but your terminal command line is unresponsive; *pyplot.show() blocks* the input of additional commands until you manually kill the plot window.

What good is this--being forced to use a blocking function? Suppose you need a script that plots the contents of a file to the screen. You want to look at that plot, and then end the script. Without some blocking command such as `show()`, the script would flash up the plot and then end immediately, leaving nothing on the screen.

In addition, non-interactive mode delays all drawing until `show()` is called; this is more efficient than redrawing the plot each time a line in the script adds a new feature.

Prior to version 1.0, `show()` generally could not be called more than once in a single script (although sometimes one could get away with it); for version 1.0.1 and above, this restriction is lifted, so one can write a script like this:

```
import numpy as np
import matplotlib.pyplot as plt

plt.ioff()
for i in range(3):
    plt.plot(np.random.rand(10))
    plt.show()
```

which makes three plots, one at a time. I.e. the second plot will show up, once the first plot is closed.

Summary

In interactive mode, pyplot functions automatically draw to the screen.

When plotting interactively, if using object method calls in addition to pyplot functions, then call *draw()* whenever you want to refresh the plot.

Use non-interactive mode in scripts in which you want to generate one or more figures and display them before ending or generating a new set of figures. In that case, use *show()* to display the figure(s) and to block execution until you have manually destroyed them.

Performance

Whether exploring data in interactive mode or programmatically saving lots of plots, rendering performance can be a painful bottleneck in your pipeline. Matplotlib provides a couple ways to greatly reduce rendering time at the cost of a slight change (to a settable tolerance) in your plot's appearance. The methods available to reduce rendering time depend on the type of plot that is being created.

Line segment simplification

For plots that have line segments (e.g. typical line plots, outlines of polygons, etc.), rendering performance can be controlled by `rcParams["path.simplify"]` (default: `True`) and `rcParams["path.simplify_threshold"]` (default: `0.111111111111`), which can be defined e.g. in the `matplotlibrc` file (see *Customizing Matplotlib with style sheets and rcParams* for more information about the `matplotlibrc` file). `rcParams["path.simplify"]` (default: `True`) is a boolean indicating whether or not line segments are simplified at all. `rcParams["path.simplify_threshold"]` (default: `0.111111111111`) controls how much line segments are simplified; higher thresholds result in quicker rendering.

The following script will first display the data without any simplification, and then display the same data with simplification. Try interacting with both of them:

```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib as mpl

# Setup, and create the data to plot
y = np.random.rand(100000)
y[50000:] *= 2
y[np.geomspace(10, 50000, 400).astype(int)] = -1
mpl.rcParams['path.simplify'] = True

mpl.rcParams['path.simplify_threshold'] = 0.0
plt.plot(y)
plt.show()

mpl.rcParams['path.simplify_threshold'] = 1.0
plt.plot(y)
plt.show()
```

Matplotlib currently defaults to a conservative simplification threshold of `1/9`. If you want to change your default settings to use a different value, you can change your `matplotlibrc` file. Alternatively, you could create a new style for interactive plotting (with maximal simplification) and another style for publication quality plotting (with minimal simplification) and activate them as necessary. See *Customizing Matplotlib with style sheets and rcParams* for instructions on how to perform these actions.

The simplification works by iteratively merging line segments into a single vector until the next line segment's perpendicular distance to the vector (measured in display-coordinate space) is greater than the `path.simplify_threshold` parameter.

Note: Changes related to how line segments are simplified were made in version 2.1. Rendering time will still be improved by these parameters prior to 2.1, but rendering time for some kinds of data will be vastly improved in versions 2.1 and greater.

Marker simplification

Markers can also be simplified, albeit less robustly than line segments. Marker simplification is only available to *Line2D* objects (through the `markevery` property). Wherever *Line2D* construction parameters are passed through, such as *matplotlib.pyplot.plot()* and *matplotlib.axes.Axes.plot()*, the `markevery` parameter can be used:

```
plt.plot(x, y, markevery=10)
```

The markevery argument allows for naive subsampling, or an attempt at evenly spaced (along the *x* axis) sampling. See the /gallery/lines_bars_and_markers/markevery_demo for more information.

Splitting lines into smaller chunks

If you are using the Agg backend (see *What is a backend?*), then you can make use of `rcParams["agg.path.chunksize"]` (default: `0`) This allows you to specify a chunk size, and any lines with greater than that many vertices will be split into multiple lines, each of which has no more than `agg.path.chunksize` many vertices. (Unless `agg.path.chunksize` is zero, in which case there is no chunking.) For some kind of data, chunking the line up into reasonable sizes can greatly decrease rendering time.

The following script will first display the data without any chunk size restriction, and then display the same data with a chunk size of 10,000. The difference can best be seen when the figures are large, try maximizing the GUI and then interacting with them:

```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib as mpl
mpl.rcParams['path.simplify_threshold'] = 1.0

# Setup, and create the data to plot
y = np.random.rand(100000)
y[50000:] *= 2
y[np.geomspace(10, 50000, 400).astype(int)] = -1
mpl.rcParams['path.simplify'] = True

mpl.rcParams['agg.path.chunksize'] = 0
plt.plot(y)
plt.show()
```

(continues on next page)

(continued from previous page)

```
mpl.rcParams['agg.path.chunksize'] = 10000
plt.plot(y)
plt.show()
```

Legends

The default legend behavior for axes attempts to find the location that covers the fewest data points (`loc='best'`). This can be a very expensive computation if there are lots of data points. In this case, you may want to provide a specific location.

Using the *fast* style

The *fast* style can be used to automatically set simplification and chunking parameters to reasonable settings to speed up plotting large amounts of data. It can be used simply by running:

```
import matplotlib.style as mplstyle
mplstyle.use('fast')
```

It is very light weight, so it plays nicely with other styles, just make sure the fast style is applied last so that other styles do not overwrite the settings:

```
mplstyle.use(['dark_background', 'ggplot', 'fast'])
```

Total running time of the script: (0 minutes 2.252 seconds)

2.1.2 Pyplot tutorial

An introduction to the pyplot interface.

Intro to pyplot

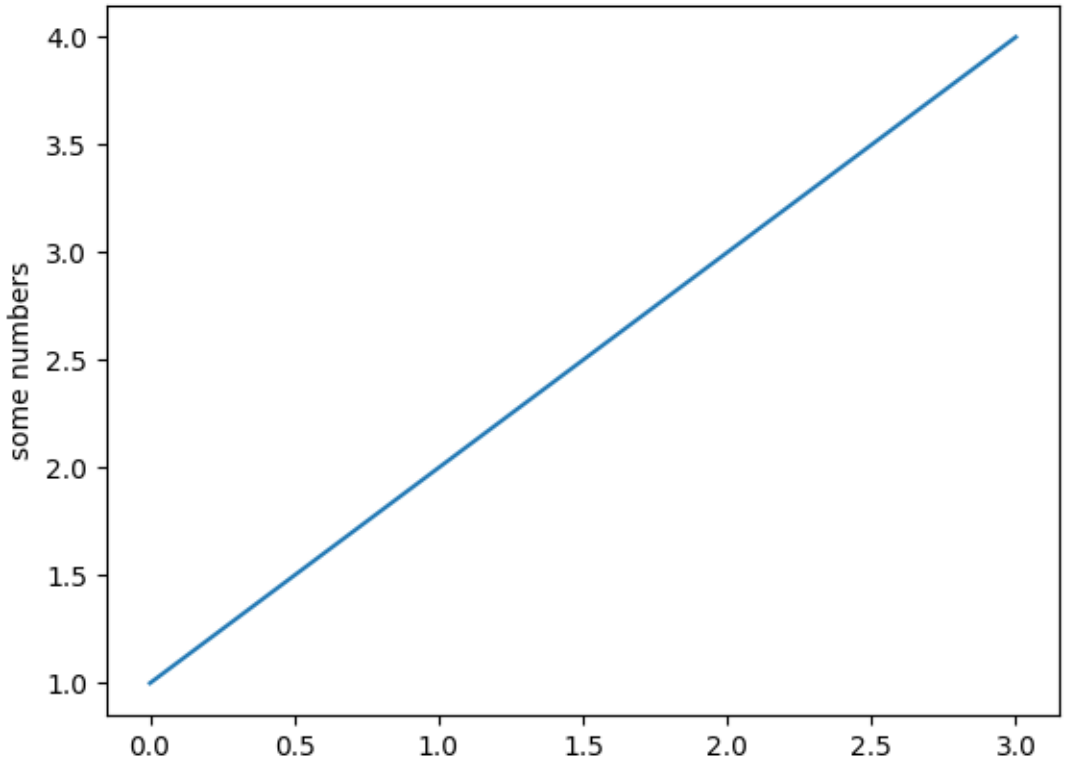
matplotlib.pyplot is a collection of functions that make matplotlib work like MATLAB. Each `pyplot` function makes some change to a figure: e.g., creates a figure, creates a plotting area in a figure, plots some lines in a plotting area, decorates the plot with labels, etc.

In *matplotlib.pyplot* various states are preserved across function calls, so that it keeps track of things like the current figure and plotting area, and the plotting functions are directed to the current axes (please note that "axes" here and in most places in the documentation refers to the *axes part of a figure* and not the strict mathematical term for more than one axis).

Note: the pyplot API is generally less-flexible than the object-oriented API. Most of the function calls you see here can also be called as methods from an `Axes` object. We recommend browsing the tutorials and examples to see how this works.

Generating visualizations with pyplot is very quick:

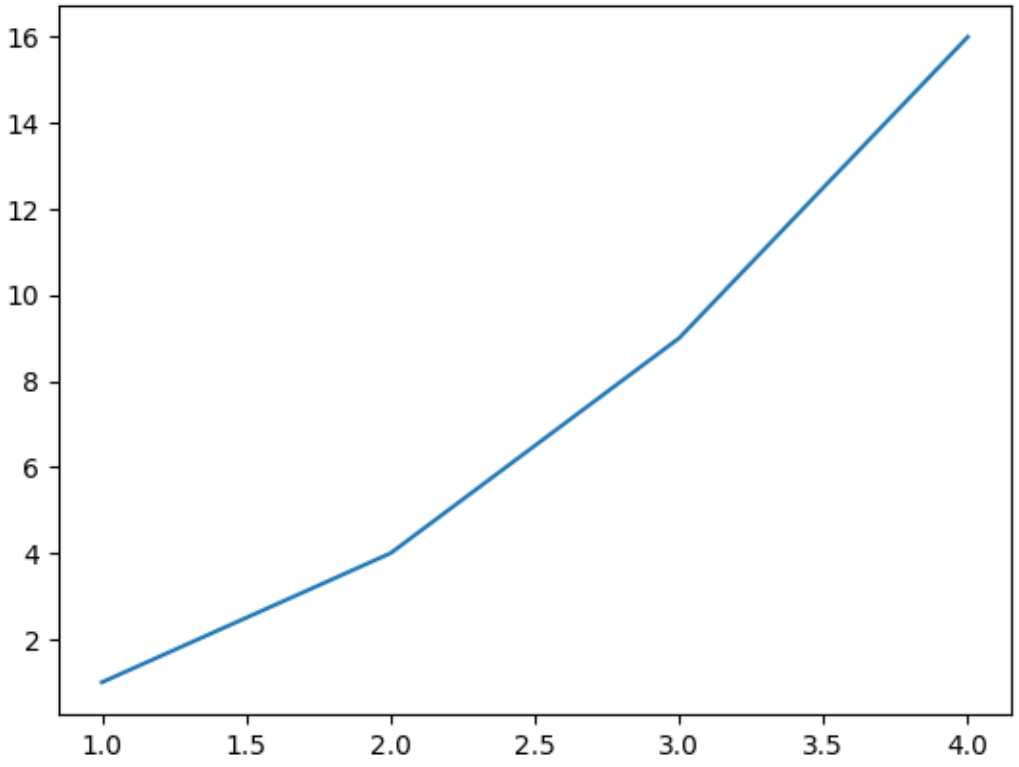
```
import matplotlib.pyplot as plt
plt.plot([1, 2, 3, 4])
plt.ylabel('some numbers')
plt.show()
```



You may be wondering why the x-axis ranges from 0-3 and the y-axis from 1-4. If you provide a single list or array to *plot*, matplotlib assumes it is a sequence of y values, and automatically generates the x values for you. Since python ranges start with 0, the default x vector has the same length as y but starts with 0. Hence the x data are `[0, 1, 2, 3]`.

plot is a versatile function, and will take an arbitrary number of arguments. For example, to plot x versus y, you can write:

```
plt.plot([1, 2, 3, 4], [1, 4, 9, 16])
```



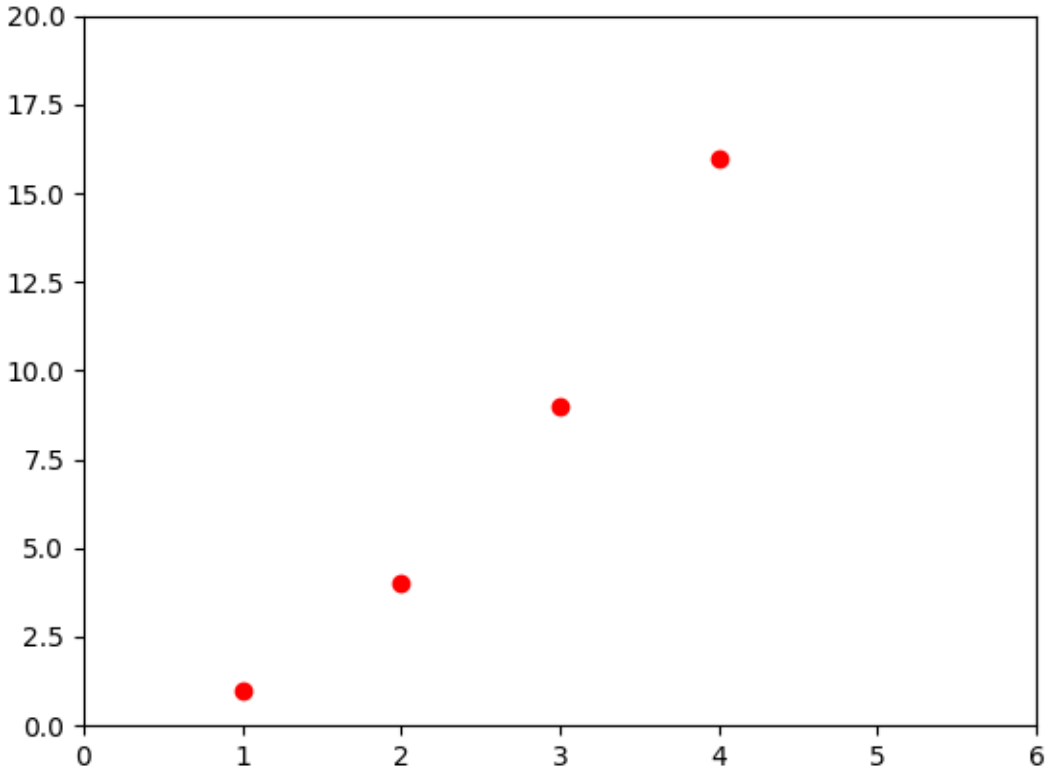
Out:

```
[<matplotlib.lines.Line2D object at 0x7f53fecaa520>]
```

Formatting the style of your plot

For every x, y pair of arguments, there is an optional third argument which is the format string that indicates the color and line type of the plot. The letters and symbols of the format string are from MATLAB, and you concatenate a color string with a line style string. The default format string is 'b-', which is a solid blue line. For example, to plot the above with red circles, you would issue

```
plt.plot([1, 2, 3, 4], [1, 4, 9, 16], 'ro')
plt.axis([0, 6, 0, 20])
plt.show()
```



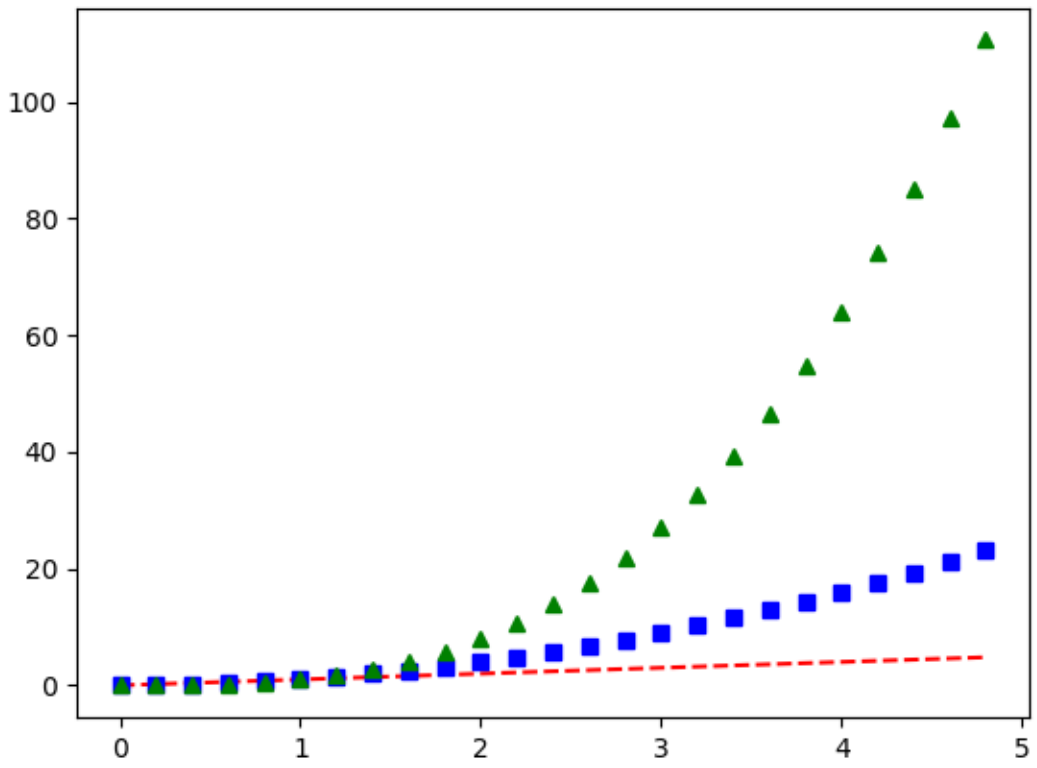
See the *plot* documentation for a complete list of line styles and format strings. The *axis* function in the example above takes a list of `[xmin, xmax, ymin, ymax]` and specifies the viewport of the axes.

If matplotlib were limited to working with lists, it would be fairly useless for numeric processing. Generally, you will use numpy arrays. In fact, all sequences are converted to numpy arrays internally. The example below illustrates plotting several lines with different format styles in one function call using arrays.

```
import numpy as np

# evenly sampled time at 200ms intervals
t = np.arange(0., 5., 0.2)

# red dashes, blue squares and green triangles
plt.plot(t, t, 'r--', t, t**2, 'bs', t, t**3, 'g^')
plt.show()
```



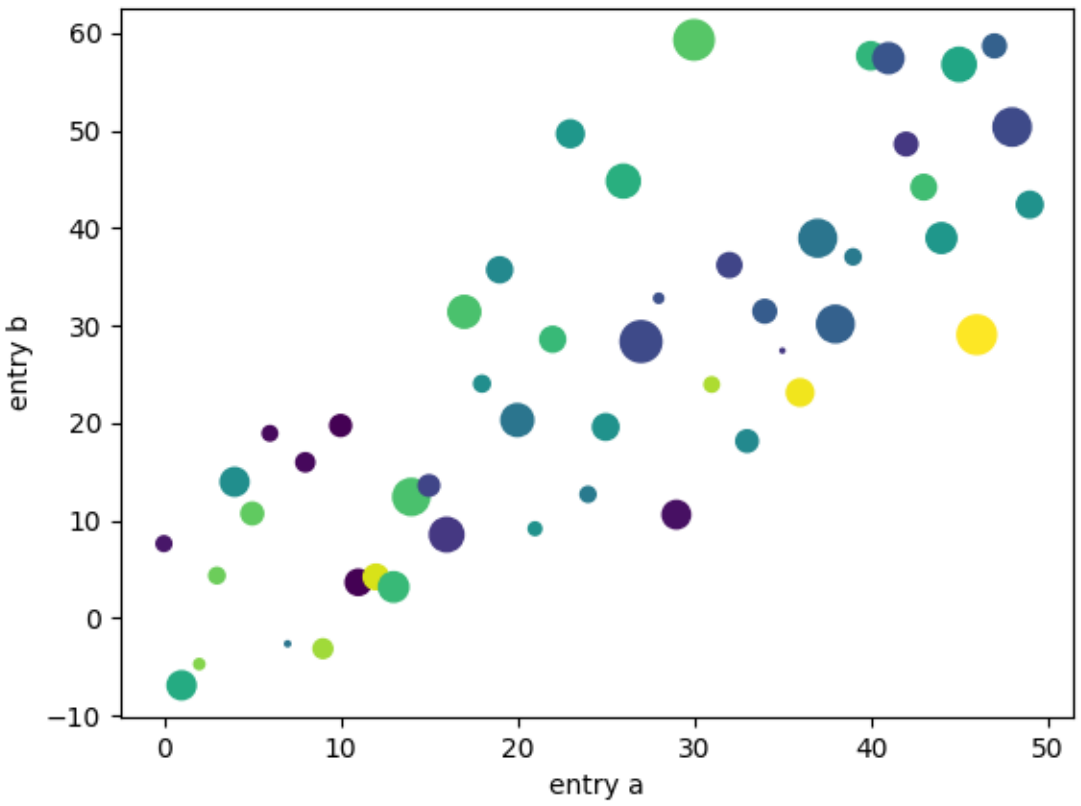
Plotting with keyword strings

There are some instances where you have data in a format that lets you access particular variables with strings. For example, with `numpy.recarray` or `pandas.DataFrame`.

Matplotlib allows you provide such an object with the `data` keyword argument. If provided, then you may generate plots with the strings corresponding to these variables.

```
data = {'a': np.arange(50),
        'c': np.random.randint(0, 50, 50),
        'd': np.random.randn(50)}
data['b'] = data['a'] + 10 * np.random.randn(50)
data['d'] = np.abs(data['d']) * 100

plt.scatter('a', 'b', c='c', s='d', data=data)
plt.xlabel('entry a')
plt.ylabel('entry b')
plt.show()
```



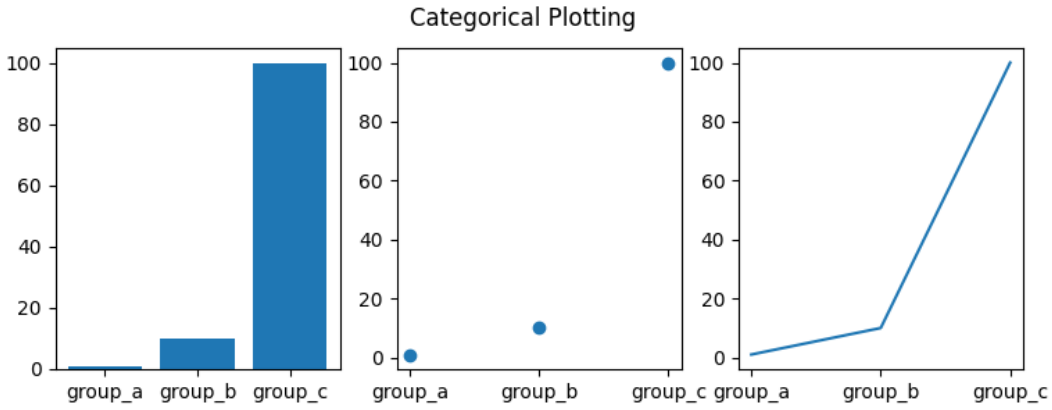
Plotting with categorical variables

It is also possible to create a plot using categorical variables. Matplotlib allows you to pass categorical variables directly to many plotting functions. For example:

```
names = ['group_a', 'group_b', 'group_c']
values = [1, 10, 100]

plt.figure(figsize=(9, 3))

plt.subplot(131)
plt.bar(names, values)
plt.subplot(132)
plt.scatter(names, values)
plt.subplot(133)
plt.plot(names, values)
plt.suptitle('Categorical Plotting')
plt.show()
```



Controlling line properties

Lines have many attributes that you can set: linewidth, dash style, antialiased, etc; see *matplotlib.lines.Line2D*. There are several ways to set line properties

- Use keyword args:

```
plt.plot(x, y, linewidth=2.0)
```

- Use the setter methods of a `Line2D` instance. `plot` returns a list of `Line2D` objects; e.g., `line1, line2 = plot(x1, y1, x2, y2)`. In the code below we will suppose that we have only one line so that the list returned is of length 1. We use tuple unpacking with `line,` to get the first element of that list:

```
line, = plt.plot(x, y, '-')
line.set_antialiased(False) # turn off antialiasing
```

- Use *setp*. The example below uses a MATLAB-style function to set multiple properties on a list of lines. `setp` works transparently with a list of objects or a single object. You can either use python keyword arguments or MATLAB-style string/value pairs:

```
lines = plt.plot(x1, y1, x2, y2)
# use keyword args
plt.setp(lines, color='r', linewidth=2.0)
# or MATLAB style string value pairs
plt.setp(lines, 'color', 'r', 'linewidth', 2.0)
```

Here are the available *Line2D* properties.

Property	Value Type
alpha	float
animated	[True | False]
antialiased or aa	[True | False]
clip_box	a matplotlib.transform.Bbox instance

continues on next page

Table 1 – continued from previous page

Property	Value Type
clip_on	[True | False]
clip_path	a Path instance and a Transform instance, a Patch
color or c	any matplotlib color
contains	the hit testing function
dash_capstyle	['butt' | 'round' | 'projecting']
dash_joinstyle	['miter' | 'round' | 'bevel']
dashes	sequence of on/off ink in points
data	(np.array xdata, np.array ydata)
figure	a matplotlib.figure.Figure instance
label	any string
linestyle or ls	['-' | '--' | '-.' | ':' | 'steps' | ...]
linewidth or lw	float value in points
marker	['+' | ',' | '.' | '1' | '2' | '3' | '4']
markeredgecolor or mec	any matplotlib color
markeredgewidth or mew	float value in points
markerfacecolor or mfc	any matplotlib color
markersize or ms	float
markevery	[None | integer | (startind, stride)]
picker	used in interactive line selection
pickradius	the line pick selection radius
solid_capstyle	['butt' | 'round' | 'projecting']
solid_joinstyle	['miter' | 'round' | 'bevel']
transform	a matplotlib.transforms.Transform instance
visible	[True | False]
xdata	np.array
ydata	np.array
zorder	any number

To get a list of settable line properties, call the *setp* function with a line or lines as argument

```
In [69]: lines = plt.plot([1, 2, 3])

In [70]: plt.setp(lines)
  alpha: float
  animated: [True | False]
  antialiased or aa: [True | False]
  ...snip
```

Working with multiple figures and axes

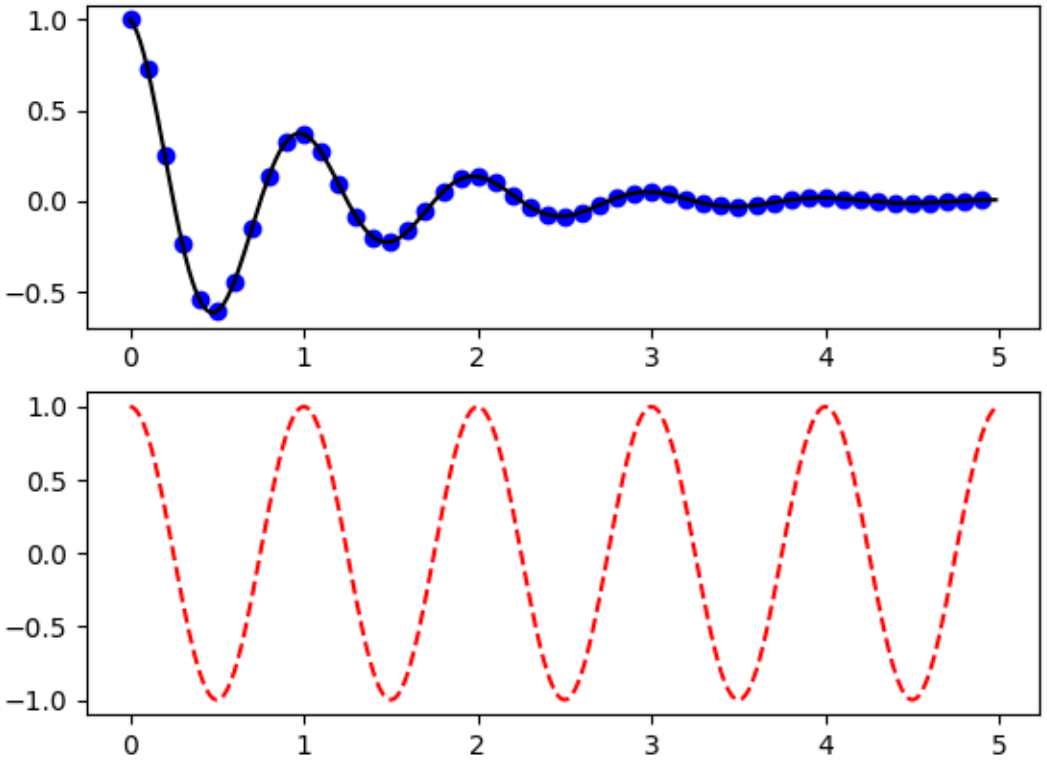
MATLAB, and *pyplot*, have the concept of the current figure and the current axes. All plotting functions apply to the current axes. The function *gca* returns the current axes (a *matplotlib.axes.Axes* instance), and *gcf* returns the current figure (a *matplotlib.figure.Figure* instance). Normally, you don't have to worry about this, because it is all taken care of behind the scenes. Below is a script to create two subplots.

```
def f(t):
    return np.exp(-t) * np.cos(2*np.pi*t)

t1 = np.arange(0.0, 5.0, 0.1)
t2 = np.arange(0.0, 5.0, 0.02)

plt.figure()
plt.subplot(211)
plt.plot(t1, f(t1), 'bo', t2, f(t2), 'k')

plt.subplot(212)
plt.plot(t2, np.cos(2*np.pi*t2), 'r--')
plt.show()
```



The *figure* call here is optional because `figure(1)` will be created by default, just as

a `subplot(111)` will be created by default if you don't manually specify any axes. The *subplot* call specifies `numrows, numcols, plot_number` where `plot_number` ranges from 1 to `numrows*numcols`. The commas in the `subplot` call are optional if `numrows*numcols<10`. So `subplot(211)` is identical to `subplot(2, 1, 1)`.

You can create an arbitrary number of subplots and axes. If you want to place an axes manually, i.e., not on a rectangular grid, use *axes*, which allows you to specify the location as `axes([left, bottom, width, height])` where all values are in fractional (0 to 1) coordinates. See /gallery/subplots_axes_and_figures/axes_demo for an example of placing axes manually and /gallery/subplots_axes_and_figures/subplot_demo for an example with lots of subplots.

You can create multiple figures by using multiple *figure* calls with an increasing figure number. Of course, each figure can contain as many axes and subplots as your heart desires:

```
import matplotlib.pyplot as plt
plt.figure(1)                # the first figure
plt.subplot(211)             # the first subplot in the first figure
plt.plot([1, 2, 3])
plt.subplot(212)             # the second subplot in the first figure
plt.plot([4, 5, 6])

plt.figure(2)                # a second figure
plt.plot([4, 5, 6])          # creates a subplot(111) by default

plt.figure(1)                # figure 1 current; subplot(212) still current
plt.subplot(211)             # make subplot(211) in figure1 current
plt.title('Easy as 1, 2, 3') # subplot 211 title
```

You can clear the current figure with *clf* and the current axes with *cla*. If you find it annoying that states (specifically the current image, figure and axes) are being maintained for you behind the scenes, don't despair: this is just a thin stateful wrapper around an object oriented API, which you can use instead (see *Artist tutorial*)

If you are making lots of figures, you need to be aware of one more thing: the memory required for a figure is not completely released until the figure is explicitly closed with *close*. Deleting all references to the figure, and/or using the window manager to kill the window in which the figure appears on the screen, is not enough, because pyplot maintains internal references until *close* is called.

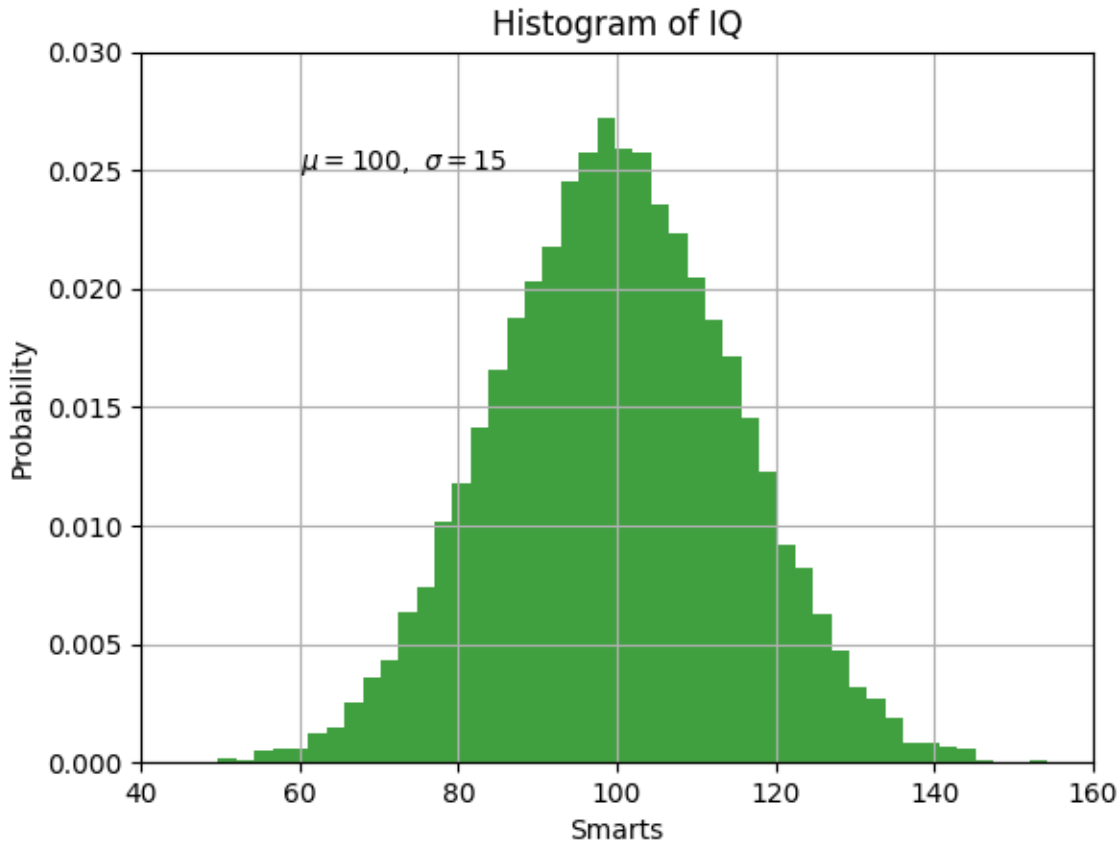
Working with text

text can be used to add text in an arbitrary location, and *xlabel*, *ylabel* and *title* are used to add text in the indicated locations (see *Text in Matplotlib Plots* for a more detailed example)

```
mu, sigma = 100, 15
x = mu + sigma * np.random.randn(10000)

# the histogram of the data
n, bins, patches = plt.hist(x, 50, density=1, facecolor='g', alpha=0.75)

plt.xlabel('Smarts')
plt.ylabel('Probability')
plt.title('Histogram of IQ')
plt.text(60, .025, r'$\mu=100,\ \sigma=15$')
plt.axis([40, 160, 0, 0.03])
plt.grid(True)
plt.show()
```



All of the *text* functions return a *matplotlib.text.Text* instance. Just as with with lines above, you can customize the properties by passing keyword arguments into the text

functions or using *setp*:

```
t = plt.xlabel('my data', fontsize=14, color='red')
```

These properties are covered in more detail in *Text properties and layout*.

Using mathematical expressions in text

matplotlib accepts TeX equation expressions in any text expression. For example to write the expression $\sigma_i = 15$ in the title, you can write a TeX expression surrounded by dollar signs:

```
plt.title(r'$\sigma_i=15$')
```

The `r` preceding the title string is important -- it signifies that the string is a *raw* string and not to treat backslashes as python escapes. matplotlib has a built-in TeX expression parser and layout engine, and ships its own math fonts -- for details see *Writing mathematical expressions*. Thus you can use mathematical text across platforms without requiring a TeX installation. For those who have LaTeX and dvipng installed, you can also use LaTeX to format your text and incorporate the output directly into your display figures or saved postscript -- see *Text rendering With LaTeX*.

Annotating text

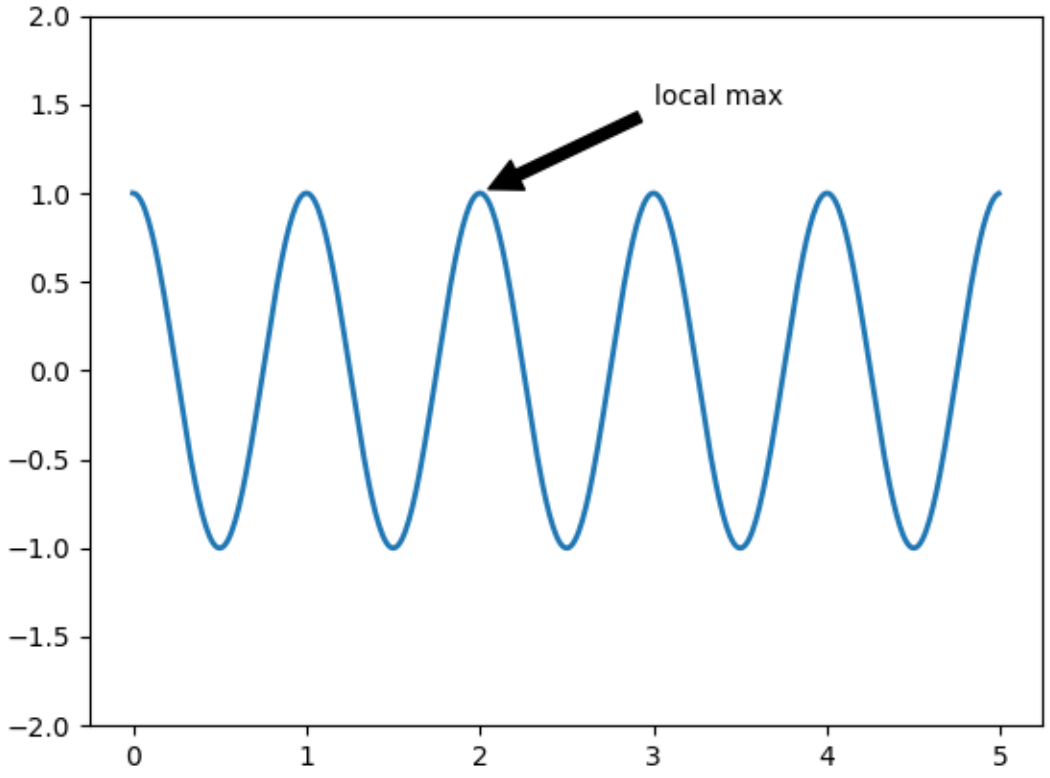
The uses of the basic *text* function above place text at an arbitrary position on the Axes. A common use for text is to annotate some feature of the plot, and the *annotate* method provides helper functionality to make annotations easy. In an annotation, there are two points to consider: the location being annotated represented by the argument `xy` and the location of the text `xytext`. Both of these arguments are `(x, y)` tuples.

```
ax = plt.subplot(111)

t = np.arange(0.0, 5.0, 0.01)
s = np.cos(2*np.pi*t)
line, = plt.plot(t, s, lw=2)

plt.annotate('local max', xy=(2, 1), xytext=(3, 1.5),
             arrowprops=dict(facecolor='black', shrink=0.05),
             )

plt.ylim(-2, 2)
plt.show()
```



In this basic example, both the `xy` (arrow tip) and `xytext` locations (text location) are in data coordinates. There are a variety of other coordinate systems one can choose -- see *Basic annotation* and *Advanced Annotations* for details. More examples can be found in /gallery/text_labels_and_annotations/annotation_demo.

Logarithmic and other nonlinear axes

matplotlib.pyplot supports not only linear axis scales, but also logarithmic and logit scales. This is commonly used if data spans many orders of magnitude. Changing the scale of an axis is easy:

```
plt.xscale('log')
```

An example of four plots with the same data and different scales for the y axis is shown below.

```
# Fixing random state for reproducibility
np.random.seed(19680801)

# make up some data in the open interval (0, 1)
y = np.random.normal(loc=0.5, scale=0.4, size=1000)
```

(continues on next page)

(continued from previous page)

```
y = y[(y > 0) & (y < 1)]
y.sort()
x = np.arange(len(y))

# plot with various axes scales
plt.figure()

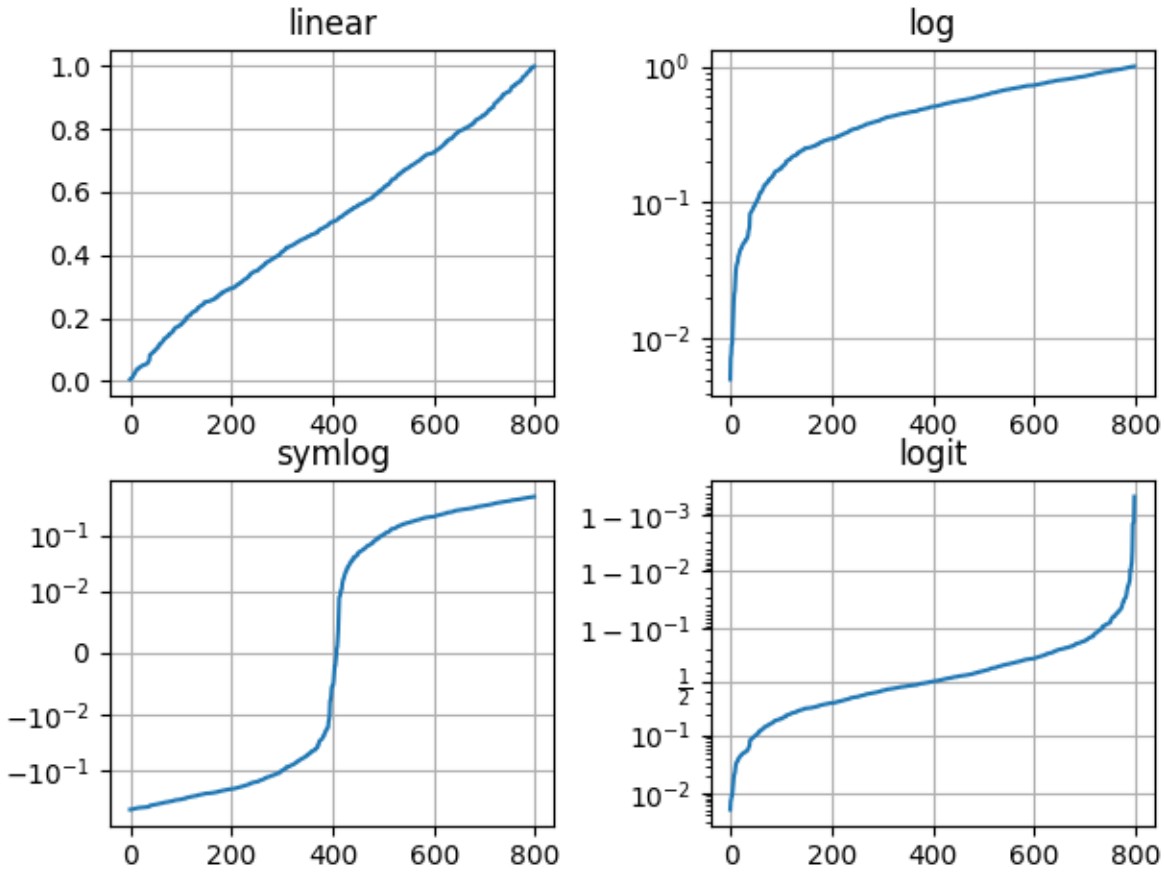
# linear
plt.subplot(221)
plt.plot(x, y)
plt.yscale('linear')
plt.title('linear')
plt.grid(True)

# log
plt.subplot(222)
plt.plot(x, y)
plt.yscale('log')
plt.title('log')
plt.grid(True)

# symmetric log
plt.subplot(223)
plt.plot(x, y - y.mean())
plt.yscale('symlog', linthresh=0.01)
plt.title('symlog')
plt.grid(True)

# logit
plt.subplot(224)
plt.plot(x, y)
plt.yscale('logit')
plt.title('logit')
plt.grid(True)
# Adjust the subplot layout, because the logit one may take more space
# than usual, due to y-tick labels like "1 - 10^{-3}"
plt.subplots_adjust(top=0.92, bottom=0.08, left=0.10, right=0.95, hspace=0.25,
                    wspace=0.35)

plt.show()
```



It is also possible to add your own scale, see *Developer's guide for creating scales and transformations* for details.

Total running time of the script: (0 minutes 3.482 seconds)

2.1.3 Sample plots in Matplotlib

Here you'll find a host of example plots with the code that generated them.

Line Plot

Here's how to create a line plot with text labels using `plot()`.

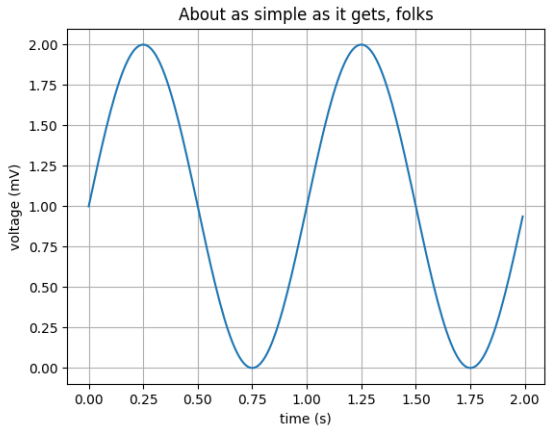


Fig. 1: Simple Plot

Multiple subplots in one figure

Multiple axes (i.e. subplots) are created with the *subplot()* function:

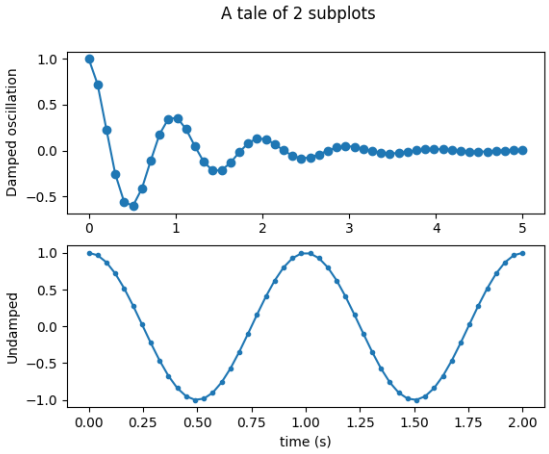

Fig. 2: Subplot

Images

Matplotlib can display images (assuming equally spaced horizontal dimensions) using the *imshow()* function.

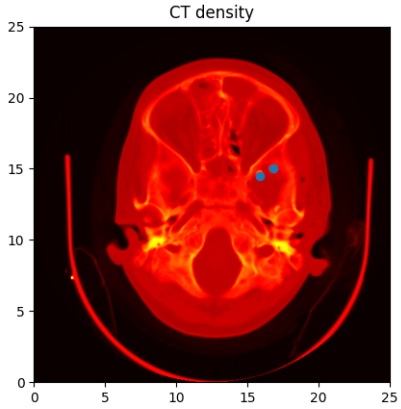

Fig. 3: Example of using *imshow()* to display a CT scan

Contouring and pseudocolor

The *pcolormesh()* function can make a colored representation of a two-dimensional array, even if the horizontal dimensions are unevenly spaced. The *contour()* function is another way to represent the same data:

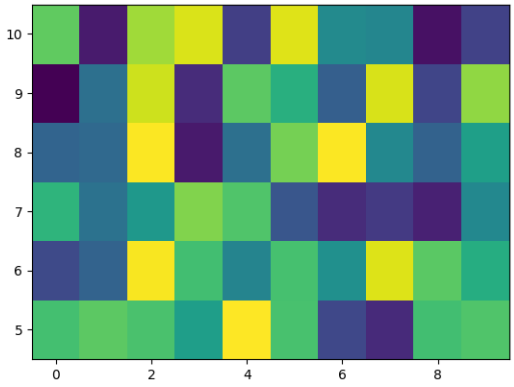

Fig. 4: Example comparing *pcolormesh()* and *contour()* for plotting two-dimensional data

Histograms

The *hist()* function automatically generates histograms and returns the bin counts or probabilities:

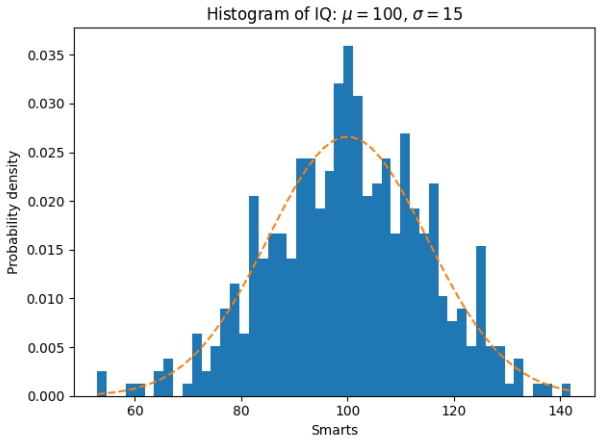

Fig. 5: Histogram Features

Paths

You can add arbitrary paths in Matplotlib using the *matplotlib.path* module:

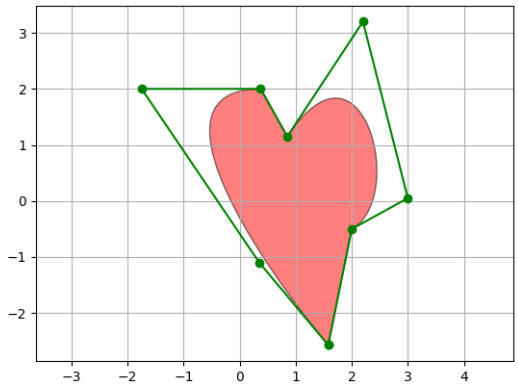

Fig. 6: Path Patch

Three-dimensional plotting

The mplot3d toolkit (see *Getting started* and mplot3d-examples-index) has support for simple 3d graphs including surface, wireframe, scatter, and bar charts.

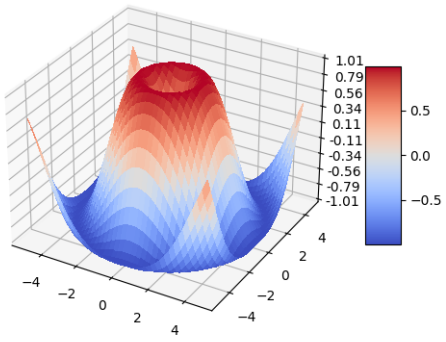

Fig. 7: Surface3d

Thanks to John Porter, Jonathon Taylor, Reinier Heeres, and Ben Root for the *mplot3d* toolkit. This toolkit is included with all standard Matplotlib installs.

Streamplot

The *streamplot()* function plots the streamlines of a vector field. In addition to simply plotting the streamlines, it allows you to map the colors and/or line widths of streamlines to a separate parameter, such as the speed or local intensity of the vector field.

This feature complements the *quiver()* function for plotting vector fields. Thanks to Tom Flannaghan and Tony Yu for adding the streamplot function.

Ellipses

In support of the Phoenix mission to Mars (which used Matplotlib to display ground tracking of spacecraft), Michael Droettboom built on work by Charlie Moad to provide an extremely accurate 8-spline approximation to elliptical arcs (see *Arc*), which are insensitive to zoom level.

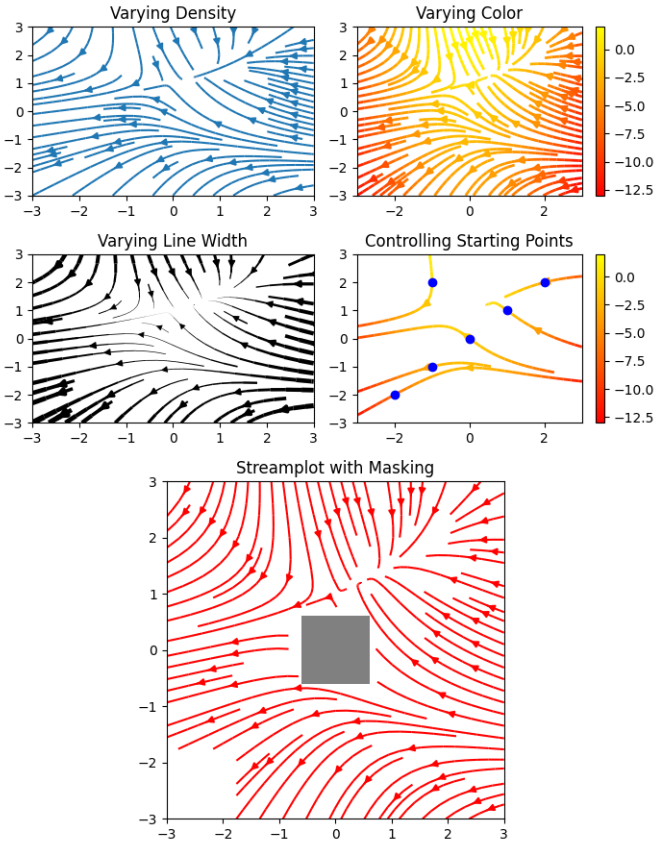

Fig. 8: Streamplot with various plotting options.

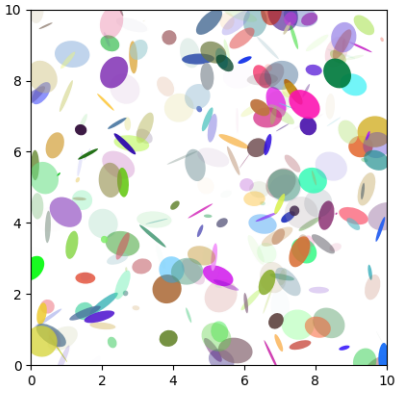

Fig. 9: Ellipse Demo

Bar charts

Use the *bar()* function to make bar charts, which includes customizations such as error bars:

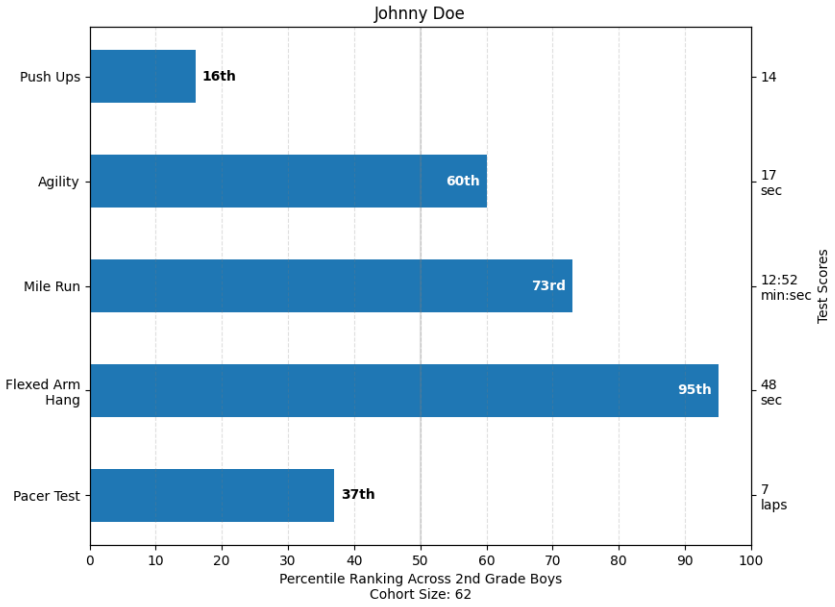

Fig. 10: Barchart Demo

You can also create stacked bars (bar_stacked.py), or horizontal bar charts (barh.py).

Pie charts

The *pie()* function allows you to create pie charts. Optional features include auto-labeling the percentage of area, exploding one or more wedges from the center of the pie, and a shadow effect. Take a close look at the attached code, which generates this figure in just a few lines of code.

Tables

The *table()* function adds a text table to an axes.

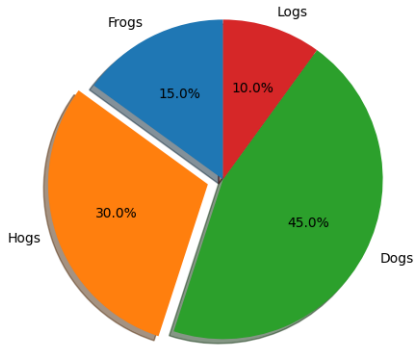

Fig. 11: Pie Features

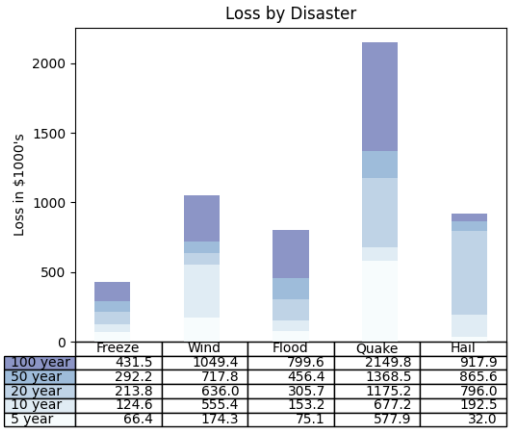

Fig. 12: Table Demo

Scatter plots

The *scatter()* function makes a scatter plot with (optional) size and color arguments. This example plots changes in Google's stock price, with marker sizes reflecting the trading volume and colors varying with time. Here, the alpha attribute is used to make semitransparent circle markers.

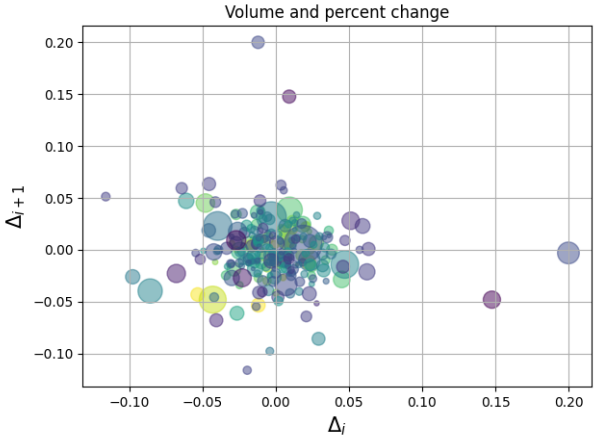

Fig. 13: Scatter Demo2

GUI widgets

Matplotlib has basic GUI widgets that are independent of the graphical user interface you are using, allowing you to write cross GUI figures and widgets. See *matplotlib.widgets* and the widget examples.

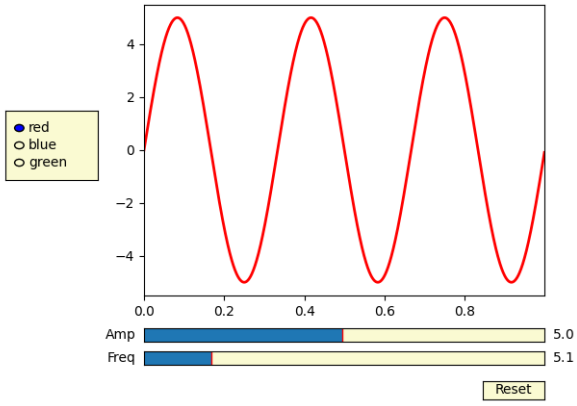

Fig. 14: Slider and radio-button GUI.

Filled curves

The *fill()* function lets you plot filled curves and polygons:

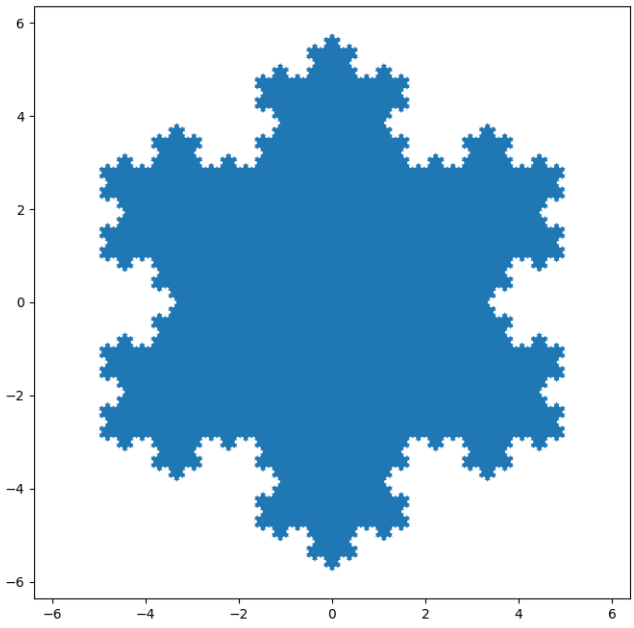

Fig. 15: Fill

Thanks to Andrew Straw for adding this function.

Date handling

You can plot timeseries data with major and minor ticks and custom tick formatters for both.

See *matplotlib.ticker* and *matplotlib.dates* for details and usage.

Log plots

The *semilogx()*, *semilogy()* and *loglog()* functions simplify the creation of logarithmic plots.

Thanks to Andrew Straw, Darren Dale and Gregory Lielens for contributions log-scaling infrastructure.

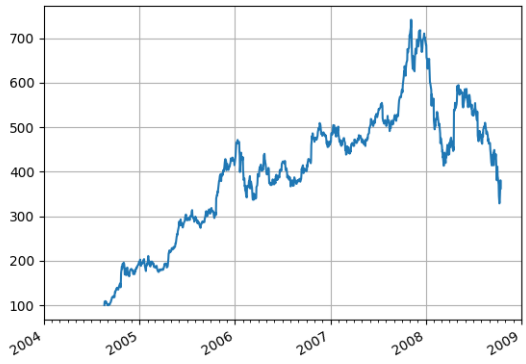

Fig. 16: Date

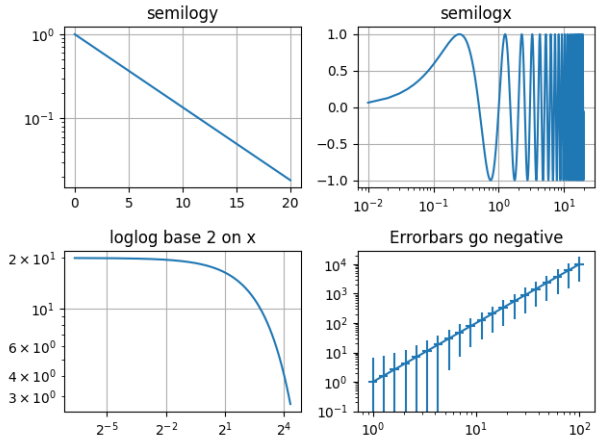

Fig. 17: Log Demo

Polar plots

The *polar()* function generates polar plots.

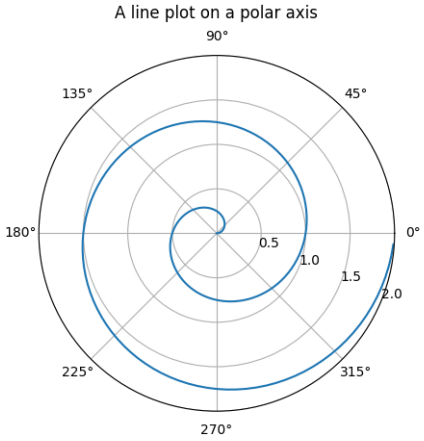

Fig. 18: Polar Demo

Legends

The *legend()* function automatically generates figure legends, with MATLAB-compatible legend-placement functions.

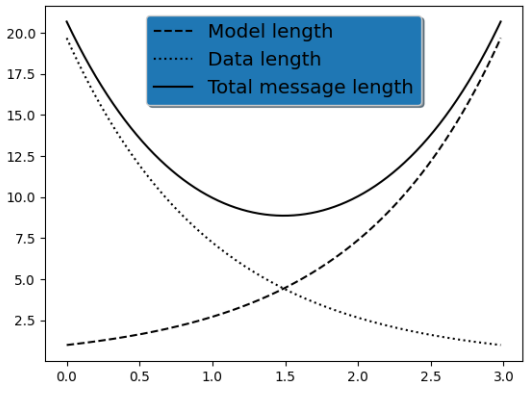

Fig. 19: Legend

Thanks to Charles Twardy for input on the legend function.

TeX-notation for text objects

Below is a sampling of the many TeX expressions now supported by Matplotlib's internal mathtext engine. The mathtext module provides TeX style mathematical expressions using FreeType and the DejaVu, BaKoMa computer modern, or STIX fonts. See the *matplotlib.mathtext* module for additional details.

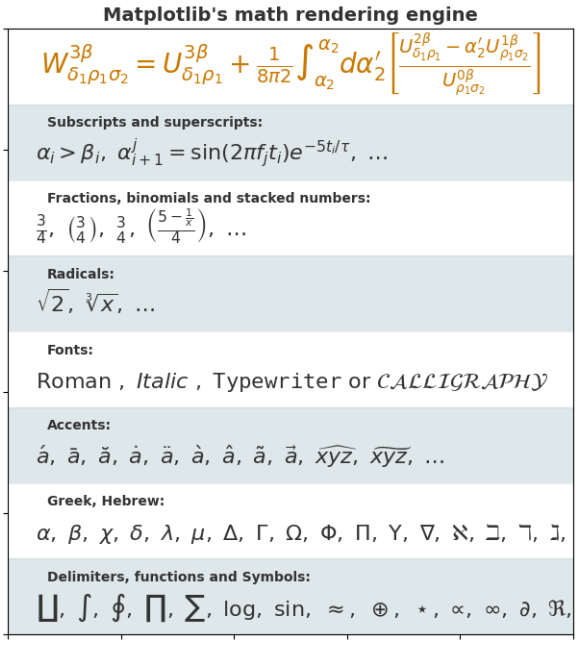

Fig. 20: Mathtext Examples

Matplotlib's mathtext infrastructure is an independent implementation and does not require TeX or any external packages installed on your computer. See the tutorial at *Writing mathematical expressions*.

Native TeX rendering

Although Matplotlib's internal math rendering engine is quite powerful, sometimes you need TeX. Matplotlib supports external TeX rendering of strings with the *usetex* option.

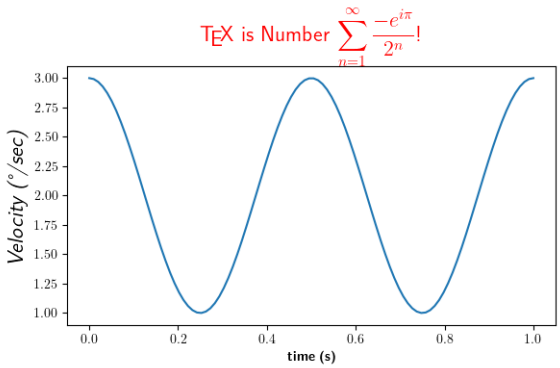

Fig. 21: Tex Demo

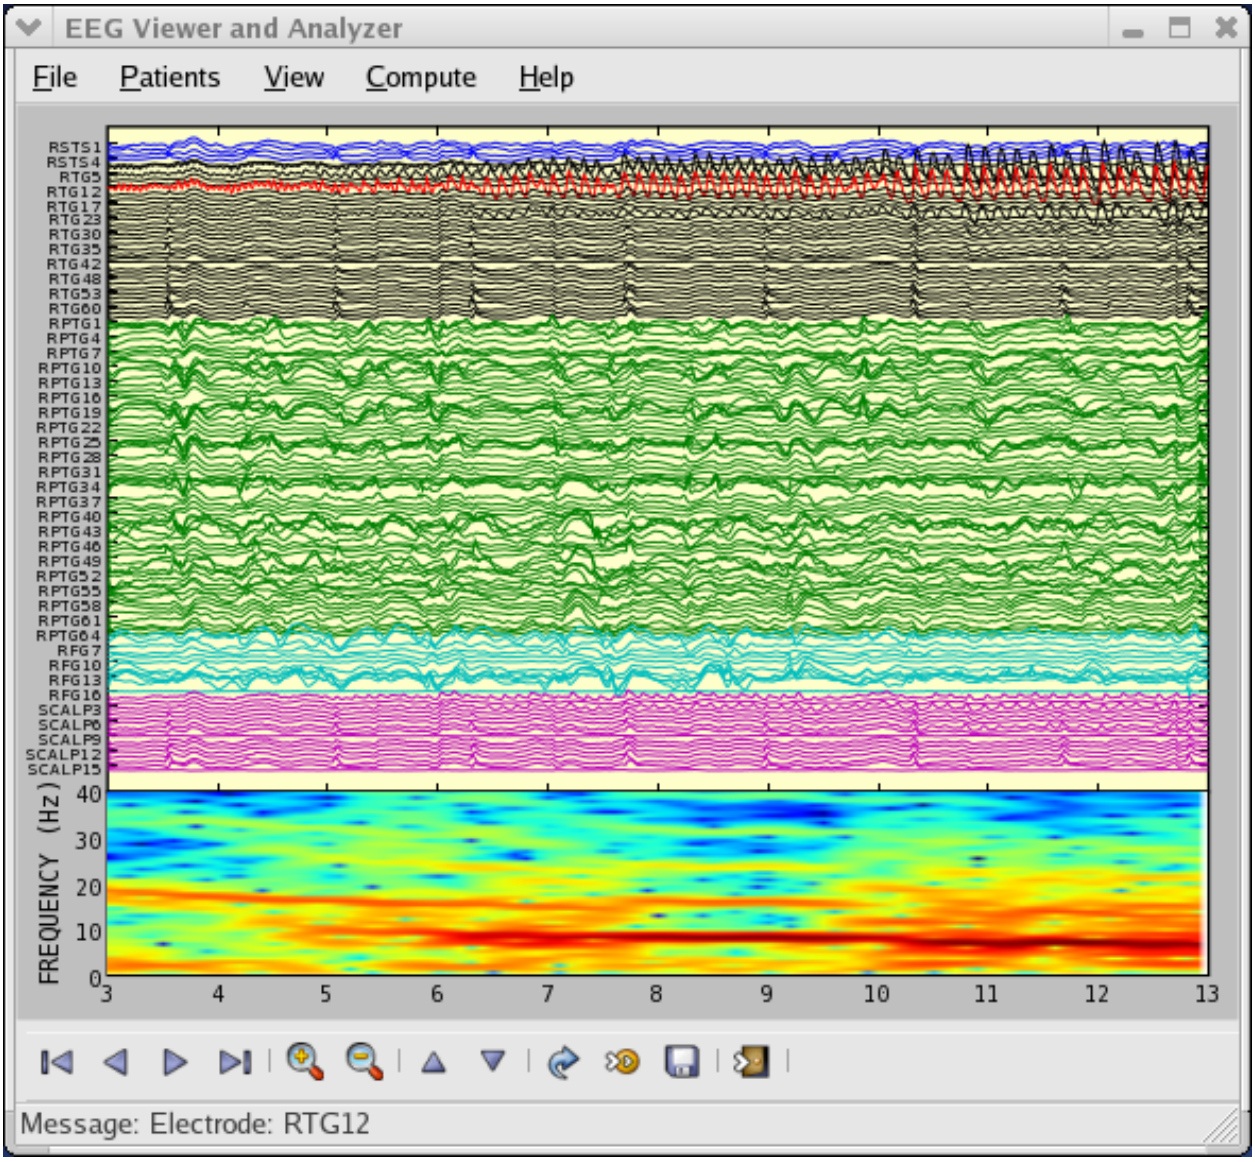
EEG GUI

You can embed Matplotlib into pygtk, wx, Tk, or Qt applications. Here is a screenshot of an EEG viewer called pbrain.



The lower axes uses *specgram()* to plot the spectrogram of one of the EEG channels.

For examples of how to embed Matplotlib in different toolkits, see:

- /gallery/user_interfaces/embedding_in_gtk3_sgskip
- /gallery/user_interfaces/embedding_in_wx2_sgskip
- /gallery/user_interfaces/mpl_with_glade3_sgskip
- /gallery/user_interfaces/embedding_in_qt_sgskip
- /gallery/user_interfaces/embedding_in_tk_sgskip

XKCD-style sketch plots

Just for fun, Matplotlib supports plotting in the style of xkcd.

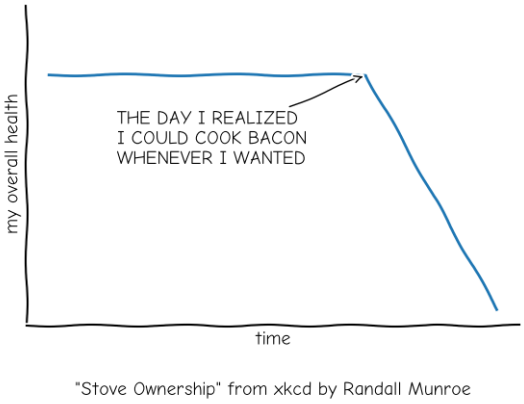


Fig. 22: xkcd

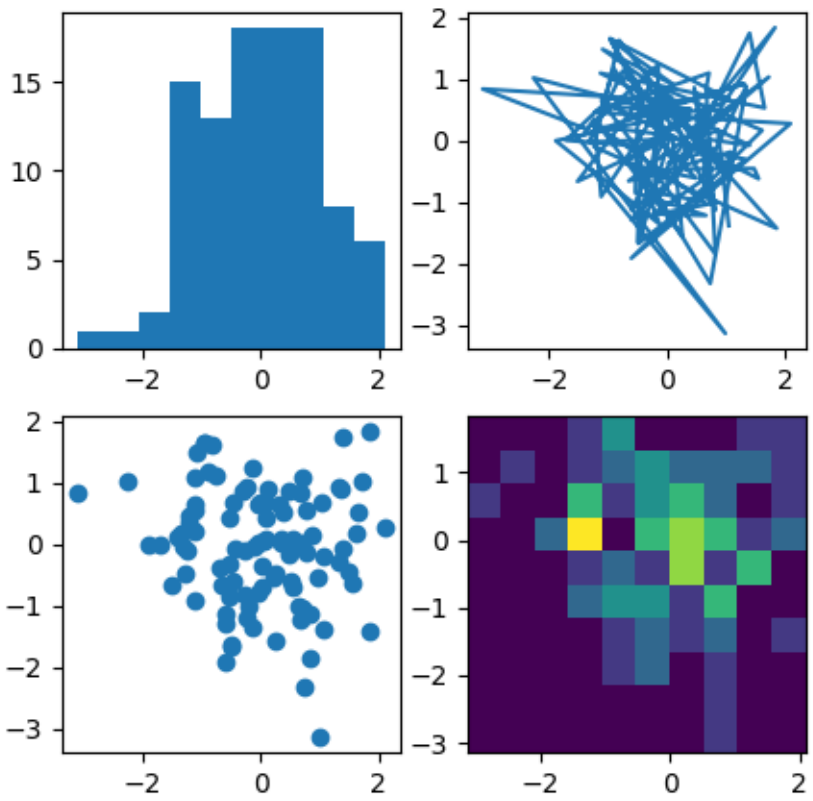
Subplot example

Many plot types can be combined in one figure to create powerful and flexible representations of data.



```
import matplotlib.pyplot as plt
import numpy as np

np.random.seed(19680801)
data = np.random.randn(2, 100)

fig, axs = plt.subplots(2, 2, figsize=(5, 5))
axs[0, 0].hist(data[0])
axs[1, 0].scatter(data[0], data[1])
axs[0, 1].plot(data[0], data[1])
axs[1, 1].hist2d(data[0], data[1])

plt.show()
```

2.1.4 Image tutorial

A short tutorial on plotting images with Matplotlib.

Startup commands

First, let's start IPython. It is a most excellent enhancement to the standard Python prompt, and it ties in especially well with Matplotlib. Start IPython either directly at a shell, or with the Jupyter Notebook (where IPython as a running kernel).

With IPython started, we now need to connect to a GUI event loop. This tells IPython where (and how) to display plots. To connect to a GUI loop, execute the **%matplotlib** magic at your IPython prompt. There's more detail on exactly what this does at IPython's documentation on GUI event loops.

If you're using Jupyter Notebook, the same commands are available, but people commonly use a specific argument to the %matplotlib magic:

```
In [1]: %matplotlib inline
```

This turns on inline plotting, where plot graphics will appear in your notebook. This has important implications for interactivity. For inline plotting, commands in cells below the cell that outputs a plot will not affect the plot. For example, changing the color map is not possible from cells below the cell that creates a plot. However, for other backends, such as Qt5, that open a separate window, cells below those that create the plot will change the plot - it is a live object in memory.

This tutorial will use Matplotlib's imperative-style plotting interface, pyplot. This interface maintains global state, and is very useful for quickly and easily experimenting with various plot settings. The alternative is the object-oriented interface, which is also very powerful, and generally more suitable for large application development. If you'd like to learn about the object-oriented interface, a great place to start is our *Usage guide*. For now, let's get on with the imperative-style approach:

```
import matplotlib.pyplot as plt
import matplotlib.image as mpimg
```

Importing image data into Numpy arrays

Matplotlib relies on the Pillow library to load image data.

Here's the image we're going to play with:

It's a 24-bit RGB PNG image (8 bits for each of R, G, B). Depending on where you get your data, the other kinds of image that you'll most likely encounter are RGBA images, which allow for transparency, or single-channel grayscale (luminosity) images. You can right click on it and choose "Save image as" to download it to your computer for the rest of this tutorial.

And here we go...

```
img = mpimg.imread('../../doc/_static/stinkbug.png')
print(img)
```

Out:

```

```

Note the dtype there - float32. Matplotlib has rescaled the 8 bit data from each channel to floating point data between 0.0 and 1.0. As a side note, the only datatype that Pillow can work with is uint8. Matplotlib plotting can handle float32 and uint8, but image reading/writing for any format other than PNG is limited to uint8 data. Why 8 bits? Most displays can only render 8 bits per channel worth of color gradation. Why can they only render 8 bits/channel? Because that's about all the human eye can see. More here (from a photography standpoint): Luminous Landscape bit depth tutorial.

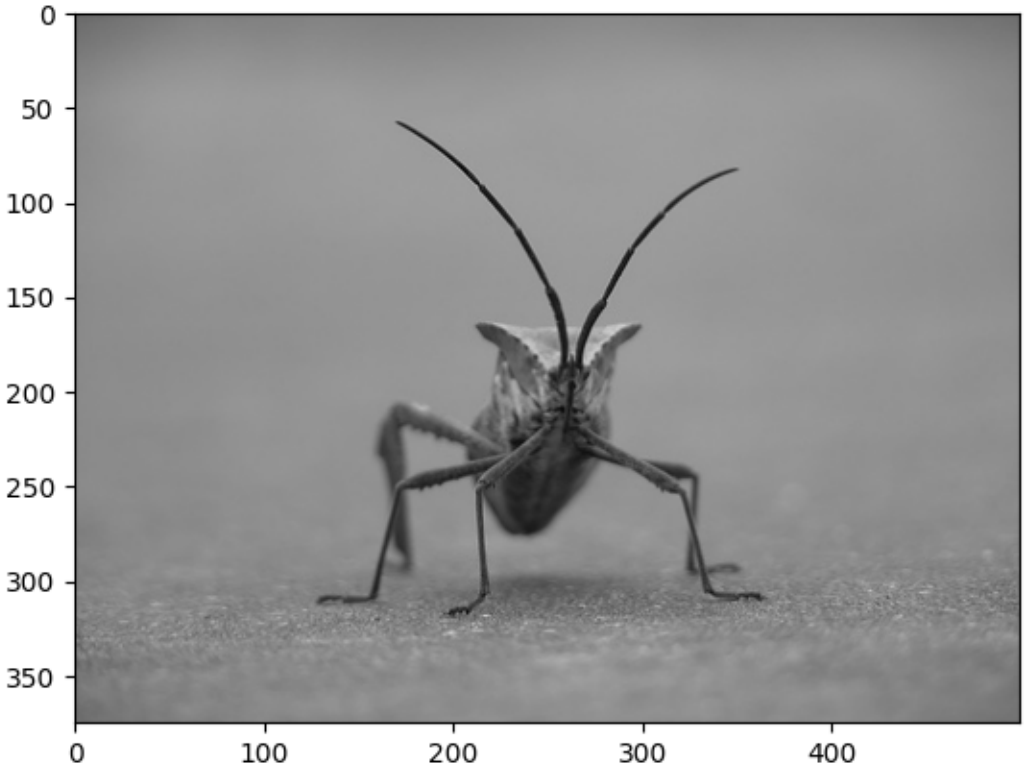
Each inner list represents a pixel. Here, with an RGB image, there are 3 values. Since it's a black and white image, R, G, and B are all similar. An RGBA (where A is alpha, or transparency), has 4 values per inner list, and a simple luminance image just has

one value (and is thus only a 2-D array, not a 3-D array). For RGB and RGBA images, Matplotlib supports float32 and uint8 data types. For grayscale, Matplotlib supports only float32. If your array data does not meet one of these descriptions, you need to rescale it.

Plotting numpy arrays as images

So, you have your data in a numpy array (either by importing it, or by generating it). Let's render it. In Matplotlib, this is performed using the *imshow()* function. Here we'll grab the plot object. This object gives you an easy way to manipulate the plot from the prompt.

```
imgplot = plt.imshow(img)
```



You can also plot any numpy array.

Applying pseudocolor schemes to image plots

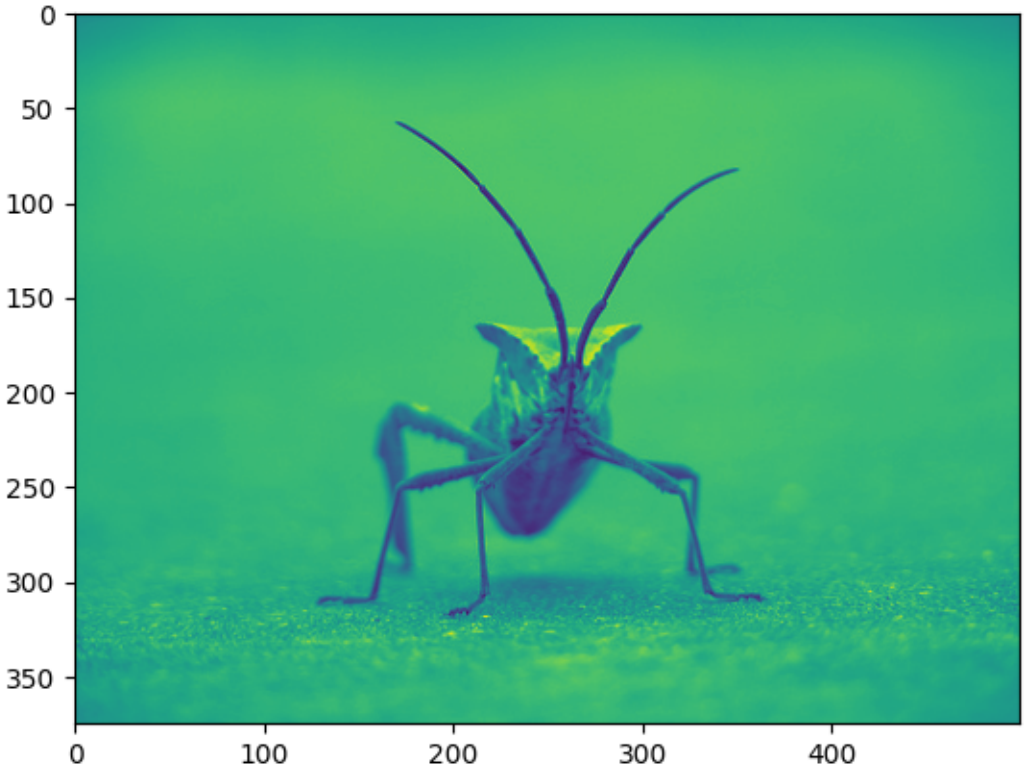
Pseudocolor can be a useful tool for enhancing contrast and visualizing your data more easily. This is especially useful when making presentations of your data using projectors - their contrast is typically quite poor.

Pseudocolor is only relevant to single-channel, grayscale, luminosity images. We currently have an RGB image. Since R, G, and B are all similar (see for yourself above or in your data), we can just pick one channel of our data:

```
lum_img = img[:, :, 0]

# This is array slicing.  You can read more in the `Numpy tutorial
# <https://docs.scipy.org/doc/numpy/user/quickstart.html>`_.

plt.imshow(lum_img)
```



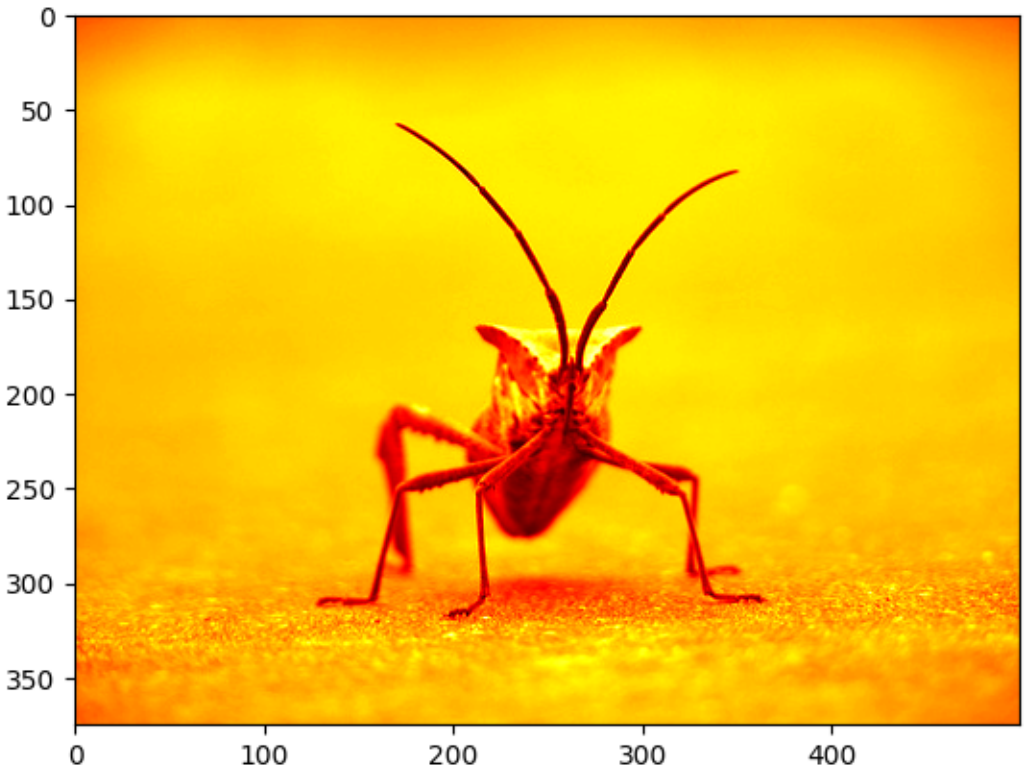
Out:

```
<matplotlib.image.AxesImage object at 0x7f53fb3eb640>
```

Now, with a luminosity (2D, no color) image, the default colormap (aka lookup table, LUT), is applied. The default is called viridis. There are plenty of others to choose

from.

```
plt.imshow(lum_img, cmap="hot")
```

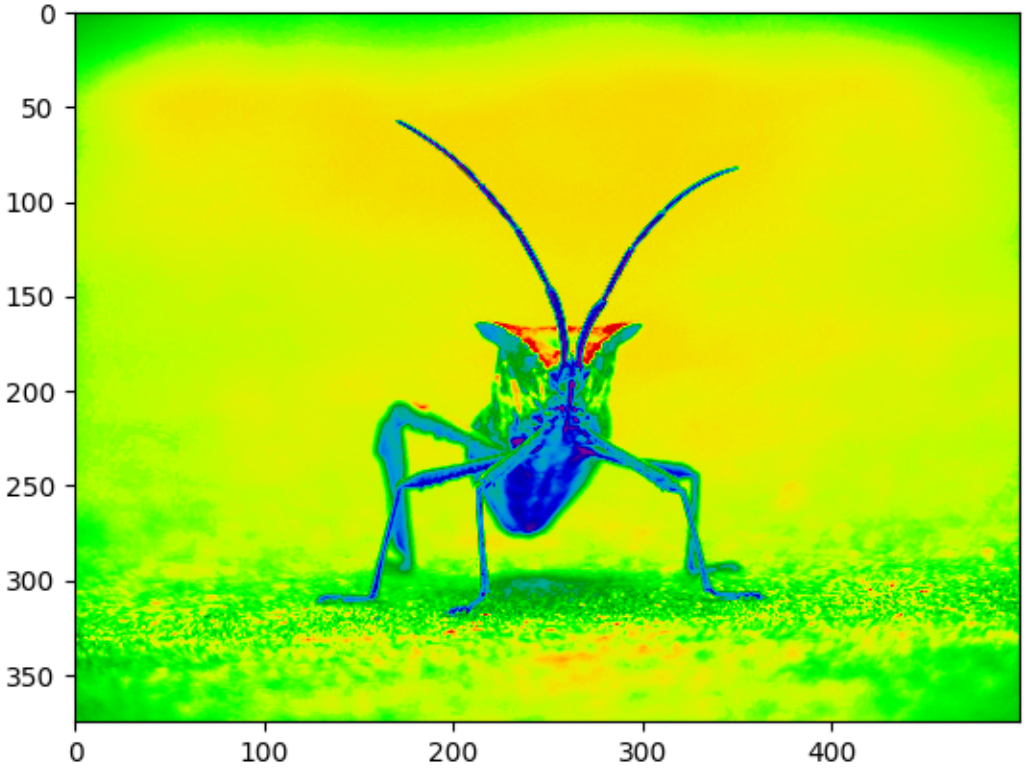


Out:

```
<matplotlib.image.AxesImage object at 0x7f53fed4b400>
```

Note that you can also change colormaps on existing plot objects using the *set_cmap()* method:

```
imgplot = plt.imshow(lum_img)
imgplot.set_cmap('nipy_spectral')
```



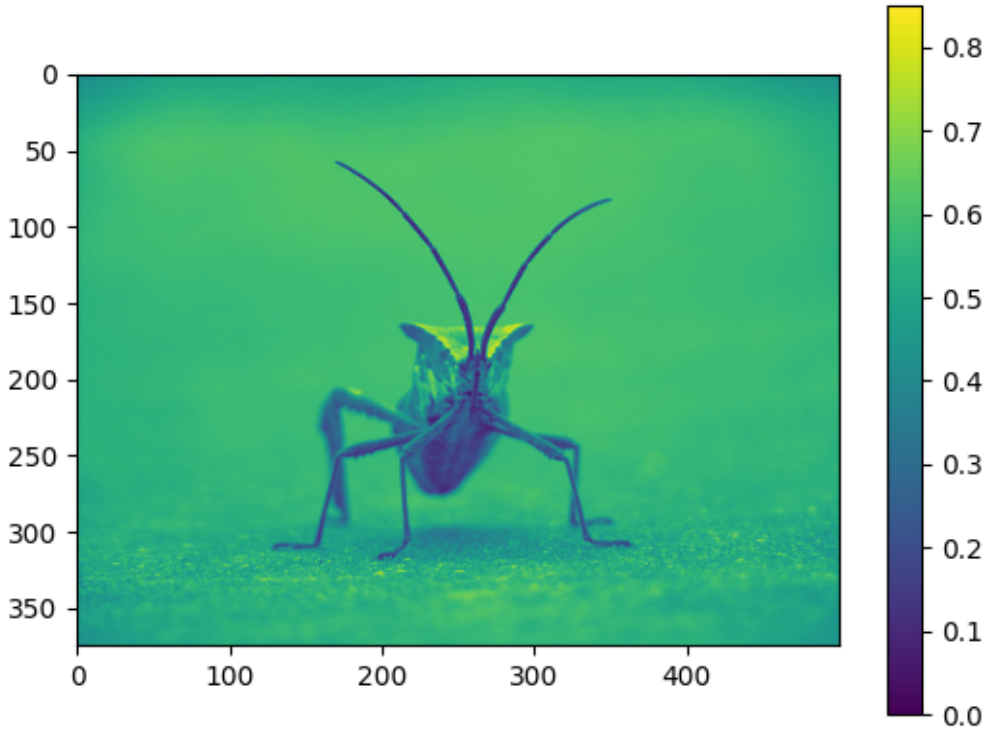
Note: However, remember that in the Jupyter Notebook with the inline backend, you can't make changes to plots that have already been rendered. If you create imgplot here in one cell, you cannot call set_cmap() on it in a later cell and expect the earlier plot to change. Make sure that you enter these commands together in one cell. plt commands will not change plots from earlier cells.

There are many other colormap schemes available. See the list and images of the colormaps.

Color scale reference

It's helpful to have an idea of what value a color represents. We can do that by adding a color bar to your figure:

```
imgplot = plt.imshow(lum_img)
plt.colorbar()
```



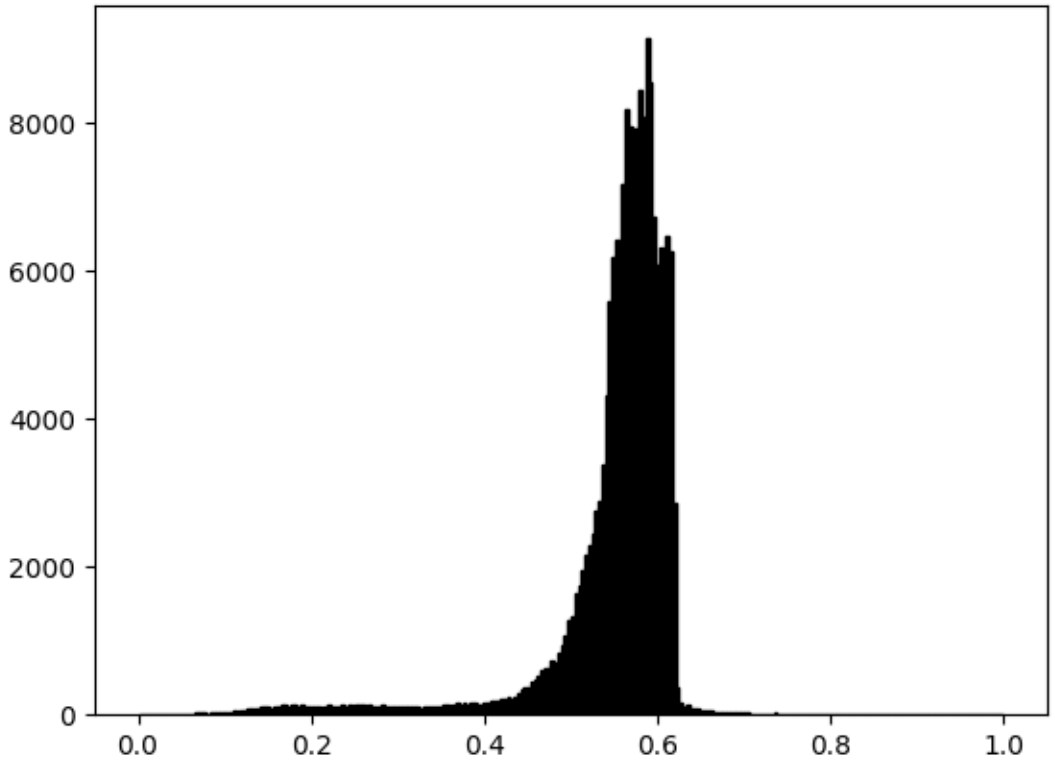
Out:

```
<matplotlib.colorbar.Colorbar object at 0x7f53fed09640>
```

Examining a specific data range

Sometimes you want to enhance the contrast in your image, or expand the contrast in a particular region while sacrificing the detail in colors that don't vary much, or don't matter. A good tool to find interesting regions is the histogram. To create a histogram of our image data, we use the *hist()* function.

```
plt.hist(lum_img.ravel(), bins=256, range=(0.0, 1.0), fc='k', ec='k')
```



Out:

```
(array([2.000e+00, 2.000e+00, 3.000e+00, 3.000e+00, 2.000e+00, 2.000e+00,

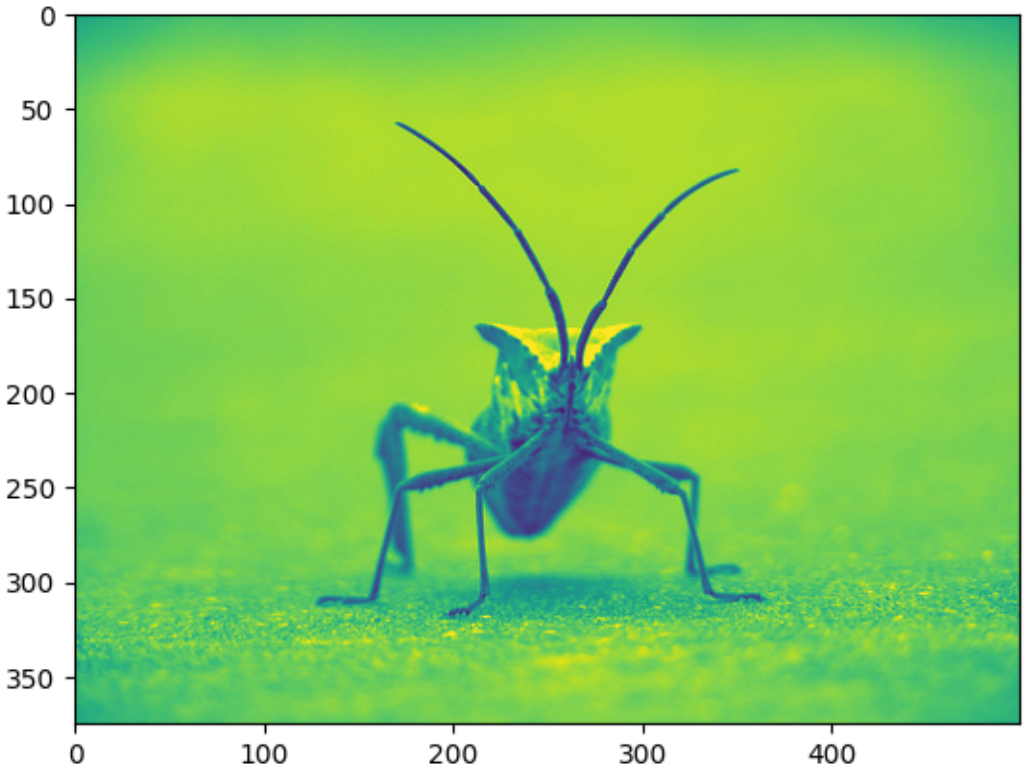
       0.9765625 , 0.98046875, 0.984375  , 0.98828125, 0.9921875 ,
       0.99609375, 1.        ], dtype=float32), <BarContainer object of 256 artists>)
```

Most often, the "interesting" part of the image is around the peak, and you can get extra contrast by clipping the regions above and/or below the peak. In our histogram, it looks like there's not much useful information in the high end (not many white things in the image). Let's adjust the upper limit, so that we effectively "zoom in on" part of the histogram. We do this by passing the clim argument to imshow. You could also do this by calling the *set_clim()* method of the image plot object, but make sure that you do so in the same cell as your plot command when working with the Jupyter Notebook - it will not change plots from earlier cells.

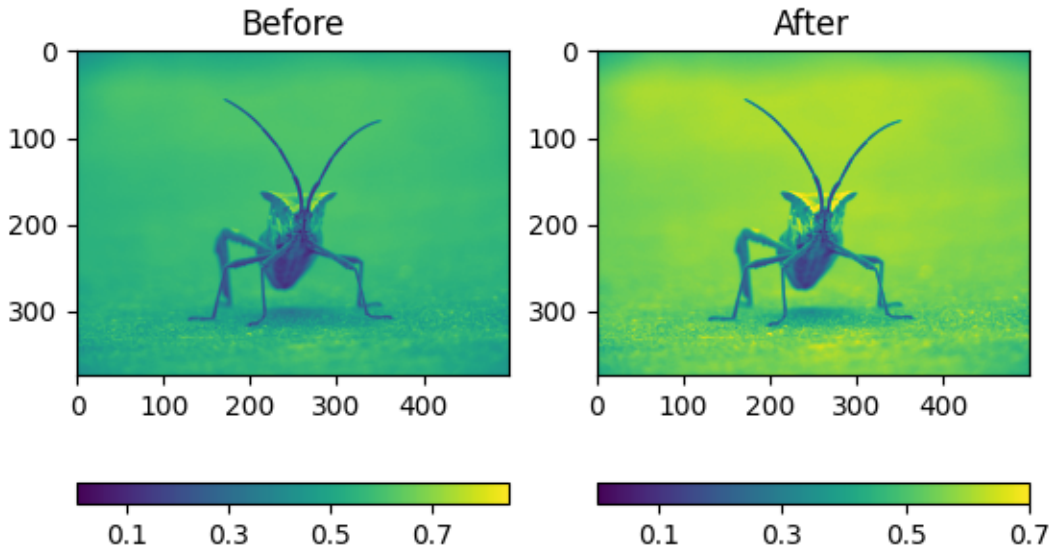
You can specify the clim in the call to `plot`.

```
imgplot = plt.imshow(lum_img, clim=(0.0, 0.7))
```



You can also specify the clim using the returned object

```
fig = plt.figure()
ax = fig.add_subplot(1, 2, 1)
imgplot = plt.imshow(lum_img)
ax.set_title('Before')
plt.colorbar(ticks=[0.1, 0.3, 0.5, 0.7], orientation='horizontal')
ax = fig.add_subplot(1, 2, 2)
imgplot = plt.imshow(lum_img)
imgplot.set_clim(0.0, 0.7)
ax.set_title('After')
plt.colorbar(ticks=[0.1, 0.3, 0.5, 0.7], orientation='horizontal')
```



Out:

```
<matplotlib.colorbar.Colorbar object at 0x7f53fe846f10>
```

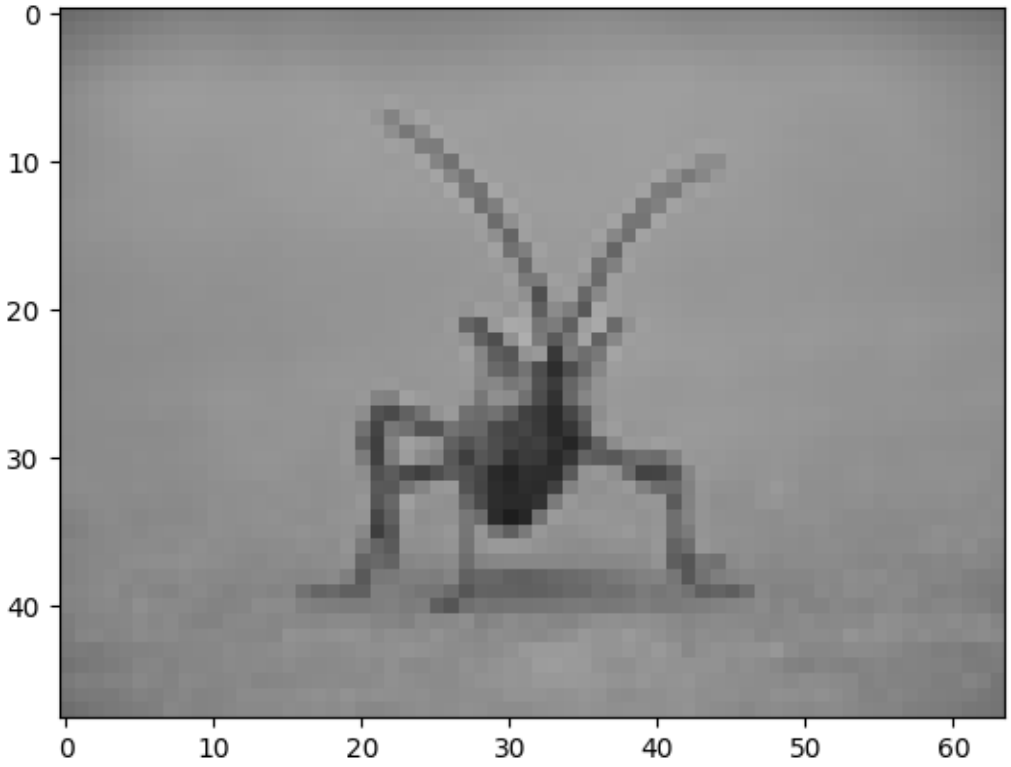
Array Interpolation schemes

Interpolation calculates what the color or value of a pixel "should" be, according to different mathematical schemes. One common place that this happens is when you resize an image. The number of pixels change, but you want the same information. Since pixels are discrete, there's missing space. Interpolation is how you fill that space. This is why your images sometimes come out looking pixelated when you blow them up. The effect is more pronounced when the difference between the original image and the expanded image is greater. Let's take our image and shrink it. We're effectively discarding pixels, only keeping a select few. Now when we plot it, that data gets blown up to the size on your screen. The old pixels aren't there anymore, and the computer has to draw in pixels to fill that space.

We'll use the Pillow library that we used to load the image also to resize the image.

```
from PIL import Image

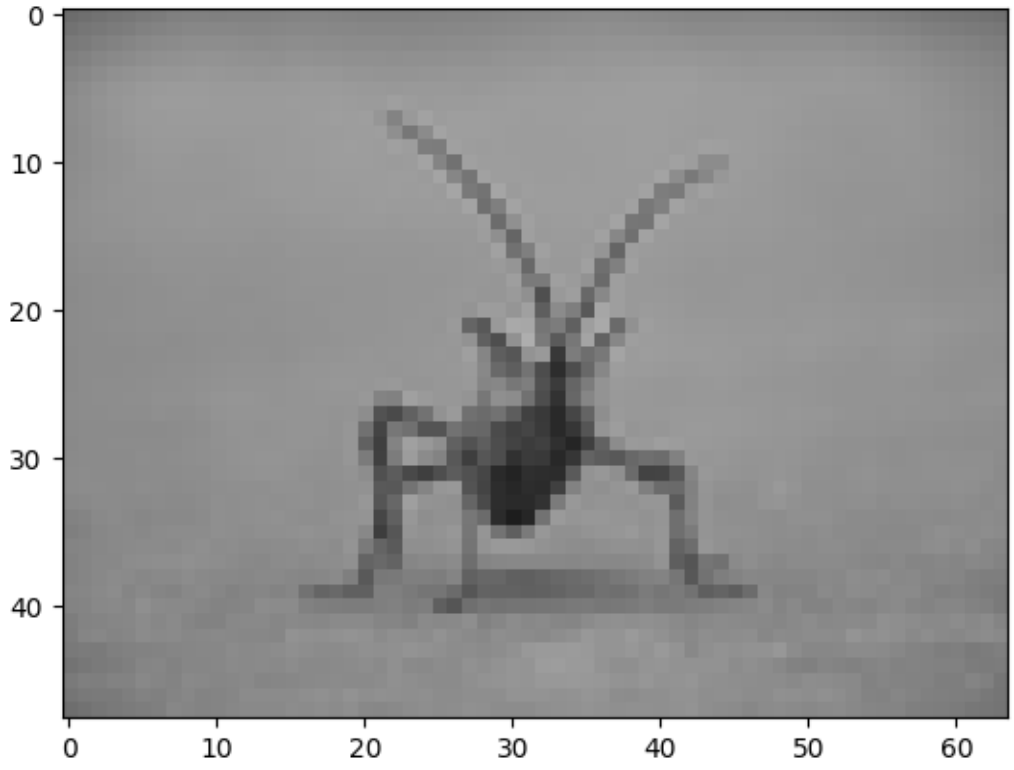
img = Image.open('../../doc/_static/stinkbug.png')
img.thumbnail((64, 64), Image.ANTIALIAS)  # resizes image in-place
imgplot = plt.imshow(img)
```



Here we have the default interpolation, bilinear, since we did not give *imshow()* any interpolation argument.

Let's try some others. Here's "nearest", which does no interpolation.

```
imgplot = plt.imshow(img, interpolation="nearest")
```



and bicubic:

```
imgplot = plt.imshow(img, interpolation="bicubic")
```

Bicubic interpolation is often used when blowing up photos - people tend to prefer blurry over pixelated.

Total running time of the script: (0 minutes 7.057 seconds)

2.1.5 The Lifecycle of a Plot

This tutorial aims to show the beginning, middle, and end of a single visualization using Matplotlib. We'll begin with some raw data and end by saving a figure of a customized visualization. Along the way we try to highlight some neat features and best-practices using Matplotlib.

Note: This tutorial is based on this excellent blog post by Chris Moffitt. It was transformed into this tutorial by Chris Holdgraf.

A note on the Object-Oriented API vs. Pyplot

Matplotlib has two interfaces. The first is an object-oriented (OO) interface. In this case, we utilize an instance of *axes.Axes* in order to render visualizations on an instance of *figure.Figure*.

The second is based on MATLAB and uses a state-based interface. This is encapsulated in the *pyplot* module. See the *pyplot tutorials* for a more in-depth look at the pyplot interface.

Most of the terms are straightforward but the main thing to remember is that:

- The Figure is the final image that may contain 1 or more Axes.
- The Axes represent an individual plot (don't confuse this with the word "axis", which refers to the x/y axis of a plot).

We call methods that do the plotting directly from the Axes, which gives us much more flexibility and power in customizing our plot.

Note: In general, try to use the object-oriented interface over the pyplot interface.

Our data

We'll use the data from the post from which this tutorial was derived. It contains sales information for a number of companies.

```
import numpy as np
import matplotlib.pyplot as plt

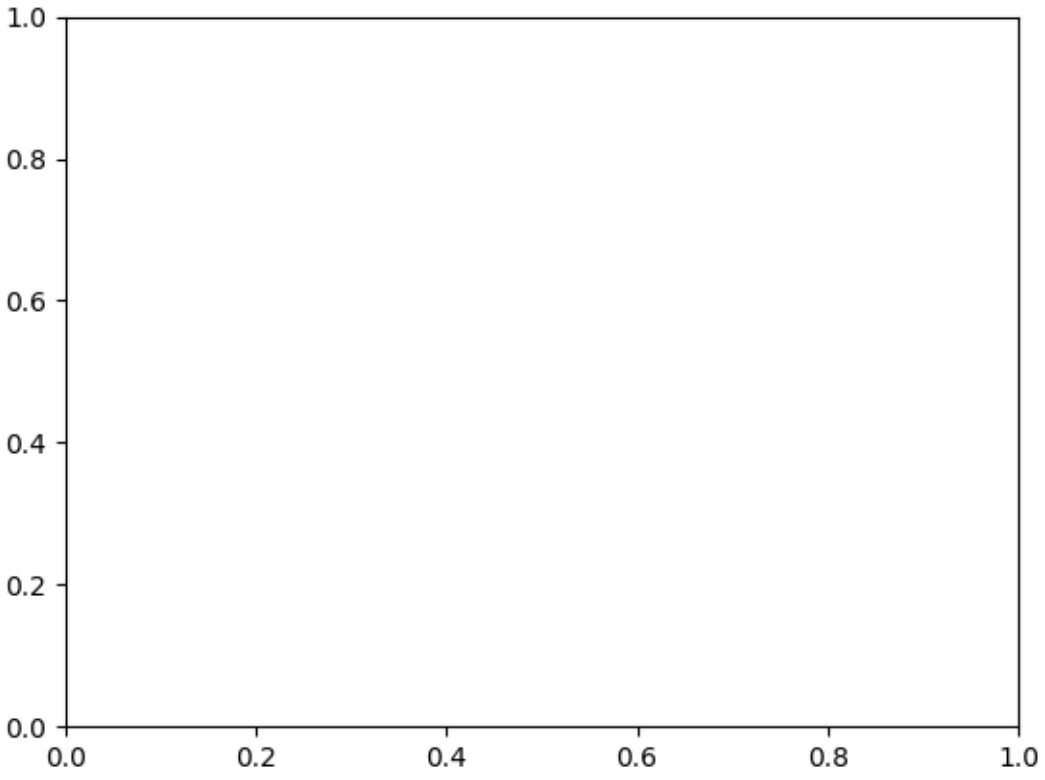
data = {'Barton LLC': 109438.50,
        'Frami, Hills and Schmidt': 103569.59,
        'Fritsch, Russel and Anderson': 112214.71,
        'Jerde-Hilpert': 112591.43,
        'Keeling LLC': 100934.30,
        'Koepp Ltd': 103660.54,
        'Kulas Inc': 137351.96,
        'Trantow-Barrows': 123381.38,
        'White-Trantow': 135841.99,
        'Will LLC': 104437.60}
group_data = list(data.values())
group_names = list(data.keys())
group_mean = np.mean(group_data)
```

Getting started

This data is naturally visualized as a barplot, with one bar per group. To do this with the object-oriented approach, we first generate an instance of *figure.Figure* and *axes.Axes*. The Figure is like a canvas, and the Axes is a part of that canvas on which we will make a particular visualization.

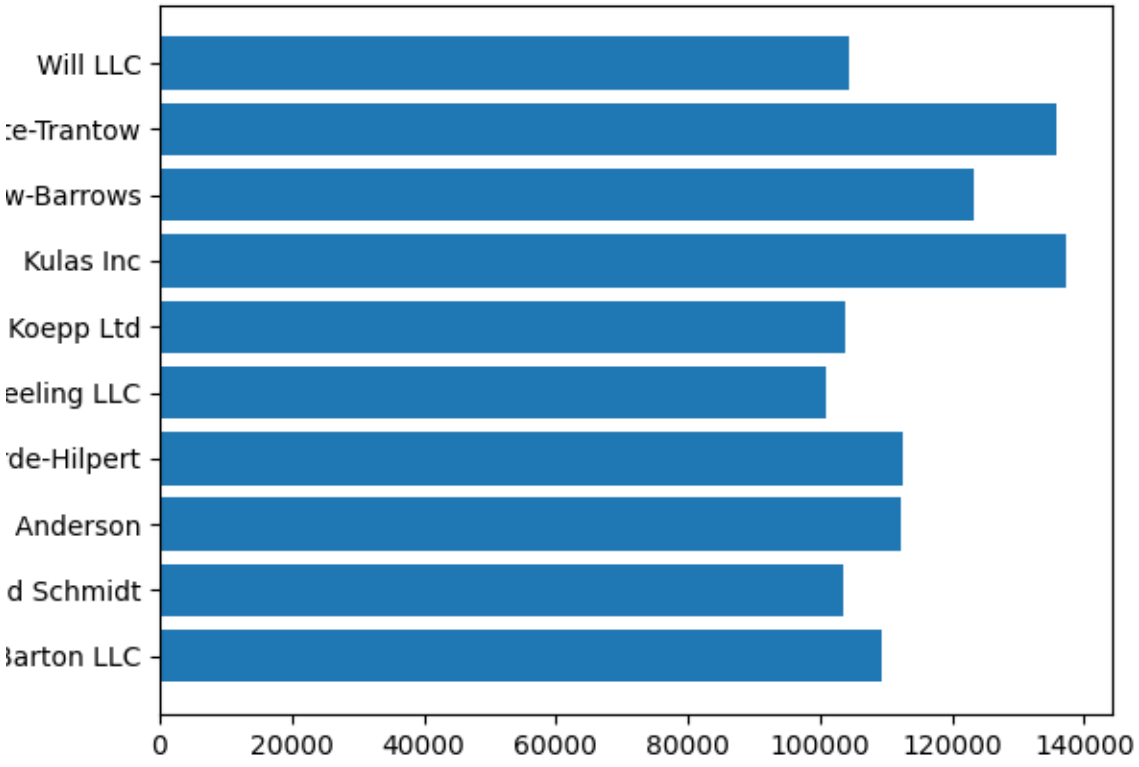
Note: Figures can have multiple axes on them. For information on how to do this, see the *Tight Layout tutorial*.

```
fig, ax = plt.subplots()
```



Now that we have an Axes instance, we can plot on top of it.

```
fig, ax = plt.subplots()
ax.barh(group_names, group_data)
```



Out:

```
<BarContainer object of 10 artists>
```

Controlling the style

There are many styles available in Matplotlib in order to let you tailor your visualization to your needs. To see a list of styles, we can use *style*.

```
print(plt.style.available)
```

Out:

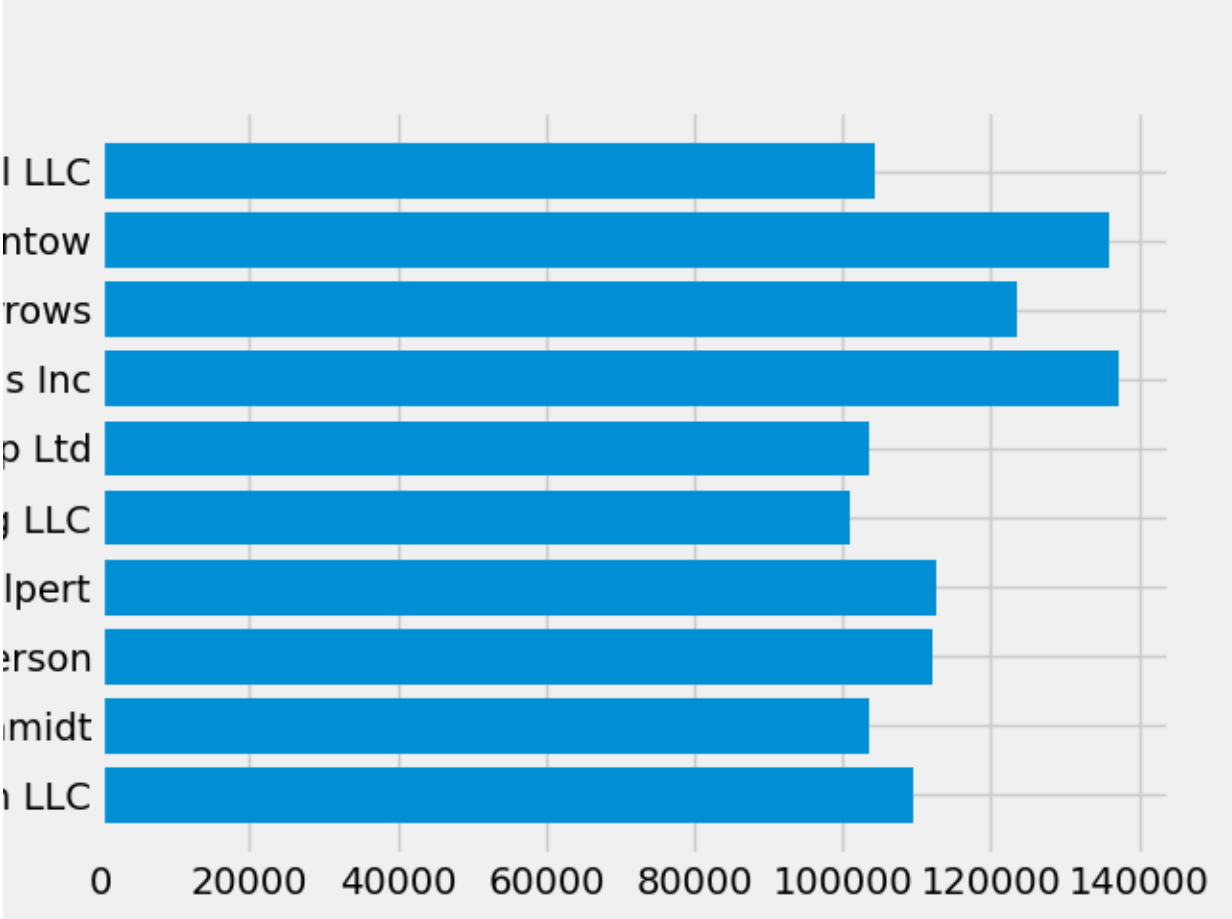
```
['Solarize_Light2', '_classic_test_patch', 'bmh', 'classic', 'dark_background', 'fast',
↪'fivethirtyeight', 'ggplot', 'grayscale', 'seaborn', 'seaborn-bright', 'seaborn-
↪colorblind', 'seaborn-dark', 'seaborn-dark-palette', 'seaborn-darkgrid', 'seaborn-deep
↪', 'seaborn-muted', 'seaborn-notebook', 'seaborn-paper', 'seaborn-pastel', 'seaborn-
↪poster', 'seaborn-talk', 'seaborn-ticks', 'seaborn-white', 'seaborn-whitegrid',
↪'tableau-colorblind10']
```

You can activate a style with the following:

```
plt.style.use('fivethirtyeight')
```

Now let's remake the above plot to see how it looks:

```
fig, ax = plt.subplots()
ax.barh(group_names, group_data)
```



Out:

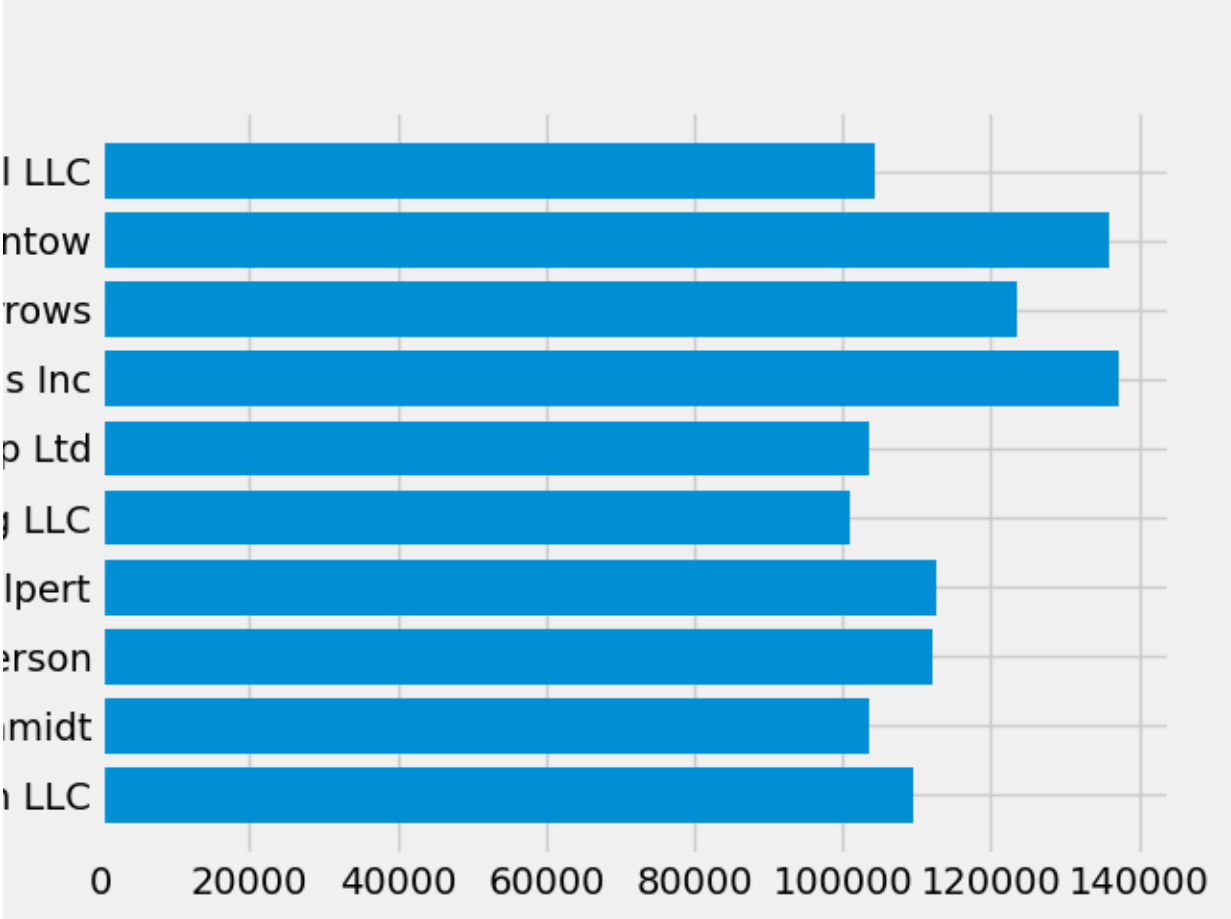
```
<BarContainer object of 10 artists>
```

The style controls many things, such as color, linewidths, backgrounds, etc.

Customizing the plot

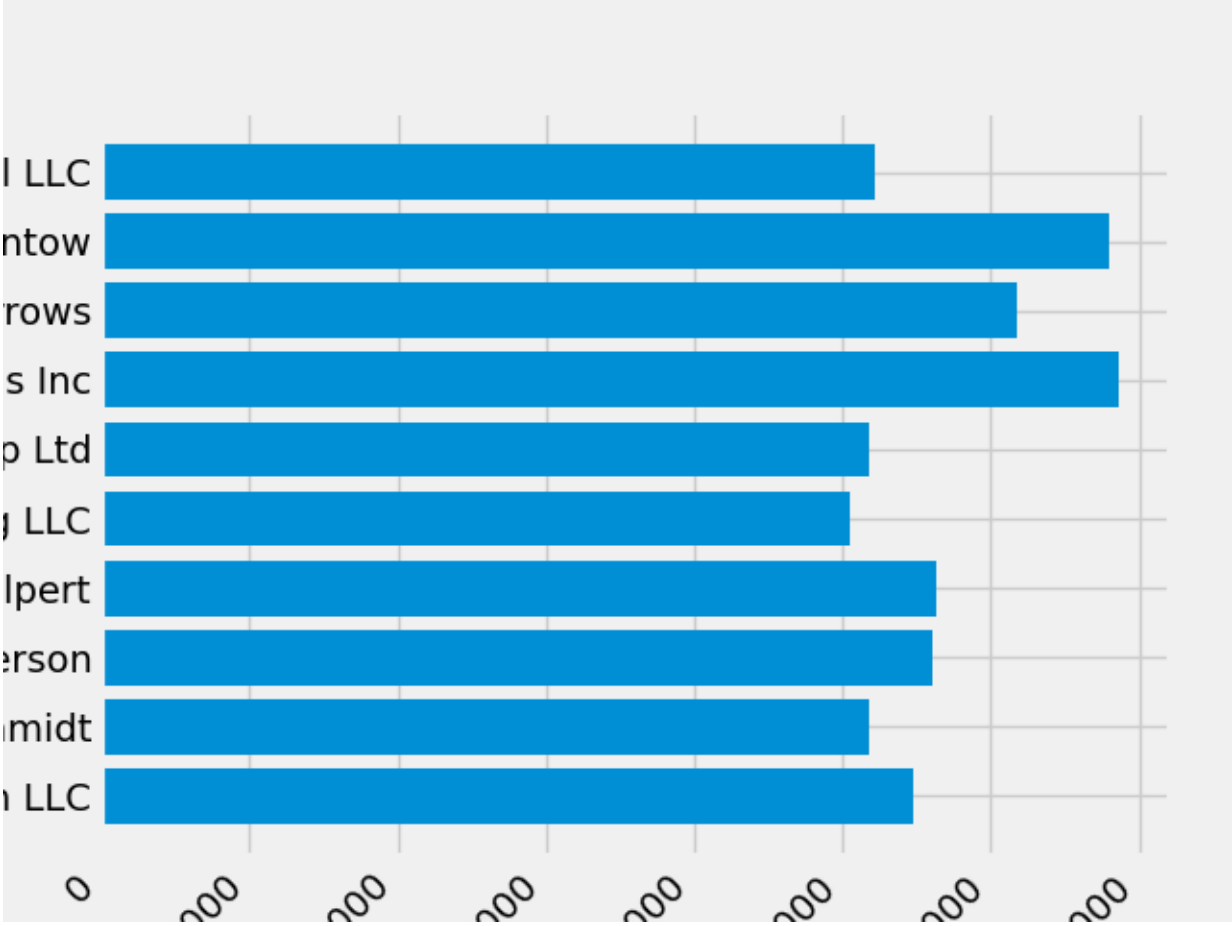
Now we've got a plot with the general look that we want, so let's fine-tune it so that it's ready for print. First let's rotate the labels on the x-axis so that they show up more clearly. We can gain access to these labels with the *axes.Axes.get_xticklabels()* method:

```
fig, ax = plt.subplots()
ax.barh(group_names, group_data)
labels = ax.get_xticklabels()
```



If we'd like to set the property of many items at once, it's useful to use the *pyplot.setp()* function. This will take a list (or many lists) of Matplotlib objects, and attempt to set some style element of each one.

```
fig, ax = plt.subplots()
ax.barh(group_names, group_data)
labels = ax.get_xticklabels()
plt.setp(labels, rotation=45, horizontalalignment='right')
```



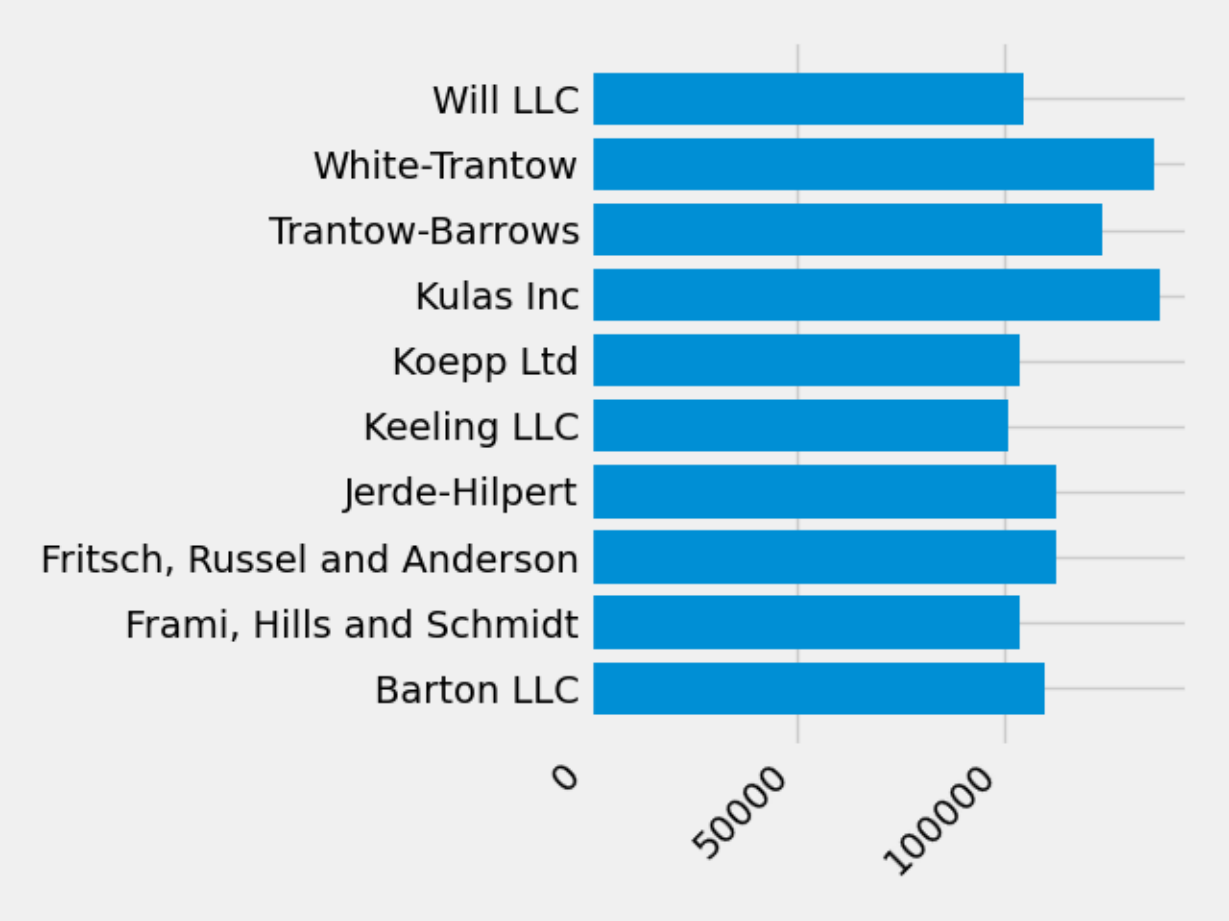
Out:

```
[None, None, None, None, None, None, None, None, None, None, None, None, None,␣
↪None, None, None, None]
```

It looks like this cut off some of the labels on the bottom. We can tell Matplotlib to automatically make room for elements in the figures that we create. To do this we set the `autolayout` value of our rcParams. For more information on controlling the style, layout, and other features of plots with rcParams, see *Customizing Matplotlib with style sheets and rcParams*.

```
plt.rcParams.update({'figure.autolayout': True})

fig, ax = plt.subplots()
ax.barh(group_names, group_data)
labels = ax.get_xticklabels()
plt.setp(labels, rotation=45, horizontalalignment='right')
```

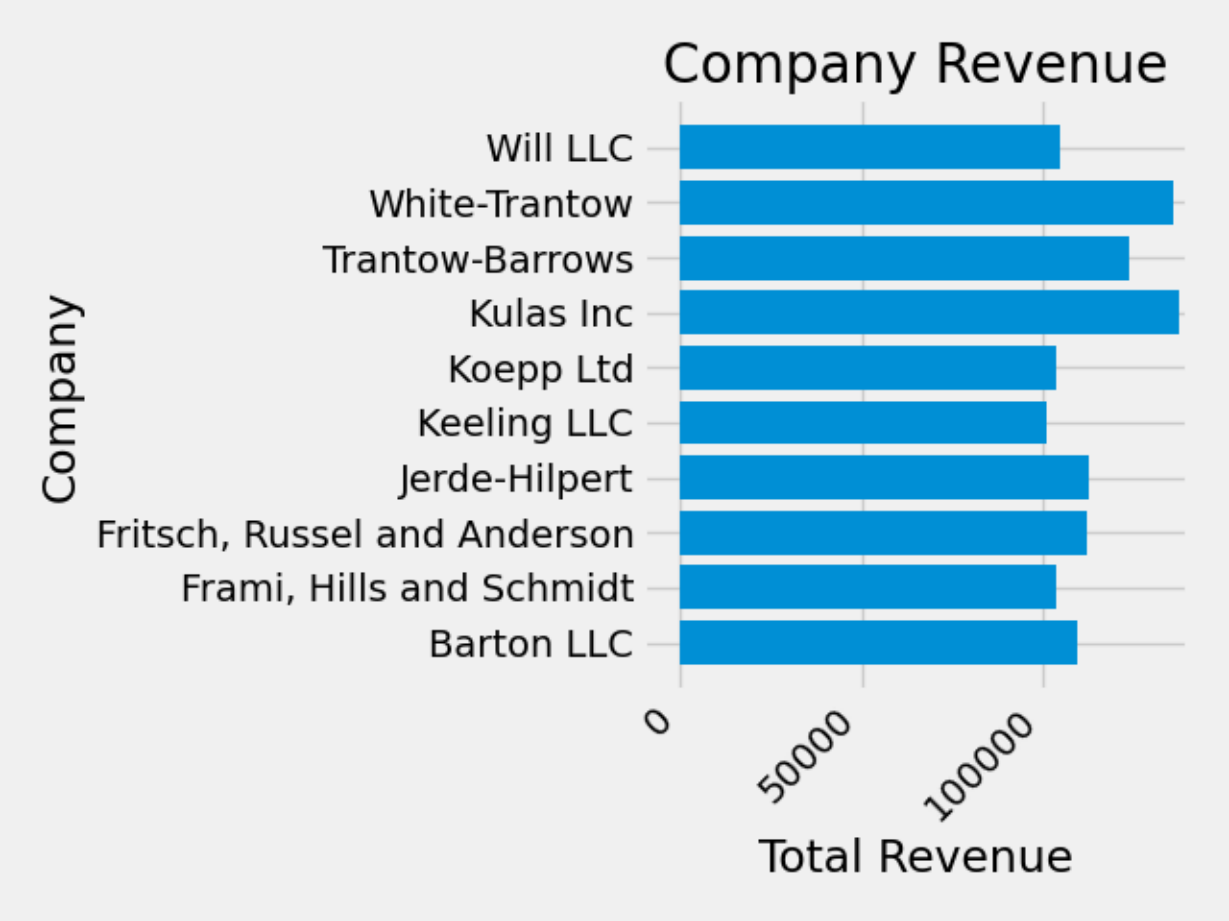


Out:

```
[None, None, None, None, None, None, None, None, None, None, None, None, None,␣
↪None, None, None, None]
```

Next, we add labels to the plot. To do this with the OO interface, we can use the *Artist.set()* method to set properties of this Axes object.

```
fig, ax = plt.subplots()
ax.barh(group_names, group_data)
labels = ax.get_xticklabels()
plt.setp(labels, rotation=45, horizontalalignment='right')
ax.set(xlim=[-10000, 140000], xlabel='Total Revenue', ylabel='Company',
       title='Company Revenue')
```



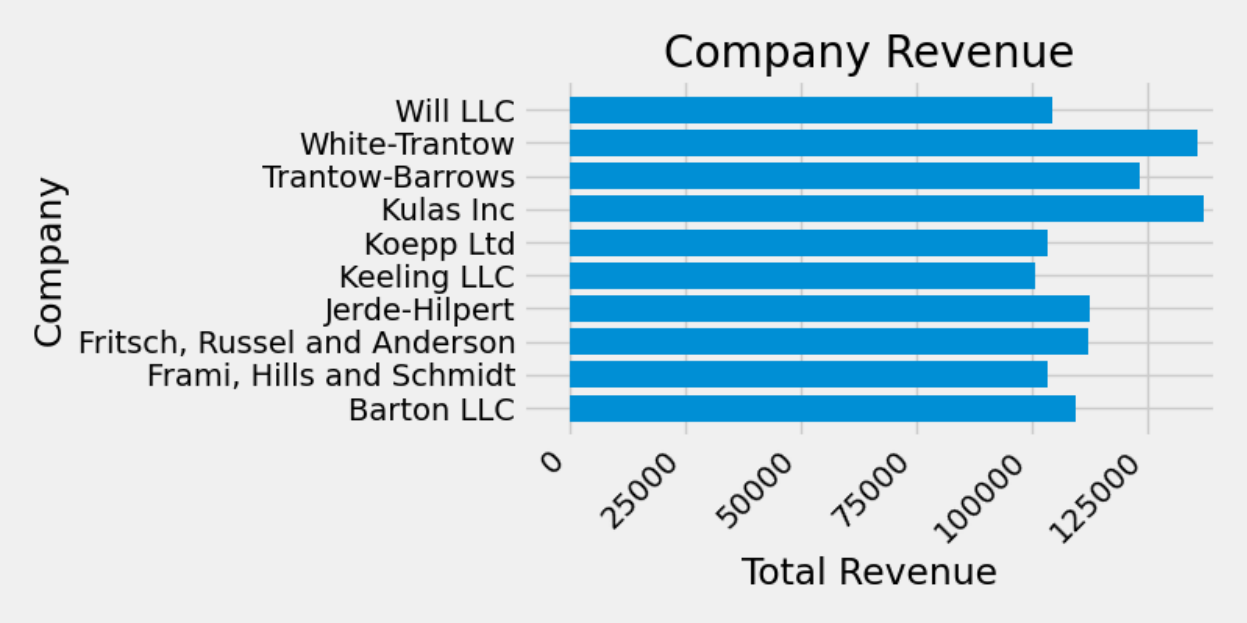
Out:

```
[(-10000.0, 140000.0), Text(0.5, 0, 'Total Revenue'), Text(0, 0.5, 'Company'), Text(0.5,␣
↪1.0, 'Company Revenue')]
```

We can also adjust the size of this plot using the *pyplot.subplots()* function. We can do this with the `figsize` kwarg.

Note: While indexing in NumPy follows the form (row, column), the figsize kwarg follows the form (width, height). This follows conventions in visualization, which unfortunately are different from those of linear algebra.

```
fig, ax = plt.subplots(figsize=(8, 4))
ax.barh(group_names, group_data)
labels = ax.get_xticklabels()
plt.setp(labels, rotation=45, horizontalalignment='right')
ax.set(xlim=[-10000, 140000], xlabel='Total Revenue', ylabel='Company',
       title='Company Revenue')
```



Out:

```
[(-10000.0, 140000.0), Text(0.5, 0, 'Total Revenue'), Text(0, 0.5, 'Company'), Text(0.5,␣
↪1.0, 'Company Revenue')]
```

For labels, we can specify custom formatting guidelines in the form of functions. Below we define a function that takes an integer as input, and returns a string as an output. When used with *Axis.set_major_formatter* or *Axis.set_minor_formatter*, they will automatically create and use a *ticker.FuncFormatter* class.

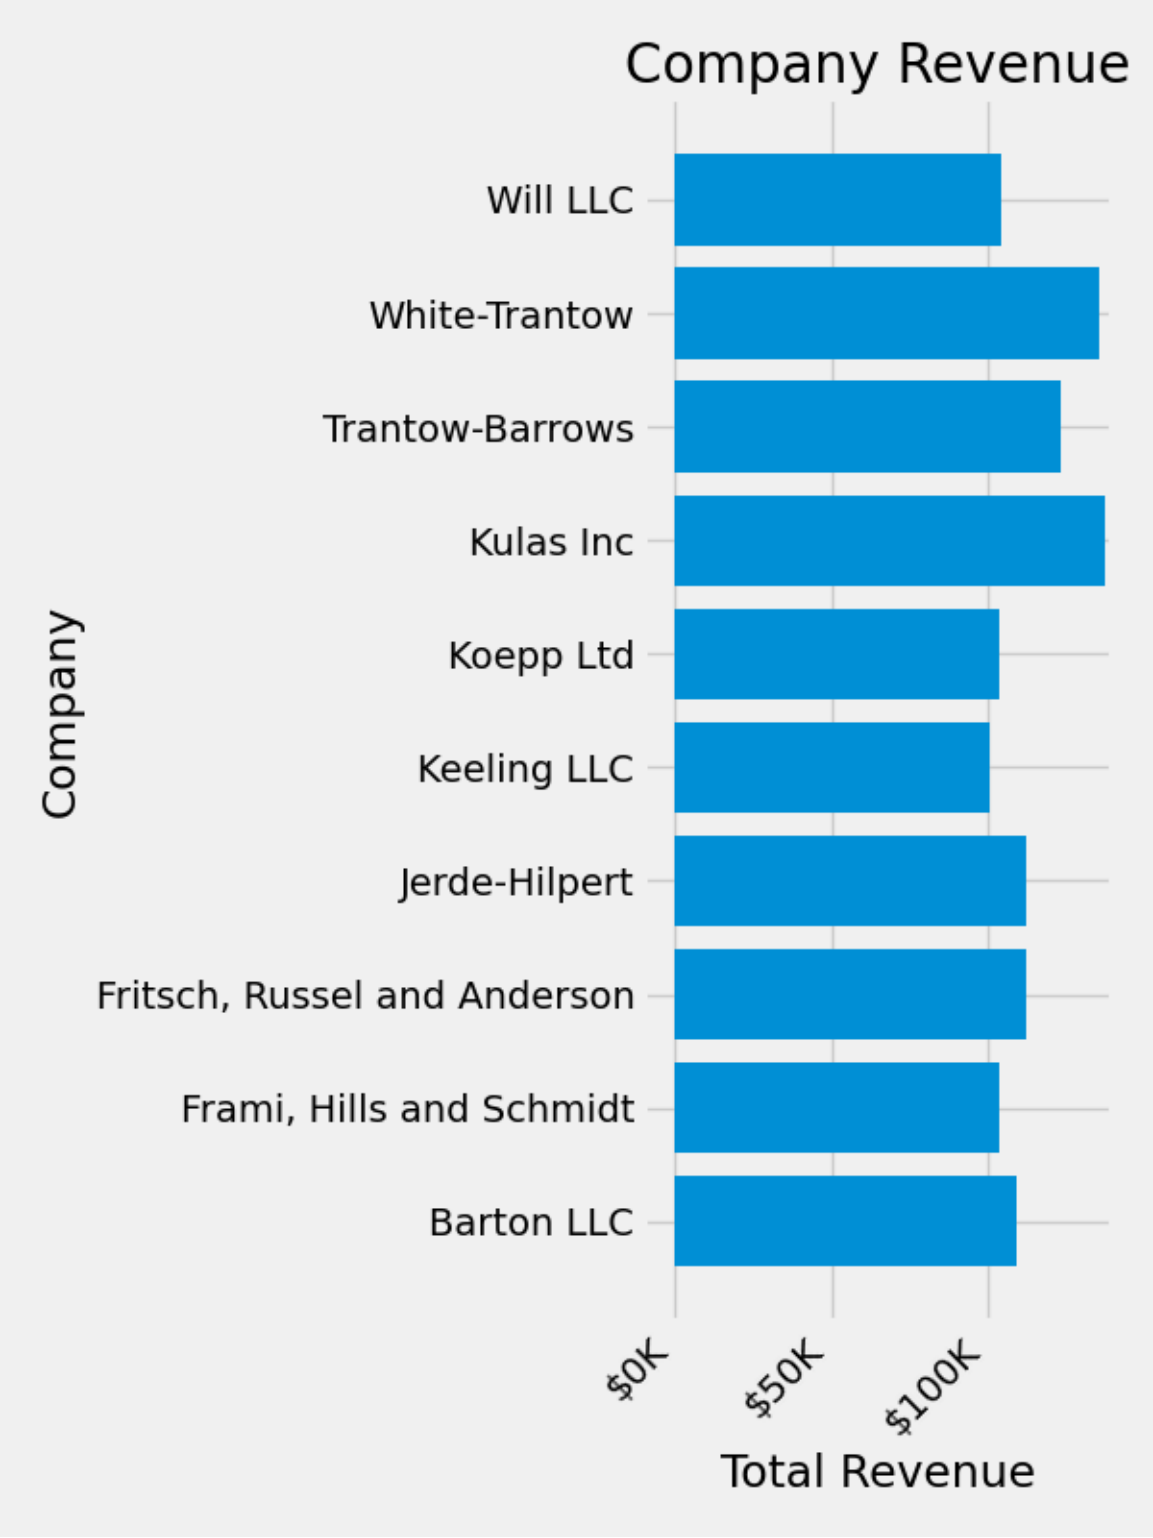
For this function, the `x` argument is the original tick label and `pos` is the tick position. We will only use `x` here but both arguments are needed.

```
def currency(x, pos):
    """The two args are the value and tick position"""
    if x >= 1e6:
        s = '${:1.1f}M'.format(x*1e-6)
    else:
        s = '${:1.0f}K'.format(x*1e-3)
    return s
```

We can then apply this function to the labels on our plot. To do this, we use the `xaxis` attribute of our axes. This lets you perform actions on a specific axis on our plot.

```
fig, ax = plt.subplots(figsize=(6, 8))
ax.barh(group_names, group_data)
labels = ax.get_xticklabels()
plt.setp(labels, rotation=45, horizontalalignment='right')

ax.set(xlim=[-10000, 140000], xlabel='Total Revenue', ylabel='Company',
       title='Company Revenue')
ax.xaxis.set_major_formatter(currency)
```



Company Revenue
Will LLC
White-Trantow
Trantow-Barrows
Kulas Inc
Koepp Ltd
Keeling LLC
Jerde-Hilpert
Fritsch, Russel and Anderson
Frami, Hills and Schmidt
Barton LLC
Company
$0K
$50K
$100K
Total Revenue

Combining multiple visualizations

It is possible to draw multiple plot elements on the same instance of *axes.Axes*. To do this we simply need to call another one of the plot methods on that axes object.

```
fig, ax = plt.subplots(figsize=(8, 8))
ax.barh(group_names, group_data)
labels = ax.get_xticklabels()
plt.setp(labels, rotation=45, horizontalalignment='right')

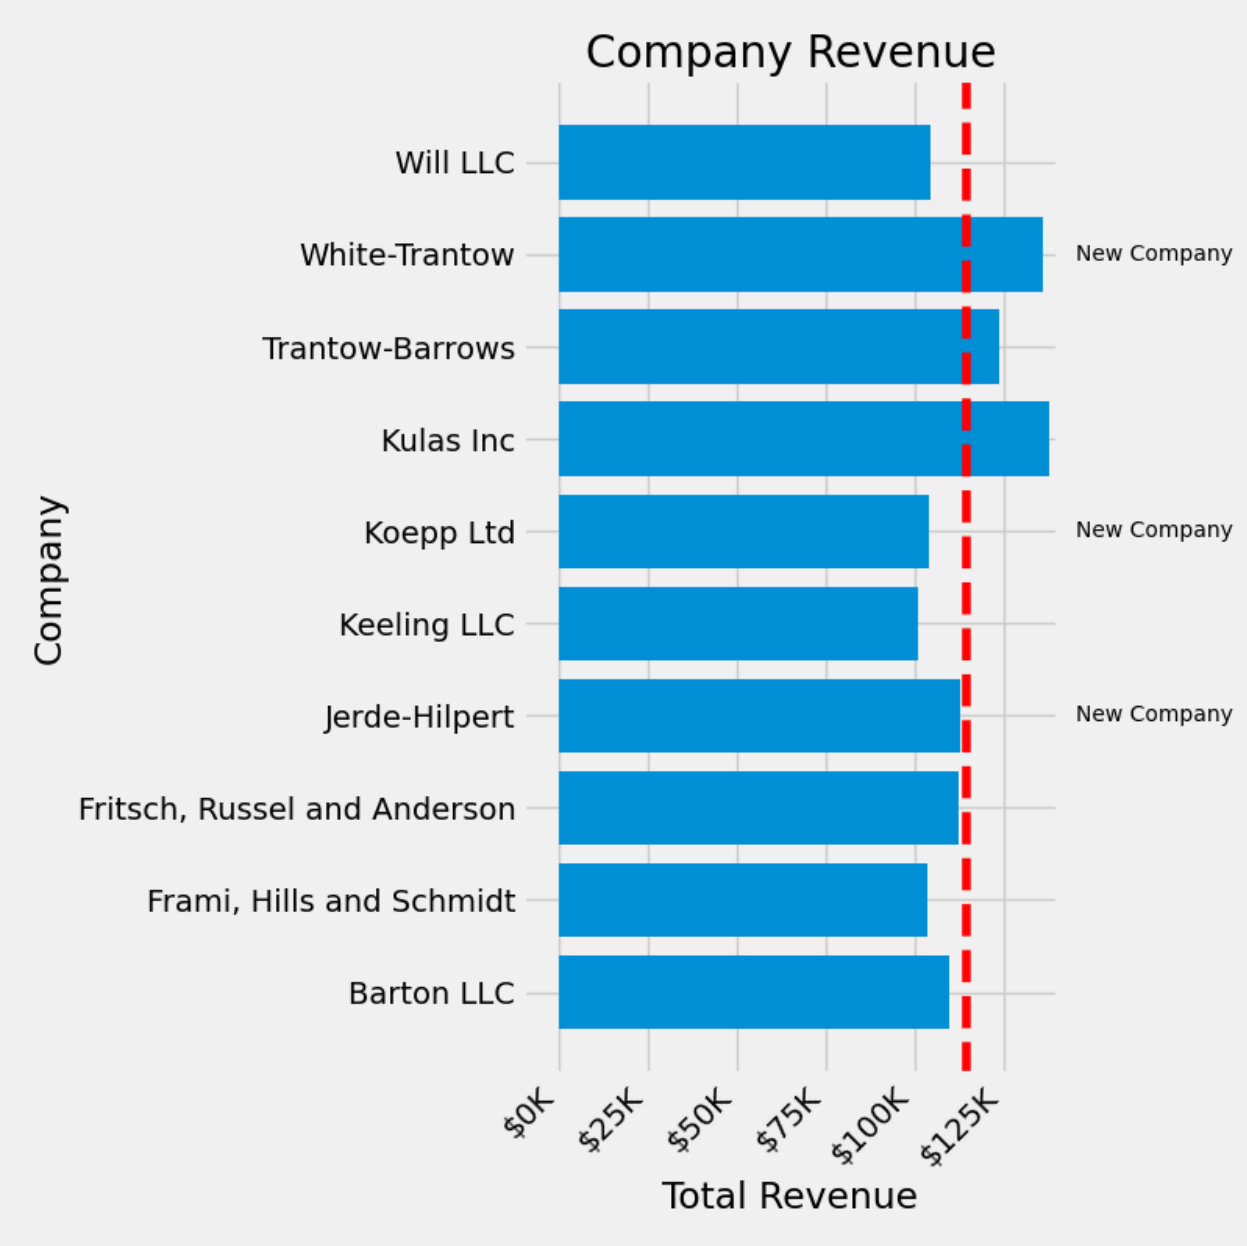
# Add a vertical line, here we set the style in the function call
ax.axvline(group_mean, ls='--', color='r')

# Annotate new companies
for group in [3, 5, 8]:
    ax.text(145000, group, "New Company", fontsize=10,
            verticalalignment="center")

# Now we move our title up since it's getting a little cramped
ax.title.set(y=1.05)

ax.set(xlim=[-10000, 140000], xlabel='Total Revenue', ylabel='Company',
       title='Company Revenue')
ax.xaxis.set_major_formatter(currency)
ax.set_xticks([0, 25e3, 50e3, 75e3, 100e3, 125e3])
fig.subplots_adjust(right=.1)

plt.show()
```



Saving our plot

Now that we're happy with the outcome of our plot, we want to save it to disk. There are many file formats we can save to in Matplotlib. To see a list of available options, use:

```
print(fig.canvas.get_supported_filetypes())
```

Out:

```
{'eps': 'Encapsulated Postscript', 'jpg': 'Joint Photographic Experts Group', 'jpeg':
↪'Joint Photographic Experts Group', 'pdf': 'Portable Document Format', 'pgf': 'PGF␣
↪code for LaTeX', 'png': 'Portable Network Graphics', 'ps': 'Postscript', 'raw': 'Raw␣
↪RGBA bitmap', 'rgba': 'Raw RGBA bitmap', 'svg': 'Scalable Vector Graphics', 'svgz':
↪'Scalable Vector Graphics', 'tif': 'Tagged Image File Format', 'tiff': 'Tagged Image␣
↪File Format'}
```

We can then use the *figure.Figure.savefig()* in order to save the figure to disk. Note that there are several useful flags we show below:

- `transparent=True` makes the background of the saved figure transparent if the format supports it.
- `dpi=80` controls the resolution (dots per square inch) of the output.
- `bbox_inches="tight"` fits the bounds of the figure to our plot.

```
# Uncomment this line to save the figure.
# fig.savefig('sales.png', transparent=False, dpi=80, bbox_inches="tight")
```

Total running time of the script: (0 minutes 2.779 seconds)

2.1.6 Customizing Matplotlib with style sheets and rcParams

Tips for customizing the properties and default styles of Matplotlib.

Using style sheets

The *style* package adds support for easy-to-switch plotting "styles" with the same parameters as a *matplotlib rc* file (which is read at startup to configure Matplotlib).

There are a number of pre-defined styles provided by Matplotlib. For example, there's a pre-defined style called "ggplot", which emulates the aesthetics of ggplot (a popular plotting package for R). To use this style, just add:

```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib as mpl
from cycler import cycler
plt.style.use('ggplot')
data = np.random.randn(50)
```

To list all available styles, use:

```
print(plt.style.available)
```

Out:

```
['Solarize_Light2', '_classic_test_patch', 'bmh', 'classic', 'dark_background', 'fast',
↪'fivethirtyeight', 'ggplot', 'grayscale', 'seaborn', 'seaborn-bright', 'seaborn-
↪colorblind', 'seaborn-dark', 'seaborn-dark-palette', 'seaborn-darkgrid', 'seaborn-deep
↪', 'seaborn-muted', 'seaborn-notebook', 'seaborn-paper', 'seaborn-pastel', 'seaborn-
↪poster', 'seaborn-talk', 'seaborn-ticks', 'seaborn-white', 'seaborn-whitegrid',
↪'tableau-colorblind10']
```

(continues on next page)

(continued from previous page)

Defining your own style

You can create custom styles and use them by calling *style.use* with the path or URL to the style sheet.

For example, you might want to create `./images/presentation.mplstyle` with the following:

```
axes.titlesize : 24
axes.labelsize : 20
lines.linewidth : 3
lines.markersize : 10
xtick.labelsize : 16
ytick.labelsize : 16
```

Then, when you want to adapt a plot designed for a paper to one that looks good in a presentation, you can just add:

```
>>> import matplotlib.pyplot as plt
>>> plt.style.use('./images/presentation.mplstyle')
```

Alternatively, you can make your style known to Matplotlib by placing your `<style-name>.mplstyle` file into `mpl_configdir/stylelib`. You can then load your custom style sheet with a call to `style.use(<style-name>)`. By default `mpl_configdir` should be `~/.config/matplotlib`, but you can check where yours is with *matplotlib.get_configdir()*; you may need to create this directory. You also can change the directory where Matplotlib looks for the stylelib/ folder by setting the *MPLCONFIGDIR* environment variable, see *matplotlib configuration and cache directory locations*.

Note that a custom style sheet in `mpl_configdir/stylelib` will override a style sheet defined by Matplotlib if the styles have the same name.

Once your `<style-name>.mplstyle` file is in the appropriate `mpl_configdir` you can specify your style with:

```
>>> import matplotlib.pyplot as plt
>>> plt.style.use(<style-name>)
```

Composing styles

Style sheets are designed to be composed together. So you can have a style sheet that customizes colors and a separate style sheet that alters element sizes for presentations. These styles can easily be combined by passing a list of styles:

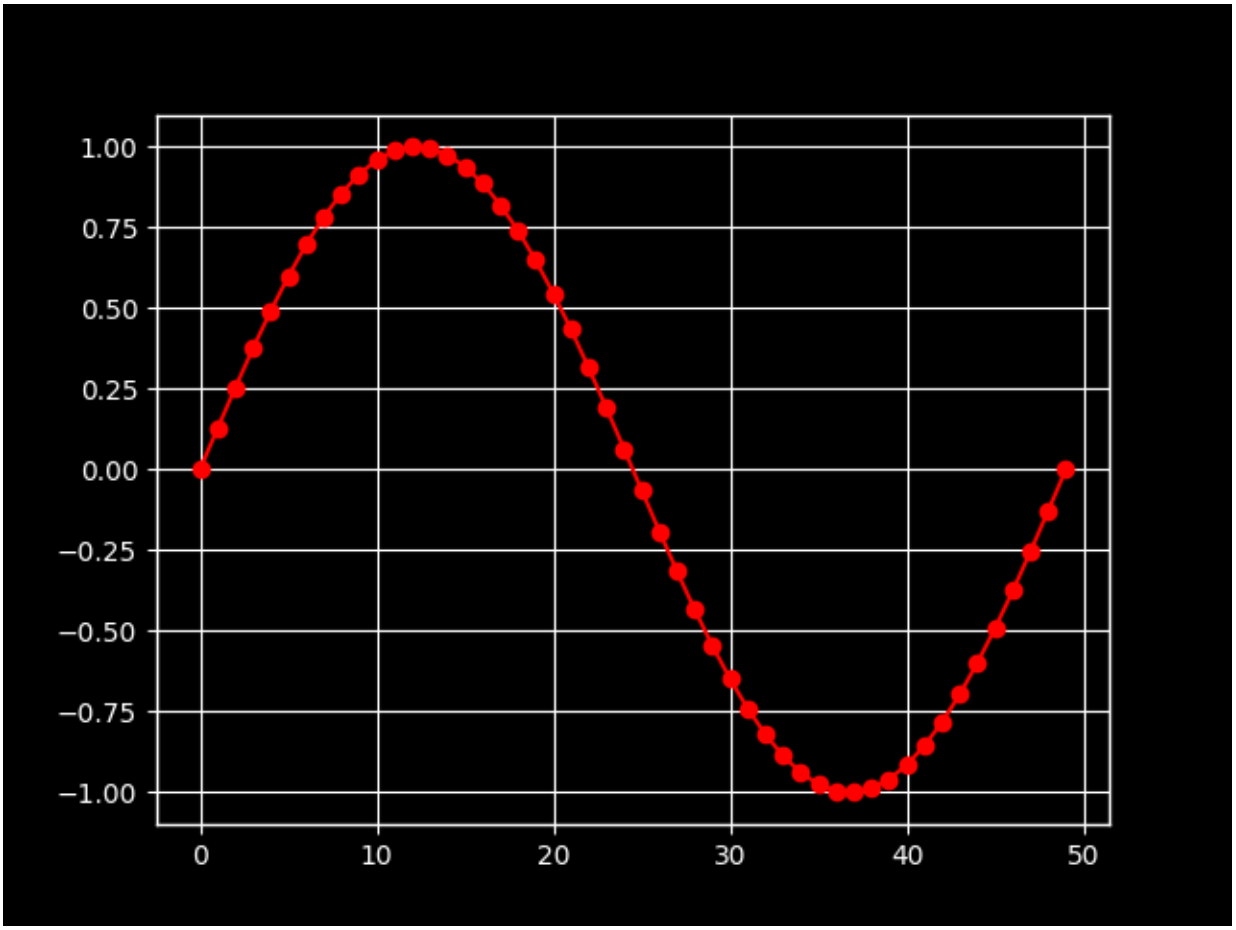
```
>>> import matplotlib.pyplot as plt
>>> plt.style.use(['dark_background', 'presentation'])
```

Note that styles further to the right will overwrite values that are already defined by styles on the left.

Temporary styling

If you only want to use a style for a specific block of code but don't want to change the global styling, the style package provides a context manager for limiting your changes to a specific scope. To isolate your styling changes, you can write something like the following:

```
with plt.style.context('dark_background'):
    plt.plot(np.sin(np.linspace(0, 2 * np.pi)), 'r-o')
plt.show()
```

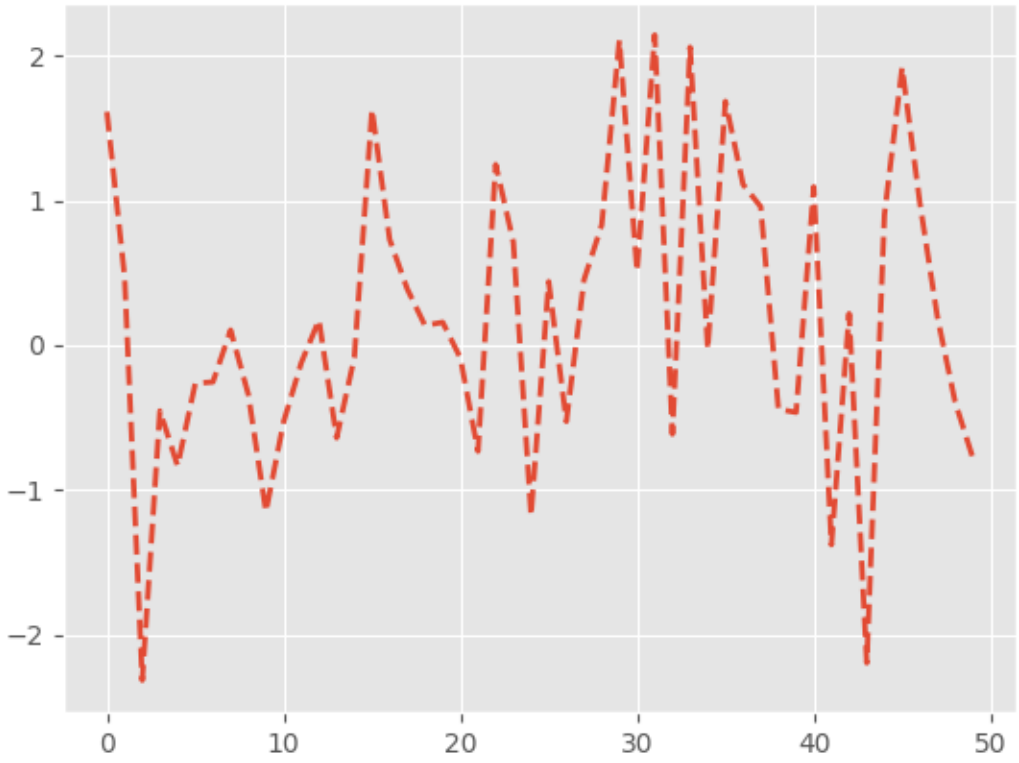


2.1.7 Matplotlib rcParams

Dynamic rc settings

You can also dynamically change the default rc settings in a python script or interactively from the python shell. All of the rc settings are stored in a dictionary-like variable called *matplotlib.rcParams*, which is global to the matplotlib package. rcParams can be modified directly, for example:

```
mpl.rcParams['lines.linewidth'] = 2
mpl.rcParams['lines.linestyle'] = '--'
plt.plot(data)
```

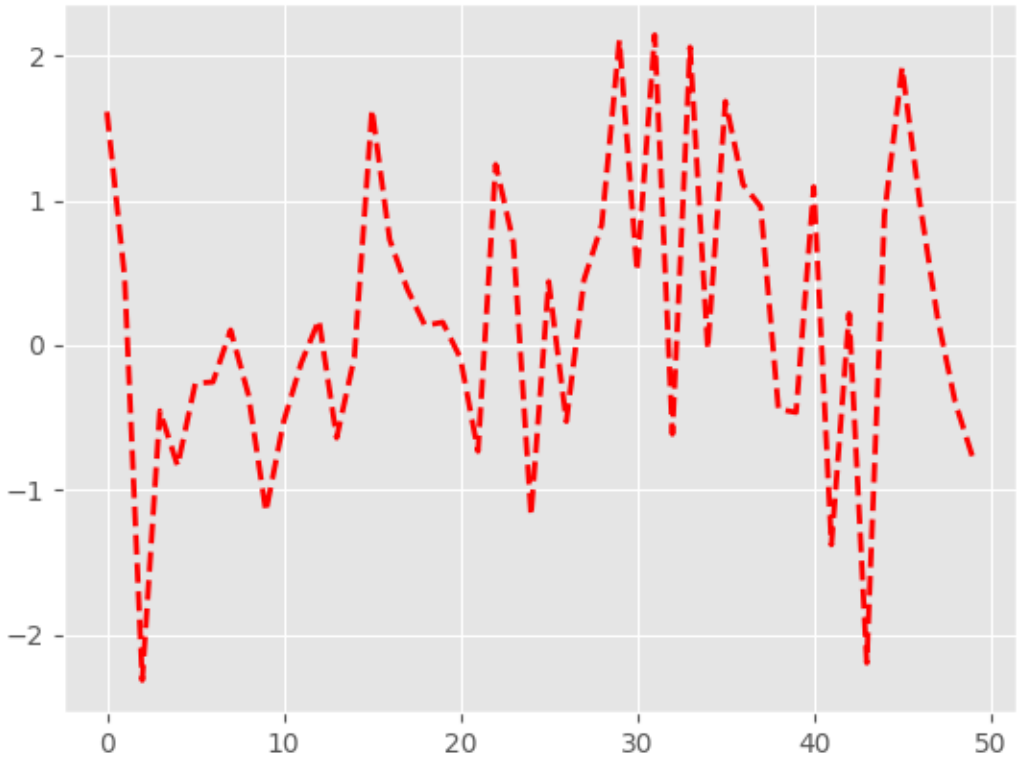


Out:

```
[<matplotlib.lines.Line2D object at 0x7f53ff786550>]
```

Note, that in order to change the usual *plot* color you have to change the *prop_cycle* property of *axes*:

```
mpl.rcParams['axes.prop_cycle'] = cycler(color=['r', 'g', 'b', 'y'])
plt.plot(data)  # first color is red
```

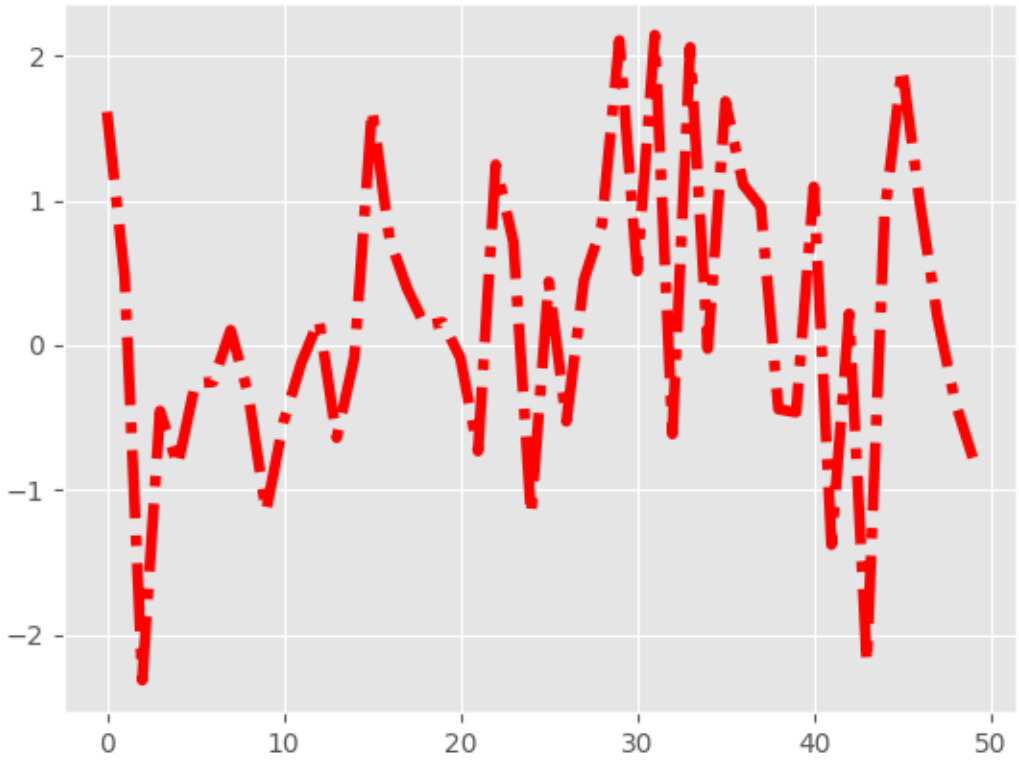


Out:

```
[<matplotlib.lines.Line2D object at 0x7f54003ff550>]
```

Matplotlib also provides a couple of convenience functions for modifying rc settings. *matplotlib.rc* can be used to modify multiple settings in a single group at once, using keyword arguments:

```
mpl.rc('lines', linewidth=4, linestyle='-.')
plt.plot(data)
```



Out:

```
[<matplotlib.lines.Line2D object at 0x7f53fb3ccf40>]
```

matplotlib.rcdefaults will restore the standard Matplotlib default settings.

There is some degree of validation when setting the values of rcParams, see *matplotlib.rcsetup* for details.

The `matplotlibrc` file

Matplotlib uses `matplotlibrc` configuration files to customize all kinds of properties, which we call 'rc settings' or 'rc parameters'. You can control the defaults of almost every property in Matplotlib: figure size and DPI, line width, color and style, axes, axis and grid properties, text and font properties and so on. When a URL or path is not specified with a call to `style.use('<path>/<style-name>.mplstyle')`, Matplotlib looks for `matplotlibrc` in four locations, in the following order:

1. `matplotlibrc` in the current working directory, usually used for specific customizations that you do not want to apply elsewhere.
2. `$MATPLOTLIBRC` if it is a file, else `$MATPLOTLIBRC/matplotlibrc`.

3. It next looks in a user-specific place, depending on your platform:

   - On Linux and FreeBSD, it looks in `.config/matplotlib/matplotlibrc` (or `$XDG_CONFIG_HOME/matplotlib/matplotlibrc`) if you've customized your environment.
   - On other platforms, it looks in `.matplotlib/matplotlibrc`.

   See *matplotlib configuration and cache directory locations*.

4. *INSTALL*`/matplotlib/mpl-data/matplotlibrc`, where *INSTALL* is something like `/usr/lib/python3.7/site-packages` on Linux, and maybe `C:\Python37\Lib\site-packages` on Windows. Every time you install matplotlib, this file will be overwritten, so if you want your customizations to be saved, please move this file to your user-specific matplotlib directory.

Once a `matplotlibrc` file has been found, it will *not* search any of the other paths.

To display where the currently active `matplotlibrc` file was loaded from, one can do the following:

```
>>> import matplotlib
>>> matplotlib.matplotlib_fname()
'/home/foo/.config/matplotlib/matplotlibrc'
```

See below for a sample *matplotlibrc file*.

A sample matplotlibrc file

```
#### MATPLOTLIBRC FORMAT

## NOTE FOR END USERS: DO NOT EDIT THIS FILE!
##
## This is a sample matplotlib configuration file - you can find a copy
## of it on your system in site-packages/matplotlib/mpl-data/matplotlibrc
## (which related to your Python installation location).
##
## You should find a copy of it on your system at
## site-packages/matplotlib/mpl-data/matplotlibrc (relative to your Python
## installation location).  DO NOT EDIT IT!
##
## If you wish to change your default style, copy this file to one of the
## following locations
##     unix/linux:
##         $HOME/.config/matplotlib/matplotlibrc OR
##         $XDG_CONFIG_HOME/matplotlib/matplotlibrc (if $XDG_CONFIG_HOME is set)
##     other platforms:
##         $HOME/.matplotlib/matplotlibrc
## and edit that copy.
##
## See https://matplotlib.org/users/customizing.html#the-matplotlibrc-file
## for more details on the paths which are checked for the configuration file.
```

(continues on next page)

(continued from previous page)

```
##
## Blank lines, or lines starting with a comment symbol, are ignored, as are
## trailing comments.  Other lines must have the format:
##     key: val  # optional comment
##
## Formatting: Use PEP8-like style (as enforced in the rest of the codebase).
## All lines start with an additional '#', so that removing all leading '#'s
## yields a valid style file.
##
## Colors: for the color values below, you can either use
##     - a matplotlib color string, such as r, k, or b
##     - an rgb tuple, such as (1.0, 0.5, 0.0)
##     - a hex string, such as ff00ff
##     - a scalar grayscale intensity such as 0.75
##     - a legal html color name, e.g., red, blue, darkslategray
##
## Matplotlib configuration are currently divided into following parts:
##     - BACKENDS
##     - LINES
##     - PATCHES
##     - HATCHES
##     - BOXPLOT
##     - FONT
##     - TEXT
##     - LaTeX
##     - AXES
##     - DATES
##     - TICKS
##     - GRIDS
##     - LEGEND
##     - FIGURE

## ***************************************************************************
## * BACKENDS                                                                *
## ***************************************************************************
## The default backend.  If you omit this parameter, the first working
## backend from the following list is used:
##     MacOSX Qt5Agg Gtk3Agg TkAgg WxAgg Agg
```

(continues on next page)

(continued from previous page)

```
## Other choices include:
##     Qt5Cairo GTK3Cairo TkCairo WxCairo Cairo
##     Qt4Agg Qt4Cairo Wx  # deprecated.
##     PS PDF SVG Template
## You can also deploy your own backend outside of matplotlib by referring to
## the module name (which must be in the PYTHONPATH) as 'module://my_backend'.
#backend: Agg

## The port to use for the web server in the WebAgg backend.
#webagg.port: 8988

## The address on which the WebAgg web server should be reachable
#webagg.address: 127.0.0.1

## If webagg.port is unavailable, a number of other random ports will
## be tried until one that is available is found.
#webagg.port_retries: 50

## When True, open the webbrowser to the plot that is shown
#webagg.open_in_browser: True

## If you are running pyplot inside a GUI and your backend choice
## conflicts, we will automatically try to find a compatible one for
## you if backend_fallback is True
#backend_fallback: True

#interactive: False
#toolbar:     toolbar2  # {None, toolbar2, toolmanager}
#timezone:    UTC       # a pytz timezone string, e.g., US/Central or Europe/Paris

## * FONT                                                                    *
## ***************************************************************************
## The font properties used by `text.Text`.
## See https://matplotlib.org/api/font_manager_api.html for more information
## on font properties.  The 6 font properties used for font matching are
## given below with their default values.
##
## The font.family property has five values:
##     - 'serif' (e.g., Times),
##     - 'sans-serif' (e.g., Helvetica),
##     - 'cursive' (e.g., Zapf-Chancery),
##     - 'fantasy' (e.g., Western), and
##     - 'monospace' (e.g., Courier).
## Each of these font families has a default list of font names in decreasing
## order of priority associated with them.  When text.usetex is False,
## font.family may also be one or more concrete font names.
##
## The font.style property has three values: normal (or roman), italic
## or oblique.  The oblique style will be used for italic, if it is not
## present.
##
## The font.variant property has two values: normal or small-caps.  For
## TrueType fonts, which are scalable fonts, small-caps is equivalent
## to using a font size of 'smaller', or about 83%% of the current font
```

(continues on next page)

(continued from previous page)

```
## size.
##
## The font.weight property has effectively 13 values: normal, bold,
## bolder, lighter, 100, 200, 300, ..., 900.  Normal is the same as
## 400, and bold is 700.  bolder and lighter are relative values with
## respect to the current weight.
##
## The font.stretch property has 11 values: ultra-condensed,
## extra-condensed, condensed, semi-condensed, normal, semi-expanded,
## expanded, extra-expanded, ultra-expanded, wider, and narrower.  This
## property is not currently implemented.
##
## The font.size property is the default font size for text, given in pts.
## 10 pt is the standard value.
##
## Note that font.size controls default text sizes.  To configure
## special text sizes tick labels, axes, labels, title, etc, see the rc
## settings for axes and ticks.  Special text sizes can be defined
## relative to font.size, using the following values: xx-small, x-small,
## small, medium, large, x-large, xx-large, larger, or smaller

#font.family:  sans-serif
#font.style:   normal
#font.variant: normal
#font.weight:  normal
#font.stretch: normal
#font.size:    10.0

#font.serif:      DejaVu Serif, Bitstream Vera Serif, Computer Modern Roman, New Century␣
↪Schoolbook, Century Schoolbook L, Utopia, ITC Bookman, Bookman, Nimbus Roman No9 L,␣
↪Times New Roman, Times, Palatino, Charter, serif
#font.sans-serif: DejaVu Sans, Bitstream Vera Sans, Computer Modern Sans Serif, Lucida␣
↪Grande, Verdana, Geneva, Lucid, Arial, Helvetica, Avant Garde, sans-serif
#font.cursive:    Apple Chancery, Textile, Zapf Chancery, Sand, Script MT, Felipa,␣
↪cursive
#font.fantasy:    Comic Neue, Comic Sans MS, Chicago, Charcoal, ImpactWestern, Humor␣
↪Sans, xkcd, fantasy
#font.monospace:  DejaVu Sans Mono, Bitstream Vera Sans Mono, Computer Modern Typewriter,
↪ Andale Mono, Nimbus Mono L, Courier New, Courier, Fixed, Terminal, monospace

## * LaTeX                                                                *
## ************************************************************************
## For more information on LaTex properties, see
## https://matplotlib.org/tutorials/text/usetex.html
#text.usetex: False  # use latex for all text handling. The following fonts
                     # are supported through the usual rc parameter settings:
                     # new century schoolbook, bookman, times, palatino,
                     # zapf chancery, charter, serif, sans-serif, helvetica,
                     # avant garde, courier, monospace, computer modern roman,
                     # computer modern sans serif, computer modern typewriter
                     # If another font is desired which can loaded using the
                     # LaTeX \usepackage command, please inquire at the
                     # matplotlib mailing list
#text.latex.preamble:   # IMPROPER USE OF THIS FEATURE WILL LEAD TO LATEX FAILURES
                       # AND IS THEREFORE UNSUPPORTED. PLEASE DO NOT ASK FOR HELP
                       # IF THIS FEATURE DOES NOT DO WHAT YOU EXPECT IT TO.
                       # text.latex.preamble is a single line of LaTeX code that
                       # will be passed on to the LaTeX system. It may contain
                       # any code that is valid for the LaTeX "preamble", i.e.
                       # between the "\documentclass" and "\begin{document}"
                       # statements.
                       # Note that it has to be put on a single line, which may
                       # become quite long.
                       # The following packages are always loaded with usetex, so
                       # beware of package collisions: color, geometry, graphicx,
                       # type1cm, textcomp.
                       # Adobe Postscript (PSSNFS) font packages may also be
                       # loaded, depending on your font settings.

## FreeType hinting flag ("foo" corresponds to FT_LOAD_FOO); may be one of the
## following (Proprietary Matplotlib-specific synonyms are given in parentheses,
## but their use is discouraged):
## - default: Use the font's native hinter if possible, else FreeType's auto-hinter.
##            ("either" is a synonym).
## - no_autohint: Use the font's native hinter if possible, else don't hint.
##                ("native" is a synonym.)
## - force_autohint: Use FreeType's auto-hinter.  ("auto" is a synonym.)
## - no_hinting: Disable hinting.  ("none" is a synonym.)
#text.hinting: force_autohint

#text.hinting_factor: 8  # Specifies the amount of softness for hinting in the
                        # horizontal direction.  A value of 1 will hint to full
                        # pixels.  A value of 2 will hint to half pixels etc.
#text.kerning_factor : 0  # Specifies the scaling factor for kerning values. This
                         # is provided solely to allow old test images to remain
                         # unchanged. Set to 6 to obtain previous behavior. Values
                         # other than 0 or 6 have no defined meaning.
#text.antialiased: True  # If True (default), the text will be antialiased.
                        # This only affects the Agg backend.

## The following settings allow you to select the fonts in math mode.
```

(continues on next page)

(continued from previous page)

```
#mathtext.fontset: dejavusans  # Should be 'dejavusans' (default),
                               # 'dejavuserif', 'cm' (Computer Modern), 'stix',
                               # 'stixsans' or 'custom' (unsupported, may go
                               # away in the future)
## "mathtext.fontset: custom" is defined by the mathtext.bf, .cal, .it, ...
## settings which map a TeX font name to a fontconfig font pattern.  (These
## settings are not used for other font sets.)
#mathtext.bf:  sans:bold
#mathtext.cal: cursive
#mathtext.it:  sans:italic
#mathtext.rm:  sans
#mathtext.sf:  sans
#mathtext.tt:  monospace
#mathtext.fallback: cm  # Select fallback font from ['cm' (Computer Modern), 'stix'
                        # 'stixsans'] when a symbol can not be found in one of the
                        # custom math fonts. Select 'None' to not perform fallback
                        # and replace the missing character by a dummy symbol.
#mathtext.default: it  # The default font to use for math.
                       # Can be any of the LaTeX font names, including
                       # the special name "regular" for the same font
                       # used in regular text.

## ***************************************************************************
## * DATES                                                                   *
## ***************************************************************************
## These control the default format strings used in AutoDateFormatter.
## Any valid format datetime format string can be used (see the python
## `datetime` for details).  For example, by using:
##     - '%%x' will use the locale date representation
##     - '%%X' will use the locale time representation
##     - '%%c' will use the full locale datetime representation
## These values map to the scales:
##     {'year': 365, 'month': 30, 'day': 1, 'hour': 1/24, 'minute': 1 / (24 * 60)}

#date.autoformatter.year:        %Y
#date.autoformatter.month:       %Y-%m
#date.autoformatter.day:         %Y-%m-%d
#date.autoformatter.hour:        %m-%d %H
#date.autoformatter.minute:      %d %H:%M
#date.autoformatter.second:      %H:%M:%S

Total running time of the script: (0 minutes 1.592 seconds)

2.2 Intermediate

These tutorials cover some of the more complicated classes and functions in Matplotlib. They can be useful for particular custom and complex visualizations.

2.2.1 Artist tutorial

Using Artist objects to render on the canvas.

There are three layers to the matplotlib API.

- the `matplotlib.backend_bases.FigureCanvas` is the area onto which the figure is drawn
- the `matplotlib.backend_bases.Renderer` is the object which knows how to draw on the `FigureCanvas`
- and the *matplotlib.artist.Artist* is the object that knows how to use a renderer to paint onto the canvas.

The `FigureCanvas` and `Renderer` handle all the details of talking to user interface toolkits like wxPython or drawing languages like PostScript®, and the `Artist` handles all the high level constructs like representing and laying out the figure, text, and lines. The typical user will spend 95% of their time working with the `Artists`.

There are two types of `Artists`: primitives and containers. The primitives represent the standard graphical objects we want to paint onto our canvas: *Line2D*, *Rectangle*, *Text*, *AxesImage*, etc., and the containers are places to put them (*Axis*, *Axes* and *Figure*). The standard use is to create a *Figure* instance, use the `Figure` to create one or more *Axes* or `Subplot` instances, and use the `Axes` instance helper methods to create the primitives. In the example below, we create a `Figure` instance using *matplotlib.pyplot.figure()*, which is a convenience method for instantiating `Figure` instances and connecting them with your user interface or drawing toolkit `FigureCanvas`. As we will discuss below, this is not necessary -- you can work directly with PostScript, PDF Gtk+, or wxPython `FigureCanvas` instances, instantiate your `Figures` directly and connect them yourselves -- but since we are focusing here on the `Artist` API we'll let *pyplot* handle some of those details for us:

```
import matplotlib.pyplot as plt
fig = plt.figure()
ax = fig.add_subplot(2, 1, 1) # two rows, one column, first plot
```

The *Axes* is probably the most important class in the matplotlib API, and the one you will be working with most of the time. This is because the `Axes` is the plotting area into which most of the objects go, and the `Axes` has many special helper methods (*plot()*, *text()*, *hist()*, *imshow()*) to create the most common graphics primitives (*Line2D*, *Text*, *Rectangle*, *AxesImage*, respectively). These helper methods will take your data (e.g., `numpy` arrays and strings) and create primitive `Artist` instances as needed (e.g., `Line2D`), add them to the relevant containers, and draw them when requested. Most of you are probably familiar with the `Subplot`, which is just a special case of an `Axes` that lives on a regular rows by columns grid of `Subplot` instances. If you want to create an `Axes` at an arbitrary location, simply use the *add_axes()* method which takes a list of `[left, bottom, width, height]` values in 0-1 relative figure coordinates:

```
fig2 = plt.figure()
ax2 = fig2.add_axes([0.15, 0.1, 0.7, 0.3])
```

Continuing with our example:

```
import numpy as np
t = np.arange(0.0, 1.0, 0.01)
s = np.sin(2*np.pi*t)
line, = ax.plot(t, s, color='blue', lw=2)
```

In this example, `ax` is the `Axes` instance created by the `fig.add_subplot` call above (remember `Subplot` is just a subclass of `Axes`) and when you call `ax.plot`, it creates a `Line2D` instance and adds it to the `Axes.lines` list. In the interactive ipython session below, you can see that the `Axes.lines` list is length one and contains the same line that was returned by the `line, = ax.plot...` call:

```
In [101]: ax.lines[0]
Out[101]: <matplotlib.lines.Line2D instance at 0x19a95710>

In [102]: line
Out[102]: <matplotlib.lines.Line2D instance at 0x19a95710>
```

If you make subsequent calls to `ax.plot` (and the hold state is "on" which is the default) then additional lines will be added to the list. You can remove lines later simply by calling the list methods; either of these will work:

```
del ax.lines[0]
ax.lines.remove(line)  # one or the other, not both!
```

The Axes also has helper methods to configure and decorate the x-axis and y-axis tick, tick labels and axis labels:

```
xtext = ax.set_xlabel('my xdata') # returns a Text instance
ytext = ax.set_ylabel('my ydata')
```

When you call *ax.set_xlabel*, it passes the information on the *Text* instance of the *XAxis*. Each `Axes` instance contains an *XAxis* and a *YAxis* instance, which handle the layout and drawing of the ticks, tick labels and axis labels.

Try creating the figure below.

```
import numpy as np
import matplotlib.pyplot as plt

fig = plt.figure()
fig.subplots_adjust(top=0.8)
ax1 = fig.add_subplot(211)
ax1.set_ylabel('volts')
ax1.set_title('a sine wave')

t = np.arange(0.0, 1.0, 0.01)
s = np.sin(2*np.pi*t)
line, = ax1.plot(t, s, color='blue', lw=2)

# Fixing random state for reproducibility
```

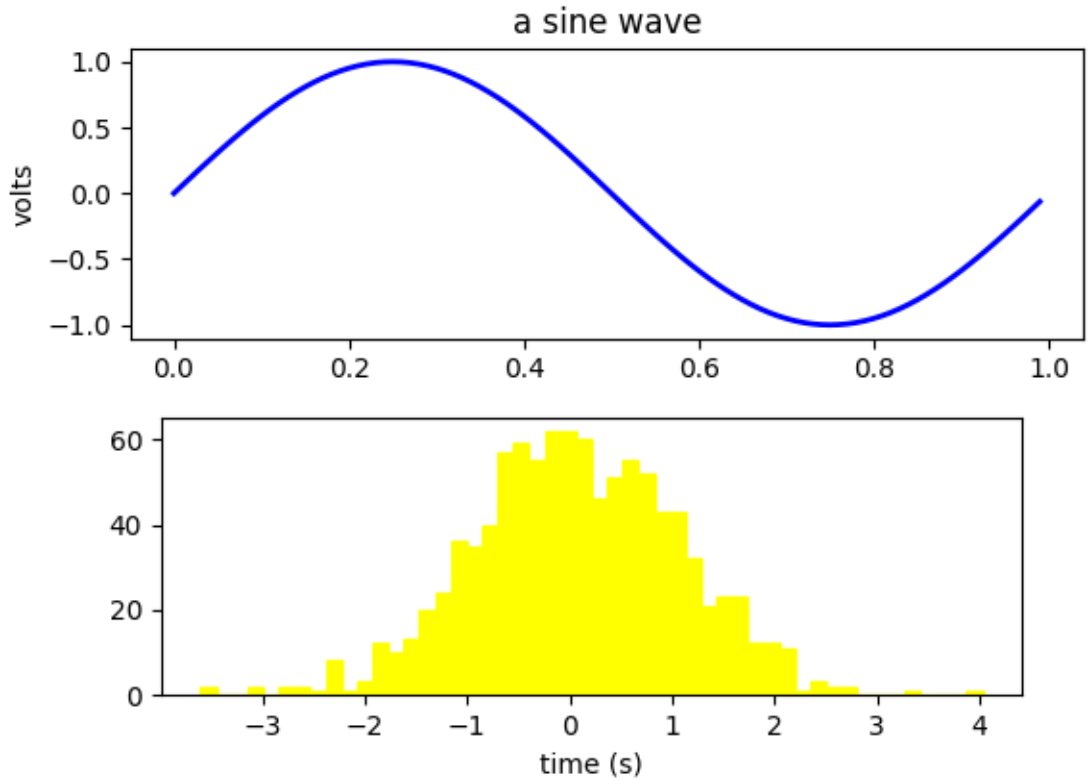
(continues on next page)

(continued from previous page)

```
np.random.seed(19680801)

ax2 = fig.add_axes([0.15, 0.1, 0.7, 0.3])
n, bins, patches = ax2.hist(np.random.randn(1000), 50,
                            facecolor='yellow', edgecolor='yellow')
ax2.set_xlabel('time (s)')

plt.show()
```



Customizing your objects

Every element in the figure is represented by a matplotlib *Artist*, and each has an extensive list of properties to configure its appearance. The figure itself contains a *Rectangle* exactly the size of the figure, which you can use to set the background color and transparency of the figures. Likewise, each *Axes* bounding box (the standard white box with black edges in the typical matplotlib plot, has a `Rectangle` instance that determines the color, transparency, and other properties of the Axes. These instances are stored as member variables `Figure.patch` and `Axes.patch` ("Patch" is a name inherited from MATLAB, and is a 2D "patch" of color on the figure, e.g., rectangles, circles and polygons). Every matplotlib `Artist` has the following properties

Property	Description
alpha	The transparency - a scalar from 0-1
animated	A boolean that is used to facilitate animated drawing
axes	The axes that the Artist lives in, possibly None
clip_box	The bounding box that clips the Artist
clip_on	Whether clipping is enabled
clip_path	The path the artist is clipped to
contains	A picking function to test whether the artist contains the pick point
figure	The figure instance the artist lives in, possibly None
label	A text label (e.g., for auto-labeling)
picker	A python object that controls object picking
transform	The transformation
visible	A boolean whether the artist should be drawn
zorder	A number which determines the drawing order
rasterized	Boolean; Turns vectors into raster graphics (for compression & eps transparency)

Each of the properties is accessed with an old-fashioned setter or getter (yes we know this irritates Pythonistas and we plan to support direct access via properties or traits but it hasn't been done yet). For example, to multiply the current alpha by a half:

```
a = o.get_alpha()
o.set_alpha(0.5*a)
```

If you want to set a number of properties at once, you can also use the `set` method with keyword arguments. For example:

```
o.set(alpha=0.5, zorder=2)
```

If you are working interactively at the python shell, a handy way to inspect the `Artist` properties is to use the *matplotlib.artist.getp()* function (simply *getp()* in pyplot), which lists the properties and their values. This works for classes derived from `Artist` as well, e.g., `Figure` and `Rectangle`. Here are the `Figure` rectangle properties mentioned above:

```
In [149]: matplotlib.artist.getp(fig.patch)
    alpha = 1.0
    animated = False
    antialiased or aa = True
    axes = None
    clip_box = None
    clip_on = False
    clip_path = None
    contains = None
    edgecolor or ec = w
    facecolor or fc = 0.75
```

(continues on next page)

(continued from previous page)

```
    figure = Figure(8.125x6.125)
    fill = 1
    hatch = None
    height = 1
    label =
    linewidth or lw = 1.0
    picker = None
    transform = <Affine object at 0x134cca84>
    verts = ((0, 0), (0, 1), (1, 1), (1, 0))
    visible = True
    width = 1
    window_extent = <Bbox object at 0x134acbcc>
    x = 0
    y = 0
    zorder = 1
```

The docstrings for all of the classes also contain the `Artist` properties, so you can consult the interactive "help" or the *matplotlib.artist* for a listing of properties for a given object.

Object containers

Now that we know how to inspect and set the properties of a given object we want to configure, we need to know how to get at that object. As mentioned in the introduction, there are two kinds of objects: primitives and containers. The primitives are usually the things you want to configure (the font of a *Text* instance, the width of a *Line2D*) although the containers also have some properties as well -- for example the *Axes Artist* is a container that contains many of the primitives in your plot, but it also has properties like the `xscale` to control whether the xaxis is 'linear' or 'log'. In this section we'll review where the various container objects store the `Artists` that you want to get at.

Figure container

The top level container `Artist` is the *matplotlib.figure.Figure*, and it contains everything in the figure. The background of the figure is a *Rectangle* which is stored in `Figure.patch`. As you add subplots (*add_subplot()*) and axes (*add_axes()*) to the figure these will be appended to the *Figure.axes*. These are also returned by the methods that create them:

```
In [156]: fig = plt.figure()

In [157]: ax1 = fig.add_subplot(211)

In [158]: ax2 = fig.add_axes([0.1, 0.1, 0.7, 0.3])
```

(continues on next page)

(continued from previous page)

```
In [159]: ax1
Out[159]: <matplotlib.axes.Subplot instance at 0xd54b26c>

In [160]: print(fig.axes)
[<matplotlib.axes.Subplot instance at 0xd54b26c>,
<matplotlib.axes.Axes instance at 0xd3f0b2c>]
```

Because the figure maintains the concept of the "current axes" (see *Figure.gca* and *Figure.sca*) to support the pylab/pyplot state machine, you should not insert or remove axes directly from the axes list, but rather use the *add_subplot()* and *add_axes()* methods to insert, and the *delaxes()* method to delete. You are free however, to iterate over the list of axes or index into it to get access to `Axes` instances you want to customize. Here is an example which turns all the axes grids on:

```
for ax in fig.axes:
    ax.grid(True)
```

The figure also has its own text, lines, patches and images, which you can use to add primitives directly. The default coordinate system for the `Figure` will simply be in pixels (which is not usually what you want) but you can control this by setting the transform property of the `Artist` you are adding to the figure.

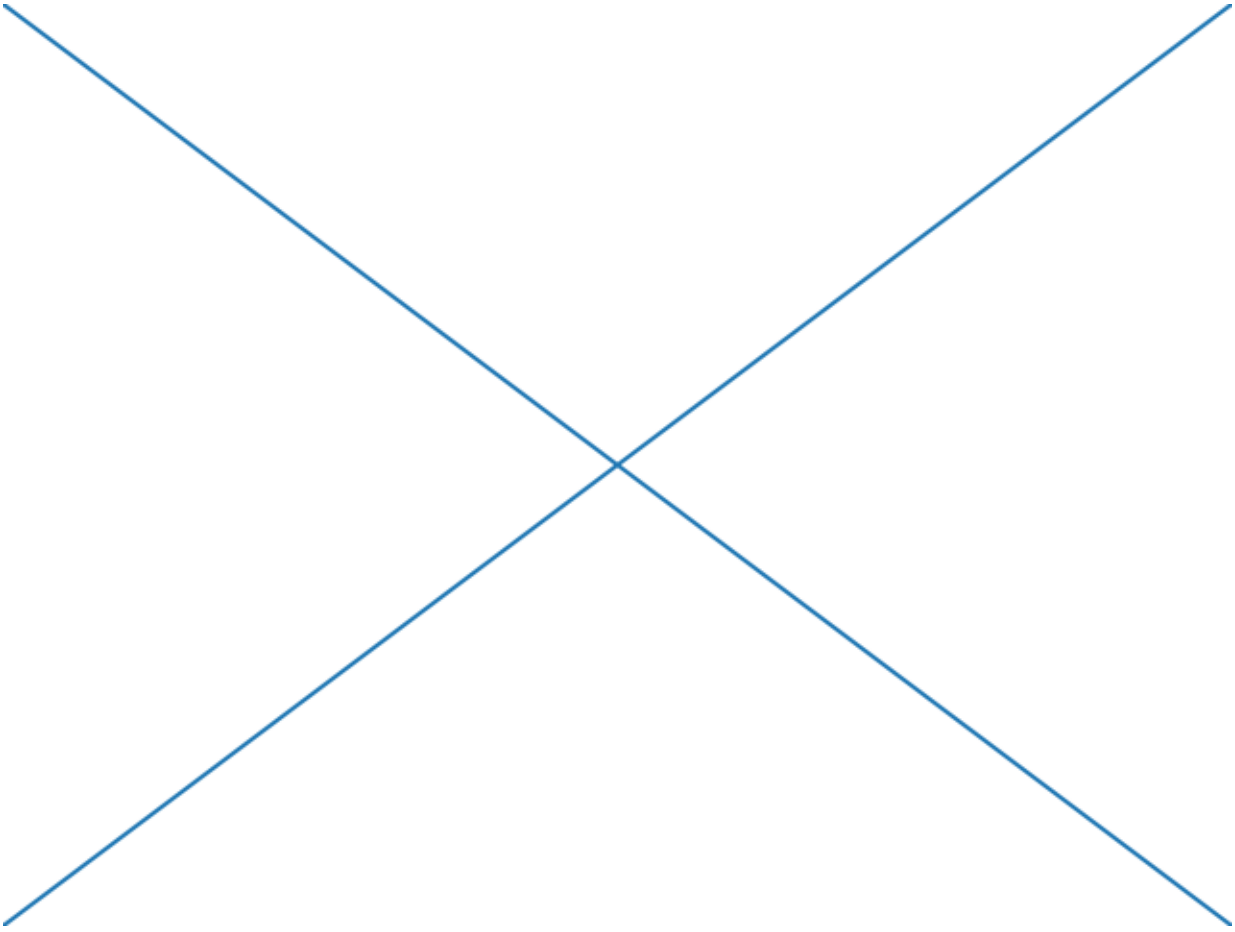
More useful is "figure coordinates" where (0, 0) is the bottom-left of the figure and (1, 1) is the top-right of the figure which you can obtain by setting the `Artist` transform to `fig.transFigure`:

```
import matplotlib.lines as lines

fig = plt.figure()

l1 = lines.Line2D([0, 1], [0, 1], transform=fig.transFigure, figure=fig)
l2 = lines.Line2D([0, 1], [1, 0], transform=fig.transFigure, figure=fig)
fig.lines.extend([l1, l2])

plt.show()
```



Here is a summary of the Artists the figure contains

Figure attribute	Description
axes	A list of Axes instances (includes Subplot)
patch	The Rectangle background
images	A list of FigureImage patches - useful for raw pixel display
legends	A list of Figure Legend instances (different from Axes.legends)
lines	A list of Figure Line2D instances (rarely used, see Axes.lines)
patches	A list of Figure patches (rarely used, see Axes.patches)
texts	A list Figure Text instances

Axes container

The *matplotlib.axes.Axes* is the center of the matplotlib universe -- it contains the vast majority of all the `Artists` used in a figure with many helper methods to create and add these `Artists` to itself, as well as helper methods to access and customize the `Artists` it contains. Like the *Figure*, it contains a *Patch* `patch` which is a *Rectangle* for Cartesian coordinates and a *Circle* for polar coordinates; this patch determines the shape, background and border of the plotting region:

```
ax = fig.add_subplot(111)
rect = ax.patch  # a Rectangle instance
rect.set_facecolor('green')
```

When you call a plotting method, e.g., the canonical *plot()* and pass in arrays or lists of values, the method will create a *matplotlib.lines.Line2D()* instance, update the line with all the `Line2D` properties passed as keyword arguments, add the line to the `Axes.lines` container, and returns it to you:

```
In [213]: x, y = np.random.rand(2, 100)

In [214]: line, = ax.plot(x, y, '-', color='blue', linewidth=2)
```

`plot` returns a list of lines because you can pass in multiple x, y pairs to plot, and we are unpacking the first element of the length one list into the line variable. The line has been added to the `Axes.lines` list:

```
In [229]: print(ax.lines)
[<matplotlib.lines.Line2D instance at 0xd378b0c>]
```

Similarly, methods that create patches, like *bar()* creates a list of rectangles, will add the patches to the `Axes.patches` list:

```
In [233]: n, bins, rectangles = ax.hist(np.random.randn(1000), 50)

In [234]: rectangles
Out[234]: <a list of 50 Patch objects>

In [235]: print(len(ax.patches))
```

You should not add objects directly to the `Axes.lines` or `Axes.patches` lists unless you know exactly what you are doing, because the `Axes` needs to do a few things when it creates and adds an object. It sets the figure and axes property of the `Artist`, as well as the default `Axes` transformation (unless a transformation is set). It also inspects the data contained in the `Artist` to update the data structures controlling auto-scaling, so that the view limits can be adjusted to contain the plotted data. You can, nonetheless, create objects yourself and add them directly to the `Axes` using helper methods like *add_line()* and *add_patch()*. Here is an annotated interactive session illustrating what is going on:

```
In [262]: fig, ax = plt.subplots()

# create a rectangle instance
In [263]: rect = matplotlib.patches.Rectangle((1, 1), width=5, height=12)

# by default the axes instance is None
In [264]: print(rect.axes)
None

# and the transformation instance is set to the "identity transform"
```

(continues on next page)

(continued from previous page)

```
In [265]: print(rect.get_transform())
<Affine object at 0x13695544>

# now we add the Rectangle to the Axes
In [266]: ax.add_patch(rect)

# and notice that the ax.add_patch method has set the axes
# instance
In [267]: print(rect.axes)
Axes(0.125,0.1;0.775x0.8)

# and the transformation has been set too
In [268]: print(rect.get_transform())
<Affine object at 0x15009ca4>

# the default axes transformation is ax.transData
In [269]: print(ax.transData)
<Affine object at 0x15009ca4>

# notice that the xlimits of the Axes have not been changed
In [270]: print(ax.get_xlim())
(0.0, 1.0)

# but the data limits have been updated to encompass the rectangle
In [271]: print(ax.dataLim.bounds)
(1.0, 1.0, 5.0, 12.0)

# we can manually invoke the auto-scaling machinery
In [272]: ax.autoscale_view()

# and now the xlim are updated to encompass the rectangle
In [273]: print(ax.get_xlim())
(1.0, 6.0)

# we have to manually force a figure draw
In [274]: ax.figure.canvas.draw()
```

There are many, many `Axes` helper methods for creating primitive `Artists` and adding them to their respective containers. The table below summarizes a small sampling of them, the kinds of `Artist` they create, and where they store them

Helper method	Artist	Container
ax.annotate - text annotations	Annotate	ax.texts
ax.bar - bar charts	Rectangle	ax.patches
ax.errorbar - error bar plots	Line2D and Rectangle	ax.lines and ax.patches
ax.fill - shared area	Polygon	ax.patches
ax.hist - histograms	Rectangle	ax.patches
ax.imshow - image data	AxesImage	ax.images
ax.legend - axes legends	Legend	ax.legends
ax.plot - xy plots	Line2D	ax.lines
ax.scatter - scatter charts	PolygonCollection	ax.collections
ax.text - text	Text	ax.texts

In addition to all of these `Artists`, the `Axes` contains two important `Artist` containers: the *`XAxis`* and *`YAxis`*, which handle the drawing of the ticks and labels. These are stored as instance variables `xaxis` and `yaxis`. The `XAxis` and `YAxis` containers will be detailed below, but note that the `Axes` contains many helper methods which forward calls on to the *`Axis`* instances so you often do not need to work with them directly unless you want to. For example, you can set the font color of the `XAxis` ticklabels using the `Axes` helper method:

```
for label in ax.get_xticklabels():
    label.set_color('orange')
```

Below is a summary of the Artists that the Axes contains

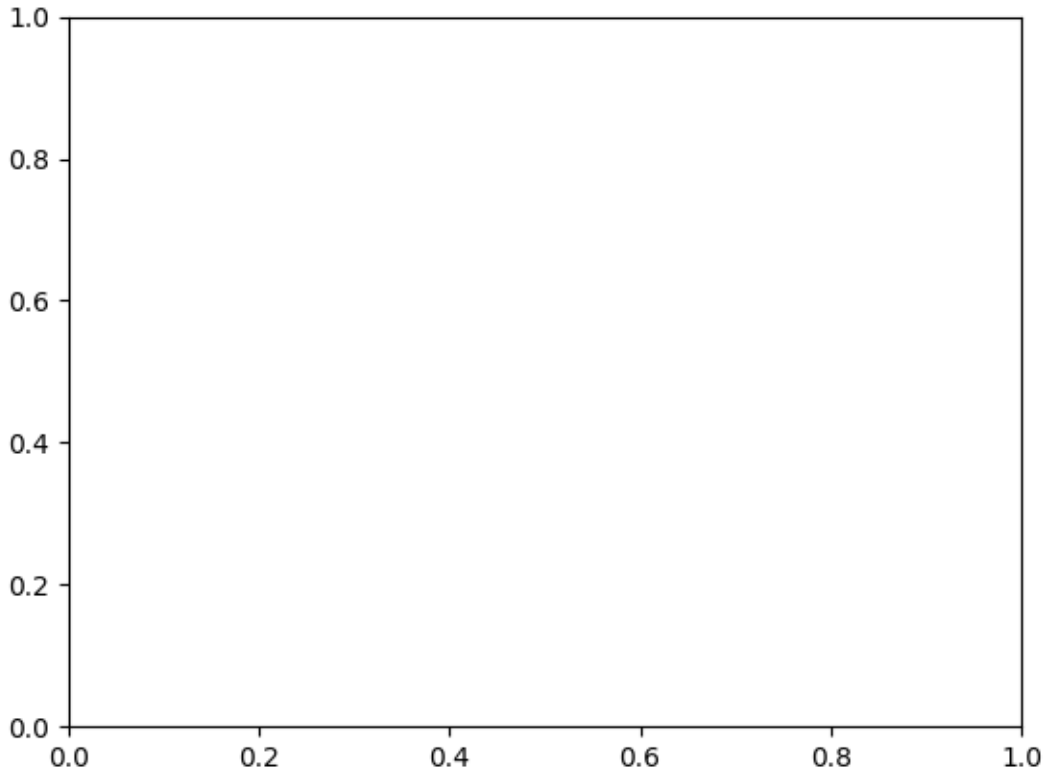
Axes attribute	Description
artists	A list of Artist instances
patch	Rectangle instance for Axes background
collections	A list of Collection instances
images	A list of AxesImage
legends	A list of Legend instances
lines	A list of Line2D instances
patches	A list of Patch instances
texts	A list of Text instances
xaxis	matplotlib.axis.XAxis instance
yaxis	matplotlib.axis.YAxis instance

Axis containers

The *matplotlib.axis.Axis* instances handle the drawing of the tick lines, the grid lines, the tick labels and the axis label. You can configure the left and right ticks separately for the y-axis, and the upper and lower ticks separately for the x-axis. The `Axis` also stores the data and view intervals used in auto-scaling, panning and zooming, as well as the *Locator* and *Formatter* instances which control where the ticks are placed and how they are represented as strings.

Each `Axis` object contains a `label` attribute (this is what *pyplot* modifies in calls to *xlabel* and *ylabel*) as well as a list of major and minor ticks. The ticks are *axis.XTick* and *axis.YTick* instances, which contain the actual line and text primitives that render the ticks and ticklabels. Because the ticks are dynamically created as needed (e.g., when panning and zooming), you should access the lists of major and minor ticks through their accessor methods *axis.Axis.get_major_ticks* and *axis.Axis.get_minor_ticks*. Although the ticks contain all the primitives and will be covered below, `Axis` instances have accessor methods that return the tick lines, tick labels, tick locations etc.:

```
fig, ax = plt.subplots()
axis = ax.xaxis
axis.get_ticklocs()
```



Out:

```
array([0. , 0.2, 0.4, 0.6, 0.8, 1. ])
```

```
axis.get_ticklabels()
```

Out:

```
[Text(0.0, 0, '0.0'), Text(0.2, 0, '0.2'), Text(0.4, 0, '0.4'), Text(0.6000000000000001,␣
↪0, '0.6'), Text(0.8, 0, '0.8'), Text(1.0, 0, '1.0')]
```

note there are twice as many ticklines as labels because by default there are tick lines at the top and bottom but only tick labels below the xaxis; however, this can be customized.

```
axis.get_ticklines()
```

Out:

```
<a list of 12 Line2D ticklines objects>
```

And with the above methods, you only get lists of major ticks back by default, but you can also ask for the minor ticks:

```
axis.get_ticklabels(minor=True)
axis.get_ticklines(minor=True)
```

Out:

```
<a list of 0 Line2D ticklines objects>
```

Here is a summary of some of the useful accessor methods of the `Axis` (these have corresponding setters where useful, such as *set_major_formatter()*.)

Accessor method	Description
get_scale	The scale of the axis, e.g., 'log' or 'linear'
get_view_interval	The interval instance of the axis view limits
get_data_interval	The interval instance of the axis data limits
get_gridlines	A list of grid lines for the Axis
get_label	The axis label - a Text instance
get_ticklabels	A list of Text instances - keyword minor=True|False
get_ticklines	A list of Line2D instances - keyword minor=True|False
get_ticklocs	A list of Tick locations - keyword minor=True|False
get_major_locator	The *ticker.Locator* instance for major ticks
get_major_formatter	The *ticker.Formatter* instance for major ticks
get_minor_locator	The *ticker.Locator* instance for minor ticks
get_minor_formatter	The *ticker.Formatter* instance for minor ticks
get_major_ticks	A list of Tick instances for major ticks
get_minor_ticks	A list of Tick instances for minor ticks
grid	Turn the grid on or off for the major or minor ticks

Here is an example, not recommended for its beauty, which customizes the axes and tick properties

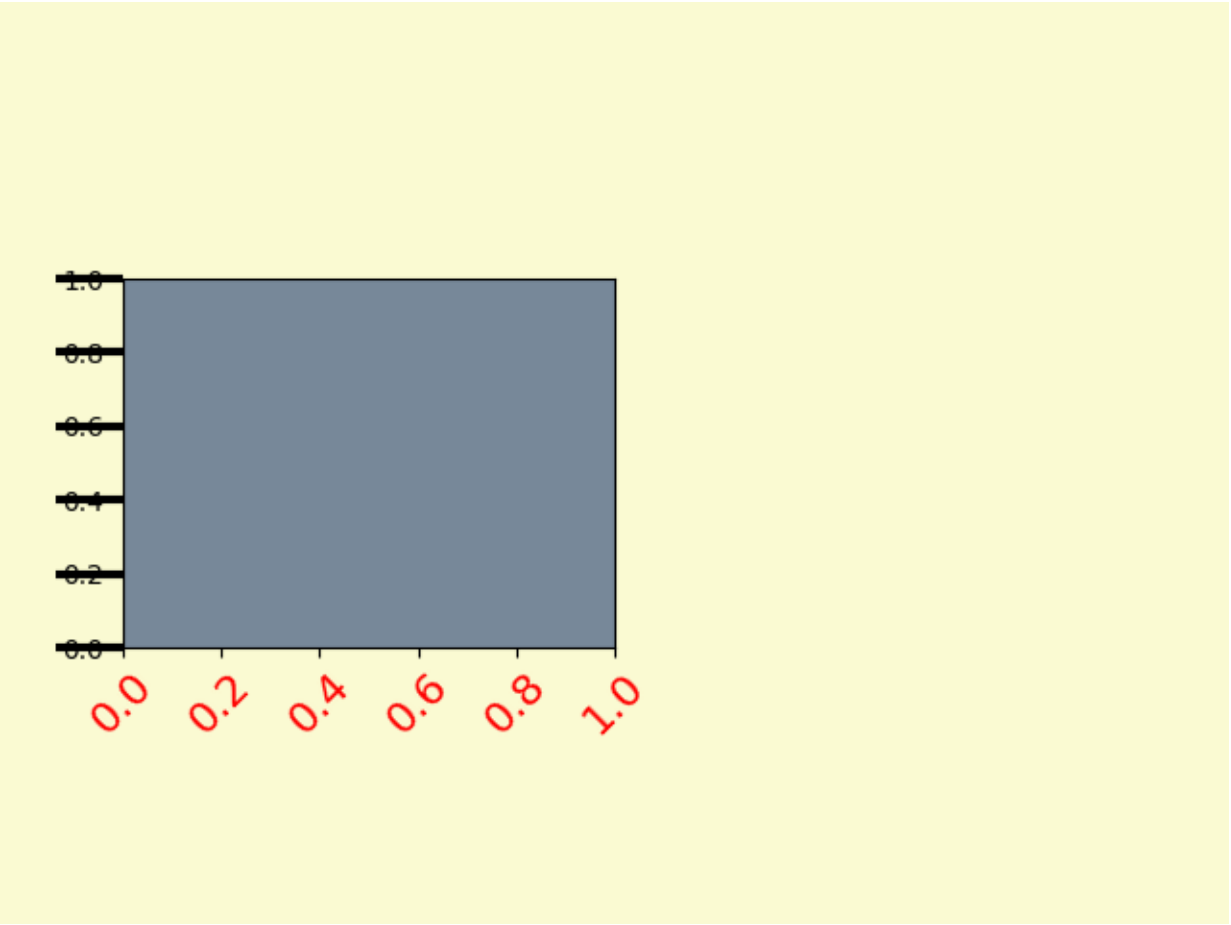
```
# plt.figure creates a matplotlib.figure.Figure instance
fig = plt.figure()
rect = fig.patch  # a rectangle instance
rect.set_facecolor('lightgoldenrodyellow')

ax1 = fig.add_axes([0.1, 0.3, 0.4, 0.4])
rect = ax1.patch
rect.set_facecolor('lightslategray')

for label in ax1.xaxis.get_ticklabels():
    # label is a Text instance
    label.set_color('red')
    label.set_rotation(45)
    label.set_fontsize(16)

for line in ax1.yaxis.get_ticklines():
    # line is a Line2D instance
    line.set_color('green')
    line.set_markersize(25)
    line.set_markeredgewidth(3)

plt.show()
```



Tick containers

The *matplotlib.axis.Tick* is the final container object in our descent from the *Figure* to the *Axes* to the *Axis* to the *Tick*. The `Tick` contains the tick and grid line instances, as well as the label instances for the upper and lower ticks. Each of these is accessible directly as an attribute of the `Tick`.

Tick attribute	Description
tick1line	Line2D instance
tick2line	Line2D instance
gridline	Line2D instance
label1	Text instance
label2	Text instance

Here is an example which sets the formatter for the right side ticks with dollar signs and colors them green on the right side of the yaxis.

```
import numpy as np
import matplotlib.pyplot as plt
```

(continues on next page)

(continued from previous page)

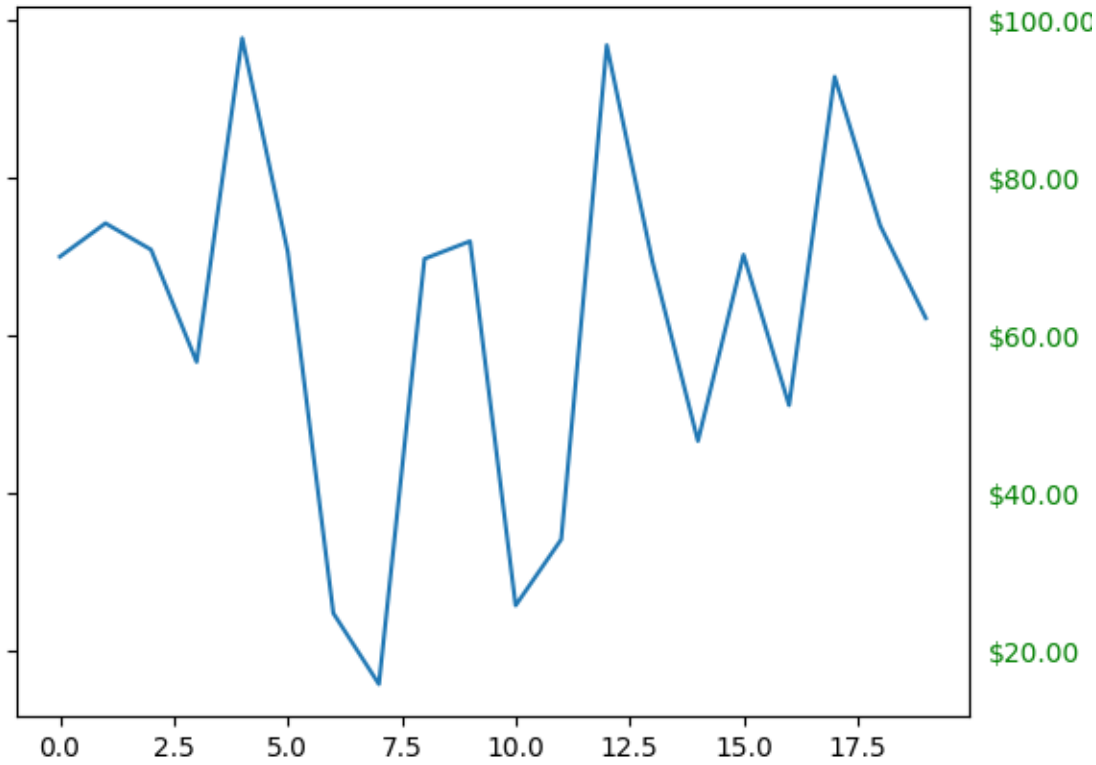
```
# Fixing random state for reproducibility
np.random.seed(19680801)

fig, ax = plt.subplots()
ax.plot(100*np.random.rand(20))

# Use automatic StrMethodFormatter
ax.yaxis.set_major_formatter('${x:1.2f}')

ax.yaxis.set_tick_params(which='major', labelcolor='green',
                         labelleft=False, labelright=True)

plt.show()
```



2.2.2 Legend guide

Generating legends flexibly in Matplotlib.

This legend guide is an extension of the documentation available at *legend()* - please ensure you are familiar with contents of that documentation before proceeding with this guide.

This guide makes use of some common terms, which are documented here for clarity:

legend entry

A legend is made up of one or more legend entries. An entry is made up of exactly one key and one label.

legend key

The colored/patterned marker to the left of each legend label.

legend label

The text which describes the handle represented by the key.

legend handle

The original object which is used to generate an appropriate entry in the legend.

Controlling the legend entries

Calling *legend()* with no arguments automatically fetches the legend handles and their associated labels. This functionality is equivalent to:

```
handles, labels = ax.get_legend_handles_labels()
ax.legend(handles, labels)
```

The *get_legend_handles_labels()* function returns a list of handles/artists which exist on the Axes which can be used to generate entries for the resulting legend - it is worth noting however that not all artists can be added to a legend, at which point a "proxy" will have to be created (see *Creating artists specifically for adding to the legend (aka. Proxy artists)* for further details).

Those artists with an empty string as label or with a label starting with "_" will be ignored.

For full control of what is being added to the legend, it is common to pass the appropriate handles directly to *legend()*:

```
line_up, = plt.plot([1, 2, 3], label='Line 2')
line_down, = plt.plot([3, 2, 1], label='Line 1')
plt.legend(handles=[line_up, line_down])
```

In some cases, it is not possible to set the label of the handle, so it is possible to pass through the list of labels to *legend()*:

```
line_up, = plt.plot([1, 2, 3], label='Line 2')
line_down, = plt.plot([3, 2, 1], label='Line 1')
plt.legend([line_up, line_down], ['Line Up', 'Line Down'])
```

Creating artists specifically for adding to the legend (aka. Proxy artists)

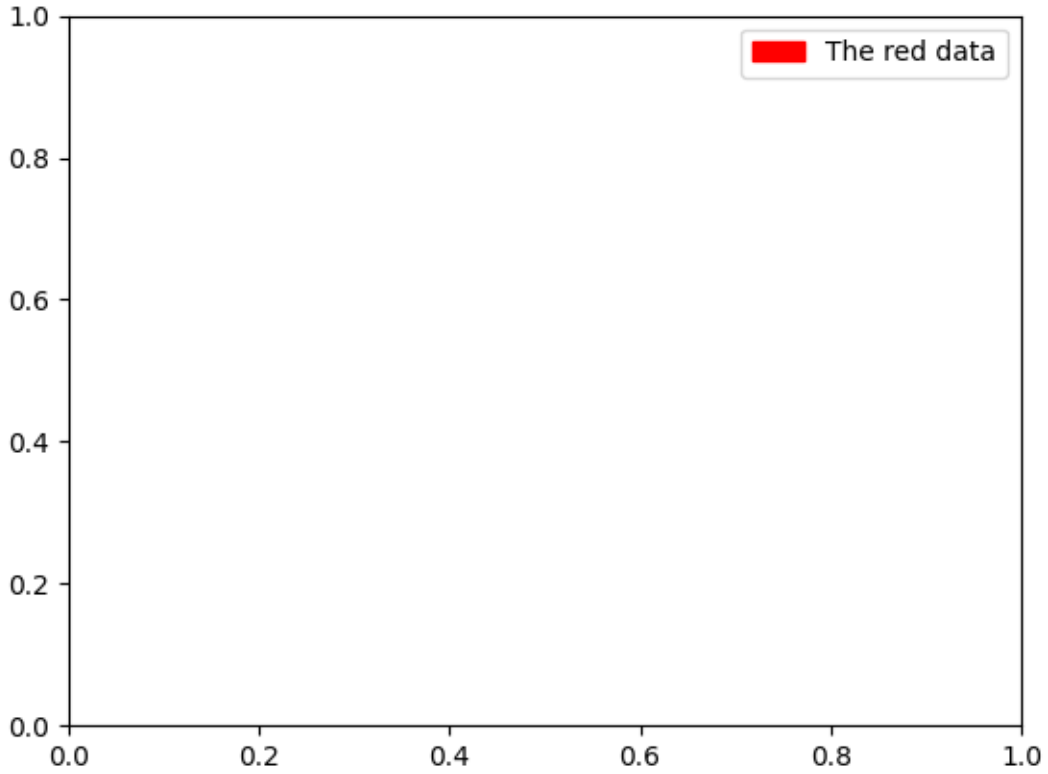
Not all handles can be turned into legend entries automatically, so it is often necessary to create an artist which *can*. Legend handles don't have to exist on the Figure or Axes in order to be used.

Suppose we wanted to create a legend which has an entry for some data which is represented by a red color:

```
import matplotlib.patches as mpatches
import matplotlib.pyplot as plt

red_patch = mpatches.Patch(color='red', label='The red data')
plt.legend(handles=[red_patch])

plt.show()
```

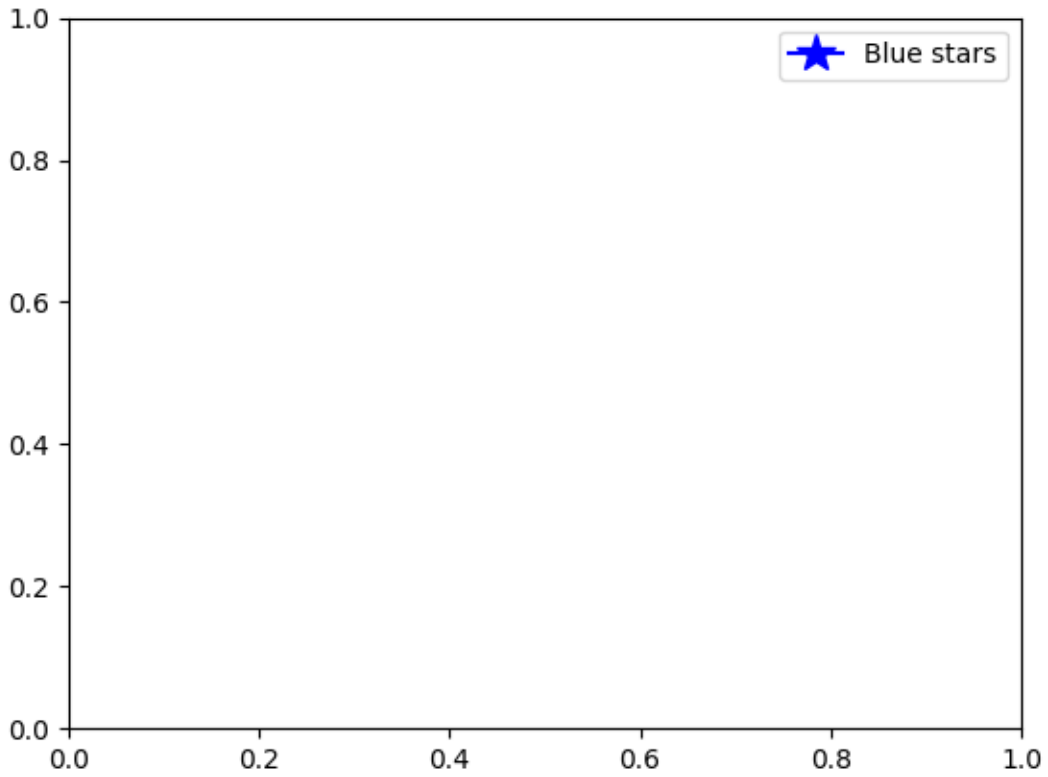


There are many supported legend handles. Instead of creating a patch of color we could have created a line with a marker:

```
import matplotlib.lines as mlines

blue_line = mlines.Line2D([], [], color='blue', marker='*',
                          markersize=15, label='Blue stars')
plt.legend(handles=[blue_line])

plt.show()
```



Legend location

The location of the legend can be specified by the keyword argument *loc*. Please see the documentation at *legend()* for more details.

The `bbox_to_anchor` keyword gives a great degree of control for manual legend placement. For example, if you want your axes legend located at the figure's top right-hand corner instead of the axes' corner, simply specify the corner's location and the coordinate system of that location:

```
plt.legend(bbox_to_anchor=(1, 1),
           bbox_transform=plt.gcf().transFigure)
```

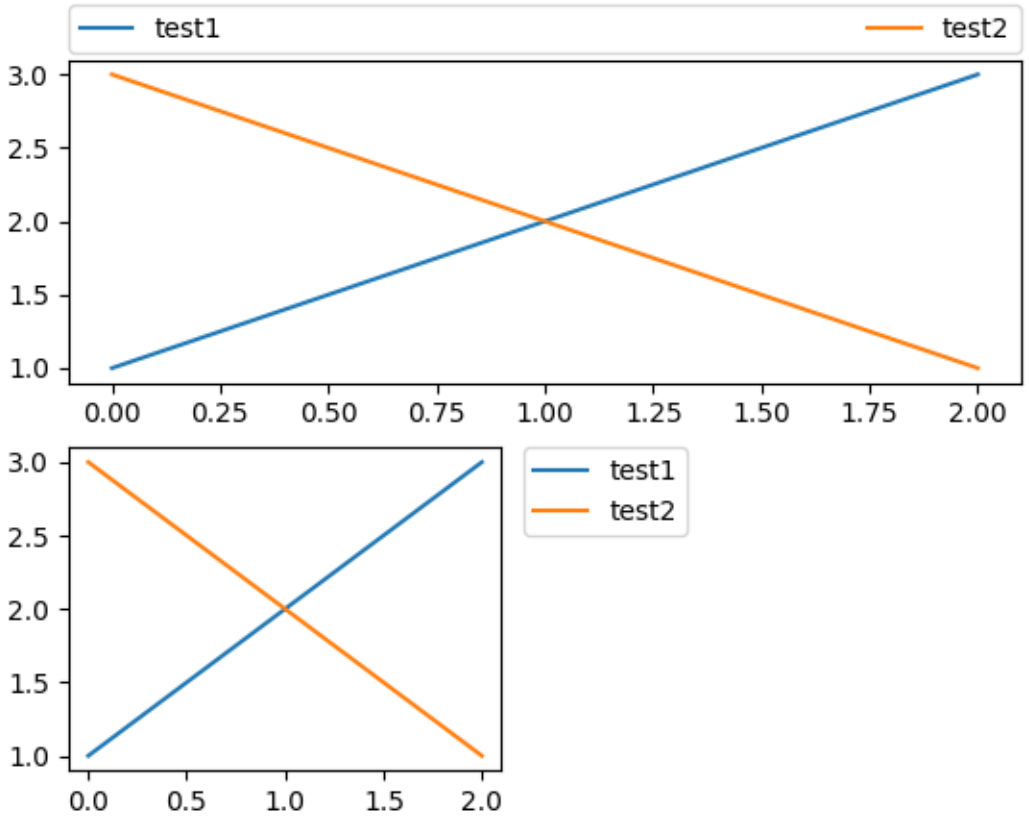
More examples of custom legend placement:

```
plt.subplot(211)
plt.plot([1, 2, 3], label="test1")
plt.plot([3, 2, 1], label="test2")

# Place a legend above this subplot, expanding itself to
# fully use the given bounding box.
plt.legend(bbox_to_anchor=(0., 1.02, 1., .102), loc='lower left',
           ncol=2, mode="expand", borderaxespad=0.)

plt.subplot(223)
plt.plot([1, 2, 3], label="test1")
plt.plot([3, 2, 1], label="test2")
# Place a legend to the right of this smaller subplot.
plt.legend(bbox_to_anchor=(1.05, 1), loc='upper left', borderaxespad=0.)

plt.show()
```



Multiple legends on the same Axes

Sometimes it is more clear to split legend entries across multiple legends. Whilst the instinctive approach to doing this might be to call the *legend()* function multiple times, you will find that only one legend ever exists on the Axes. This has been done so that it is possible to call *legend()* repeatedly to update the legend to the latest handles on the Axes. To keep old legend instances, we must add them manually to the Axes:

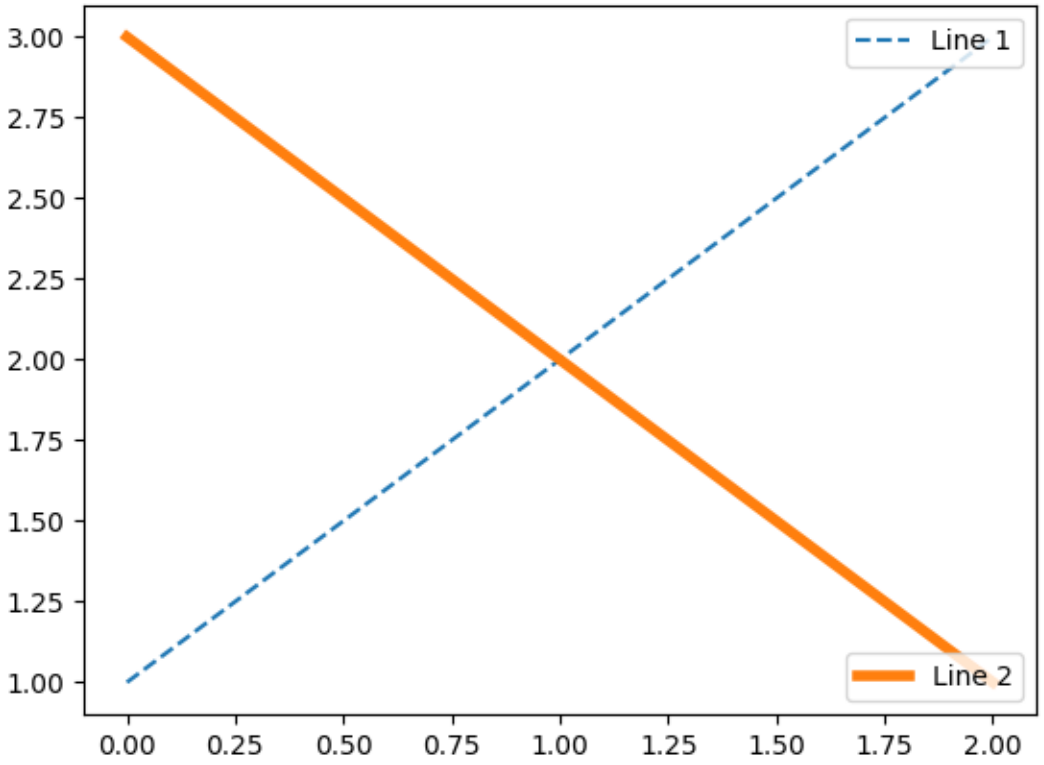
```
line1, = plt.plot([1, 2, 3], label="Line 1", linestyle='--')
line2, = plt.plot([3, 2, 1], label="Line 2", linewidth=4)

# Create a legend for the first line.
first_legend = plt.legend(handles=[line1], loc='upper right')

# Add the legend manually to the current Axes.
ax = plt.gca().add_artist(first_legend)

# Create another legend for the second line.
plt.legend(handles=[line2], loc='lower right')

plt.show()
```



Legend Handlers

In order to create legend entries, handles are given as an argument to an appropriate *HandlerBase* subclass. The choice of handler subclass is determined by the following rules:

1. Update *get_legend_handler_map()* with the value in the `handler_map` keyword.
2. Check if the `handle` is in the newly created `handler_map`.
3. Check if the type of `handle` is in the newly created `handler_map`.
4. Check if any of the types in the `handle`'s mro is in the newly created `handler_map`.

For completeness, this logic is mostly implemented in *get_legend_handler()*.

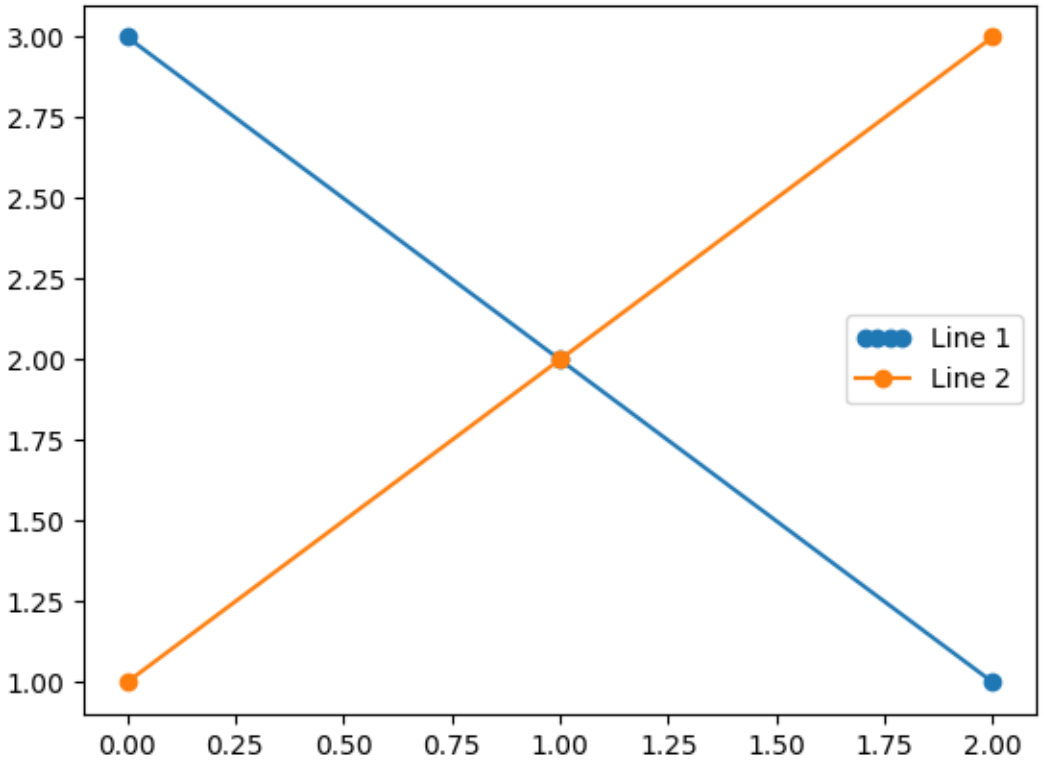
All of this flexibility means that we have the necessary hooks to implement custom handlers for our own type of legend key.

The simplest example of using custom handlers is to instantiate one of the existing *legend_handler.HandlerBase* subclasses. For the sake of simplicity, let's choose *legend_handler.HandlerLine2D* which accepts a *numpoints* argument (numpoints is also a keyword on the *legend()* function for convenience). We can then pass the mapping of instance to Handler as a keyword to legend.

```
from matplotlib.legend_handler import HandlerLine2D

line1, = plt.plot([3, 2, 1], marker='o', label='Line 1')
line2, = plt.plot([1, 2, 3], marker='o', label='Line 2')

plt.legend(handler_map={line1: HandlerLine2D(numpoints=4)})
```



Out:

```
<matplotlib.legend.Legend object at 0x7f540146f9a0>
```

As you can see, "Line 1" now has 4 marker points, where "Line 2" has 2 (the default). Try the above code, only change the map's key from `line1` to `type(line1)`. Notice how now both *Line2D* instances get 4 markers.

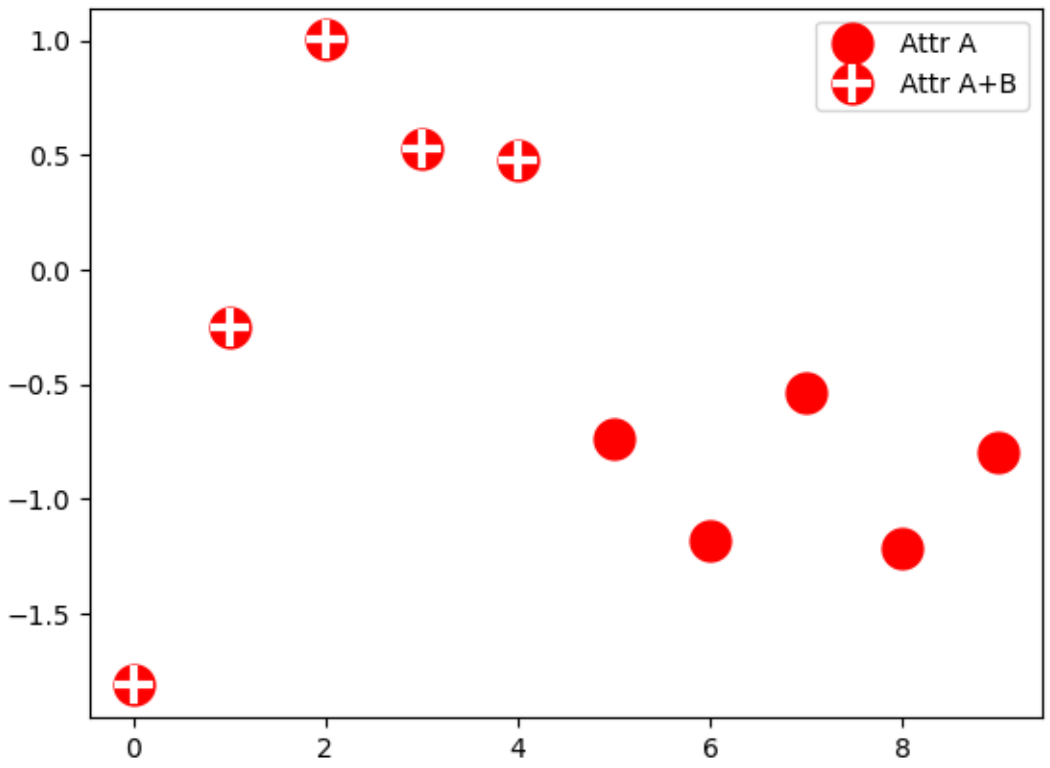
Along with handlers for complex plot types such as errorbars, stem plots and histograms, the default `handler_map` has a special `tuple` handler (*legend_handler.HandlerTuple*) which simply plots the handles on top of one another for each item in the given tuple. The following example demonstrates combining two legend keys on top of one another:

```
from numpy.random import randn

z = randn(10)

red_dot, = plt.plot(z, "ro", markersize=15)
# Put a white cross over some of the data.
white_cross, = plt.plot(z[:5], "w+", markeredgewidth=3, markersize=15)

plt.legend([red_dot, (red_dot, white_cross)], ["Attr A", "Attr A+B"])
```



Out:

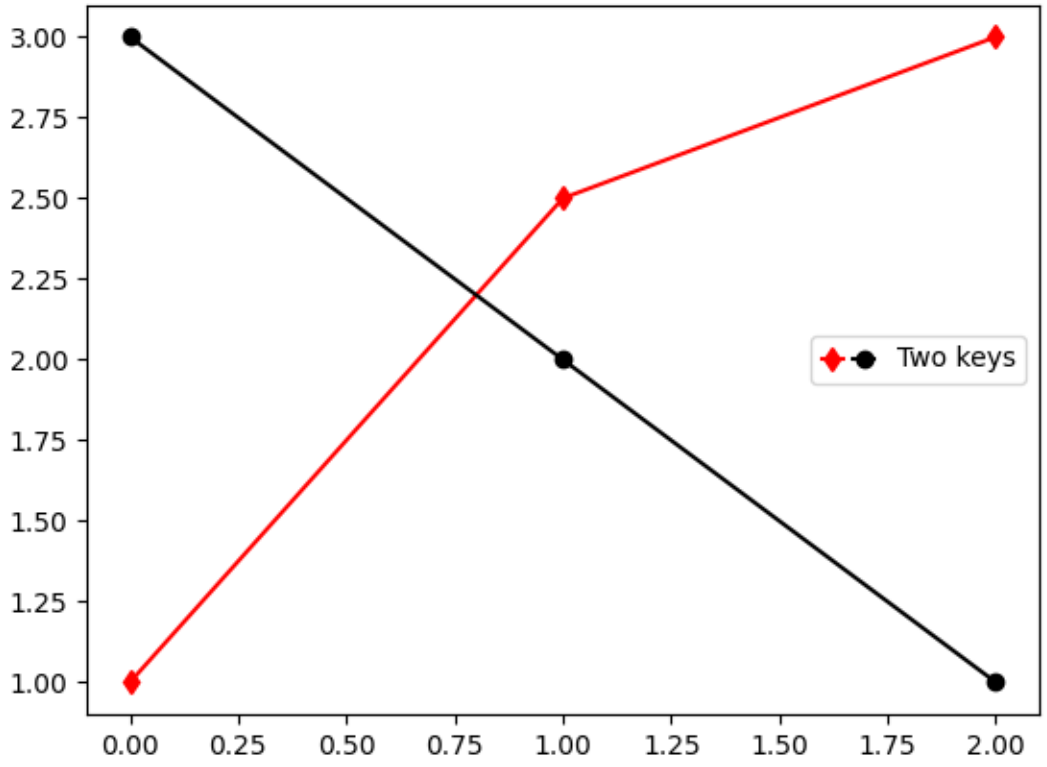
```
<matplotlib.legend.Legend object at 0x7f53fac8fd60>
```

The *legend_handler.HandlerTuple* class can also be used to assign several legend keys to the same entry:

```
from matplotlib.legend_handler import HandlerLine2D, HandlerTuple

p1, = plt.plot([1, 2.5, 3], 'r-d')
p2, = plt.plot([3, 2, 1], 'k-o')

l = plt.legend([(p1, p2)], ['Two keys'], numpoints=1,
               handler_map={tuple: HandlerTuple(ndivide=None)})
```



Implementing a custom legend handler

A custom handler can be implemented to turn any handle into a legend key (handles don't necessarily need to be matplotlib artists). The handler must implement a `legend_artist` method which returns a single artist for the legend to use. The required signature for `legend_artist` is documented at *`legend_artist`*.

```
import matplotlib.patches as mpatches

class AnyObject:
    pass

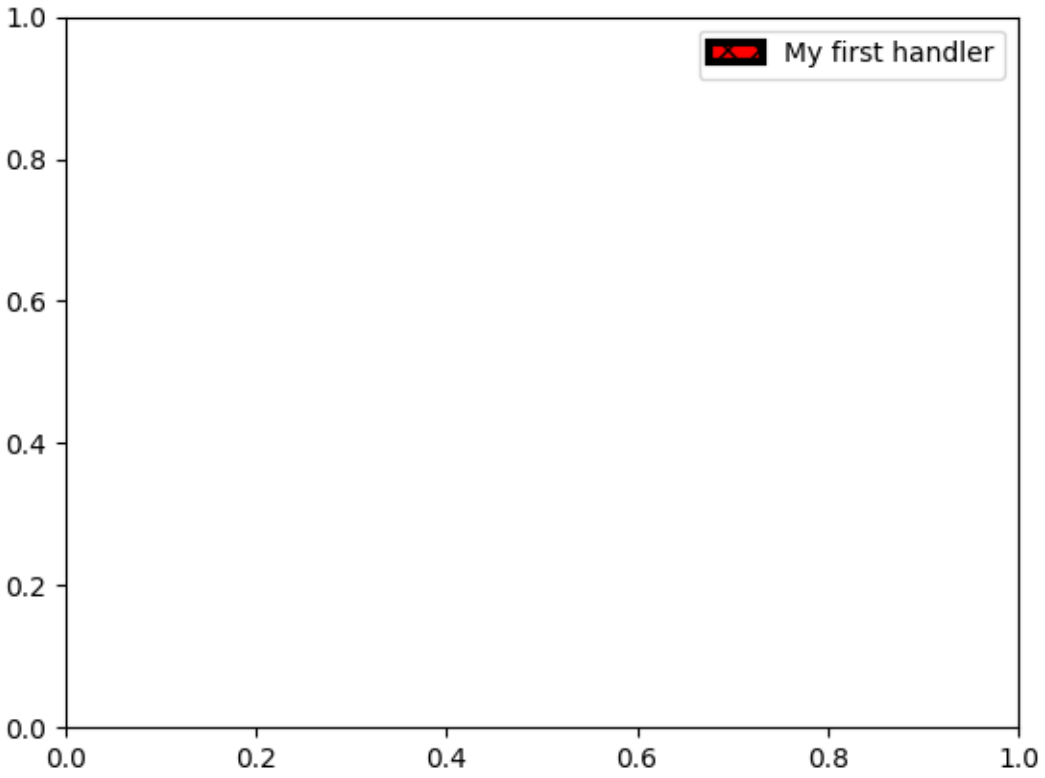
class AnyObjectHandler:
    def legend_artist(self, legend, orig_handle, fontsize, handlebox):
        x0, y0 = handlebox.xdescent, handlebox.ydescent
        width, height = handlebox.width, handlebox.height
        patch = mpatches.Rectangle([x0, y0], width, height, facecolor='red',
                                   edgecolor='black', hatch='xx', lw=3,
                                   transform=handlebox.get_transform())
```

(continues on next page)

(continued from previous page)

```
        handlebox.add_artist(patch)
        return patch

plt.legend([AnyObject()], ['My first handler'],
           handler_map={AnyObject: AnyObjectHandler()})
```



Out:

```
<matplotlib.legend.Legend object at 0x7f53fed02340>
```

Alternatively, had we wanted to globally accept `AnyObject` instances without needing to manually set the *handler_map* keyword all the time, we could have registered the new handler with:

```
from matplotlib.legend import Legend
Legend.update_default_handler_map({AnyObject: AnyObjectHandler()})
```

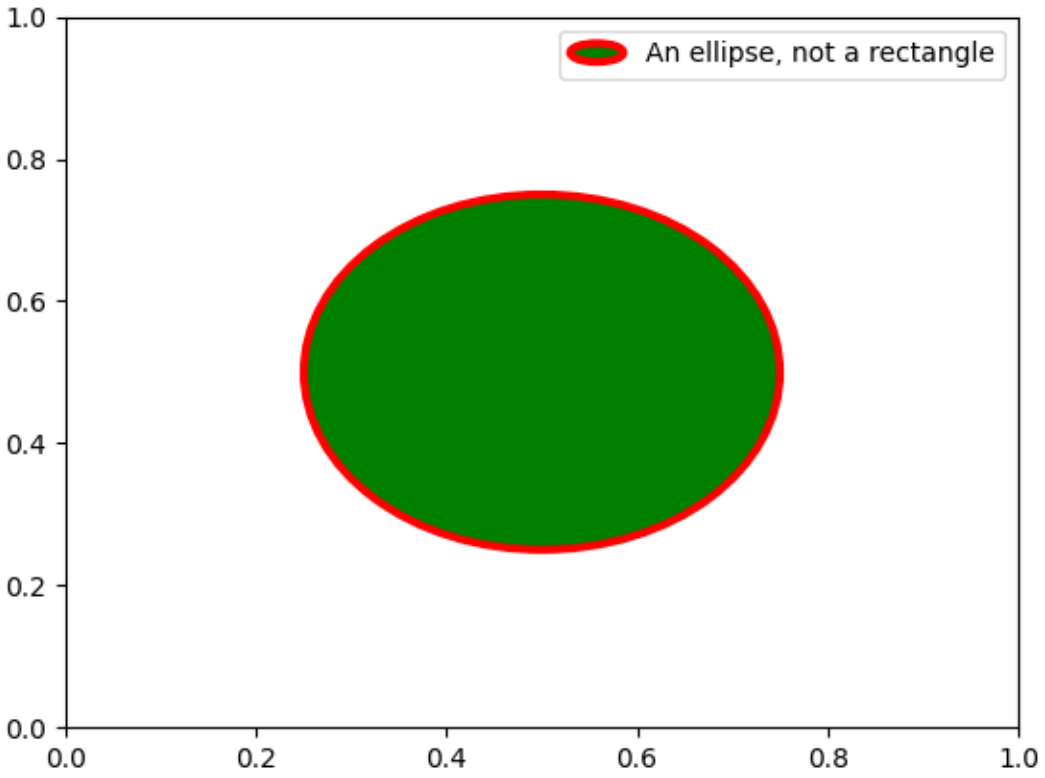
Whilst the power here is clear, remember that there are already many handlers implemented and what you want to achieve may already be easily possible with existing classes. For example, to produce elliptical legend keys, rather than rectangular ones:

```
from matplotlib.legend_handler import HandlerPatch

class HandlerEllipse(HandlerPatch):
    def create_artists(self, legend, orig_handle,
                       xdescent, ydescent, width, height, fontsize, trans):
        center = 0.5 * width - 0.5 * xdescent, 0.5 * height - 0.5 * ydescent
        p = mpatches.Ellipse(xy=center, width=width + xdescent,
                             height=height + ydescent)
        self.update_prop(p, orig_handle, legend)
        p.set_transform(trans)
        return [p]

c = mpatches.Circle((0.5, 0.5), 0.25, facecolor="green",
                    edgecolor="red", linewidth=3)
plt.gca().add_patch(c)

plt.legend([c], ["An ellipse, not a rectangle"],
           handler_map={mpatches.Circle: HandlerEllipse()})
```



Out:

```
<matplotlib.legend.Legend object at 0x7f53fee0cc10>
```

Total running time of the script: (0 minutes 2.676 seconds)

2.2.3 Styling with cycler

Demo of custom property-cycle settings to control colors and other style properties for multi-line plots.

Note: More complete documentation of the `cycler` API can be found here.

This example demonstrates two different APIs:

1. Setting the rc parameter specifying the default property cycle. This affects all subsequent axes (but not axes already created).
2. Setting the property cycle for a single pair of axes.

```
from cycler import cycler
import numpy as np
import matplotlib.pyplot as plt
```

First we'll generate some sample data, in this case, four offset sine curves.

```
x = np.linspace(0, 2 * np.pi, 50)
offsets = np.linspace(0, 2 * np.pi, 4, endpoint=False)
yy = np.transpose([np.sin(x + phi) for phi in offsets])
```

Now `yy` has shape

```
print(yy.shape)
```

Out:

```
(50, 4)
```

So `yy[:, i]` will give you the `i`-th offset sine curve. Let's set the default `prop_cycle` using *matplotlib.pyplot.rc()*. We'll combine a color cycler and a linestyle cycler by adding (+) two `cycler`'s together. See the bottom of this tutorial for more information about combining different cyclers.

```
default_cycler = (cycler(color=['r', 'g', 'b', 'y']) +
                  cycler(linestyle=['-', '--', ':', '-.']))

plt.rc('lines', linewidth=4)
plt.rc('axes', prop_cycle=default_cycler)
```

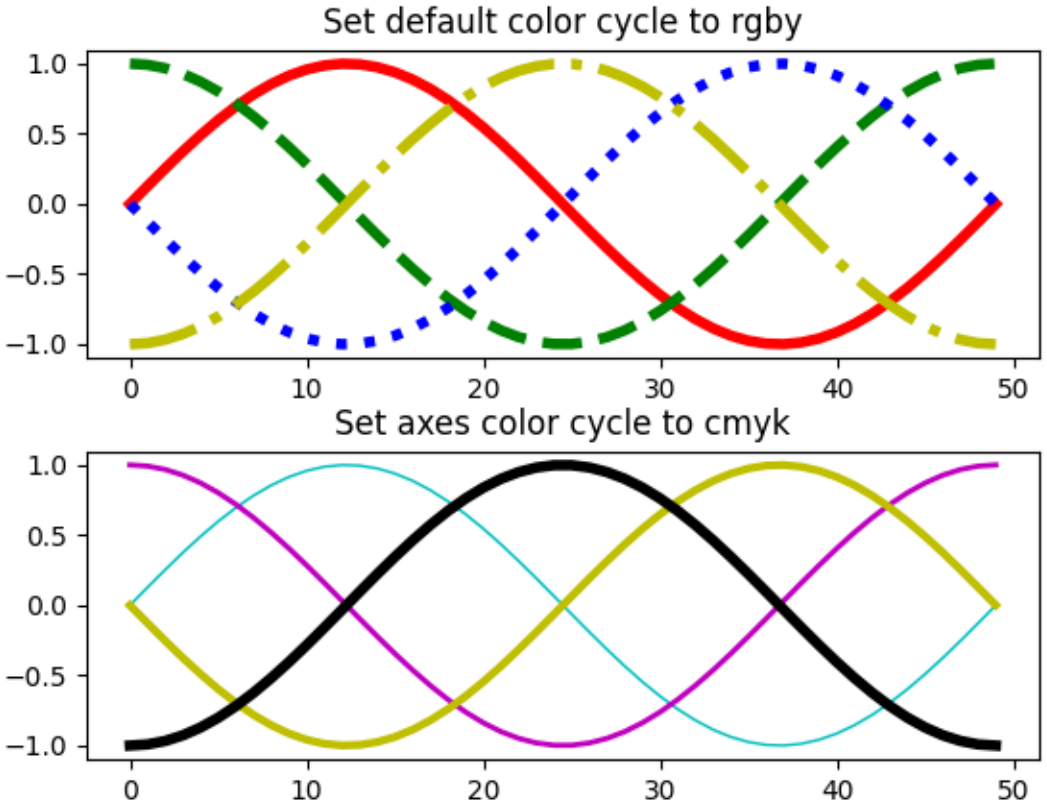
Now we'll generate a figure with two axes, one on top of the other. On the first axis, we'll plot with the default cycler. On the second axis, we'll set the `prop_cycle`

using *matplotlib.axes.Axes.set_prop_cycle()*, which will only set the `prop_cycle` for this *matplotlib.axes.Axes* instance. We'll use a second `cycler` that combines a color cycler and a linewidth cycler.

```
custom_cycler = (cycler(color=['c', 'm', 'y', 'k']) +
                 cycler(lw=[1, 2, 3, 4]))

fig, (ax0, ax1) = plt.subplots(nrows=2)
ax0.plot(yy)
ax0.set_title('Set default color cycle to rgby')
ax1.set_prop_cycle(custom_cycler)
ax1.plot(yy)
ax1.set_title('Set axes color cycle to cmyk')

# Add a bit more space between the two plots.
fig.subplots_adjust(hspace=0.3)
plt.show()
```



Setting `prop_cycle` in the `matplotlibrc` file or style files

Remember, a custom cycler can be set in your `matplotlibrc` file or a style file (`style.mplstyle`) under `axes.prop_cycle`:

```
axes.prop_cycle : cycler(color='bgrcmyk')
```

Cycling through multiple properties

You can add cyclers:

```
from cycler import cycler
cc = (cycler(color=list('rgb')) +
      cycler(linestyle=['-', '--', '-.']))
for d in cc:
    print(d)
```

Results in:

```
{'color': 'r', 'linestyle': '-'}
{'color': 'g', 'linestyle': '--'}
{'color': 'b', 'linestyle': '-.'}
```

You can multiply cyclers:

```
from cycler import cycler
cc = (cycler(color=list('rgb')) *
      cycler(linestyle=['-', '--', '-.']))
for d in cc:
    print(d)
```

Results in:

```
{'color': 'r', 'linestyle': '-'}
{'color': 'r', 'linestyle': '--'}
{'color': 'r', 'linestyle': '-.'}
{'color': 'g', 'linestyle': '-'}
{'color': 'g', 'linestyle': '--'}
{'color': 'g', 'linestyle': '-.'}
{'color': 'b', 'linestyle': '-'}
{'color': 'b', 'linestyle': '--'}
{'color': 'b', 'linestyle': '-.'}
```

2.2.4 Customizing Figure Layouts Using GridSpec and Other Functions

How to create grid-shaped combinations of axes.

subplots()

Perhaps the primary function used to create figures and axes. It's also similar to *matplotlib.pyplot.subplot()*, but creates and places all axes on the figure at once. See also *matplotlib.figure.Figure.subplots*.

GridSpec

Specifies the geometry of the grid that a subplot will be placed. The number of rows and number of columns of the grid need to be set. Optionally, the subplot layout parameters (e.g., left, right, etc.) can be tuned.

SubplotSpec

Specifies the location of the subplot in the given *GridSpec*.

subplot2grid()

A helper function that is similar to *subplot()*, but uses 0-based indexing and let subplot to occupy multiple cells. This function is not covered in this tutorial.

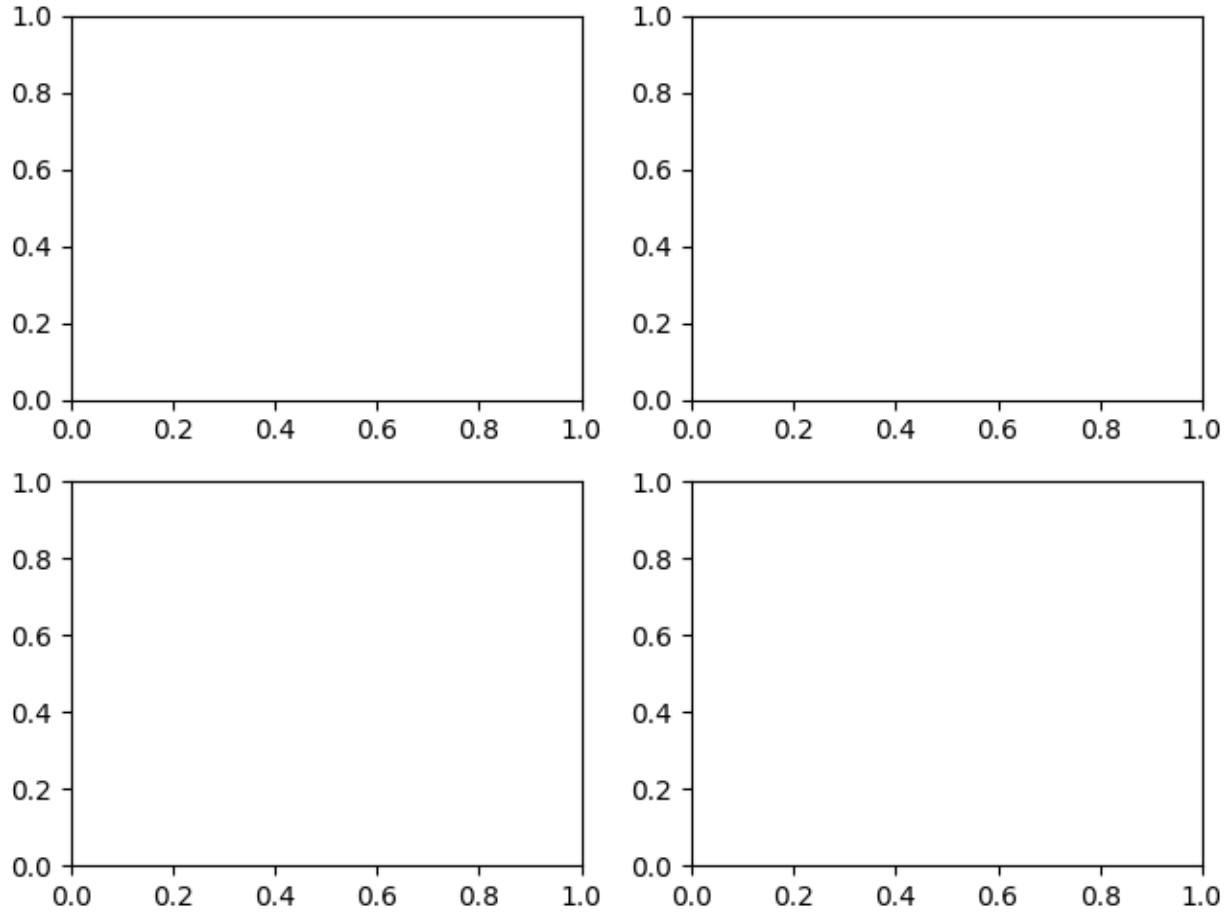
```
import matplotlib
import matplotlib.pyplot as plt
import matplotlib.gridspec as gridspec
```

Basic Quickstart Guide

These first two examples show how to create a basic 2-by-2 grid using both *subplots()* and *gridspec*.

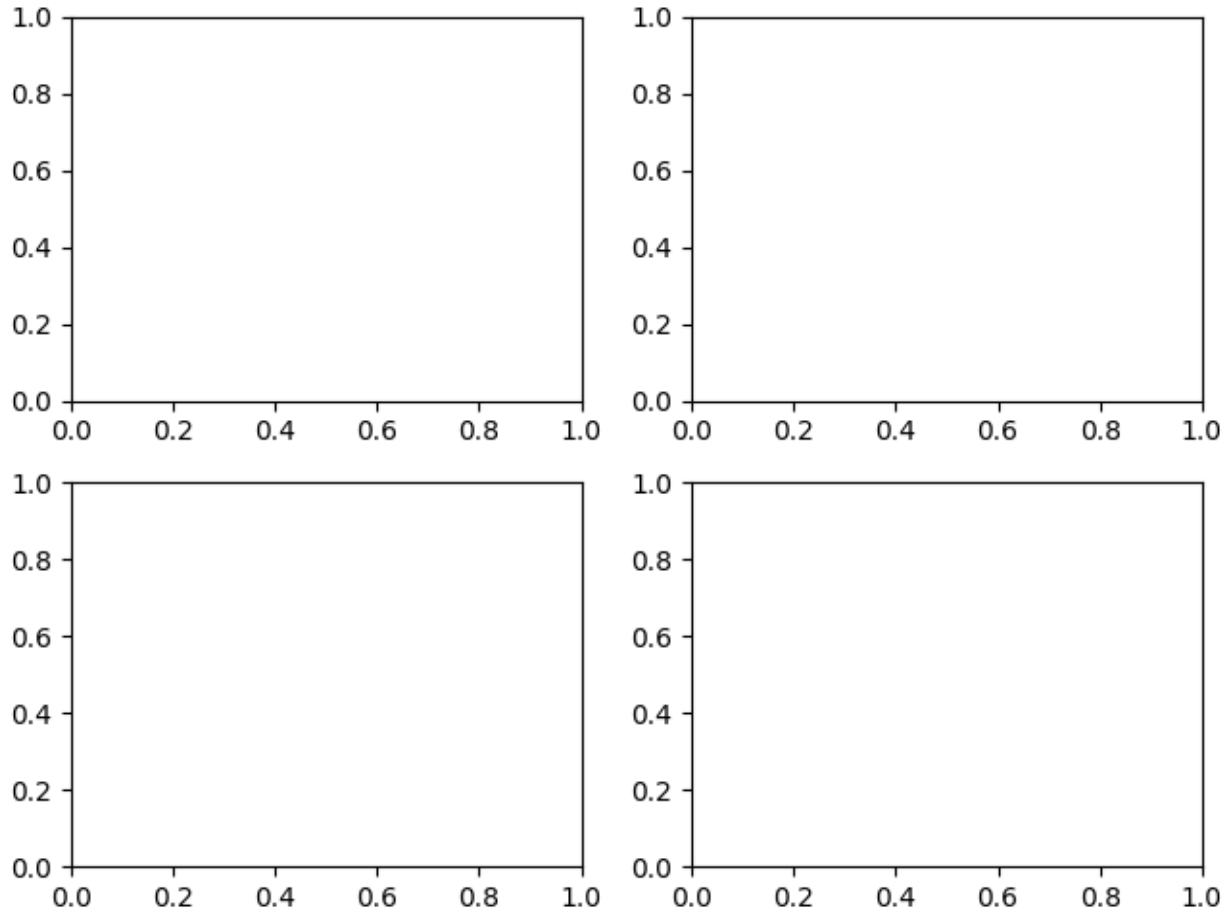
Using *subplots()* is quite simple. It returns a *Figure* instance and an array of *Axes* objects.

```
fig1, f1_axes = plt.subplots(ncols=2, nrows=2, constrained_layout=True)
```



For a simple use case such as this, *gridspec* is perhaps overly verbose. You have to create the figure and *GridSpec* instance separately, then pass elements of gridspec instance to the *add_subplot()* method to create the axes objects. The elements of the gridspec are accessed in generally the same manner as numpy arrays.

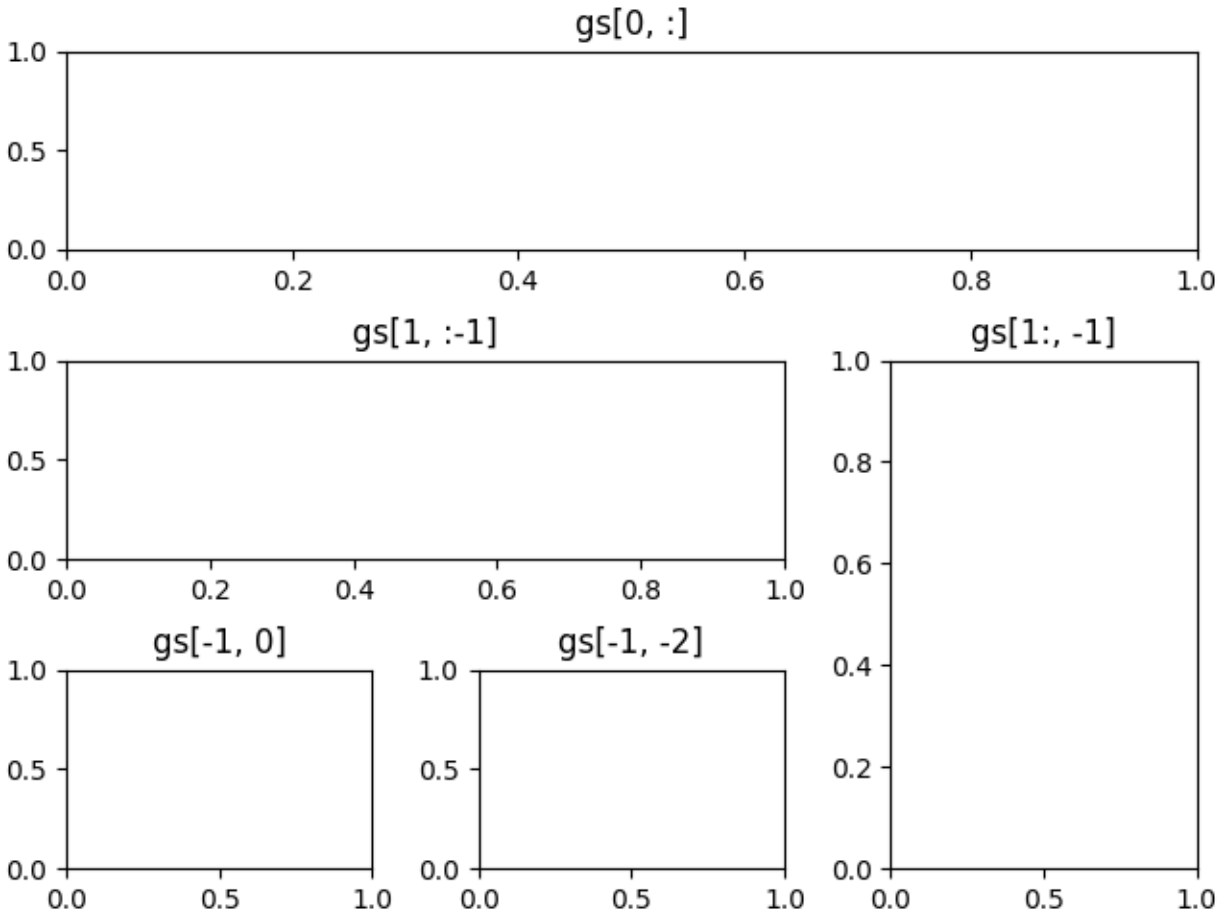
```
fig2 = plt.figure(constrained_layout=True)
spec2 = gridspec.GridSpec(ncols=2, nrows=2, figure=fig2)
f2_ax1 = fig2.add_subplot(spec2[0, 0])
f2_ax2 = fig2.add_subplot(spec2[0, 1])
f2_ax3 = fig2.add_subplot(spec2[1, 0])
f2_ax4 = fig2.add_subplot(spec2[1, 1])
```



The power of gridspec comes in being able to create subplots that span rows and columns. Note the NumPy slice syntax for selecting the part of the gridspec each subplot will occupy.

Note that we have also used the convenience method *Figure.add_gridspec* instead of *gridspec.GridSpec*, potentially saving the user an import, and keeping the namespace cleaner.

```
fig3 = plt.figure(constrained_layout=True)
gs = fig3.add_gridspec(3, 3)
f3_ax1 = fig3.add_subplot(gs[0, :])
f3_ax1.set_title('gs[0, :]')
f3_ax2 = fig3.add_subplot(gs[1, :-1])
f3_ax2.set_title('gs[1, :-1]')
f3_ax3 = fig3.add_subplot(gs[1:, -1])
f3_ax3.set_title('gs[1:, -1]')
f3_ax4 = fig3.add_subplot(gs[-1, 0])
f3_ax4.set_title('gs[-1, 0]')
f3_ax5 = fig3.add_subplot(gs[-1, -2])
f3_ax5.set_title('gs[-1, -2]')
```



Out:

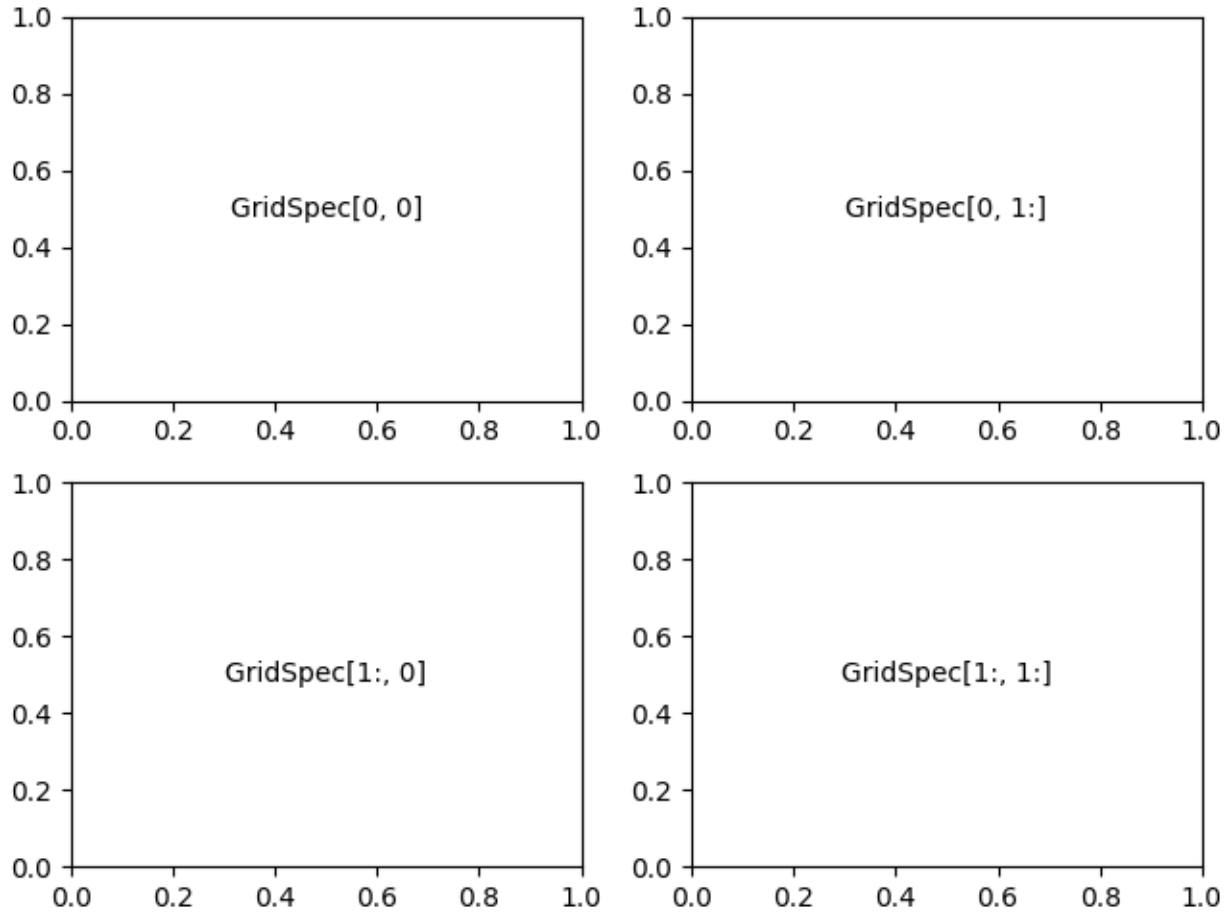
```
Text(0.5, 1.0, 'gs[-1, -2]')
```

gridspec is also indispensable for creating subplots of different widths via a couple of methods.

The method shown here is similar to the one above and initializes a uniform grid specification, and then uses numpy indexing and slices to allocate multiple "cells" for a given subplot.

```
fig4 = plt.figure(constrained_layout=True)
spec4 = fig4.add_gridspec(ncols=2, nrows=2)
anno_opts = dict(xy=(0.5, 0.5), xycoords='axes fraction',
                 va='center', ha='center')

f4_ax1 = fig4.add_subplot(spec4[0, 0])
f4_ax1.annotate('GridSpec[0, 0]', **anno_opts)
fig4.add_subplot(spec4[0, 1]).annotate('GridSpec[0, 1:]', **anno_opts)
fig4.add_subplot(spec4[1, 0]).annotate('GridSpec[1:, 0]', **anno_opts)
fig4.add_subplot(spec4[1, 1]).annotate('GridSpec[1:, 1:]', **anno_opts)
```

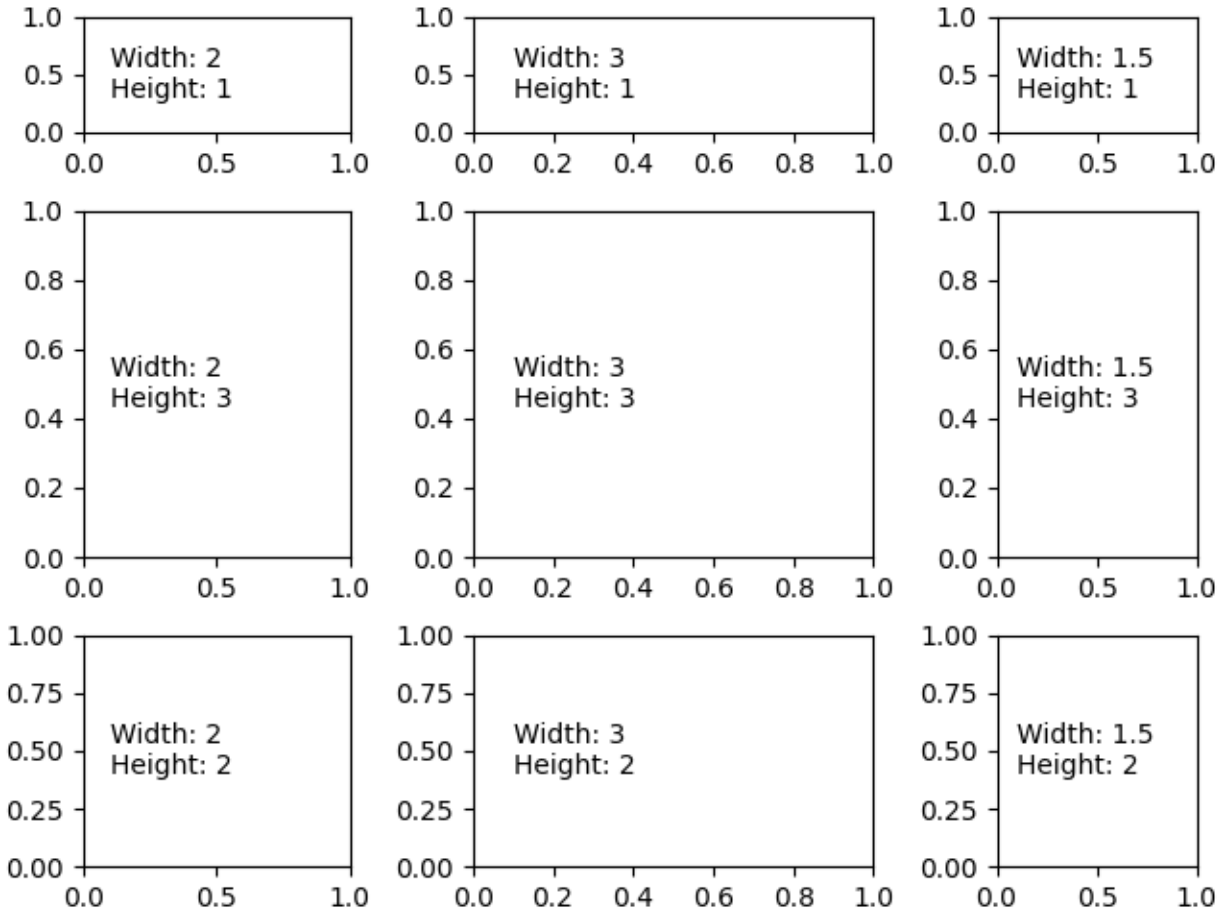


Out:

```
Text(0.5, 0.5, 'GridSpec[1:, 1:]')
```

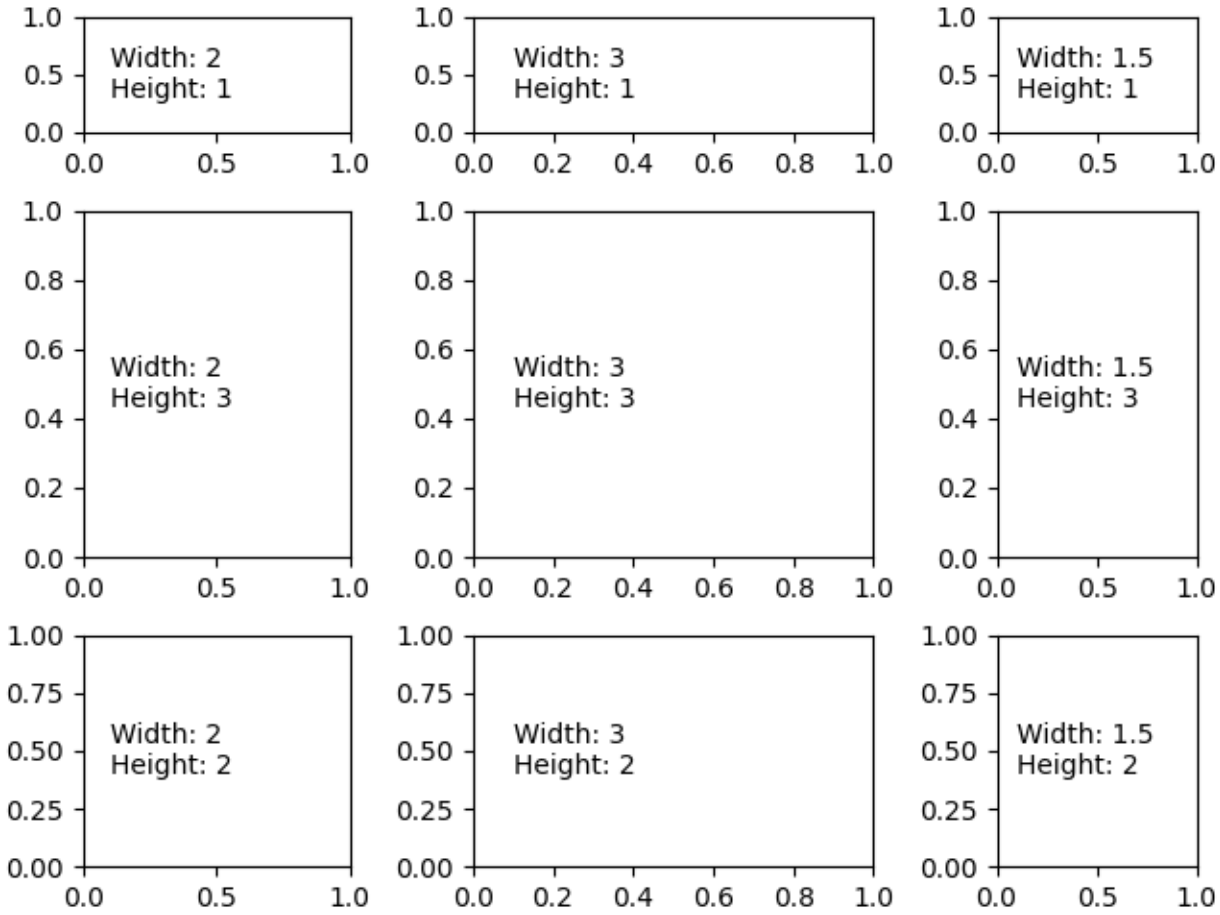
Another option is to use the `width_ratios` and `height_ratios` parameters. These keyword arguments are lists of numbers. Note that absolute values are meaningless, only their relative ratios matter. That means that `width_ratios=[2, 4, 8]` is equivalent to `width_ratios=[1, 2, 4]` within equally wide figures. For the sake of demonstration, we'll blindly create the axes within `for` loops since we won't need them later.

```
fig5 = plt.figure(constrained_layout=True)
widths = [2, 3, 1.5]
heights = [1, 3, 2]
spec5 = fig5.add_gridspec(ncols=3, nrows=3, width_ratios=widths,
                          height_ratios=heights)
for row in range(3):
    for col in range(3):
        ax = fig5.add_subplot(spec5[row, col])
        label = 'Width: {}\nHeight: {}'.format(widths[col], heights[row])
        ax.annotate(label, (0.1, 0.5), xycoords='axes fraction', va='center')
```



Learning to use `width_ratios` and `height_ratios` is particularly useful since the top-level function *subplots()* accepts them within the `gridspec_kw` parameter. For that matter, any parameter accepted by *GridSpec* can be passed to *subplots()* via the `gridspec_kw` parameter. This example recreates the previous figure without directly using a gridspec instance.

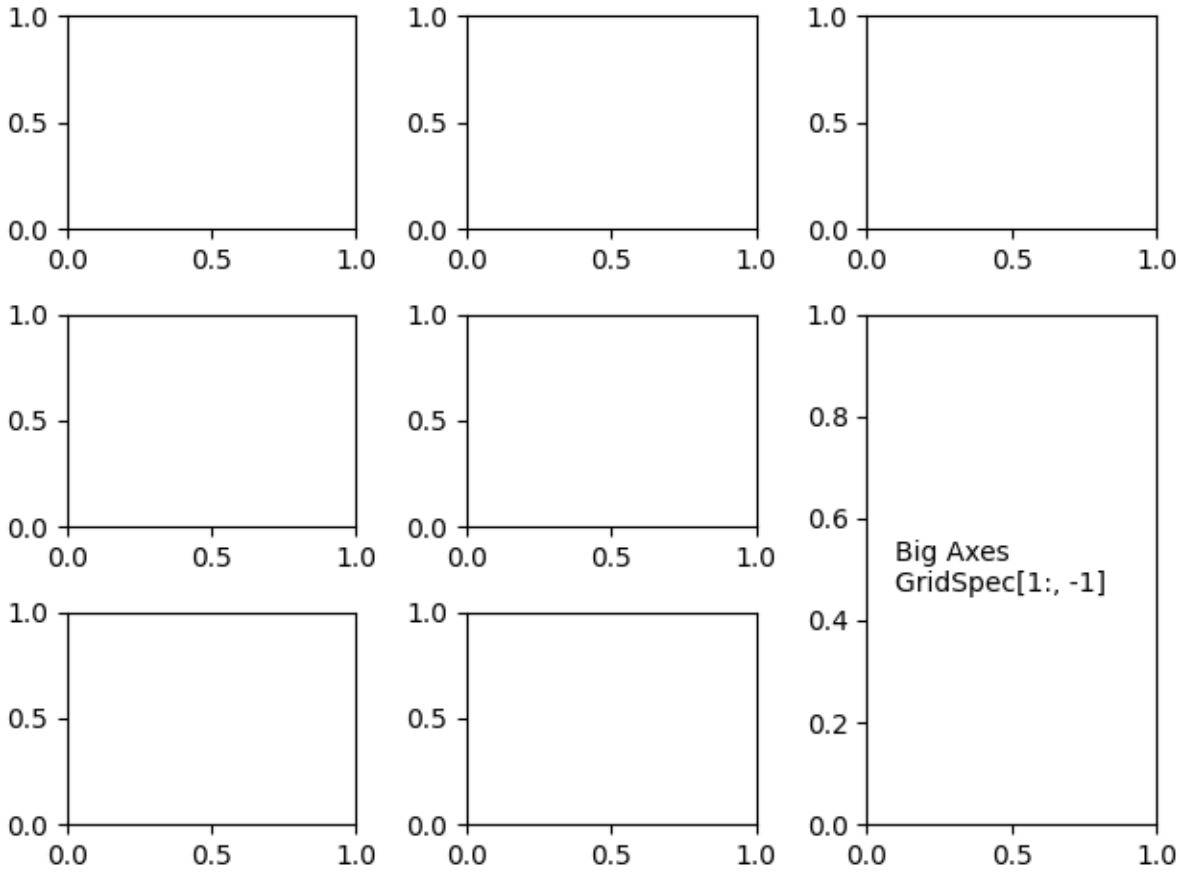
```
gs_kw = dict(width_ratios=widths, height_ratios=heights)
fig6, f6_axes = plt.subplots(ncols=3, nrows=3, constrained_layout=True,
                             gridspec_kw=gs_kw)
for r, row in enumerate(f6_axes):
    for c, ax in enumerate(row):
        label = 'Width: {}\nHeight: {}'.format(widths[c], heights[r])
        ax.annotate(label, (0.1, 0.5), xycoords='axes fraction', va='center')
```



The `subplots` and `get_gridspec` methods can be combined since it is sometimes more convenient to make most of the subplots using `subplots` and then remove some and combine them. Here we create a layout with the bottom two axes in the last column combined.

```
fig7, f7_axs = plt.subplots(ncols=3, nrows=3)
gs = f7_axs[1, 2].get_gridspec()
# remove the underlying axes
for ax in f7_axs[1:, -1]:
    ax.remove()
axbig = fig7.add_subplot(gs[1:, -1])
axbig.annotate('Big Axes \nGridSpec[1:, -1]', (0.1, 0.5),
               xycoords='axes fraction', va='center')

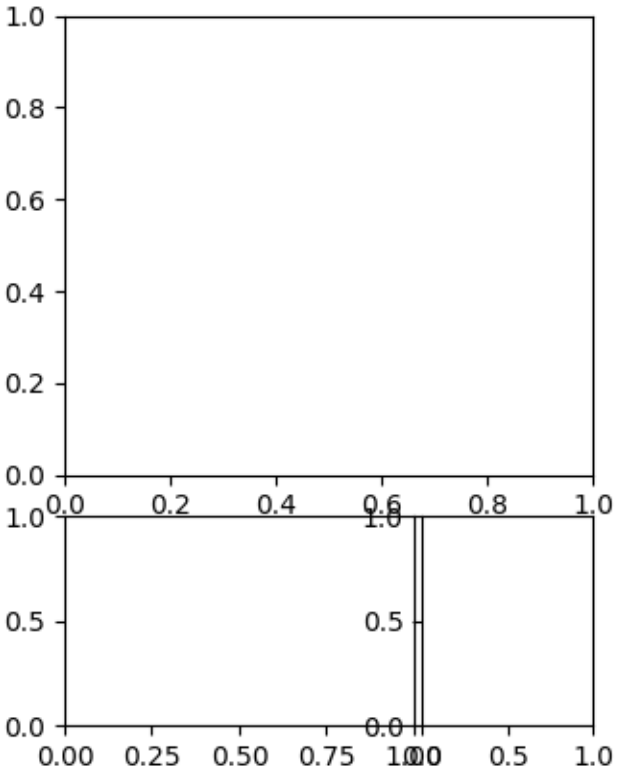
fig7.tight_layout()
```



Fine Adjustments to a Gridspec Layout

When a GridSpec is explicitly used, you can adjust the layout parameters of subplots that are created from the GridSpec. Note this option is not compatible with `constrained_layout` or *Figure.tight_layout* which both adjust subplot sizes to fill the figure.

```
fig8 = plt.figure(constrained_layout=False)
gs1 = fig8.add_gridspec(nrows=3, ncols=3, left=0.05, right=0.48, wspace=0.05)
f8_ax1 = fig8.add_subplot(gs1[:-1, :])
f8_ax2 = fig8.add_subplot(gs1[-1, :-1])
f8_ax3 = fig8.add_subplot(gs1[-1, -1])
```

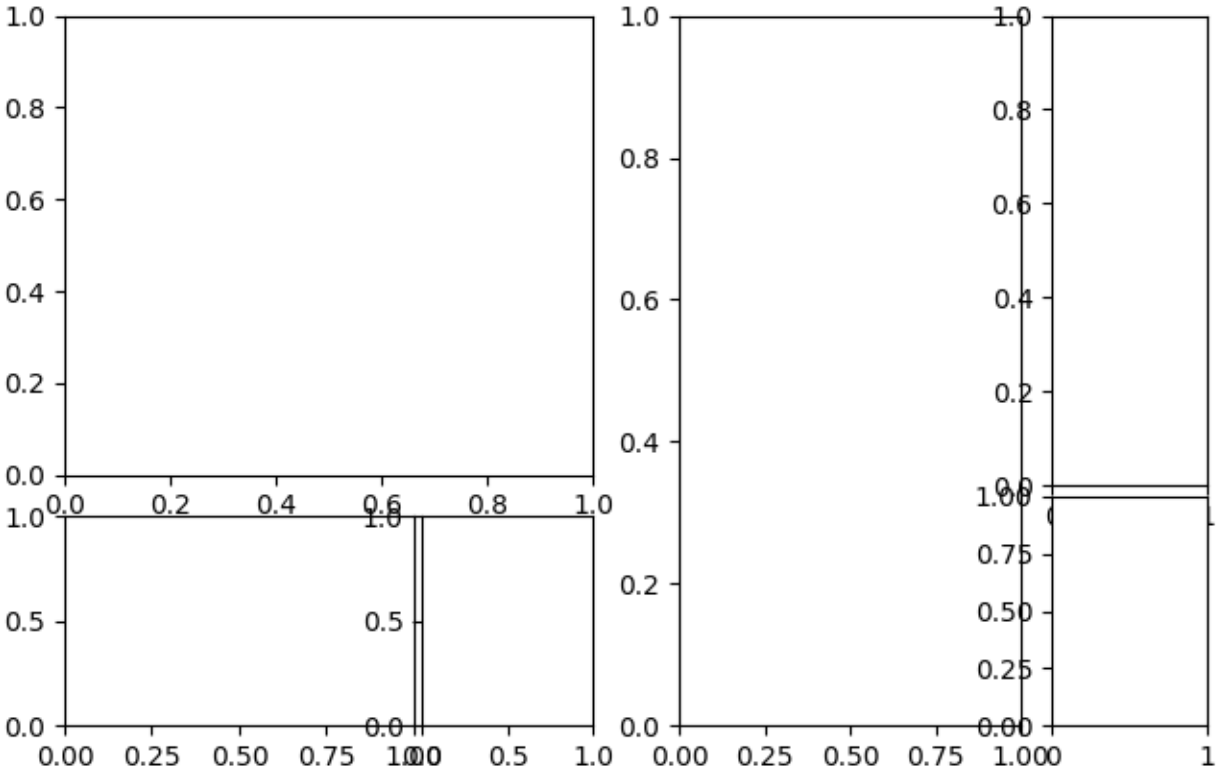


This is similar to *subplots_adjust()*, but it only affects the subplots that are created from the given GridSpec.

For example, compare the left and right sides of this figure:

```
fig9 = plt.figure(constrained_layout=False)
gs1 = fig9.add_gridspec(nrows=3, ncols=3, left=0.05, right=0.48,
                        wspace=0.05)
f9_ax1 = fig9.add_subplot(gs1[:-1, :])
f9_ax2 = fig9.add_subplot(gs1[-1, :-1])
f9_ax3 = fig9.add_subplot(gs1[-1, -1])

gs2 = fig9.add_gridspec(nrows=3, ncols=3, left=0.55, right=0.98,
                        hspace=0.05)
f9_ax4 = fig9.add_subplot(gs2[:, :-1])
f9_ax5 = fig9.add_subplot(gs2[:-1, -1])
f9_ax6 = fig9.add_subplot(gs2[-1, -1])
```



GridSpec using SubplotSpec

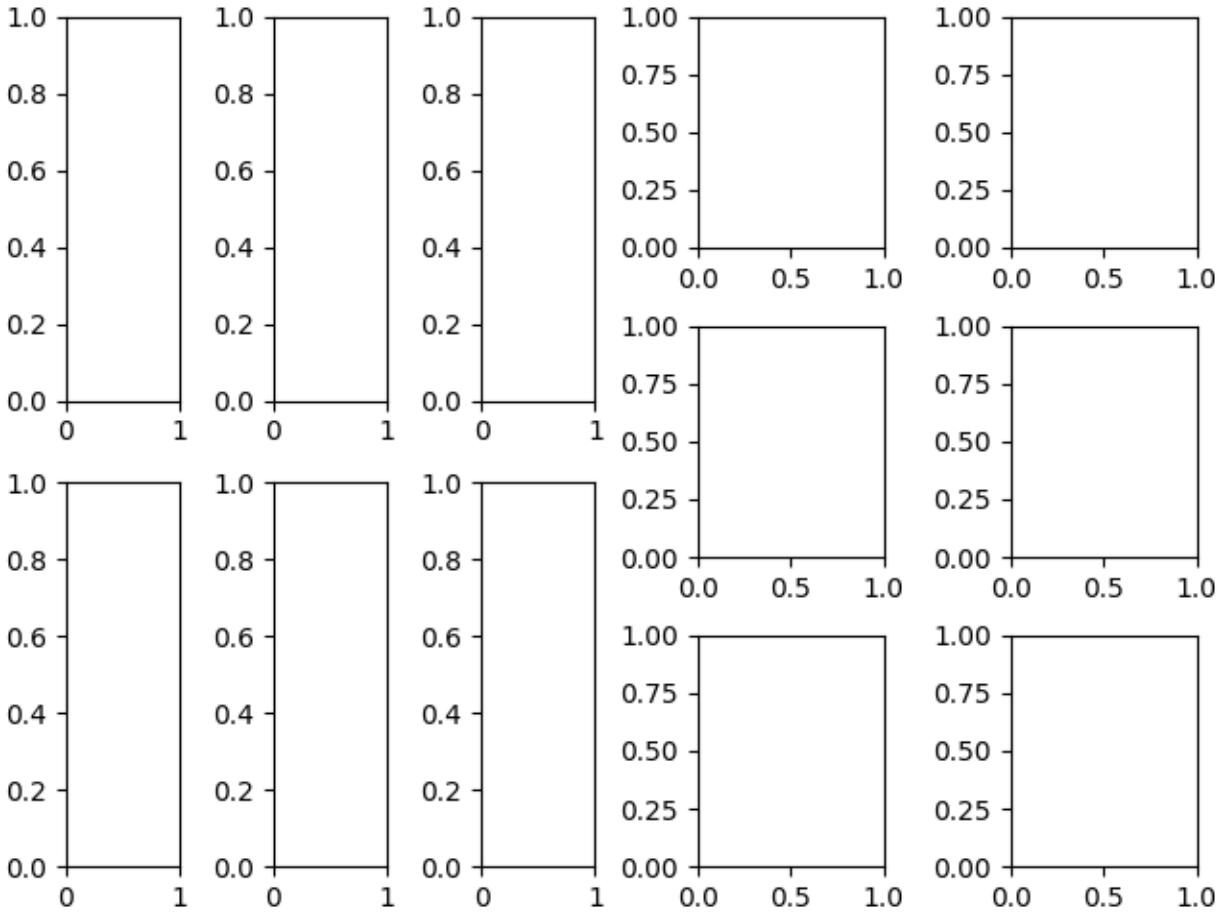
You can create GridSpec from the *SubplotSpec*, in which case its layout parameters are set to that of the location of the given SubplotSpec.

Note this is also available from the more verbose *gridspec.GridSpecFromSubplotSpec*.

```
fig10 = plt.figure(constrained_layout=True)
gs0 = fig10.add_gridspec(1, 2)

gs00 = gs0[0].subgridspec(2, 3)
gs01 = gs0[1].subgridspec(3, 2)

for a in range(2):
    for b in range(3):
        fig10.add_subplot(gs00[a, b])
        fig10.add_subplot(gs01[b, a])
```



A Complex Nested GridSpec using SubplotSpec

Here's a more sophisticated example of nested GridSpec where we put a box around each cell of the outer 4x4 grid, by hiding appropriate spines in each of the inner 3x3 grids.

```
import numpy as np

def squiggle_xy(a, b, c, d, i=np.arange(0.0, 2*np.pi, 0.05)):
    return np.sin(i*a)*np.cos(i*b), np.sin(i*c)*np.cos(i*d)

fig11 = plt.figure(figsize=(8, 8), constrained_layout=False)
outer_grid = fig11.add_gridspec(4, 4, wspace=0, hspace=0)

for a in range(4):
    for b in range(4):
        # gridspec inside gridspec
        inner_grid = outer_grid[a, b].subgridspec(3, 3, wspace=0, hspace=0)
        axs = inner_grid.subplots()  # Create all subplots for the inner grid.
```

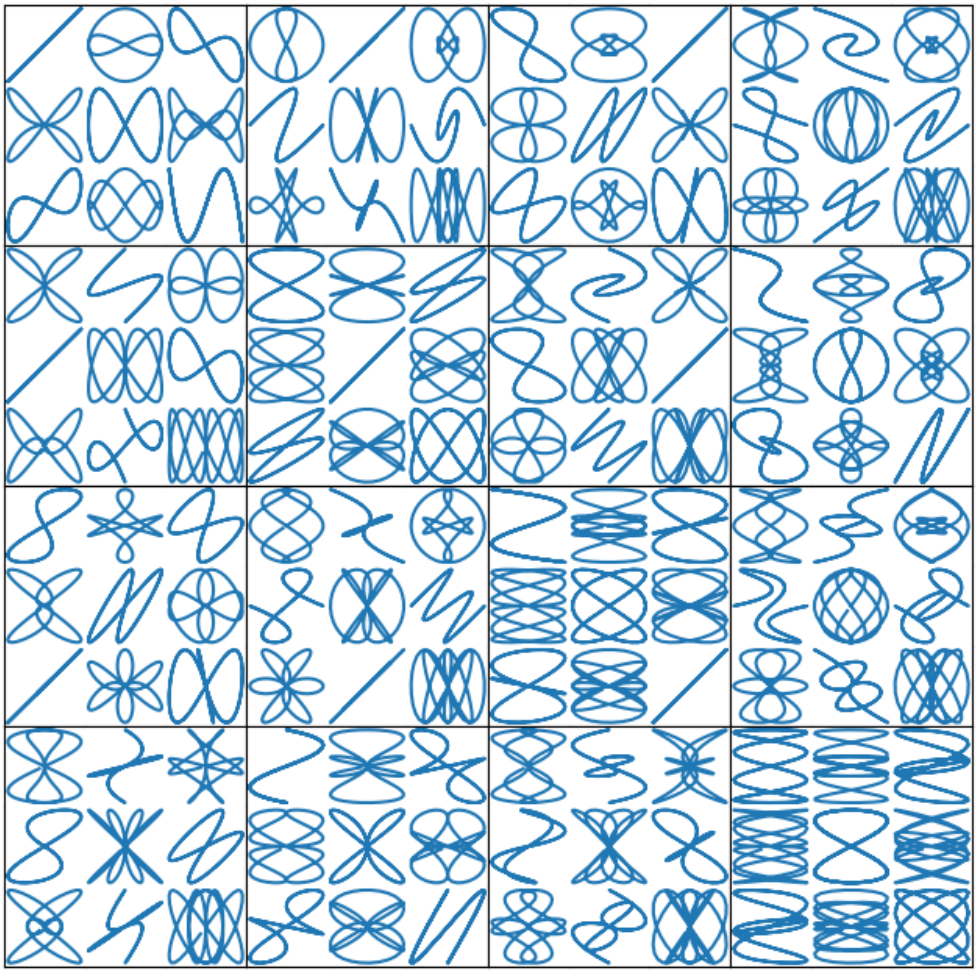
(continues on next page)

(continued from previous page)

```
        for (c, d), ax in np.ndenumerate(axs):
            ax.plot(*squiggle_xy(a + 1, b + 1, c + 1, d + 1))
            ax.set(xticks=[], yticks=[])

# show only the outside spines
for ax in fig11.get_axes():
    ax.spines['top'].set_visible(ax.is_first_row())
    ax.spines['bottom'].set_visible(ax.is_last_row())
    ax.spines['left'].set_visible(ax.is_first_col())
    ax.spines['right'].set_visible(ax.is_last_col())

plt.show()
```



References

The usage of the following functions and methods is shown in this example:

```

2.2.5 Constrained Layout Guide

How to use constrained-layout to fit plots within your figure cleanly.

constrained_layout automatically adjusts subplots and decorations like legends and colorbars so that they fit in the figure window while still preserving, as best they can, the logical layout requested by the user.

constrained_layout is similar to *tight_layout*, but uses a constraint solver to determine the size of axes that allows them to fit.

constrained_layout needs to be activated before any axes are added to a figure. Two ways of doing so are

- using the respective argument to *subplots()* or *figure()*, e.g.:

```
plt.subplots(constrained_layout=True)
```

- activate it via *rcParams*, like:

```
plt.rcParams['figure.constrained_layout.use'] = True
```

Those are described in detail throughout the following sections.

Warning: Currently Constrained Layout is **experimental**. The behaviour and API are subject to change, or the whole functionality may be removed without a deprecation period. If you *require* your plots to be absolutely reproducible, get the Axes positions after running Constrained Layout and use `ax.set_position()` in your code with `constrained_layout=False`.

Simple Example

In Matplotlib, the location of axes (including subplots) are specified in normalized figure coordinates. It can happen that your axis labels or titles (or sometimes even ticklabels) go outside the figure area, and are thus clipped.

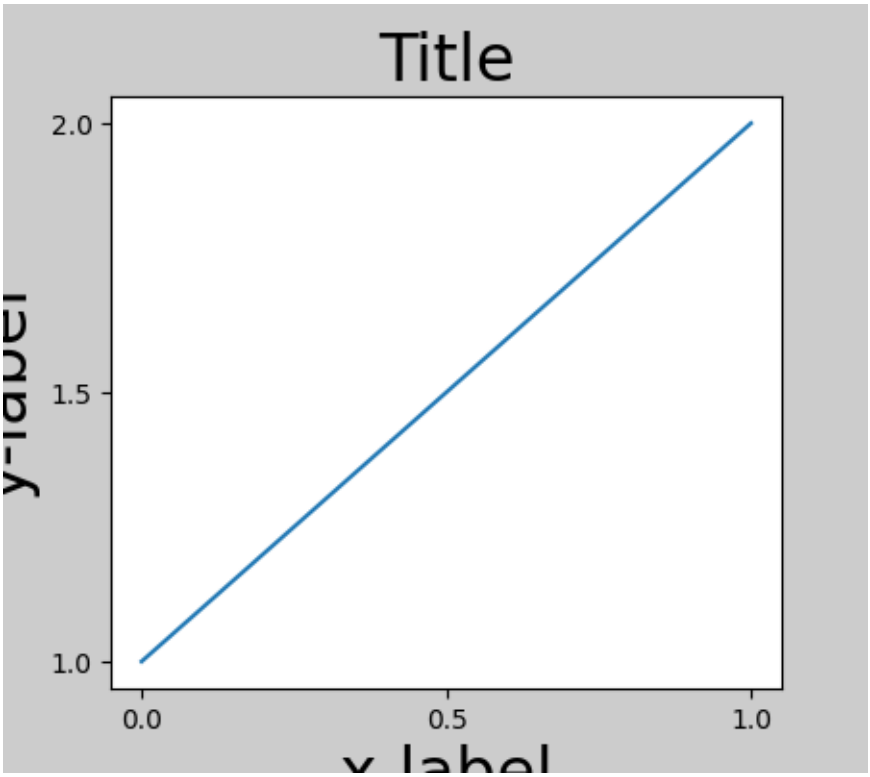
```
import matplotlib.pyplot as plt
import matplotlib.colors as mcolors
import matplotlib.gridspec as gridspec
import numpy as np

plt.rcParams['savefig.facecolor'] = "0.8"
plt.rcParams['figure.figsize'] = 4.5, 4.
plt.rcParams['figure.max_open_warning'] = 50

def example_plot(ax, fontsize=12, hide_labels=False):
    ax.plot([1, 2])

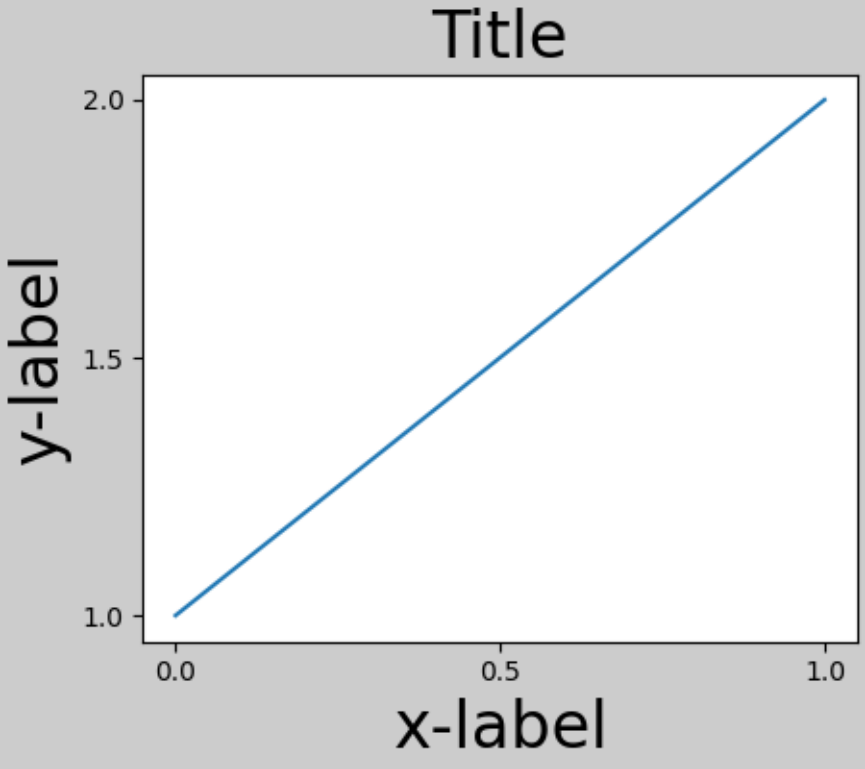
    ax.locator_params(nbins=3)
    if hide_labels:
        ax.set_xticklabels([])
        ax.set_yticklabels([])
    else:
        ax.set_xlabel('x-label', fontsize=fontsize)
        ax.set_ylabel('y-label', fontsize=fontsize)
        ax.set_title('Title', fontsize=fontsize)

fig, ax = plt.subplots(constrained_layout=False)
example_plot(ax, fontsize=24)
```



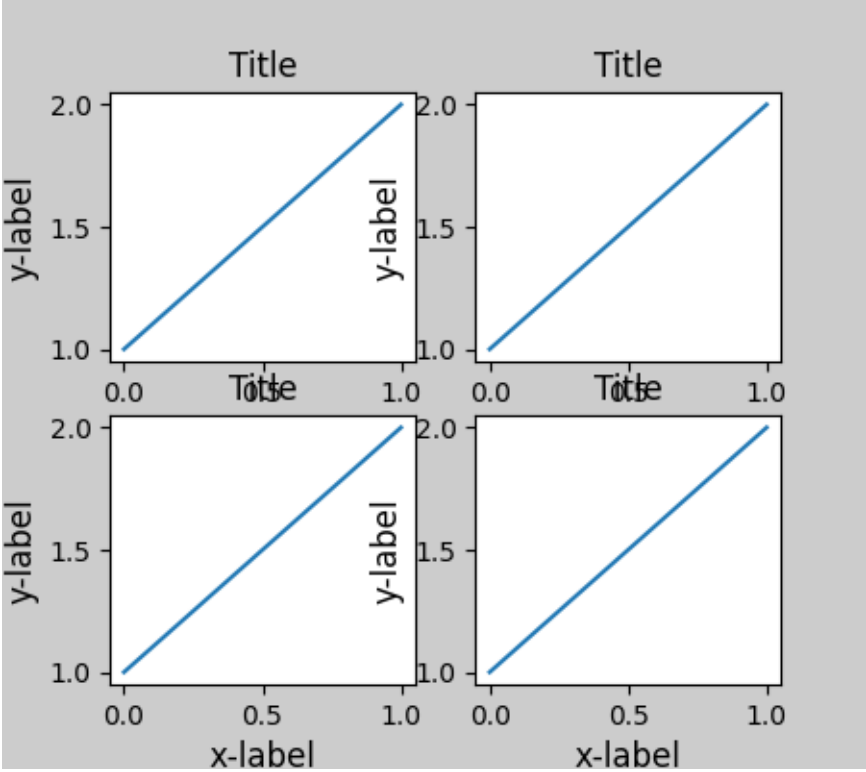
To prevent this, the location of axes needs to be adjusted. For subplots, this can be done by adjusting the subplot params (*Move the edge of an axes to make room for tick labels*). However, specifying your figure with the `constrained_layout=True` kwarg will do the adjusting automatically.

```
fig, ax = plt.subplots(constrained_layout=True)
example_plot(ax, fontsize=24)
```



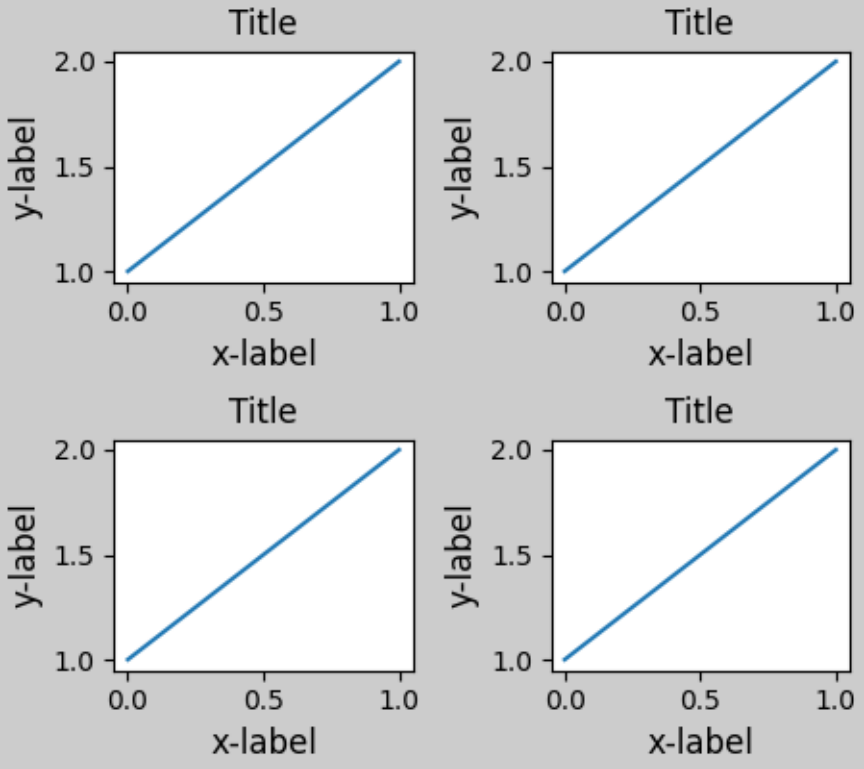
When you have multiple subplots, often you see labels of different axes overlapping each other.

```
fig, axs = plt.subplots(2, 2, constrained_layout=False)
for ax in axs.flat:
    example_plot(ax)
```



Specifying `constrained_layout=True` in the call to `plt.subplots` causes the layout to be properly constrained.

```
fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    example_plot(ax)
```

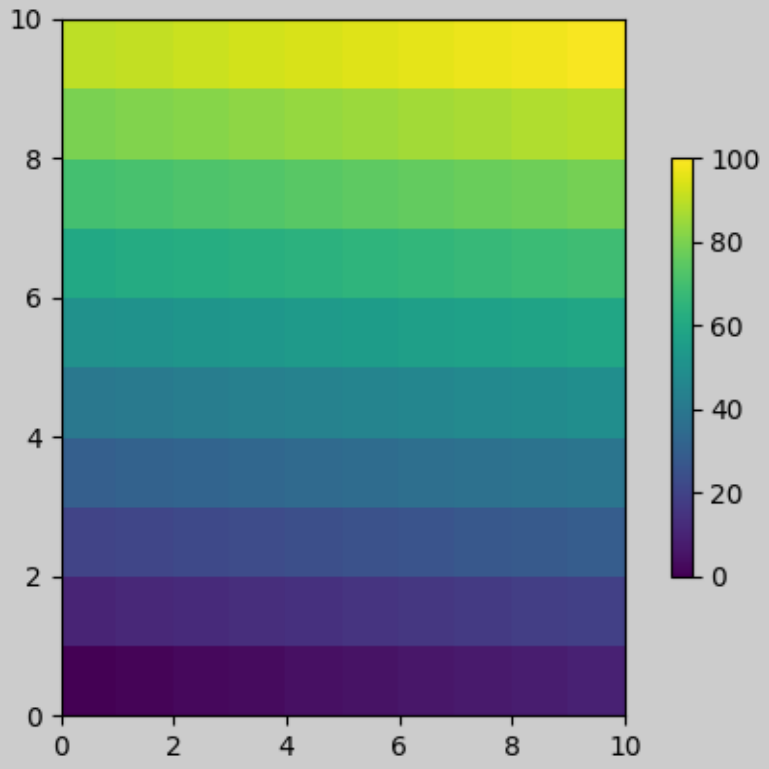


Colorbars

If you create a colorbar with *Figure.colorbar*, you need to make room for it. `constrained_layout` does this automatically. Note that if you specify `use_gridspec=True` it will be ignored because this option is made for improving the layout via `tight_layout`.

Note: For the *pcolormesh* kwargs (`pc_kwargs`) we use a dictionary. Below we will assign one colorbar to a number of axes each containing a *ScalarMappable*; specifying the norm and colormap ensures the colorbar is accurate for all the axes.

```
arr = np.arange(100).reshape((10, 10))
norm = mcolors.Normalize(vmin=0., vmax=100.)
# see note above: this makes all pcolormesh calls consistent:
pc_kwargs = {'rasterized': True, 'cmap': 'viridis', 'norm': norm}
fig, ax = plt.subplots(figsize=(4, 4), constrained_layout=True)
im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=ax, shrink=0.6)
```

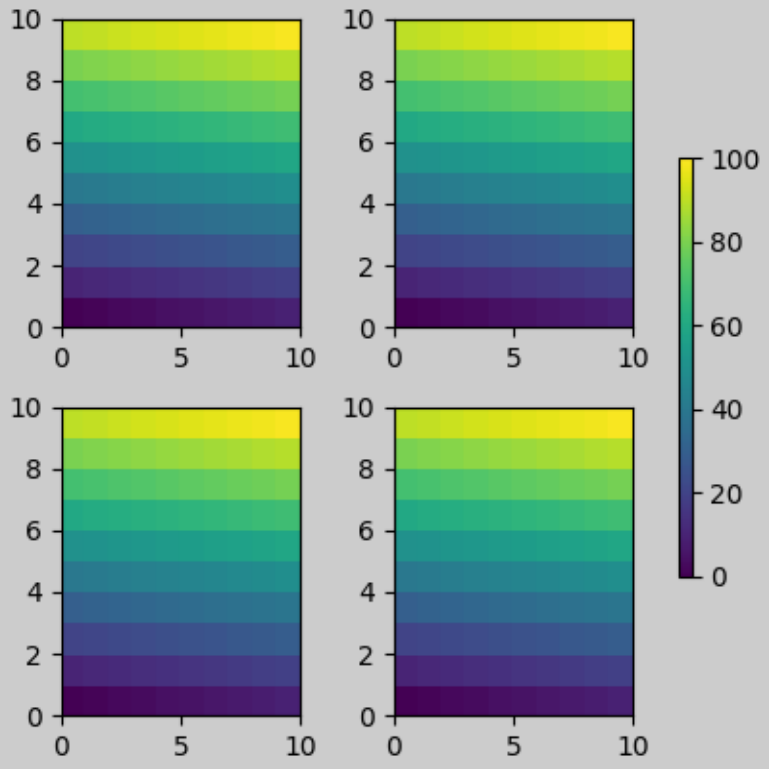


Out:

```
<matplotlib.colorbar.Colorbar object at 0x7f53fac9aa00>
```

If you specify a list of axes (or other iterable container) to the `ax` argument of `colorbar`, constrained_layout will take space from the specified axes.

```
fig, axs = plt.subplots(2, 2, figsize=(4, 4), constrained_layout=True)
for ax in axs.flat:
    im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs, shrink=0.6)
```

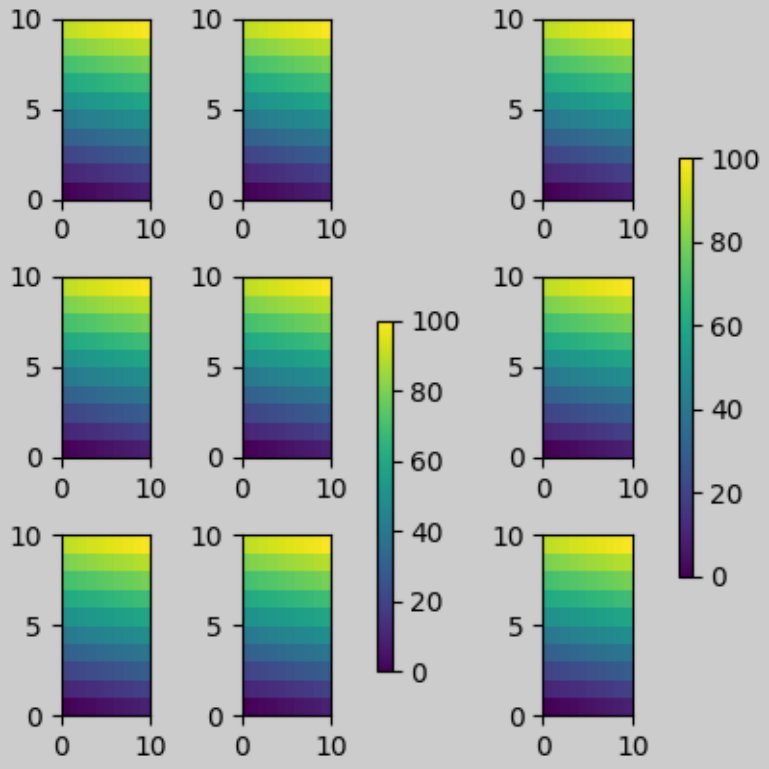


Out:

```
<matplotlib.colorbar.Colorbar object at 0x7f53fedd3c10>
```

If you specify a list of axes from inside a grid of axes, the colorbar will steal space appropriately, and leave a gap, but all subplots will still be the same size.

```
fig, axs = plt.subplots(3, 3, figsize=(4, 4), constrained_layout=True)
for ax in axs.flat:
    im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs[1:, ][:, 1], shrink=0.8)
fig.colorbar(im, ax=axs[:, -1], shrink=0.6)
```

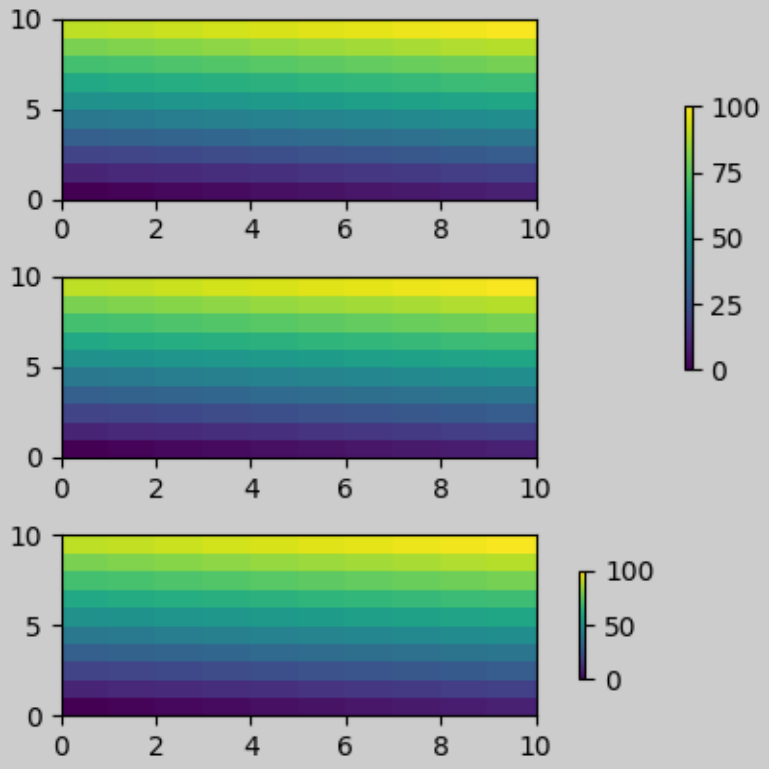


Out:

```
<matplotlib.colorbar.Colorbar object at 0x7f53fe8152b0>
```

Note that there is a bit of a subtlety when specifying a single axes as the parent. In the following, it might be desirable and expected for the colorbars to line up, but they don't because the colorbar paired with the bottom axes is tied to the subplotspec of the axes, and hence shrinks when the gridspec-level colorbar is added.

```
fig, axs = plt.subplots(3, 1, figsize=(4, 4), constrained_layout=True)
for ax in axs[:2]:
    im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs[:2], shrink=0.6)
im = axs[2].pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs[2], shrink=0.6)
```

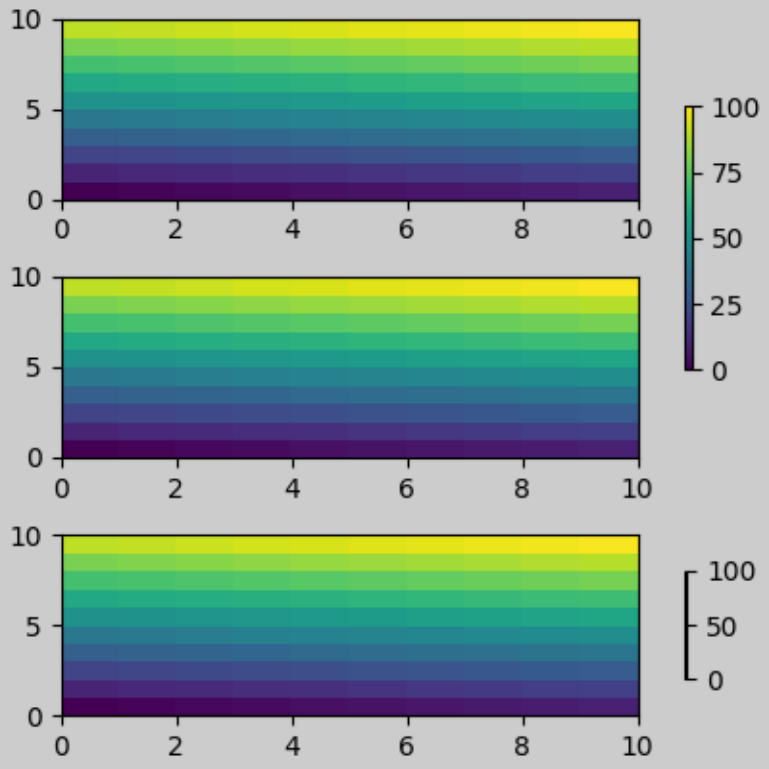


Out:

```
<matplotlib.colorbar.Colorbar object at 0x7f540010d100>
```

The API to make a single-axes behave like a list of axes is to specify it as a list (or other iterable container), as below:

```
fig, axs = plt.subplots(3, 1, figsize=(4, 4), constrained_layout=True)
for ax in axs[:2]:
    im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs[:2], shrink=0.6)
im = axs[2].pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=[axs[2]], shrink=0.6)
```



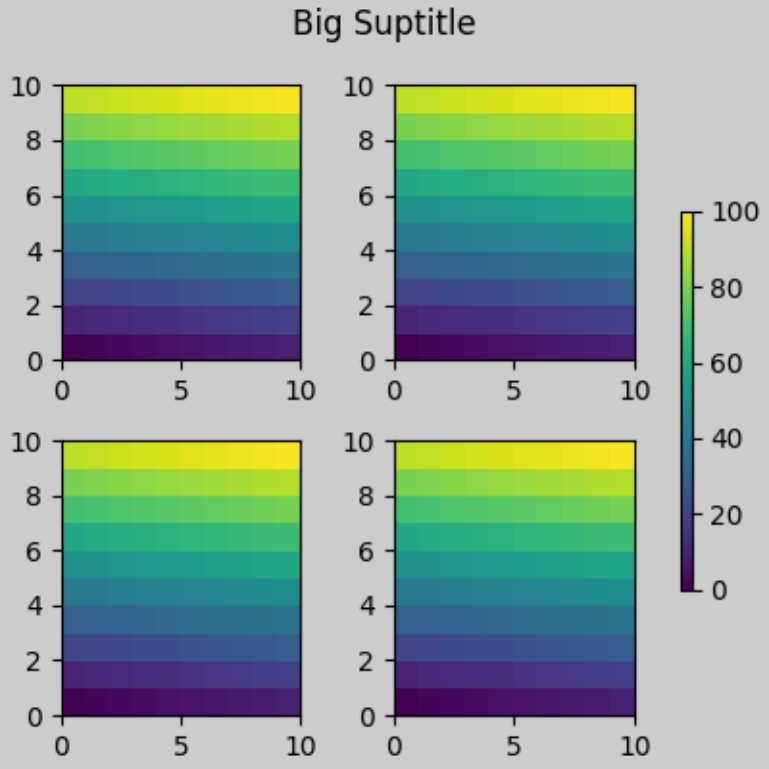
Out:

```
<matplotlib.colorbar.Colorbar object at 0x7f53f9b49e20>
```

Suptitle

`constrained_layout` can also make room for *`suptitle`*.

```
fig, axs = plt.subplots(2, 2, figsize=(4, 4), constrained_layout=True)
for ax in axs.flat:
    im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs, shrink=0.6)
fig.suptitle('Big Suptitle')
```



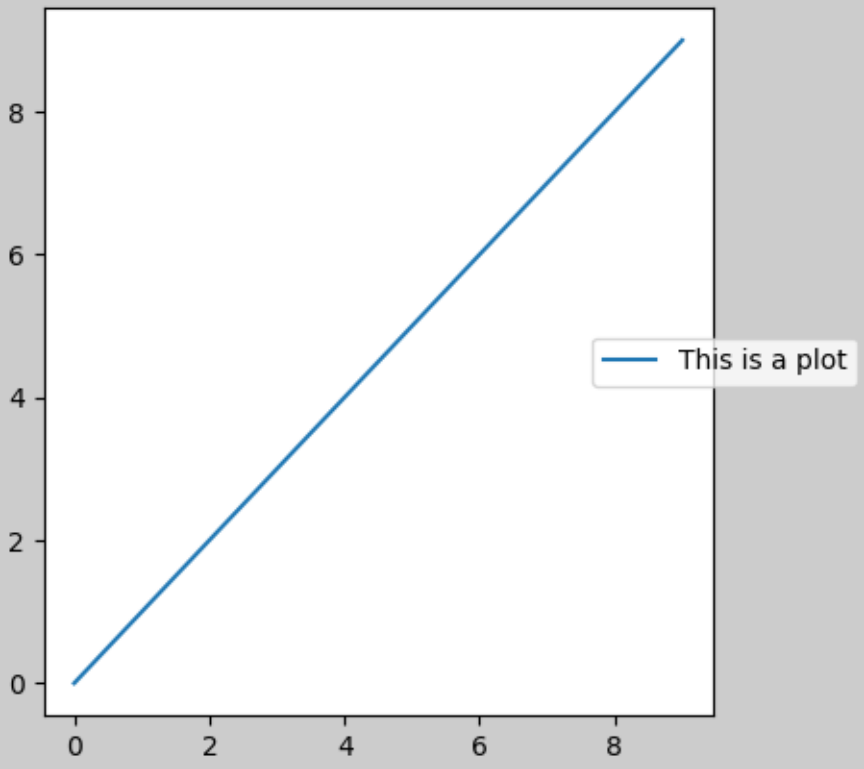
Out:

```
Text(0.5, 0.98, 'Big Suptitle')
```

Legends

Legends can be placed outside of their parent axis. Constrained-layout is designed to handle this for *Axes.legend()*. However, constrained-layout does *not* handle legends being created via *Figure.legend()* (yet).

```
fig, ax = plt.subplots(constrained_layout=True)
ax.plot(np.arange(10), label='This is a plot')
ax.legend(loc='center left', bbox_to_anchor=(0.8, 0.5))
```

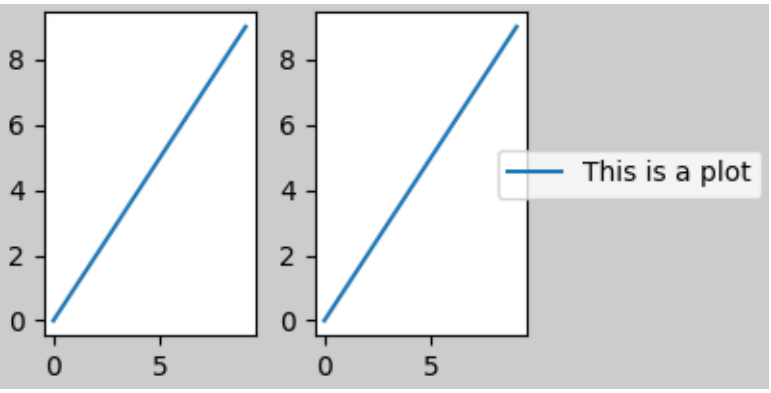


Out:

```
<matplotlib.legend.Legend object at 0x7f53f9b037c0>
```

However, this will steal space from a subplot layout:

```
fig, axs = plt.subplots(1, 2, figsize=(4, 2), constrained_layout=True)
axs[0].plot(np.arange(10))
axs[1].plot(np.arange(10), label='This is a plot')
axs[1].legend(loc='center left', bbox_to_anchor=(0.8, 0.5))
```



Out:

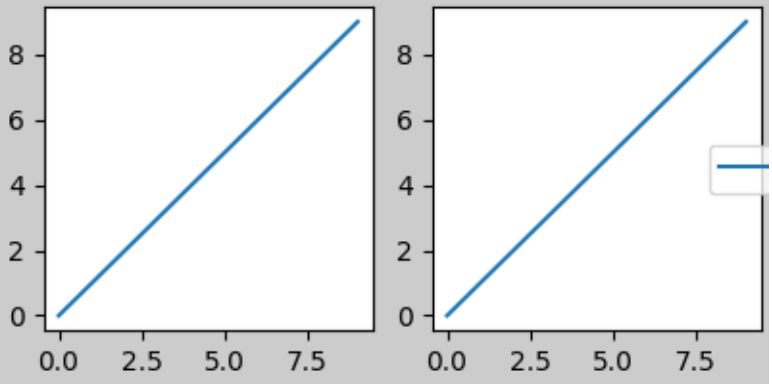
```
<matplotlib.legend.Legend object at 0x7f53f9a93b80>
```

In order for a legend or other artist to *not* steal space from the subplot layout, we

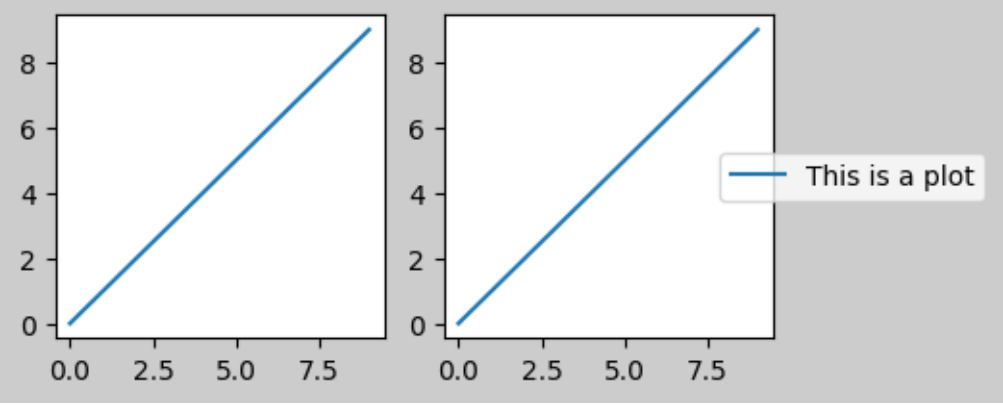
can `leg.set_in_layout(False)`. Of course this can mean the legend ends up cropped, but can be useful if the plot is subsequently called with `fig.savefig('outname.png', bbox_inches='tight')`. Note, however, that the legend's `get_in_layout` status will have to be toggled again to make the saved file work, and we must manually trigger a draw if we want constrained_layout to adjust the size of the axes before printing.

```
fig, axs = plt.subplots(1, 2, figsize=(4, 2), constrained_layout=True)

axs[0].plot(np.arange(10))
axs[1].plot(np.arange(10), label='This is a plot')
leg = axs[1].legend(loc='center left', bbox_to_anchor=(0.8, 0.5))
leg.set_in_layout(False)
# trigger a draw so that constrained_layout is executed once
# before we turn it off when printing....
fig.canvas.draw()
# we want the legend included in the bbox_inches='tight' calcs.
leg.set_in_layout(True)
# we don't want the layout to change at this point.
fig.set_constrained_layout(False)
fig.savefig('../../doc/_static/constrained_layout_1b.png',
            bbox_inches='tight', dpi=100)
```

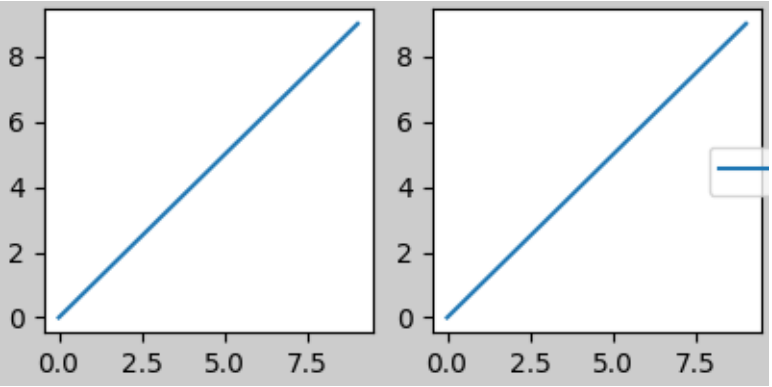


The saved file looks like:

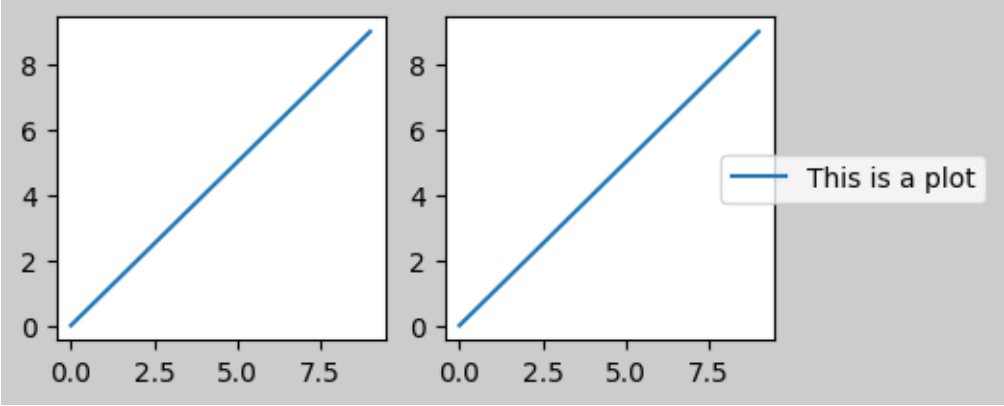


A better way to get around this awkwardness is to simply use the legend method provided by *Figure.legend*:

```
fig, axs = plt.subplots(1, 2, figsize=(4, 2), constrained_layout=True)
axs[0].plot(np.arange(10))
lines = axs[1].plot(np.arange(10), label='This is a plot')
labels = [l.get_label() for l in lines]
leg = fig.legend(lines, labels, loc='center left',
                 bbox_to_anchor=(0.8, 0.5), bbox_transform=axs[1].transAxes)
fig.savefig('../../doc/_static/constrained_layout_2b.png',
            bbox_inches='tight', dpi=100)
```



The saved file looks like:



Padding and Spacing

For constrained_layout, we have implemented a padding around the edge of each axes. This padding sets the distance from the edge of the plot, and the minimum distance between adjacent plots. It is specified in inches by the keyword arguments `w_pad` and `h_pad` to the function *set_constrained_layout_pads*:

```
fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    example_plot(ax, hide_labels=True)
fig.set_constrained_layout_pads(w_pad=4/72, h_pad=4/72, hspace=0, wspace=0)

fig, axs = plt.subplots(2, 2, constrained_layout=True)
```

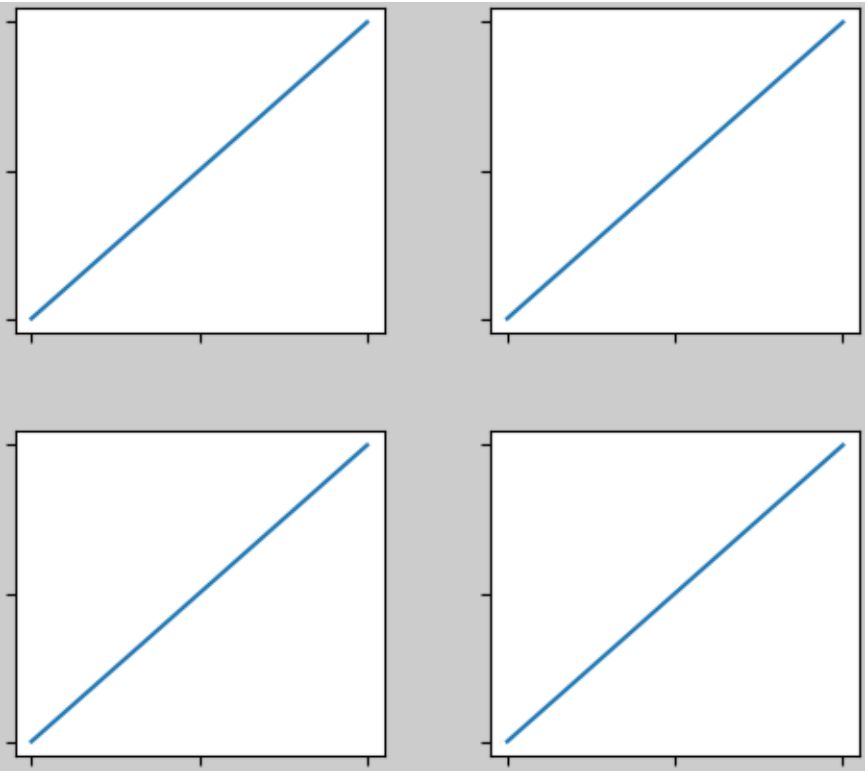
(continues on next page)

(continued from previous page)

```
for ax in axs.flat:
    example_plot(ax, hide_labels=True)
fig.set_constrained_layout_pads(w_pad=2/72, h_pad=2/72, hspace=0, wspace=0)
```

- 
- 
Spacing between subplots is set by `wspace` and `hspace`. There are specified as a fraction of the size of the subplot group as a whole. If the size of the figure is changed, then these spaces change in proportion. Note in the below how the space at the edges doesn't change from the above, but the space between subplots does.

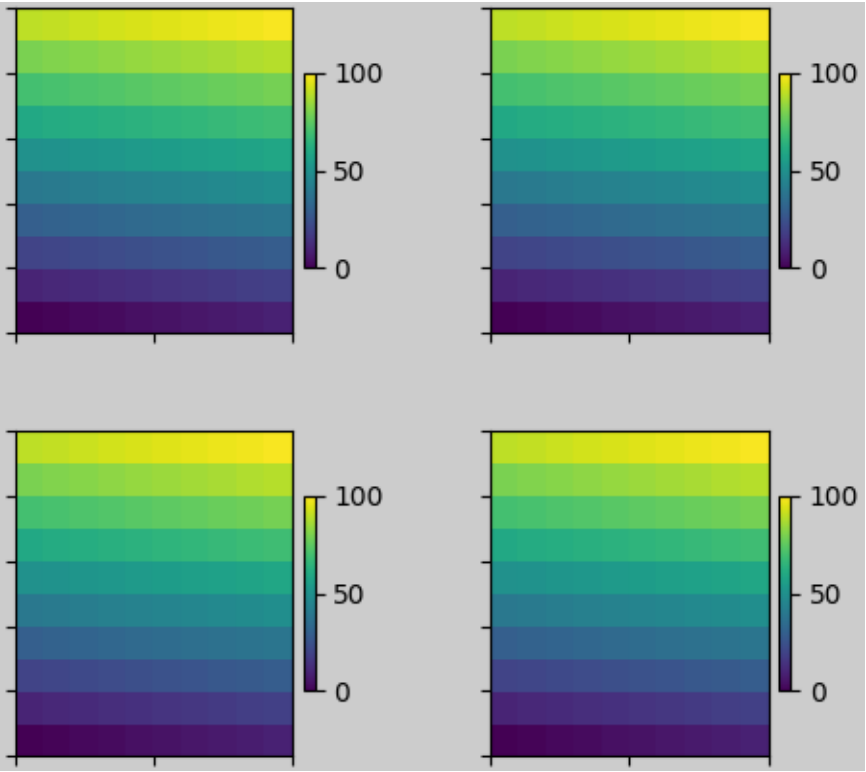
```
fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    example_plot(ax, hide_labels=True)
fig.set_constrained_layout_pads(w_pad=2/72, h_pad=2/72, hspace=0.2, wspace=0.2)
```



Spacing with colorbars

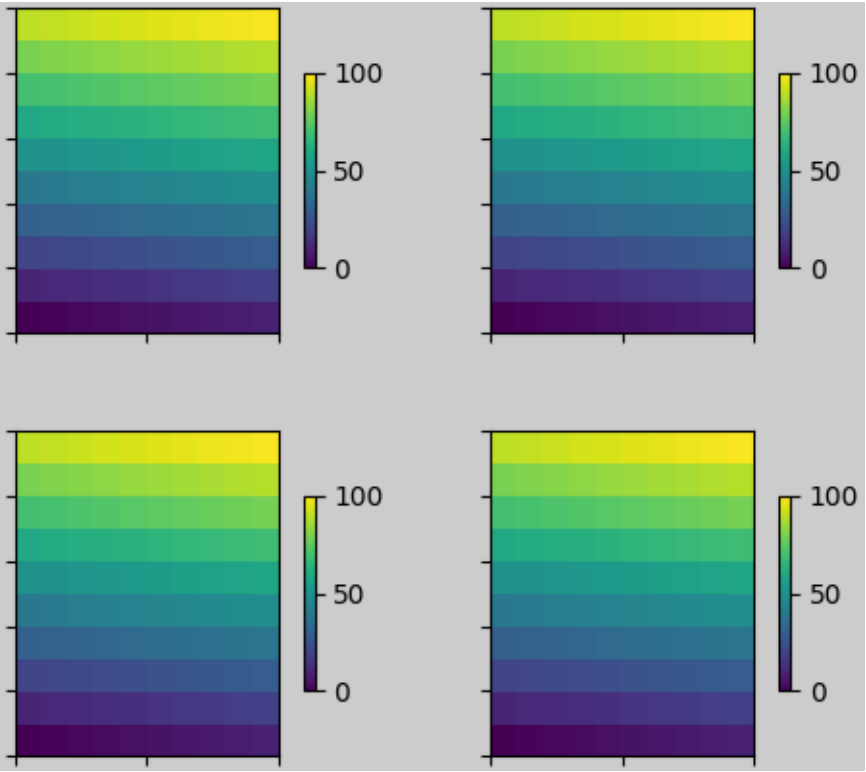
Colorbars will be placed `wspace` and `hsapce` apart from other subplots. The padding between the colorbar and the axis it is attached to will never be less than `w_pad` (for a vertical colorbar) or `h_pad` (for a horizontal colorbar). Note the use of the `pad` kwarg here in the `colorbar` call. It defaults to 0.02 of the size of the axis it is attached to.

```
fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    pc = ax.pcolormesh(arr, **pc_kwargs)
    fig.colorbar(pc, ax=ax, shrink=0.6, pad=0)
    ax.set_xticklabels('')
    ax.set_yticklabels('')
fig.set_constrained_layout_pads(w_pad=2/72, h_pad=2/72, hspace=0.2, wspace=0.2)
```



In the above example, the colorbar will not ever be closer than 2 pts to the plot, but if we want it a bit further away, we can specify its value for `pad` to be non-zero.

```
fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    pc = ax.pcolormesh(arr, **pc_kwargs)
    fig.colorbar(im, ax=ax, shrink=0.6, pad=0.05)
    ax.set_xticklabels('')
    ax.set_yticklabels('')
fig.set_constrained_layout_pads(w_pad=2/72, h_pad=2/72, hspace=0.2, wspace=0.2)
```



rcParams

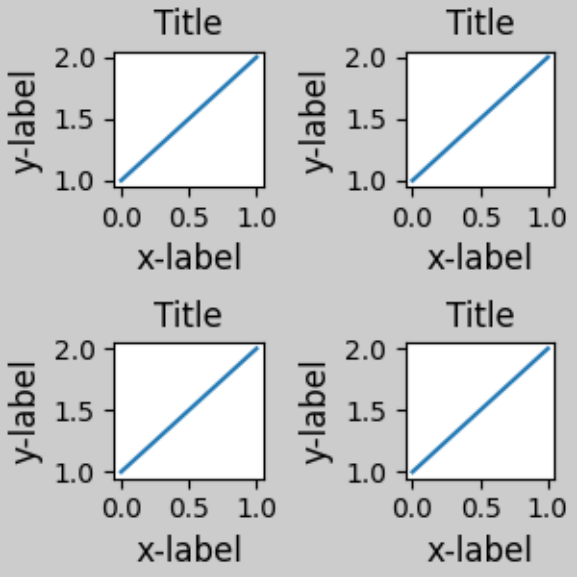
There are five *rcParams* that can be set, either in a script or in the `matplotlibrc` file. They all have the prefix `figure.constrained_layout`:

- `use`: Whether to use constrained_layout. Default is False
- **`w_pad`, `h_pad`: Padding around axes objects.**

  Float representing inches. Default is 3./72. inches (3 pts)
- **`wspace`, `hspace`: Space between subplot groups.**

  Float representing a fraction of the subplot widths being separated. Default is 0.02.

```
plt.rcParams['figure.constrained_layout.use'] = True
fig, axs = plt.subplots(2, 2, figsize=(3, 3))
for ax in axs.flat:
    example_plot(ax)
```



Use with GridSpec

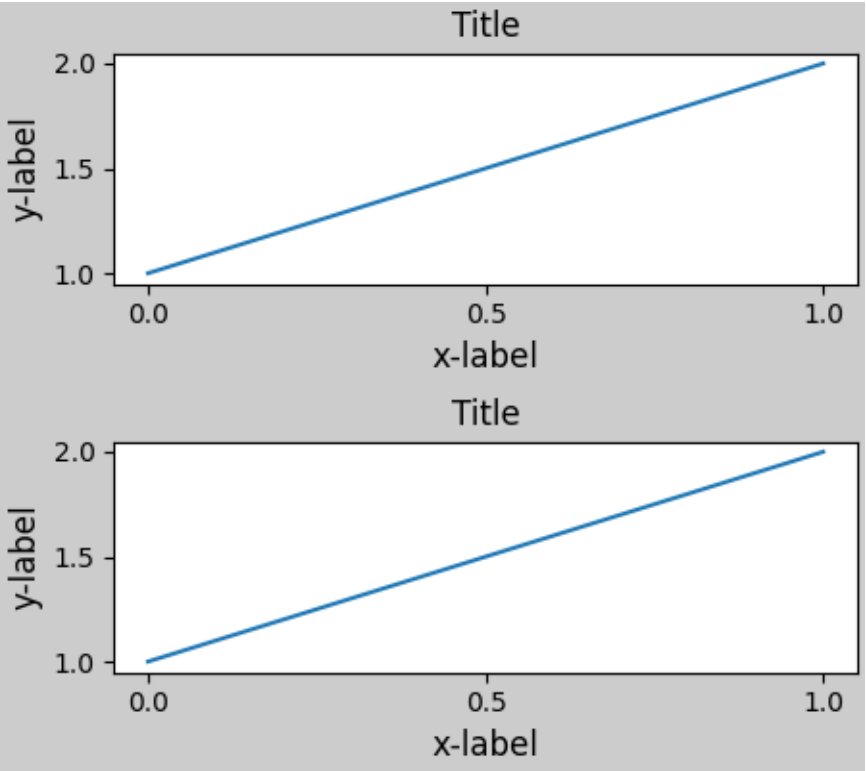
constrained_layout is meant to be used with *subplots()* or *GridSpec()* and *add_subplot()*.

Note that in what follows `constrained_layout=True`

```
fig = plt.figure()

gs1 = gridspec.GridSpec(2, 1, figure=fig)
ax1 = fig.add_subplot(gs1[0])
ax2 = fig.add_subplot(gs1[1])

example_plot(ax1)
example_plot(ax2)
```



More complicated gridspec layouts are possible. Note here we use the convenience functions `add_gridspec` and `subgridspec`.

```
fig = plt.figure()

gs0 = fig.add_gridspec(1, 2)

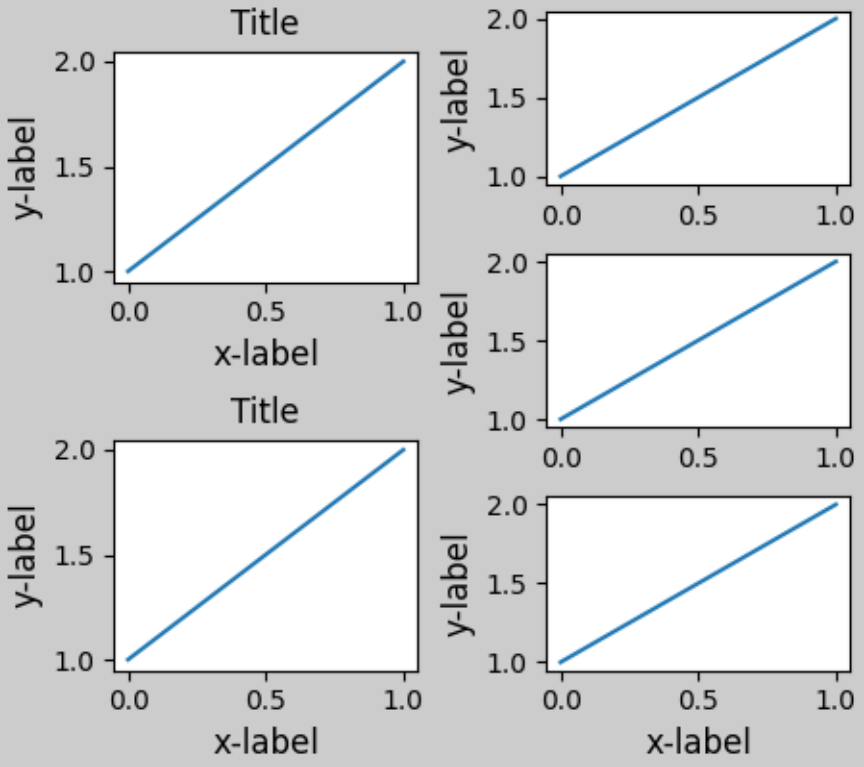
gs1 = gs0[0].subgridspec(2, 1)
ax1 = fig.add_subplot(gs1[0])
ax2 = fig.add_subplot(gs1[1])

example_plot(ax1)
example_plot(ax2)

gs2 = gs0[1].subgridspec(3, 1)

for ss in gs2:
    ax = fig.add_subplot(ss)
    example_plot(ax)
    ax.set_title("")
    ax.set_xlabel("")

ax.set_xlabel("x-label", fontsize=12)
```



Out:

```
Text(0.5, 0, 'x-label')
```

Note that in the above the left and columns don't have the same vertical extent. If we want the top and bottom of the two grids to line up then they need to be in the same gridspec:

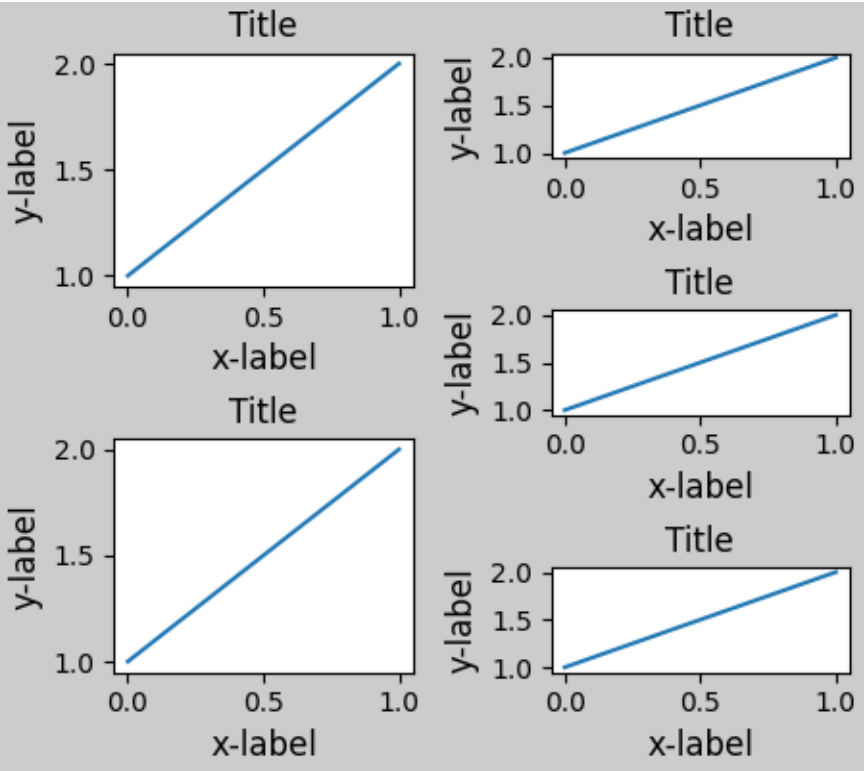
```
fig = plt.figure()

gs0 = fig.add_gridspec(6, 2)

ax1 = fig.add_subplot(gs0[:3, 0])
ax2 = fig.add_subplot(gs0[3:, 0])

example_plot(ax1)
example_plot(ax2)

ax = fig.add_subplot(gs0[0:2, 1])
example_plot(ax)
ax = fig.add_subplot(gs0[2:4, 1])
example_plot(ax)
ax = fig.add_subplot(gs0[4:, 1])
example_plot(ax)
```



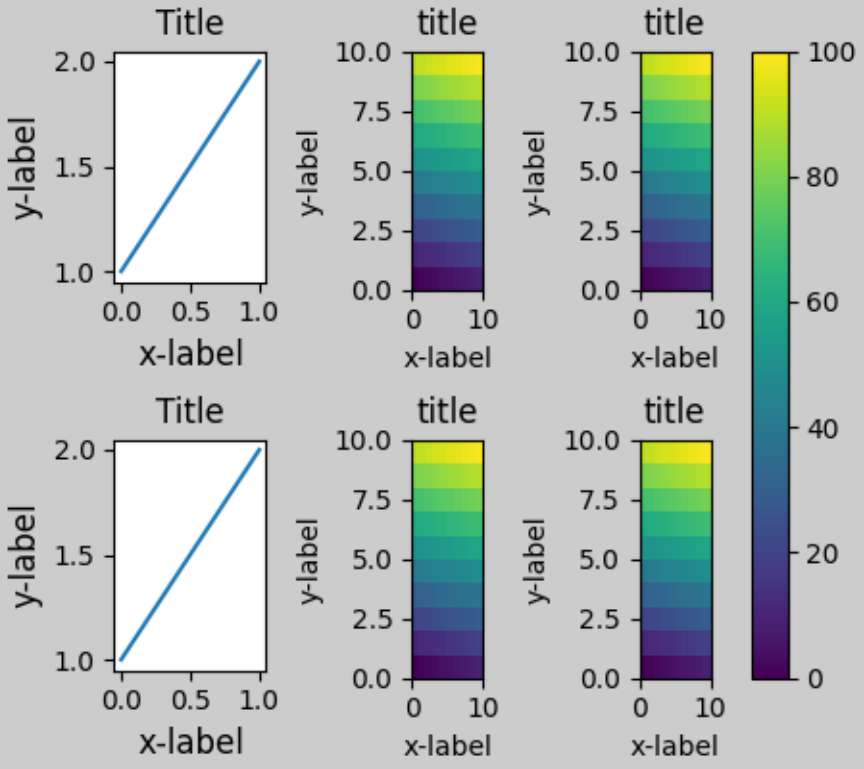
This example uses two gridspecs to have the colorbar only pertain to one set of pcolors. Note how the left column is wider than the two right-hand columns because of this. Of course, if you wanted the subplots to be the same size you only needed one gridspec.

```
def docomplicated(suptitle=None):
    fig = plt.figure()
    gs0 = fig.add_gridspec(1, 2, figure=fig, width_ratios=[1., 2.])
    gsl = gs0[0].subgridspec(2, 1)
    gsr = gs0[1].subgridspec(2, 2)

    for gs in gsl:
        ax = fig.add_subplot(gs)
        example_plot(ax)
    axs = []
    for gs in gsr:
        ax = fig.add_subplot(gs)
        pcm = ax.pcolormesh(arr, **pc_kwargs)
        ax.set_xlabel('x-label')
        ax.set_ylabel('y-label')
        ax.set_title('title')

        axs += [ax]
    fig.colorbar(pcm, ax=axs)
    if suptitle is not None:
        fig.suptitle(suptitle)

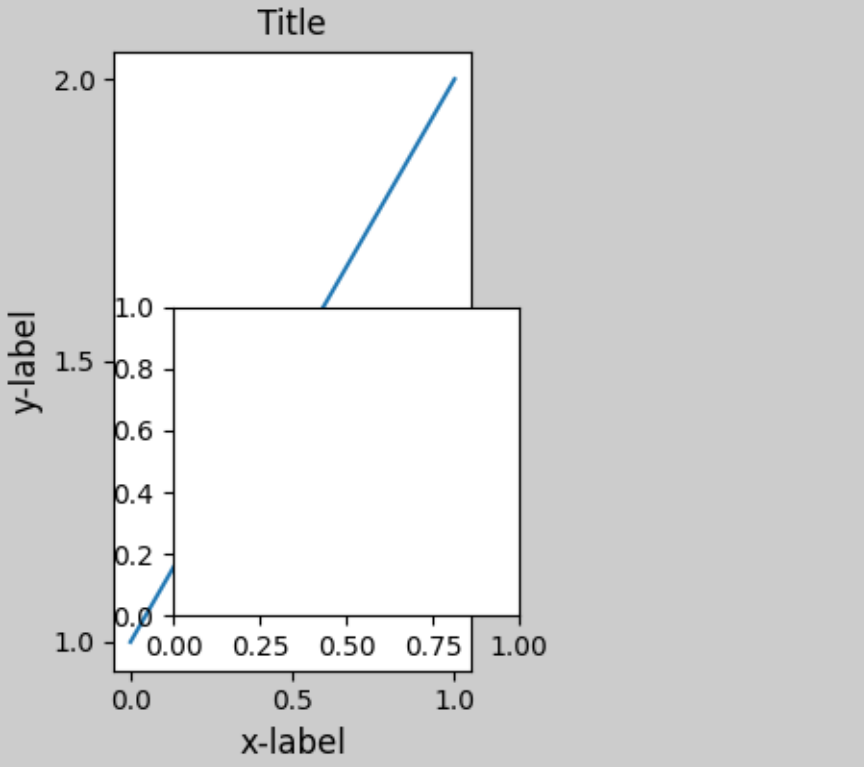
docomplicated()
```



Manually setting axes positions

There can be good reasons to manually set an axes position. A manual call to *set_position* will set the axes so constrained_layout has no effect on it anymore. (Note that constrained_layout still leaves the space for the axes that is moved).

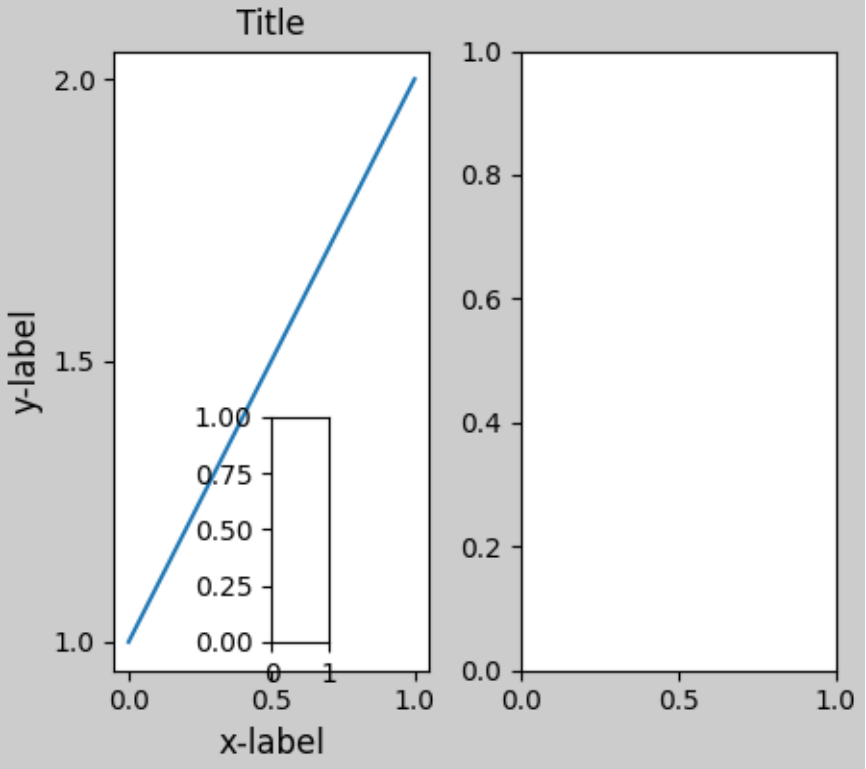
```
fig, axs = plt.subplots(1, 2)
example_plot(axs[0], fontsize=12)
axs[1].set_position([0.2, 0.2, 0.4, 0.4])
```



If you want an inset axes in data-space, you need to manually execute the layout using `fig.execute_constrained_layout()` call. The inset figure will then be properly positioned. However, it will not be properly positioned if the size of the figure is subsequently changed. Similarly, if the figure is printed to another backend, there may be slight changes of location due to small differences in how the backends render fonts.

```
from matplotlib.transforms import Bbox

fig, axs = plt.subplots(1, 2)
example_plot(axs[0], fontsize=12)
fig.execute_constrained_layout()
# put into data-space:
bb_data_ax2 = Bbox.from_bounds(0.5, 1., 0.2, 0.4)
disp_coords = axs[0].transData.transform(bb_data_ax2)
fig_coords_ax2 = fig.transFigure.inverted().transform(disp_coords)
bb_ax2 = Bbox(fig_coords_ax2)
ax2 = fig.add_axes(bb_ax2)
```



Manually turning off `constrained_layout`

`constrained_layout` usually adjusts the axes positions on each draw of the figure. If you want to get the spacing provided by `constrained_layout` but not have it update, then do the initial draw and then call `fig.set_constrained_layout(False)`. This is potentially useful for animations where the tick labels may change length.

Note that `constrained_layout` is turned off for `ZOOM` and `PAN` GUI events for the backends that use the toolbar. This prevents the axes from changing position during zooming and panning.

Limitations

Incompatible functions

`constrained_layout` will not work on subplots created via *`pyplot.subplot`*. The reason is that each call to *`pyplot.subplot`* creates a separate *`GridSpec`* instance and `constrained_layout` uses (nested) gridspecs to carry out the layout. So the following fails to yield a nice layout:

```
fig = plt.figure()

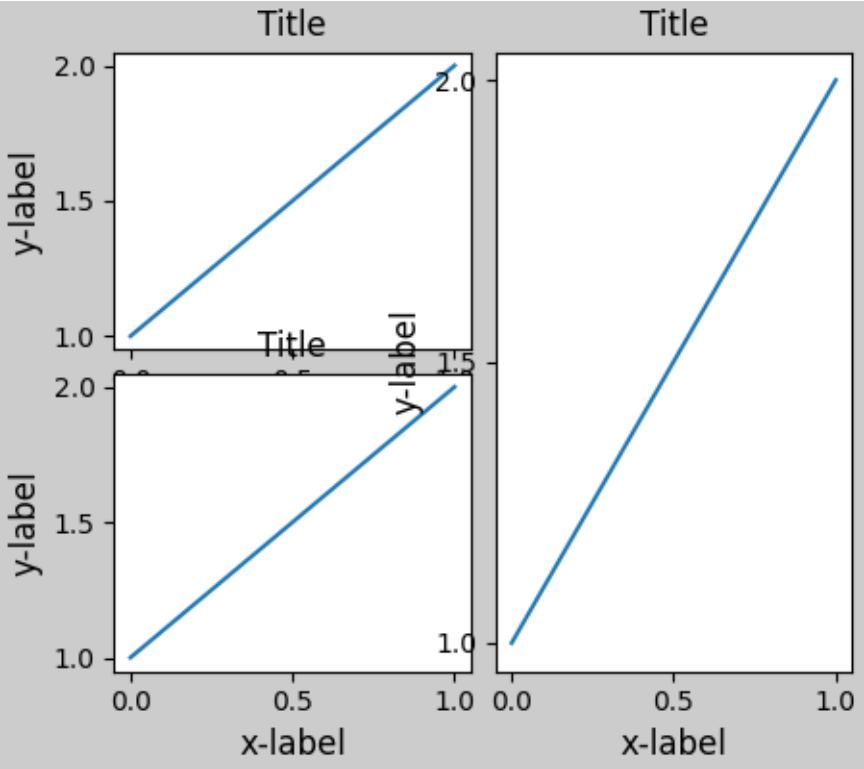
ax1 = plt.subplot(221)
```

(continues on next page)

(continued from previous page)

```
ax2 = plt.subplot(223)
ax3 = plt.subplot(122)

example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
```

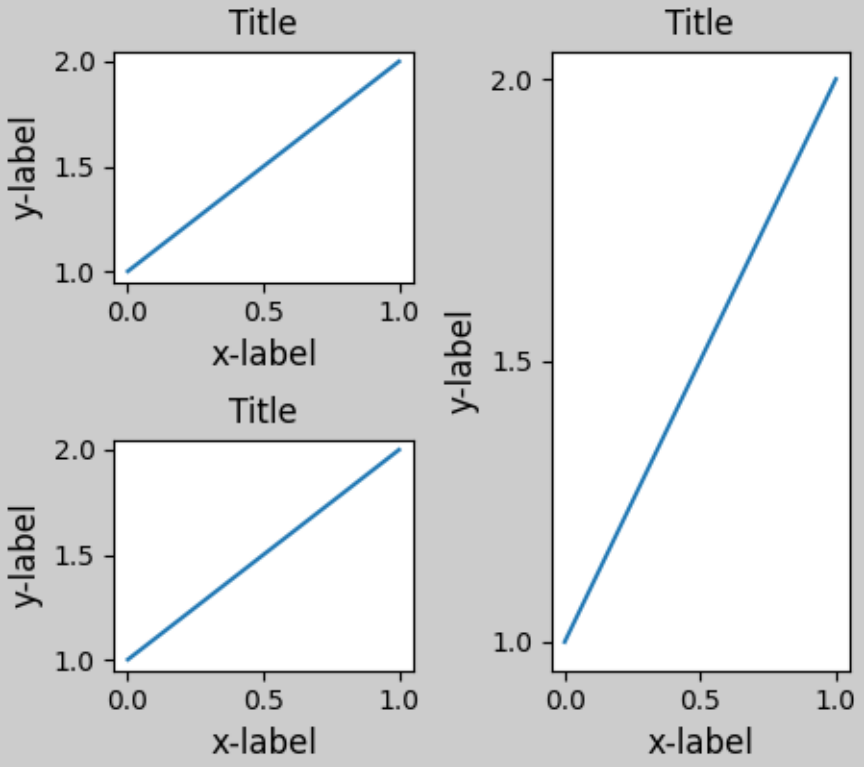


Of course that layout is possible using a gridspec:

```
fig = plt.figure()
gs = fig.add_gridspec(2, 2)

ax1 = fig.add_subplot(gs[0, 0])
ax2 = fig.add_subplot(gs[1, 0])
ax3 = fig.add_subplot(gs[:, 1])

example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
```

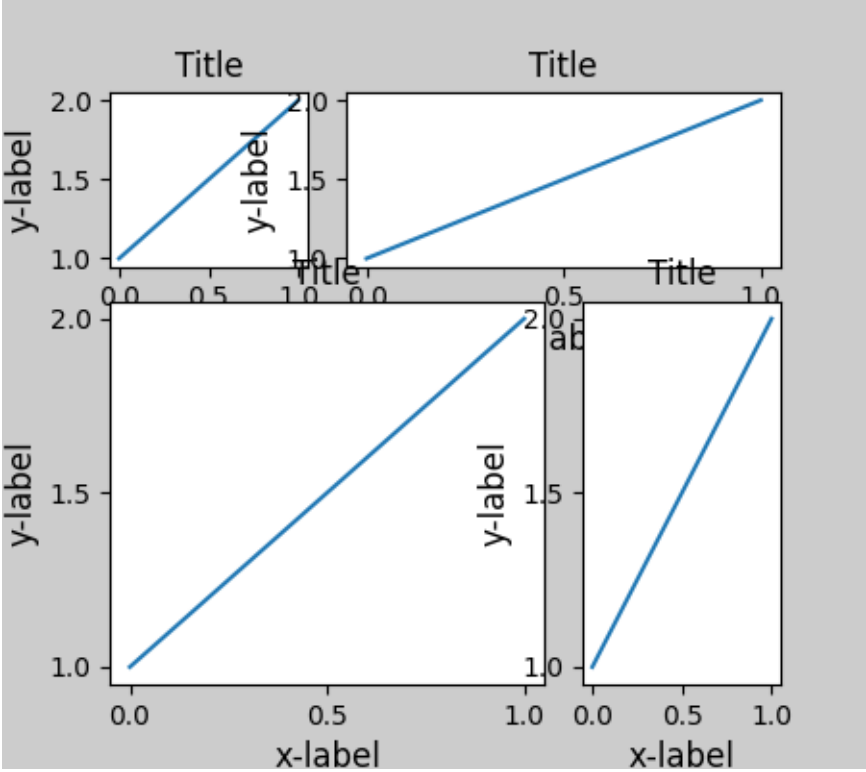


Similarly, *subplot2grid()* doesn't work for the same reason: each call creates a different parent gridspec.

```
fig = plt.figure()

ax1 = plt.subplot2grid((3, 3), (0, 0))
ax2 = plt.subplot2grid((3, 3), (0, 1), colspan=2)
ax3 = plt.subplot2grid((3, 3), (1, 0), colspan=2, rowspan=2)
ax4 = plt.subplot2grid((3, 3), (1, 2), rowspan=2)

example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
example_plot(ax4)
```

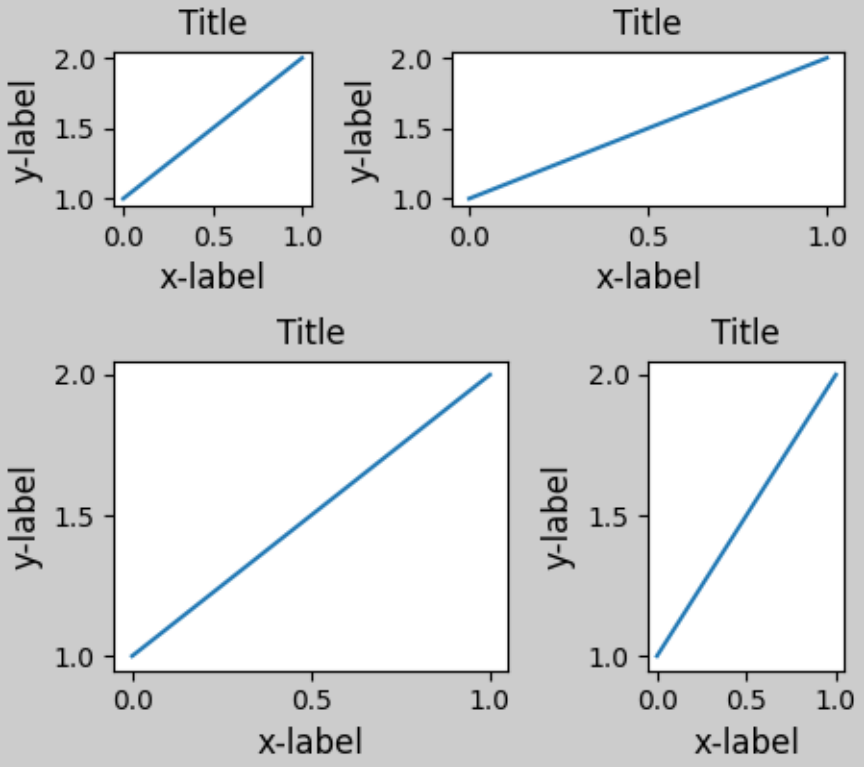


The way to make this plot compatible with `constrained_layout` is again to use `gridspec` directly

```
fig = plt.figure()
gs = fig.add_gridspec(3, 3)

ax1 = fig.add_subplot(gs[0, 0])
ax2 = fig.add_subplot(gs[0, 1:])
ax3 = fig.add_subplot(gs[1:, 0:2])
ax4 = fig.add_subplot(gs[1:, -1])

example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
example_plot(ax4)
```



Other Caveats

- `constrained_layout` only considers ticklabels, axis labels, titles, and legends. Thus, other artists may be clipped and also may overlap.
- It assumes that the extra space needed for ticklabels, axis labels, and titles is independent of original location of axes. This is often true, but there are rare cases where it is not.
- There are small differences in how the backends handle rendering fonts, so the results will not be pixel-identical.
- An artist using axes coordinates that extend beyond the axes boundary will result in unusual layouts when added to an axes. This can be avoided by adding the artist directly to the *Figure* using *add_artist()*. See *ConnectionPatch* for an example.

Debugging

Constrained-layout can fail in somewhat unexpected ways. Because it uses a constraint solver the solver can find solutions that are mathematically correct, but that aren't at all what the user wants. The usual failure mode is for all sizes to collapse to their smallest allowable value. If this happens, it is for one of two reasons:

1. There was not enough room for the elements you were requesting to draw.
2. There is a bug - in which case open an issue at https://github.com/matplotlib/matplotlib/issues.

If there is a bug, please report with a self-contained example that does not require outside data or dependencies (other than numpy).

Notes on the algorithm

The algorithm for the constraint is relatively straightforward, but has some complexity due to the complex ways we can layout a figure.

Figure layout

Figures are laid out in a hierarchy:

1. Figure: `fig = plt.figure()`

a. Gridspec `gs0 = gridspec.GridSpec(1, 2, figure=fig)`

   i. Subplotspec: `ss = gs[0, 0]`

      1. Axes: `ax0 = fig.add_subplot(ss)`

   ii. Subplotspec: `ss = gs[0, 1]`

   1. Gridspec: `gsR = gridspec.GridSpecFromSubplotSpec(2, 1, ss)`

      - Subplotspec: `ss = gsR[0, 0]`

        - Axes: `axR0 = fig.add_subplot(ss)`

      - Subplotspec: `ss = gsR[1, 0]`

        - Axes: `axR1 = fig.add_subplot(ss)`

Each item has a layoutbox associated with it. The nesting of gridspecs created with *GridSpecFromSubplotSpec* can be arbitrarily deep.

Each *Axes* has *two* layoutboxes. The first one, `ax._layoutbox` represents the outside of the Axes and all its decorations (i.e. ticklabels, axis labels, etc.). The second layoutbox corresponds to the Axes' `ax.position`, which sets where in the figure the spines are placed.

Why so many stacked containers? Ideally, all that would be needed are the Axes layout boxes. For the Gridspec case, a container is needed if the Gridspec is nested via *GridSpecFromSubplotSpec*. At the top level, it is desirable for symmetry, but it also makes room for *suptitle*.

For the Subplotspec/Axes case, Axes often have colorbars or other annotations that need to be packaged inside the Subplotspec, hence the need for the outer layer.

Simple case: one Axes

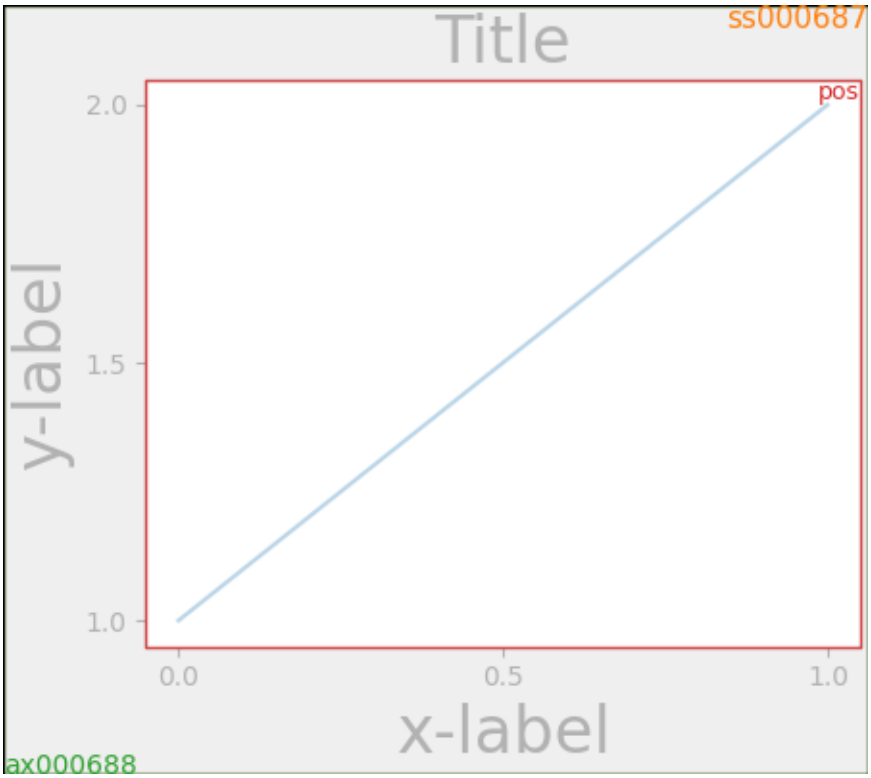
For a single Axes the layout is straight forward. The Figure and outer Gridspec layoutboxes coincide. The Subplotspec and Axes boxes also coincide because the Axes has no colorbar. Note the difference between the red `pos` box and the green `ax` box is set by the size of the decorations around the Axes.

In the code, this is accomplished by the entries in `do_constrained_layout()` like:

```
ax._poslayoutbox.edit_left_margin_min(-bbox.x0 + pos.x0 + w_padt)
```

```
from matplotlib._layoutbox import plot_children

fig, ax = plt.subplots(constrained_layout=True)
example_plot(ax, fontsize=24)
plot_children(fig, fig._layoutbox, printit=False)
```



Simple case: two Axes

For this case, the Axes layoutboxes and the Subplotspec boxes still co-incide. However, because the decorations in the right-hand plot are so much smaller than the left-hand, so the right-hand layoutboxes are smaller.

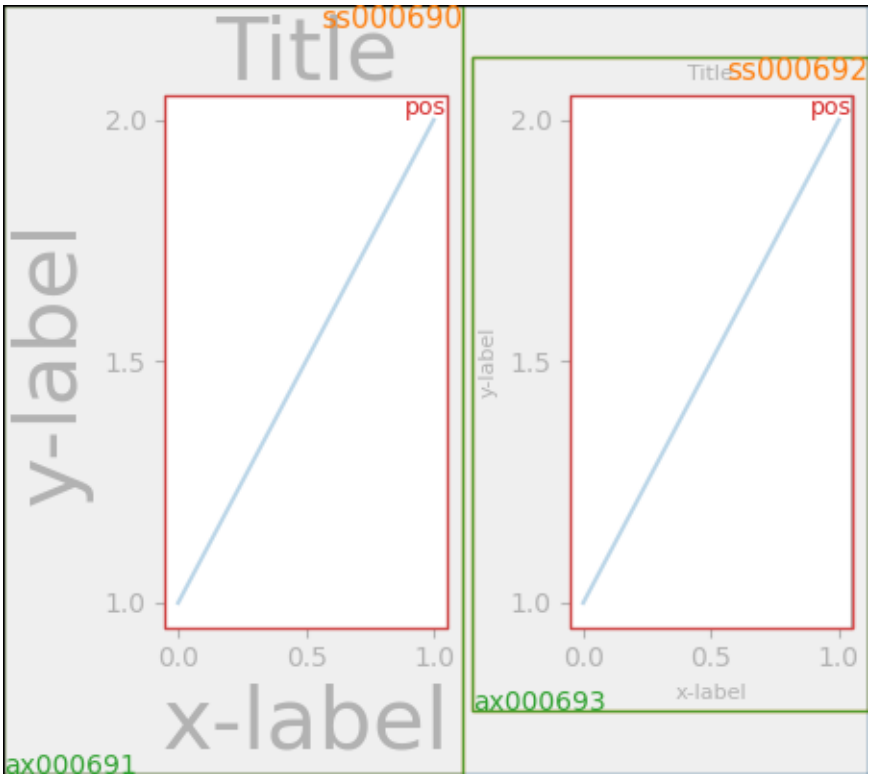
The Subplotspec boxes are laid out in the code in the subroutine `arange_subplotspecs()`, which simply checks the subplotspecs in the code against one another and stacks them appropriately.

The two `pos` axes are lined up. Because they have the same minimum row, they are lined up at the top. Because they have the same maximum row they are lined up at the bottom. In the code this is accomplished via the calls to `layoutbox.align`. If there was more than one row, then the same horizontal alignment would occur between the rows.

The two `pos` axes are given the same width because the subplotspecs occupy the same number of columns. This is accomplished in the code where `dcols0` is compared to `dcolsC`. If they are equal, then their widths are constrained to be equal.

While it is a bit subtle in this case, note that the division between the Subplotspecs is *not* centered, but has been moved to the right to make space for the larger labels on the left-hand plot.

```
fig, ax = plt.subplots(1, 2, constrained_layout=True)
example_plot(ax[0], fontsize=32)
example_plot(ax[1], fontsize=8)
plot_children(fig, fig._layoutbox, printit=False)
```



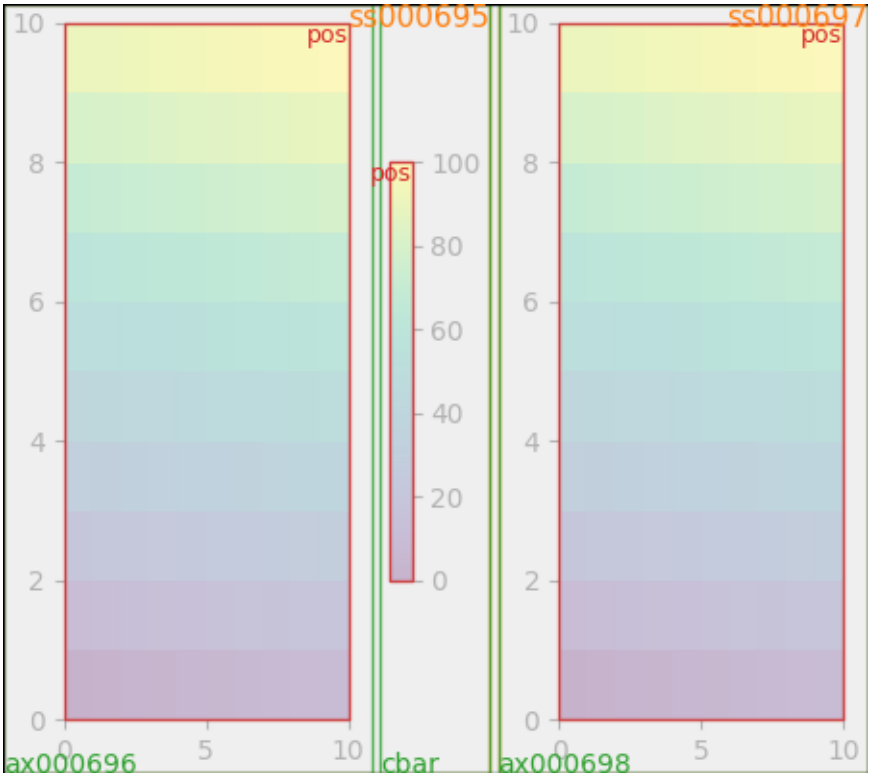
Two Axes and colorbar

Adding a colorbar makes it clear why the Subplotspec layoutboxes must be different from the axes layoutboxes. Here we see the left-hand subplotspec has more room to accommodate the *colorbar*, and that there are two green ax boxes inside the ss box.

Note that the width of the pos boxes is still the same because of the constraint on their widths because their subplotspecs occupy the same number of columns (one in this example).

The colorbar layout logic is contained in *make_axes* which calls `_constrained_layout.layoutcolorbarsingle()` for cbars attached to a single axes, and `_constrained_layout.layoutcolorbargridspec()` if the colorbar is associated with a gridspec.

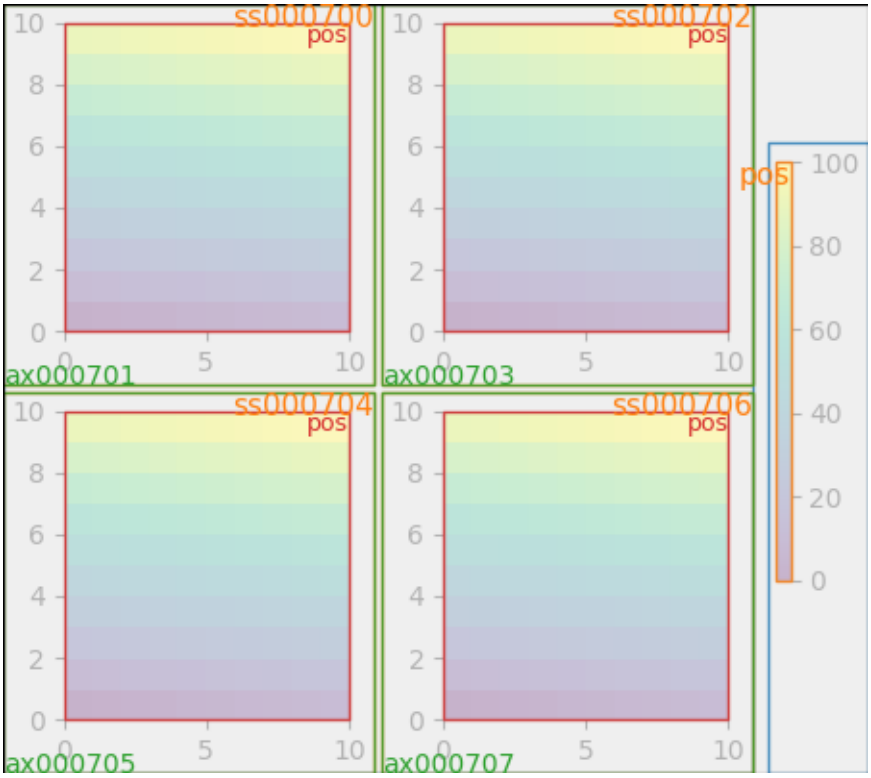
```
fig, ax = plt.subplots(1, 2, constrained_layout=True)
im = ax[0].pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=ax[0], shrink=0.6)
im = ax[1].pcolormesh(arr, **pc_kwargs)
plot_children(fig, fig._layoutbox, printit=False)
```



Colorbar associated with a Gridspec

This example shows the Subplotspec layoutboxes being made smaller by a colorbar layoutbox. The size of the colorbar layoutbox is set to be `shrink` smaller than the vertical extent of the `pos` layoutboxes in the gridspec, and it is made to be centered between those two points.

```
fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs, shrink=0.6)
plot_children(fig, fig._layoutbox, printit=False)
```



Uneven sized Axes

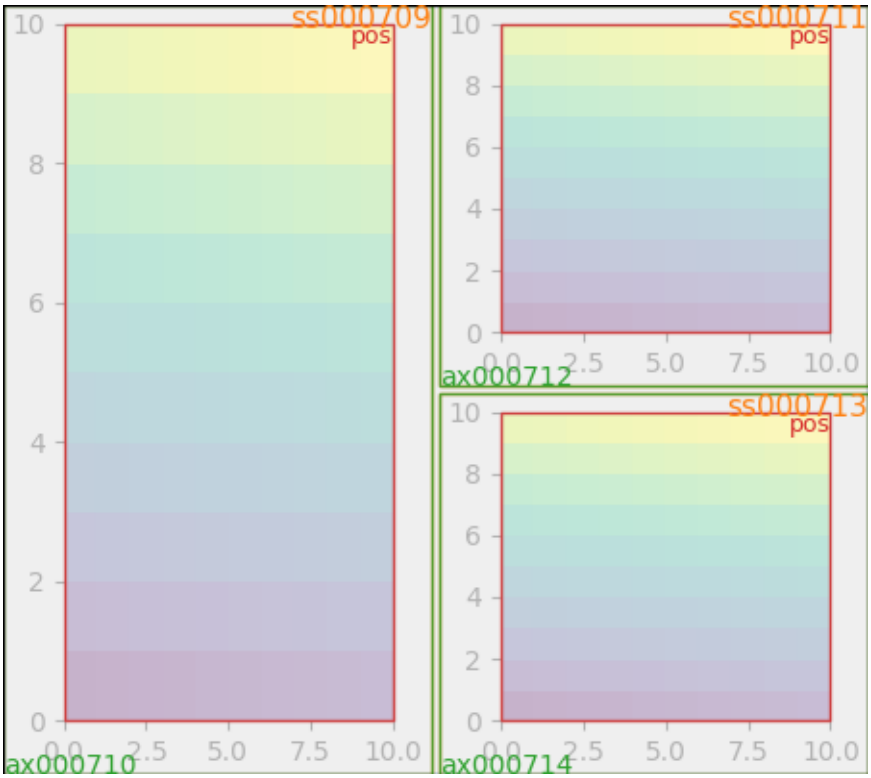
There are two ways to make axes have an uneven size in a Gridspec layout, either by specifying them to cross Gridspecs rows or columns, or by specifying width and height ratios.

The first method is used here. The constraint that makes the heights be correct is in the code where `drowsC < drows0` which in this case would be 1 is less than 2. So we constrain the height of the 1-row Axes to be less than half the height of the 2-row Axes.

Note: This algorithm can be wrong if the decorations attached to the smaller axes

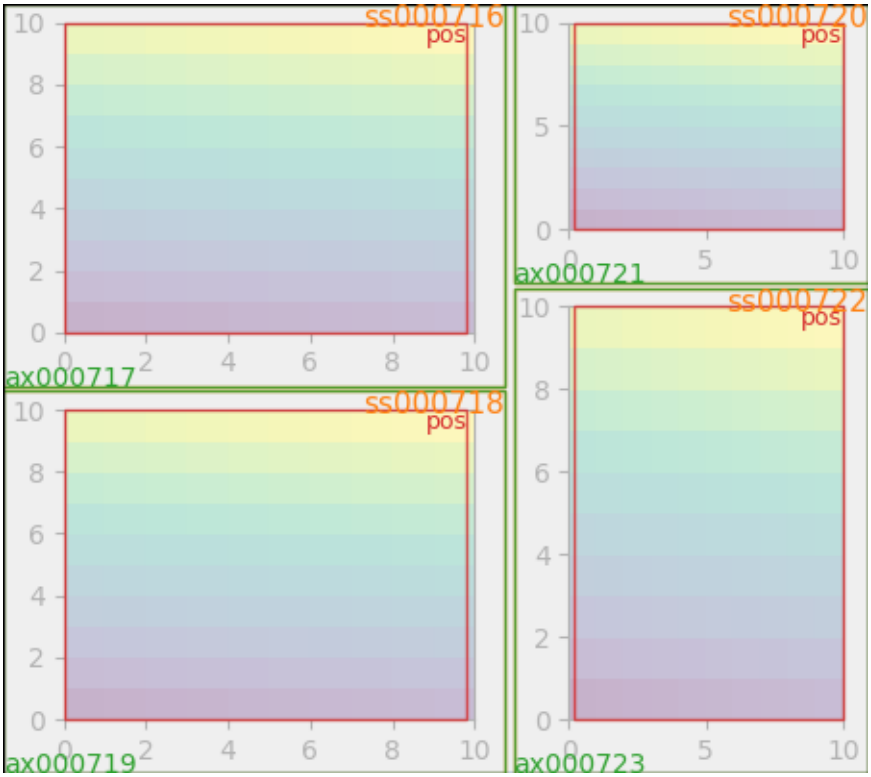
are very large, so there is an unaccounted-for edge case.

```
fig = plt.figure(constrained_layout=True)
gs = gridspec.GridSpec(2, 2, figure=fig)
ax = fig.add_subplot(gs[:, 0])
im = ax.pcolormesh(arr, **pc_kwargs)
ax = fig.add_subplot(gs[0, 1])
im = ax.pcolormesh(arr, **pc_kwargs)
ax = fig.add_subplot(gs[1, 1])
im = ax.pcolormesh(arr, **pc_kwargs)
plot_children(fig, fig._layoutbox, printit=False)
```



Height and width ratios are accommodated with the same part of the code with the smaller axes always constrained to be less in size than the larger.

```
fig = plt.figure(constrained_layout=True)
gs = gridspec.GridSpec(3, 2, figure=fig,
                       height_ratios=[1., 0.5, 1.5], width_ratios=[1.2, 0.8])
ax = fig.add_subplot(gs[:2, 0])
im = ax.pcolormesh(arr, **pc_kwargs)
ax = fig.add_subplot(gs[2, 0])
im = ax.pcolormesh(arr, **pc_kwargs)
ax = fig.add_subplot(gs[0, 1])
im = ax.pcolormesh(arr, **pc_kwargs)
ax = fig.add_subplot(gs[1:, 1])
im = ax.pcolormesh(arr, **pc_kwargs)
plot_children(fig, fig._layoutbox, printit=False)
```

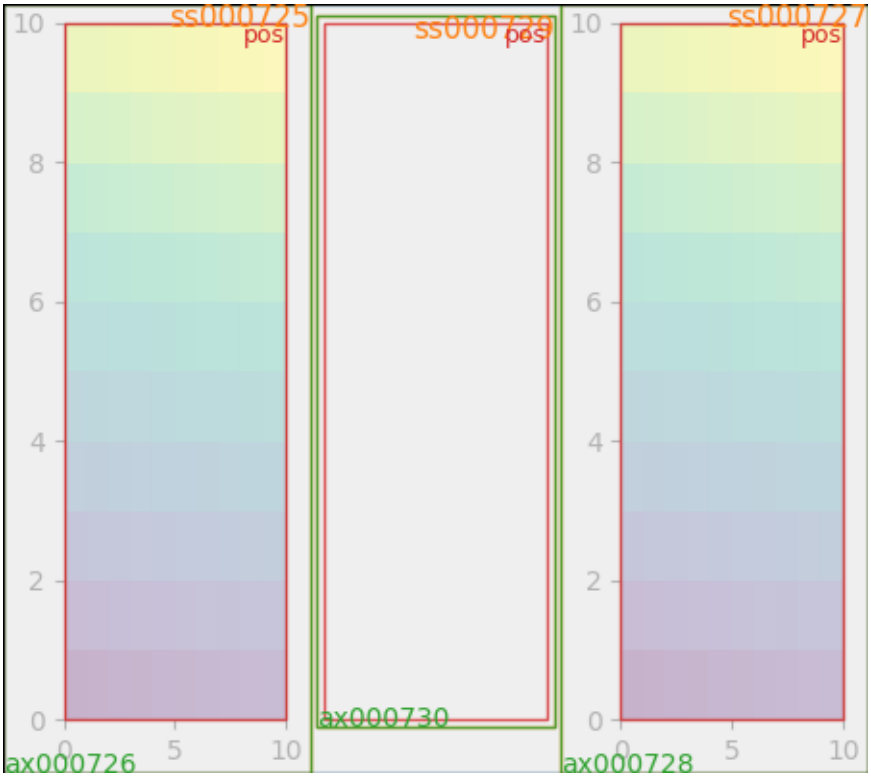


Empty gridspec slots

The final piece of the code that has not been explained is what happens if there is an empty gridspec opening. In that case a fake invisible axes is added and we proceed as before. The empty gridspec has no decorations, but the axes position in made the same size as the occupied Axes positions.

This is done at the start of `_constrained_layout.do_constrained_layout()` (`hassubplotspec`).

```
fig = plt.figure(constrained_layout=True)
gs = gridspec.GridSpec(1, 3, figure=fig)
ax = fig.add_subplot(gs[0])
im = ax.pcolormesh(arr, **pc_kwargs)
ax = fig.add_subplot(gs[-1])
im = ax.pcolormesh(arr, **pc_kwargs)
plot_children(fig, fig._layoutbox, printit=False)
plt.show()
```



Other notes

The layout is called only once. This is OK if the original layout was pretty close (which it should be in most cases). However, if the layout changes a lot from the default layout then the decorators can change size. In particular the x and ytick labels can change. If this happens, then we should probably call the whole routine twice.

Total running time of the script: (0 minutes 13.819 seconds)

2.2.6 Tight Layout guide

How to use tight-layout to fit plots within your figure cleanly.

tight_layout automatically adjusts subplot params so that the subplot(s) fits in to the figure area. This is an experimental feature and may not work for some cases. It only checks the extents of ticklabels, axis labels, and titles.

An alternative to *tight_layout* is *constrained_layout*.

Simple Example

In matplotlib, the location of axes (including subplots) are specified in normalized figure coordinates. It can happen that your axis labels or titles (or sometimes even ticklabels) go outside the figure area, and are thus clipped.

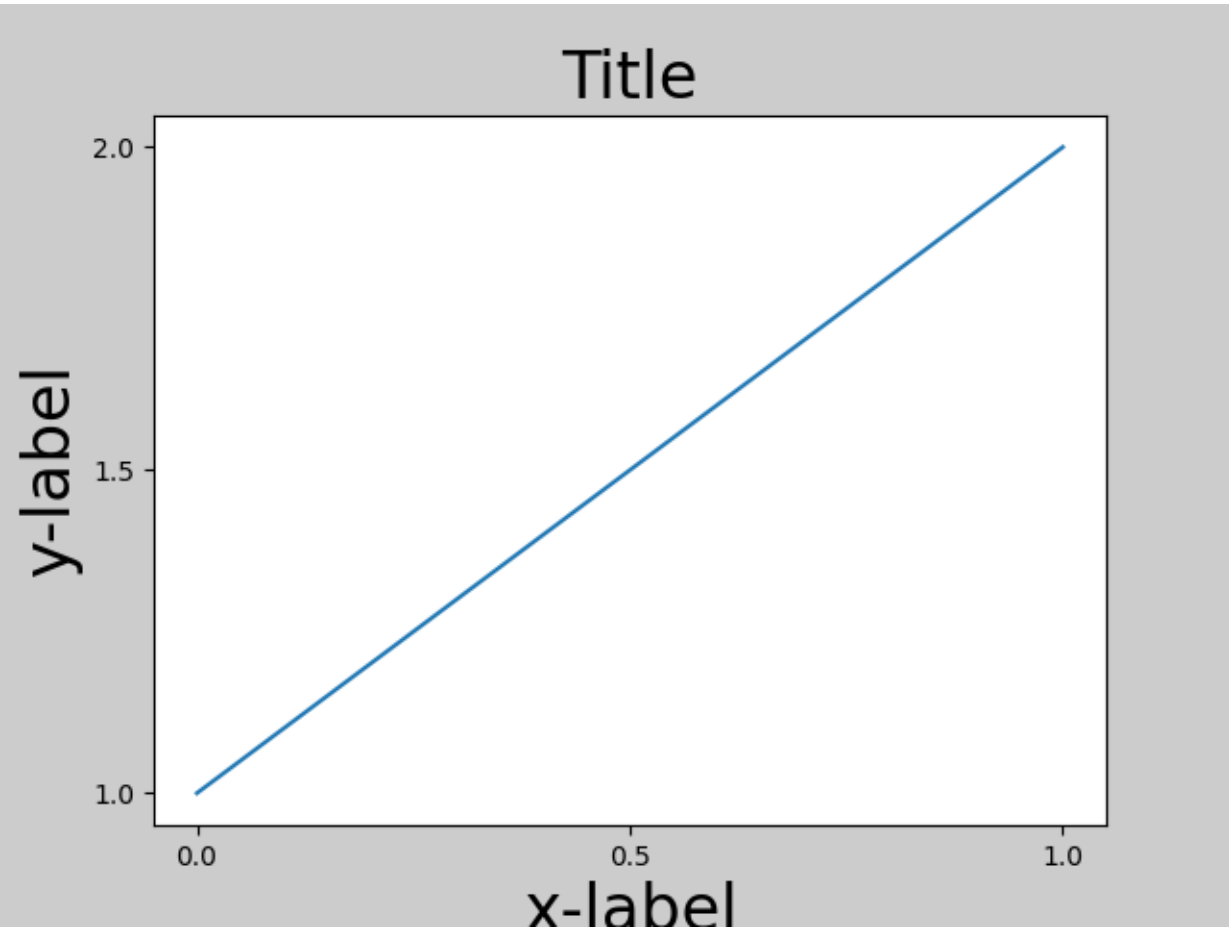
```
import matplotlib.pyplot as plt
import numpy as np

plt.rcParams['savefig.facecolor'] = "0.8"

def example_plot(ax, fontsize=12):
    ax.plot([1, 2])

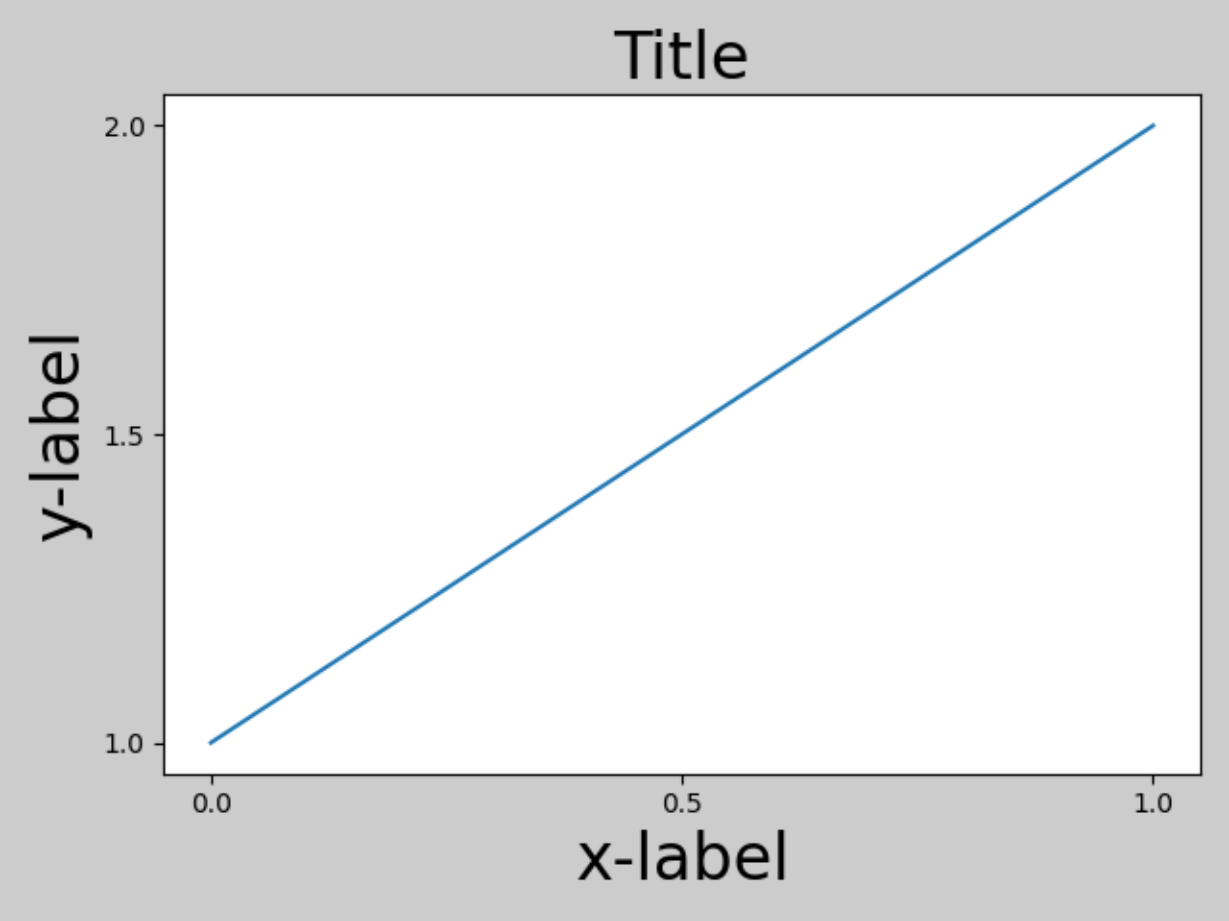
    ax.locator_params(nbins=3)
    ax.set_xlabel('x-label', fontsize=fontsize)
    ax.set_ylabel('y-label', fontsize=fontsize)
    ax.set_title('Title', fontsize=fontsize)

plt.close('all')
fig, ax = plt.subplots()
example_plot(ax, fontsize=24)
```



To prevent this, the location of axes needs to be adjusted. For subplots, this can be done by adjusting the subplot params (*Move the edge of an axes to make room for tick labels*). Matplotlib v1.1 introduced *Figure.tight_layout* that does this automatically for you.

```
fig, ax = plt.subplots()
example_plot(ax, fontsize=24)
plt.tight_layout()
```



Note that *matplotlib.pyplot.tight_layout()* will only adjust the subplot params when it is called. In order to perform this adjustment each time the figure is redrawn, you can call `fig.set_tight_layout(True)`, or, equivalently, set `rcParams["figure.autolayout"]` (default: `False`) to `True`.

When you have multiple subplots, often you see labels of different axes overlapping each other.

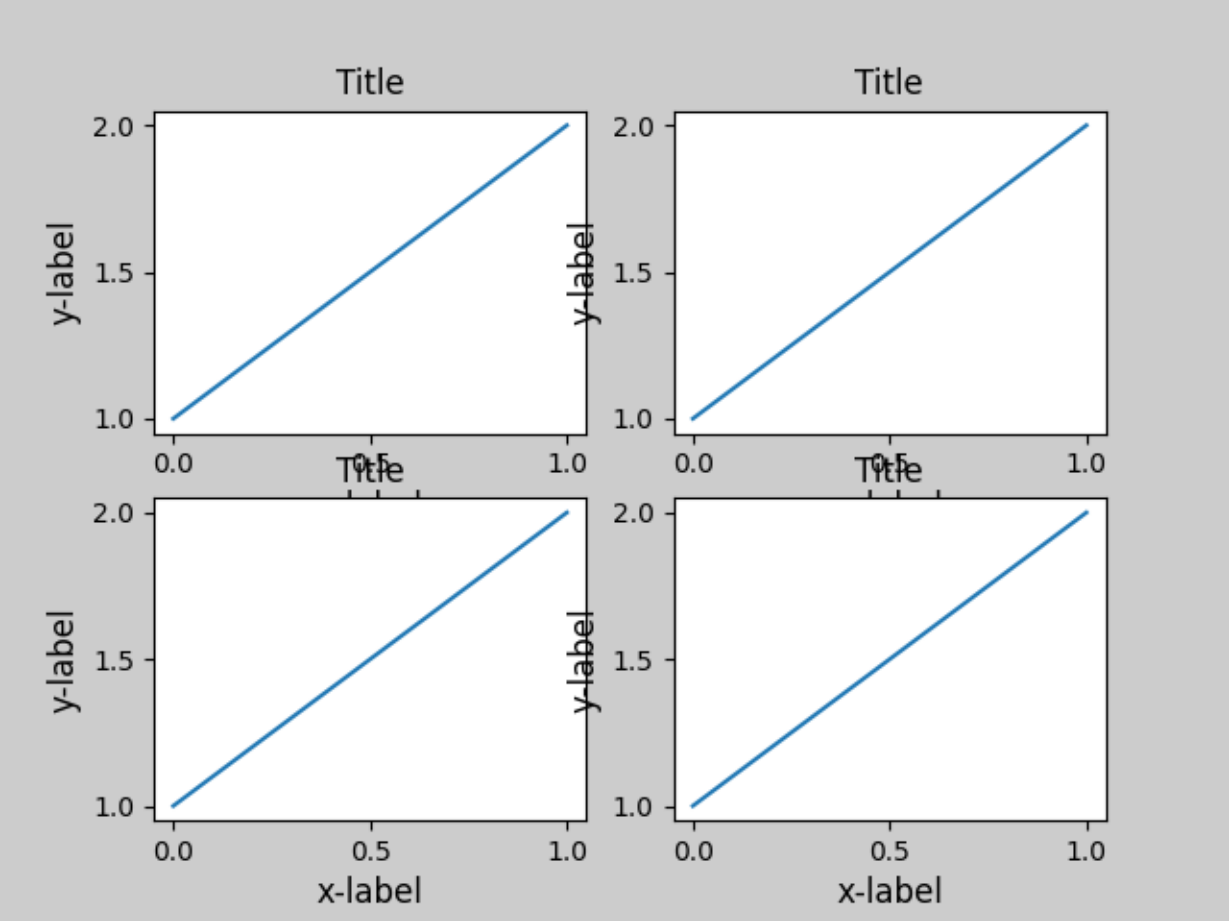
```
plt.close('all')

fig, ((ax1, ax2), (ax3, ax4)) = plt.subplots(nrows=2, ncols=2)
example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
```

(continues on next page)

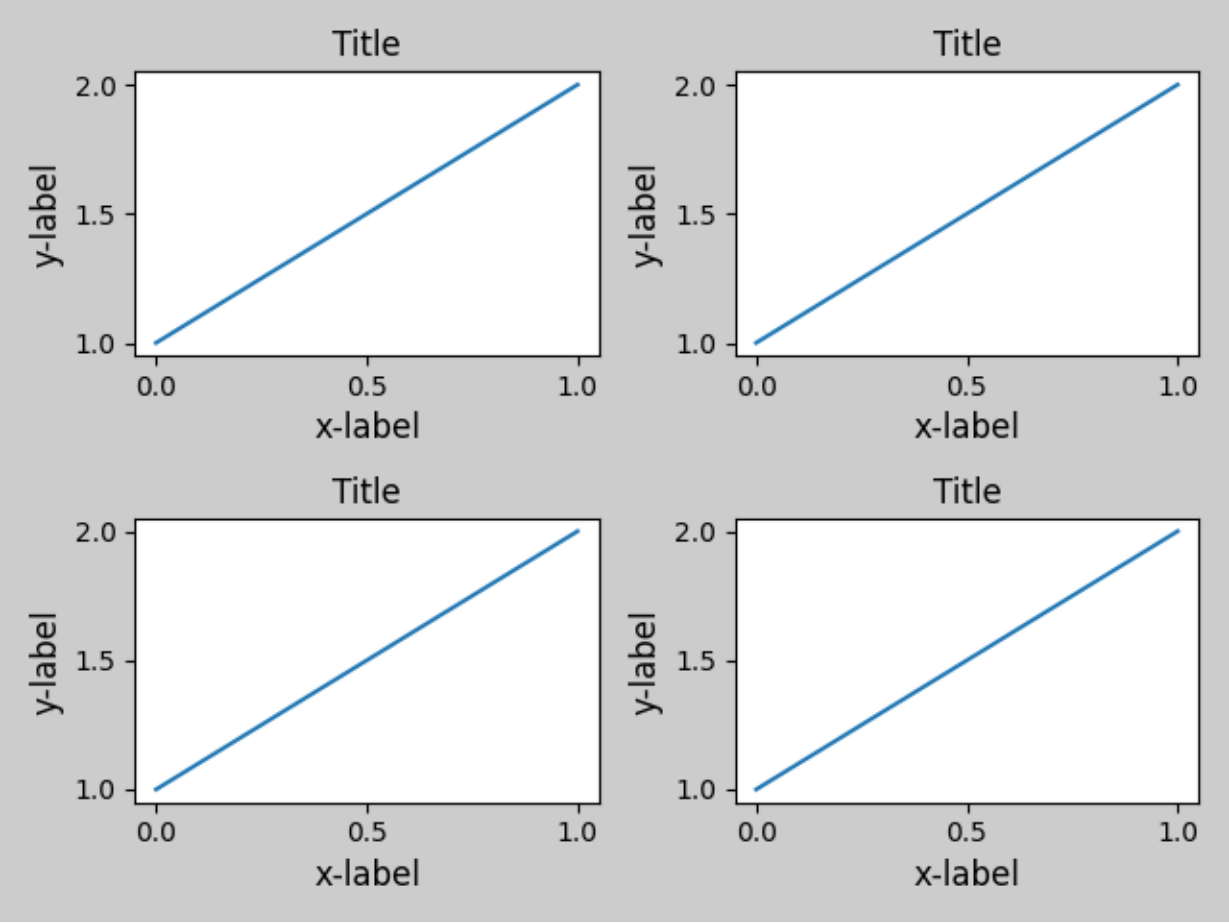
(continued from previous page)

```
example_plot(ax4)
```



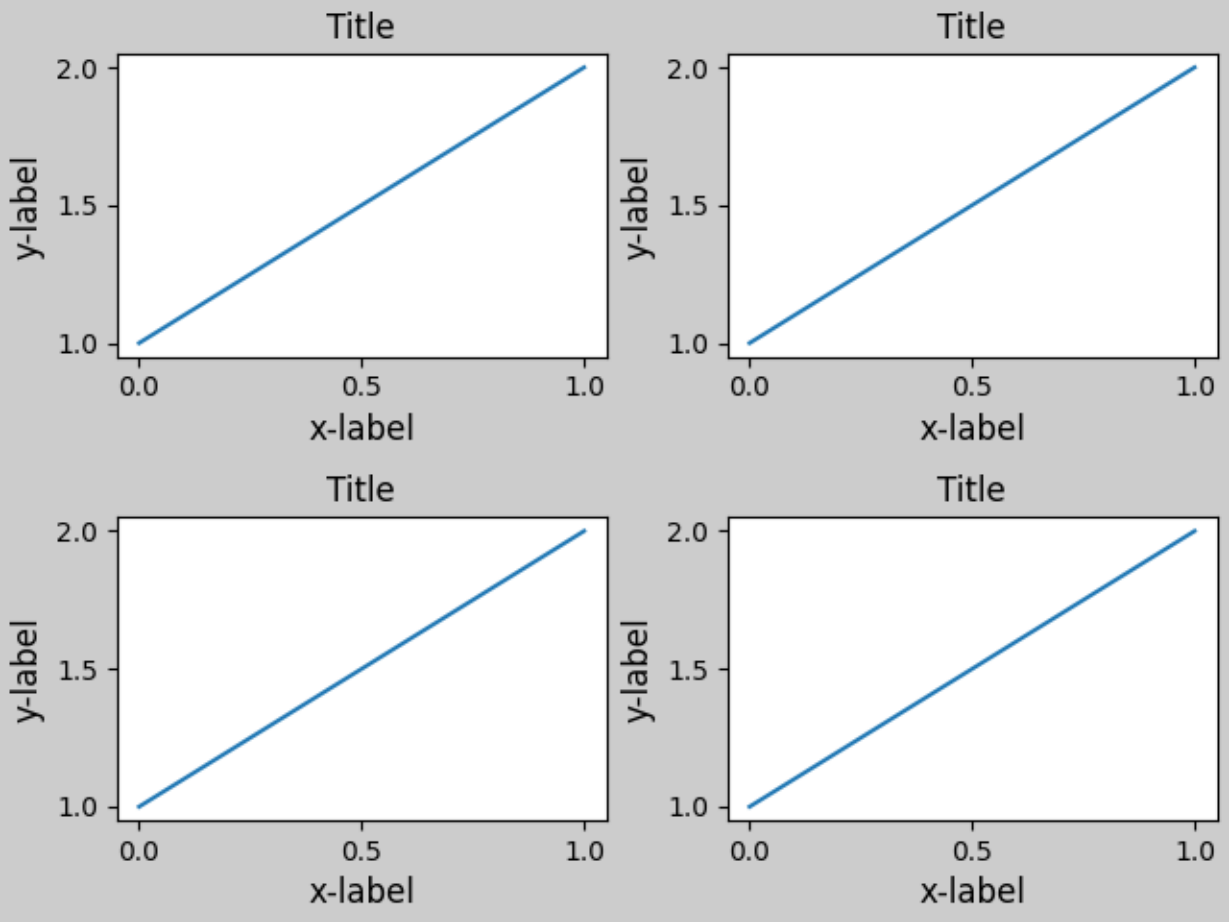
tight_layout() will also adjust spacing between subplots to minimize the overlaps.

```
fig, ((ax1, ax2), (ax3, ax4)) = plt.subplots(nrows=2, ncols=2)
example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
example_plot(ax4)
plt.tight_layout()
```



tight_layout() can take keyword arguments of *pad*, *w_pad* and *h_pad*. These control the extra padding around the figure border and between subplots. The pads are specified in fraction of fontsize.

```
fig, ((ax1, ax2), (ax3, ax4)) = plt.subplots(nrows=2, ncols=2)
example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
example_plot(ax4)
plt.tight_layout(pad=0.4, w_pad=0.5, h_pad=1.0)
```



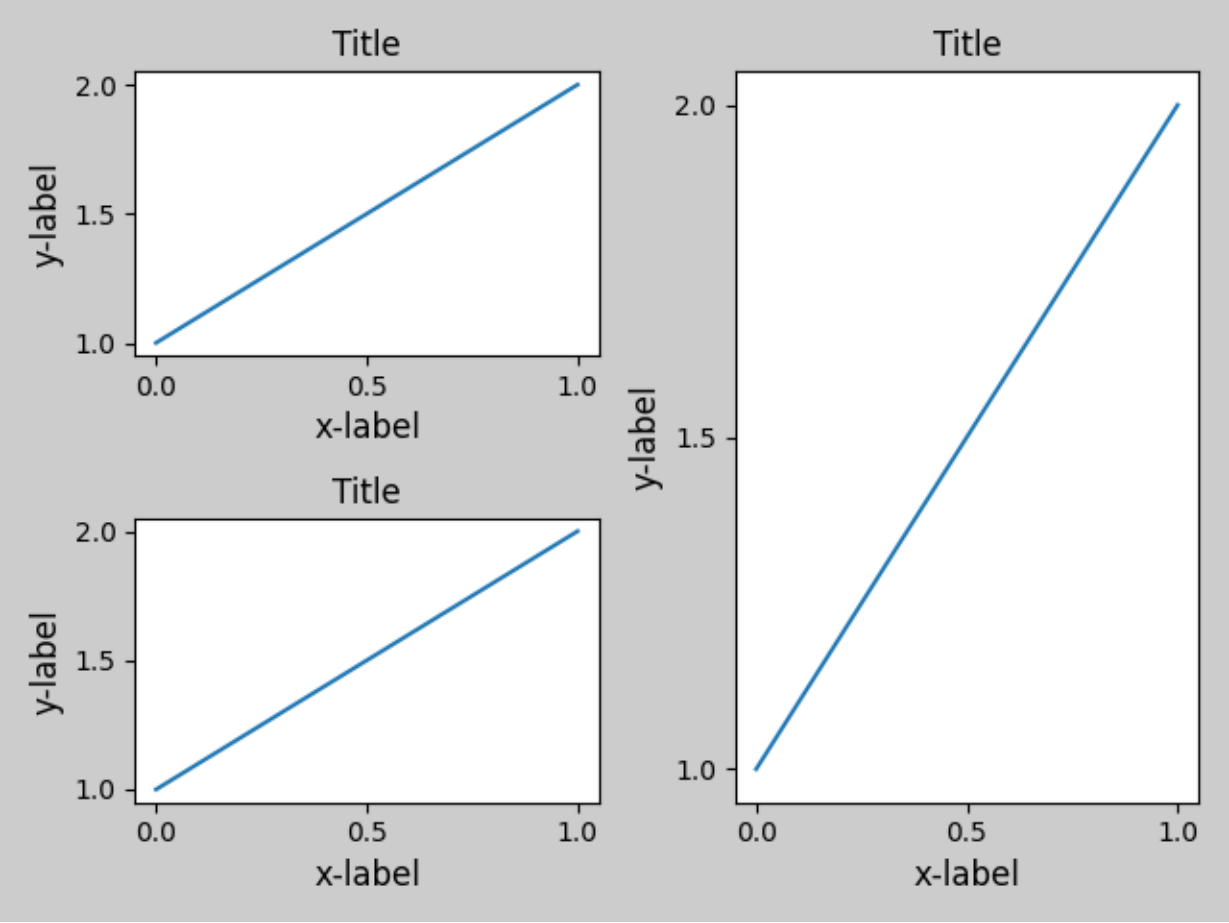
tight_layout() will work even if the sizes of subplots are different as far as their grid specification is compatible. In the example below, *ax1* and *ax2* are subplots of a 2x2 grid, while *ax3* is of a 1x2 grid.

```
plt.close('all')
fig = plt.figure()

ax1 = plt.subplot(221)
ax2 = plt.subplot(223)
ax3 = plt.subplot(122)

example_plot(ax1)
example_plot(ax2)
example_plot(ax3)

plt.tight_layout()
```



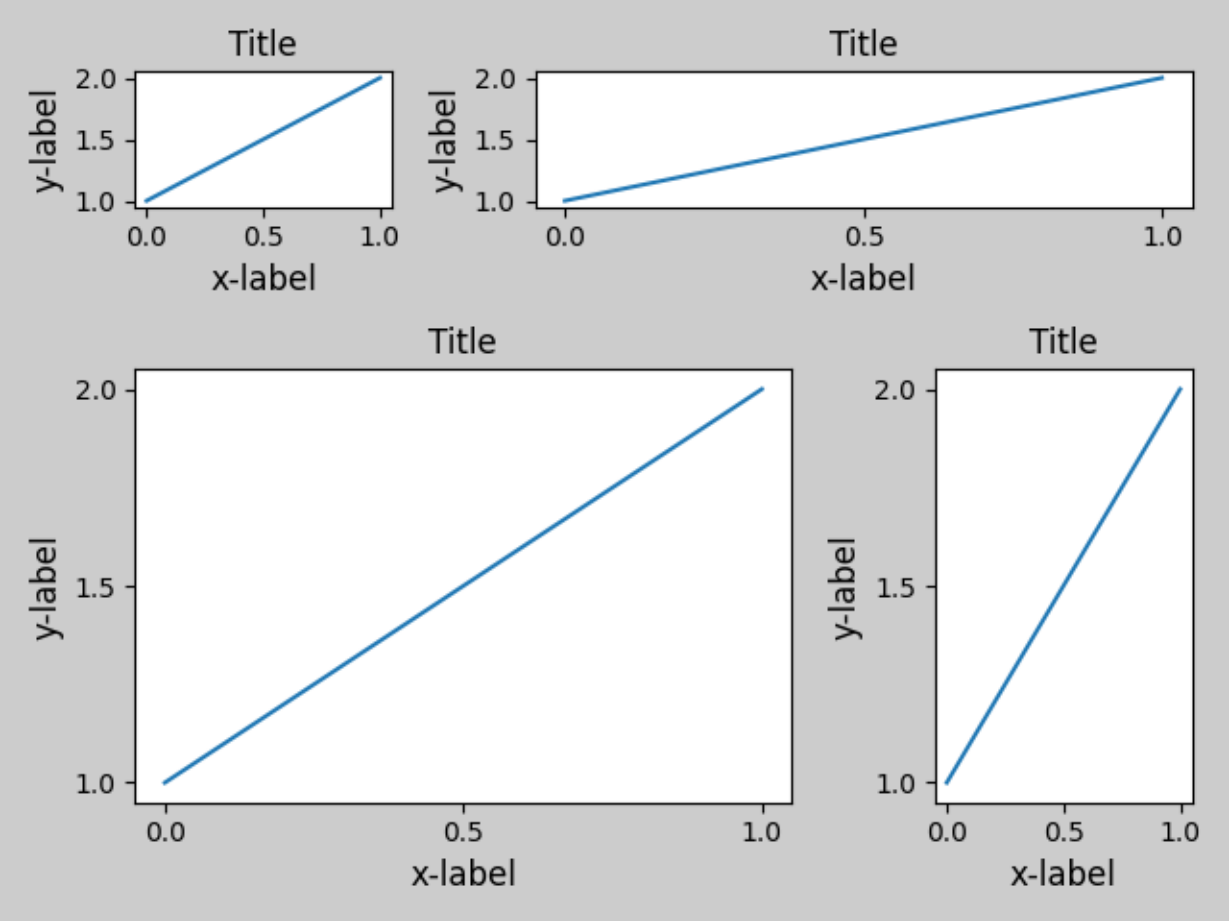
It works with subplots created with *subplot2grid()*. In general, subplots created from the gridspec (*Customizing Figure Layouts Using GridSpec and Other Functions*) will work.

```
plt.close('all')
fig = plt.figure()

ax1 = plt.subplot2grid((3, 3), (0, 0))
ax2 = plt.subplot2grid((3, 3), (0, 1), colspan=2)
ax3 = plt.subplot2grid((3, 3), (1, 0), colspan=2, rowspan=2)
ax4 = plt.subplot2grid((3, 3), (1, 2), rowspan=2)

example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
example_plot(ax4)

plt.tight_layout()
```



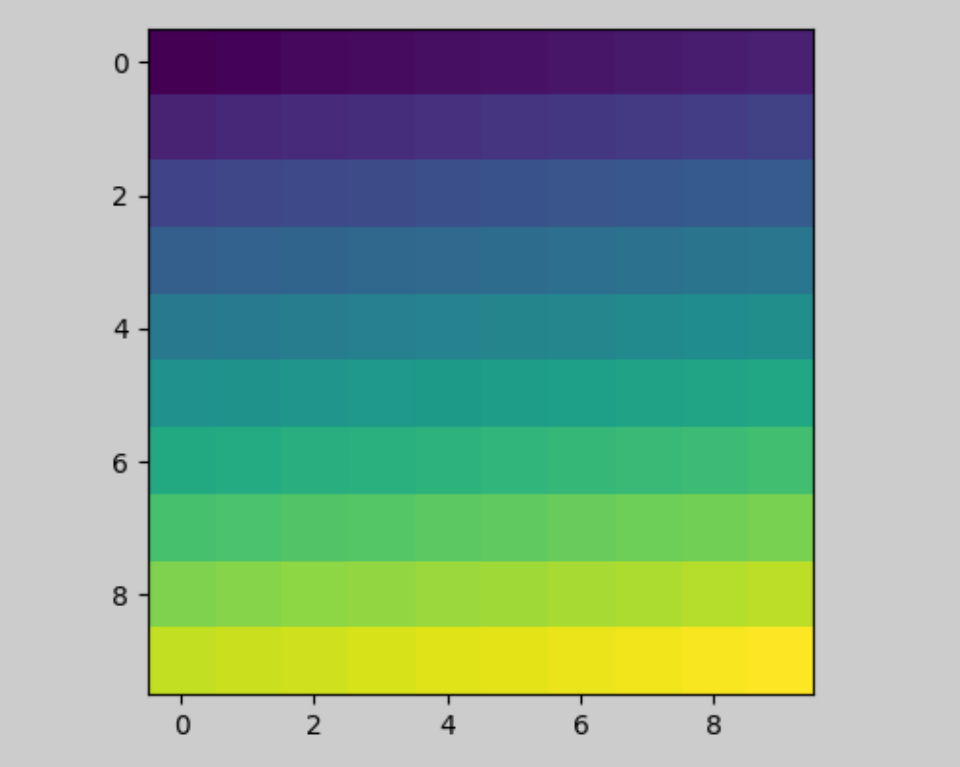
Although not thoroughly tested, it seems to work for subplots with aspect != "auto" (e.g., axes with images).

```
arr = np.arange(100).reshape((10, 10))

plt.close('all')
fig = plt.figure(figsize=(5, 4))

ax = plt.subplot(111)
im = ax.imshow(arr, interpolation="none")

plt.tight_layout()
```



Caveats

- *tight_layout* considers all artists on the axes by default. To remove an artist from the layout calculation you can call *Artist.set_in_layout*.
- `tight_layout` assumes that the extra space needed for artists is independent of the original location of axes. This is often true, but there are rare cases where it is not.
- `pad=0` can clip some texts by a few pixels. This may be a bug or a limitation of the current algorithm and it is not clear why it happens. Meanwhile, use of pad larger than 0.3 is recommended.

Use with GridSpec

GridSpec has its own *GridSpec.tight_layout* method (the pyplot api *pyplot.tight_layout* also works).

```
import matplotlib.gridspec as gridspec

plt.close('all')
fig = plt.figure()

gs1 = gridspec.GridSpec(2, 1)
```

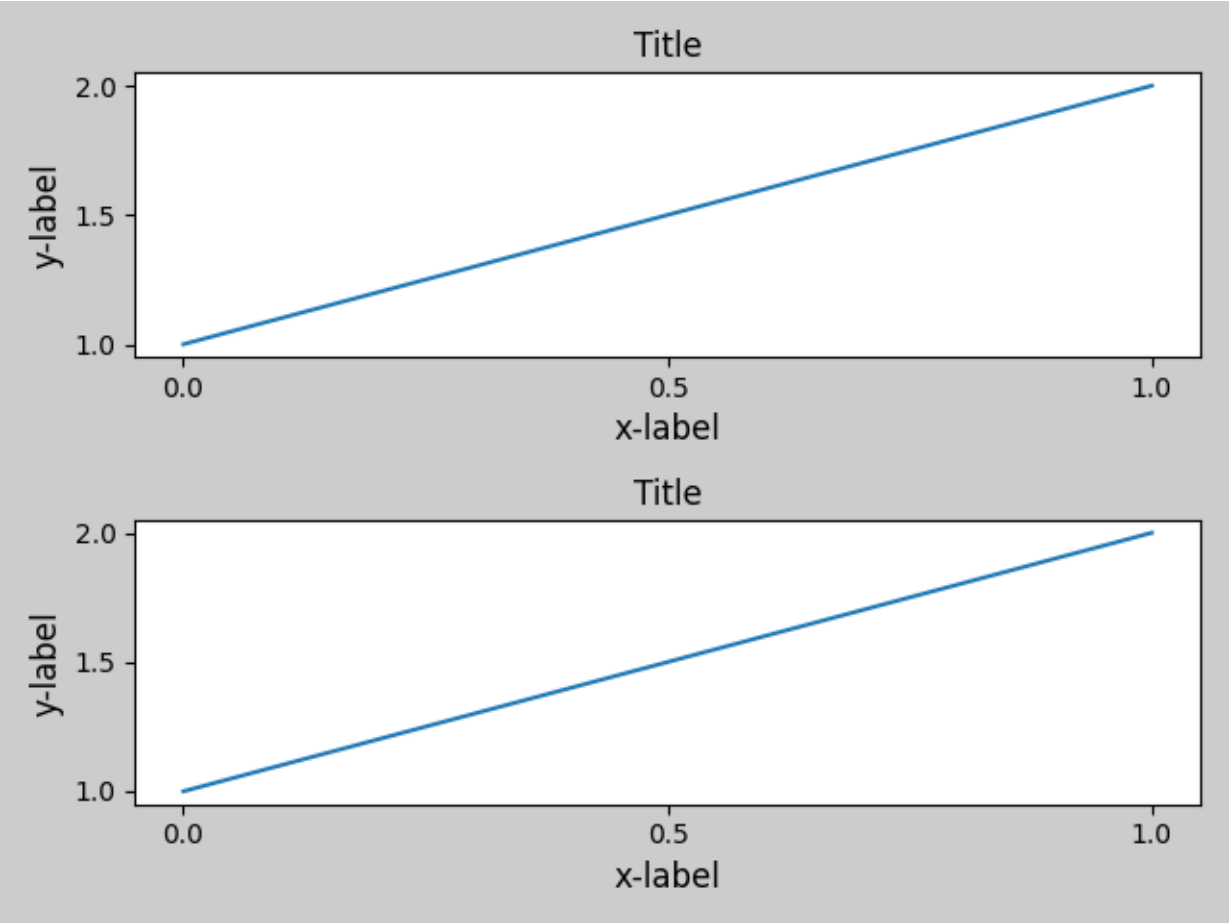
(continues on next page)

(continued from previous page)

```
ax1 = fig.add_subplot(gs1[0])
ax2 = fig.add_subplot(gs1[1])

example_plot(ax1)
example_plot(ax2)

gs1.tight_layout(fig)
```



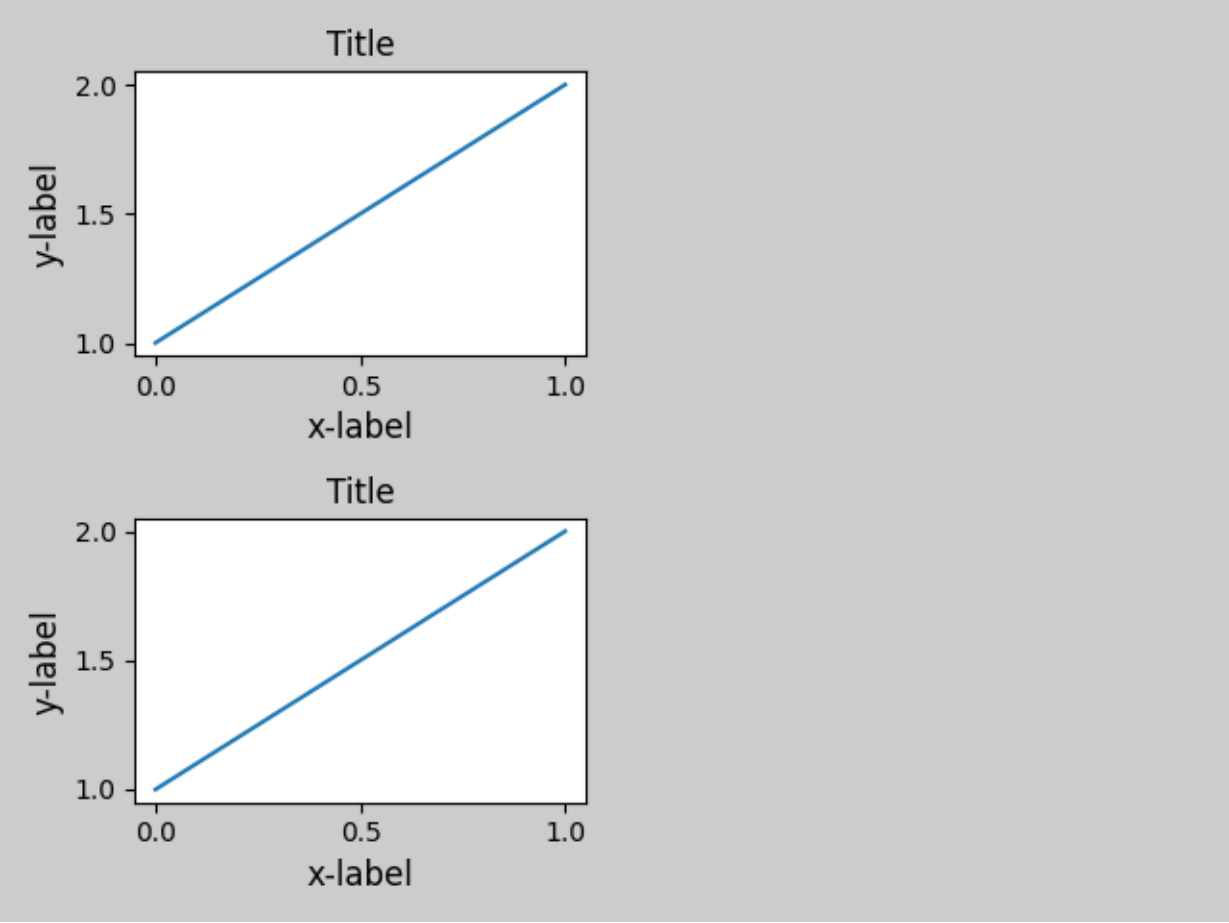
You may provide an optional *rect* parameter, which specifies the bounding box that the subplots will be fit inside. The coordinates must be in normalized figure coordinates and the default is (0, 0, 1, 1).

```
fig = plt.figure()

gs1 = gridspec.GridSpec(2, 1)
ax1 = fig.add_subplot(gs1[0])
ax2 = fig.add_subplot(gs1[1])

example_plot(ax1)
example_plot(ax2)

gs1.tight_layout(fig, rect=[0, 0, 0.5, 1])
```



For example, this can be used for a figure with multiple gridspecs.

```
fig = plt.figure()

gs1 = gridspec.GridSpec(2, 1)
ax1 = fig.add_subplot(gs1[0])
ax2 = fig.add_subplot(gs1[1])

example_plot(ax1)
example_plot(ax2)

gs1.tight_layout(fig, rect=[0, 0, 0.5, 1])

gs2 = gridspec.GridSpec(3, 1)

for ss in gs2:
    ax = fig.add_subplot(ss)
    example_plot(ax)
    ax.set_title("")
    ax.set_xlabel("")

ax.set_xlabel("x-label", fontsize=12)
```

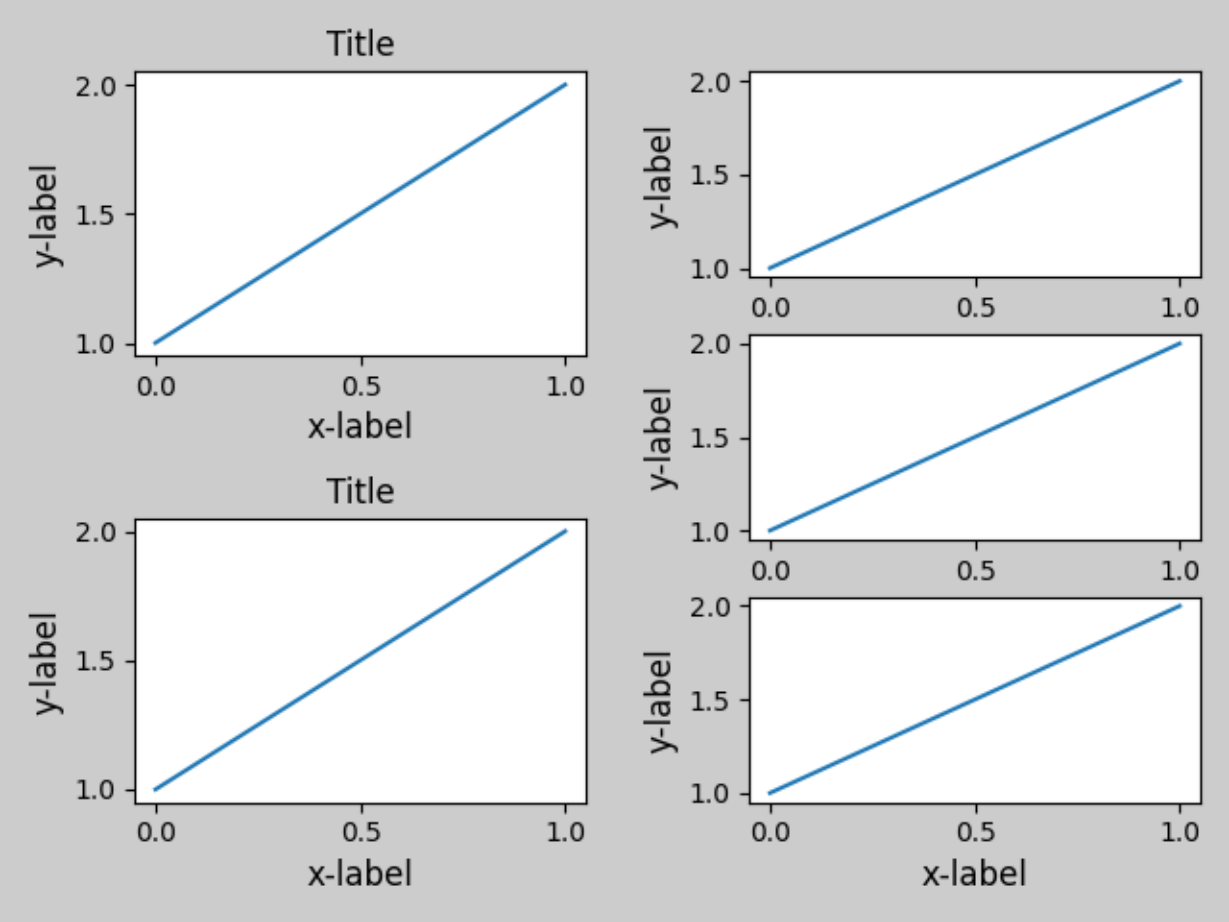
(continues on next page)

(continued from previous page)

```
gs2.tight_layout(fig, rect=[0.5, 0, 1, 1], h_pad=0.5)

# We may try to match the top and bottom of two grids ::
top = min(gs1.top, gs2.top)
bottom = max(gs1.bottom, gs2.bottom)

gs1.update(top=top, bottom=bottom)
gs2.update(top=top, bottom=bottom)
plt.show()
```



Out:

```
/root/matplotlib/tutorials/intermediate/tight_layout_guide.py:227: UserWarning: This␣
↪figure includes Axes that are not compatible with tight_layout, so results might be␣
↪incorrect.
  gs2.tight_layout(fig, rect=[0.5, 0, 1, 1], h_pad=0.5)
```

While this should be mostly good enough, adjusting top and bottom may require adjustment of hspace also. To update hspace & vspace, we call *GridSpec.tight_layout* again with updated rect argument. Note that the rect argument specifies the area including the ticklabels, etc. Thus, we will increase the bottom (which is 0 for the normal case) by the difference between the *bottom* from above and the bottom of

each gridspec. Same thing for the top.

```
fig = plt.gcf()

gs1 = gridspec.GridSpec(2, 1)
ax1 = fig.add_subplot(gs1[0])
ax2 = fig.add_subplot(gs1[1])

example_plot(ax1)
example_plot(ax2)

gs1.tight_layout(fig, rect=[0, 0, 0.5, 1])

gs2 = gridspec.GridSpec(3, 1)

for ss in gs2:
    ax = fig.add_subplot(ss)
    example_plot(ax)
    ax.set_title("")
    ax.set_xlabel("")

ax.set_xlabel("x-label", fontsize=12)

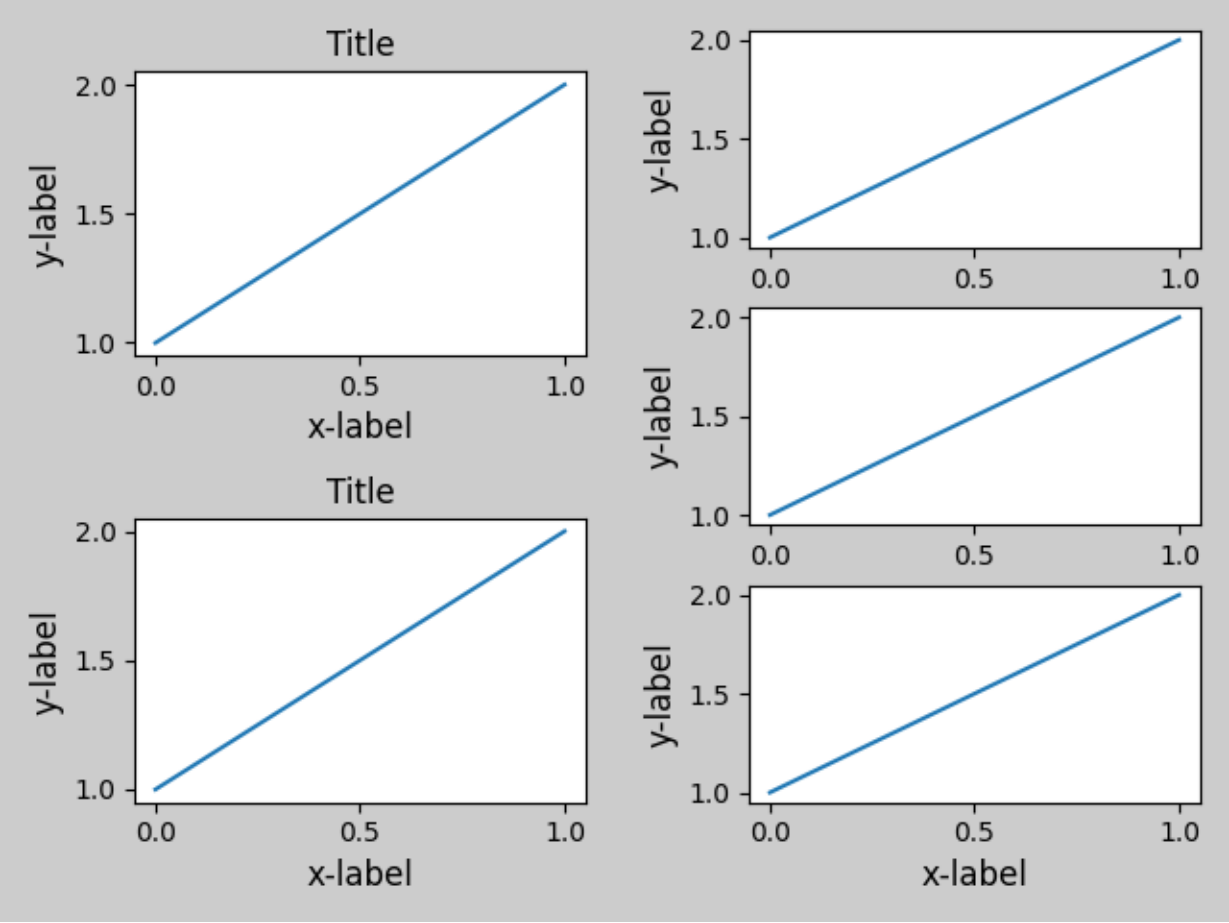
gs2.tight_layout(fig, rect=[0.5, 0, 1, 1], h_pad=0.5)

top = min(gs1.top, gs2.top)
bottom = max(gs1.bottom, gs2.bottom)

gs1.update(top=top, bottom=bottom)
gs2.update(top=top, bottom=bottom)

top = min(gs1.top, gs2.top)
bottom = max(gs1.bottom, gs2.bottom)

gs1.tight_layout(fig, rect=[None, 0 + (bottom-gs1.bottom),
                            0.5, 1 - (gs1.top-top)])
gs2.tight_layout(fig, rect=[0.5, 0 + (bottom-gs2.bottom),
                            None, 1 - (gs2.top-top)],
                 h_pad=0.5)
```



Out:

```
/root/matplotlib/tutorials/intermediate/tight_layout_guide.py:267: UserWarning: This␣
↪figure includes Axes that are not compatible with tight_layout, so results might be␣
↪incorrect.
  gs2.tight_layout(fig, rect=[0.5, 0, 1, 1], h_pad=0.5)
/root/matplotlib/tutorials/intermediate/tight_layout_guide.py:278: UserWarning: This␣

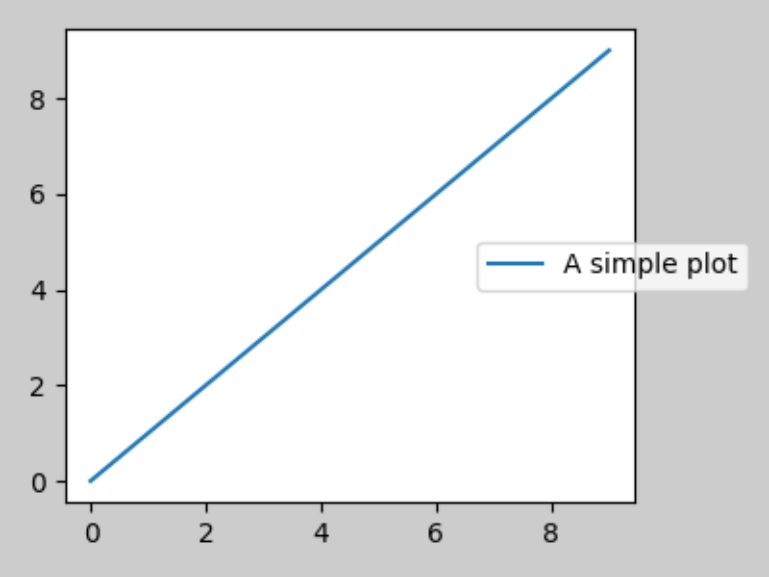
  gs2.tight_layout(fig, rect=[0.5, 0 + (bottom-gs2.bottom),
```

Legends and Annotations

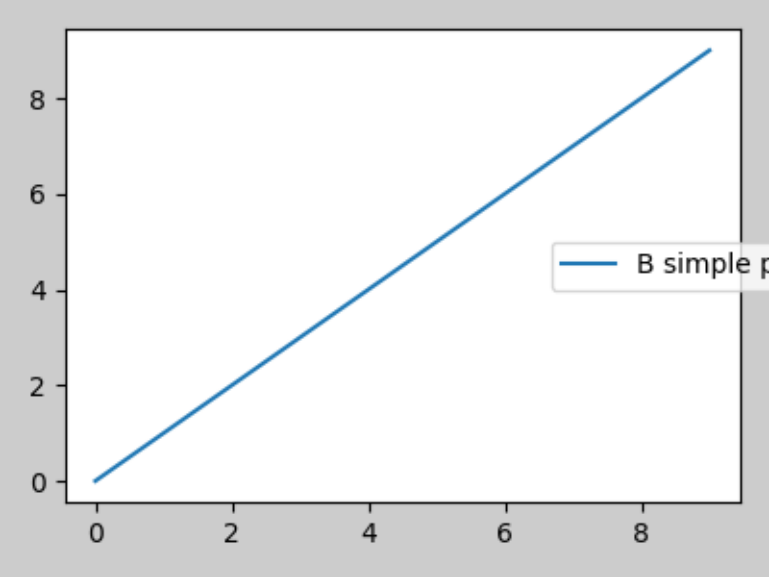
Pre Matplotlib 2.2, legends and annotations were excluded from the bounding box calculations that decide the layout. Subsequently these artists were added to the calculation, but sometimes it is undesirable to include them. For instance in this case it might be good to have the axes shring a bit to make room for the legend:

```
fig, ax = plt.subplots(figsize=(4, 3))
lines = ax.plot(range(10), label='A simple plot')
ax.legend(bbox_to_anchor=(0.7, 0.5), loc='center left',)
fig.tight_layout()
plt.show()
```



However, sometimes this is not desired (quite often when using `fig.savefig('outname.png', bbox_inches='tight')`). In order to remove the legend from the bounding box calculation, we simply set its bounding `leg.set_in_layout(False)` and the legend will be ignored.

```
fig, ax = plt.subplots(figsize=(4, 3))
lines = ax.plot(range(10), label='B simple plot')
leg = ax.legend(bbox_to_anchor=(0.7, 0.5), loc='center left',)
leg.set_in_layout(False)
fig.tight_layout()
plt.show()
```



Use with AxesGrid1

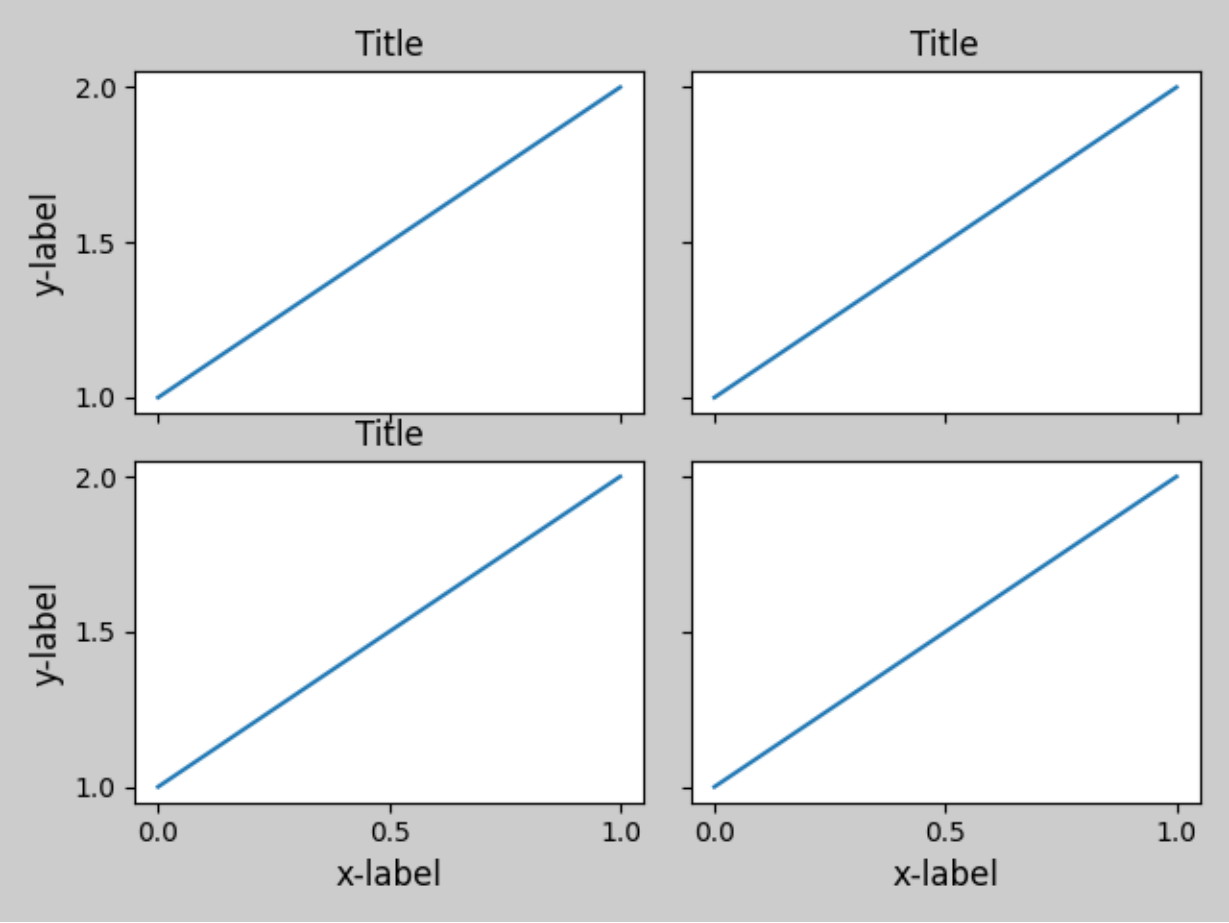
While limited, *mpl_toolkits.axes_grid1* is also supported.

```
from mpl_toolkits.axes_grid1 import Grid

plt.close('all')
fig = plt.figure()
grid = Grid(fig, rect=111, nrows_ncols=(2, 2),
            axes_pad=0.25, label_mode='L',
            )

for ax in grid:
    example_plot(ax)
ax.title.set_visible(False)

plt.tight_layout()
```



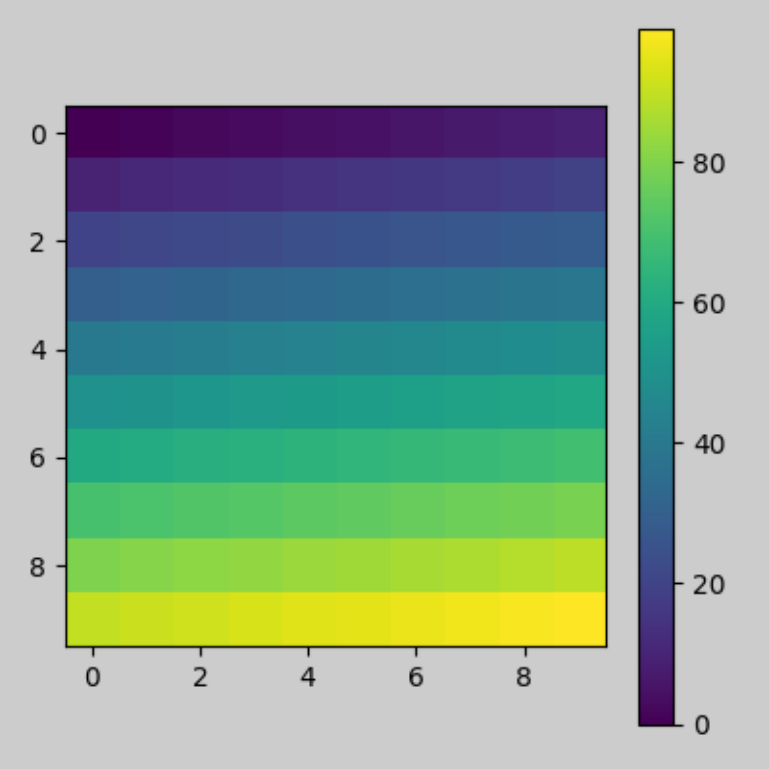
Colorbar

If you create a colorbar with *Figure.colorbar*, the created colorbar is drawn in a Subplot as long as the parent axes is also a Subplot, so *Figure.tight_layout* will work.

```
plt.close('all')
arr = np.arange(100).reshape((10, 10))
fig = plt.figure(figsize=(4, 4))
im = plt.imshow(arr, interpolation="none")

plt.colorbar(im)

plt.tight_layout()
```



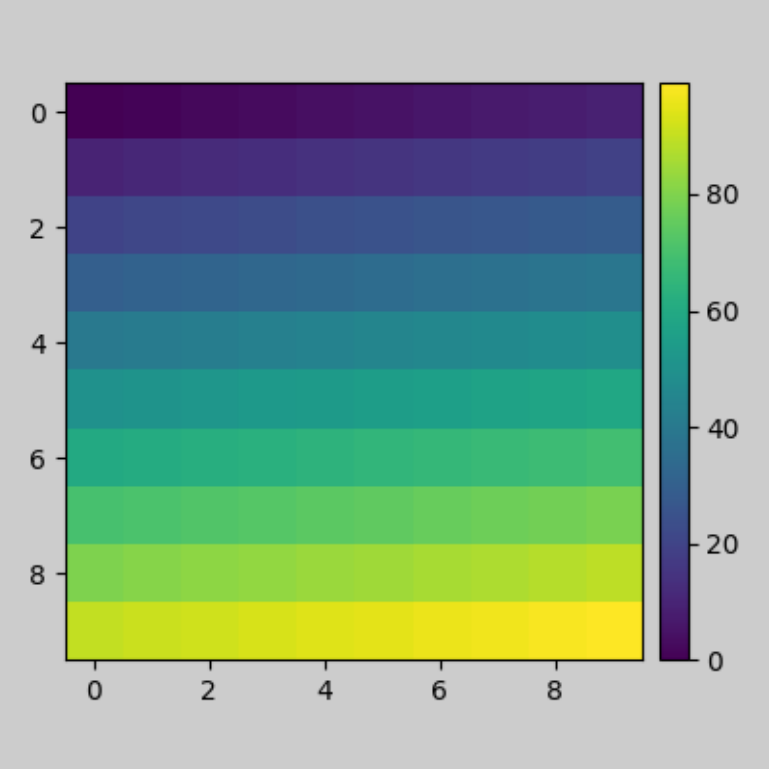
Another option is to use AxesGrid1 toolkit to explicitly create an axes for colorbar.

```
from mpl_toolkits.axes_grid1 import make_axes_locatable

plt.close('all')
arr = np.arange(100).reshape((10, 10))
fig = plt.figure(figsize=(4, 4))
im = plt.imshow(arr, interpolation="none")

divider = make_axes_locatable(plt.gca())
cax = divider.append_axes("right", "5%", pad="3%")
plt.colorbar(im, cax=cax)

plt.tight_layout()
```



Total running time of the script: (0 minutes 5.914 seconds)

2.2.7 *origin* and *extent* in `imshow`

imshow() allows you to render an image (either a 2D array which will be color-mapped (based on *norm* and *cmap*) or a 3D RGB(A) array which will be used as-is) to a rectangular region in dataspace. The orientation of the image in the final rendering is controlled by the *origin* and *extent* kwargs (and attributes on the resulting *AxesImage* instance) and the data limits of the axes.

The *extent* kwarg controls the bounding box in data coordinates that the image will fill specified as `(left, right, bottom, top)` in **data coordinates**, the *origin* kwarg controls how the image fills that bounding box, and the orientation in the final rendered image is also affected by the axes limits.

Hint: Most of the code below is used for adding labels and informative text to the plots. The described effects of *origin* and *extent* can be seen in the plots without the need to follow all code details.

For a quick understanding, you may want to skip the code details below and directly continue with the discussion of the results.

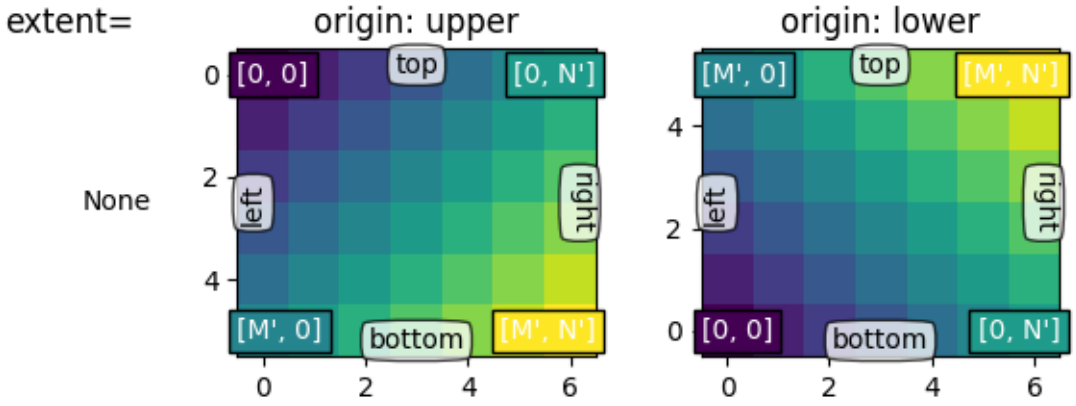
            text = (f'left: {left:0.1f}\nright: {right:0.1f}\n'
                    f'bottom: {bottom:0.1f}\ntop: {top:0.1f}\n')
        ax.text(1., .5, text, transform=ax.transAxes, ha='right', va='center')
        ax.axis('off')
    return columns
```

Default extent

First, let's have a look at the default `extent=None`

```
generate_imshow_demo_grid(extents=[None])
```



Out:

```
{'label': [<AxesSubplot:title={'center':'extent='}>], 'upper': [<AxesSubplot:title={
↪'center':'origin: upper'}>], 'lower': [<AxesSubplot:title={'center':'origin: lower'}>]}
```

Generally, for an array of shape (M, N), the first index runs along the vertical, the second index runs along the horizontal. The pixel centers are at integer positions ranging from 0 to `N' = N - 1` horizontally and from 0 to `M' = M - 1` vertically. *origin* determines how to the data is filled in the bounding box.

For `origin='lower'`:

- [0, 0] is at (left, bottom)
- [M', 0] is at (left, top)
- [0, N'] is at (right, bottom)
- [M', N'] is at (right, top)

`origin='upper'` reverses the vertical axes direction and filling:

- [0, 0] is at (left, top)
- [M', 0] is at (left, bottom)
- [0, N'] is at (right, top)
- [M', N'] is at (right, bottom)

In summary, the position of the [0, 0] index as well as the extent are influenced by *origin*:

origin	[0, 0] position	extent
upper	top left	`(-0.5, numcols-0.5, numrows-0.5, -0.5)`
lower	bottom left	`(-0.5, numcols-0.5, -0.5, numrows-0.5)`

The default value of *origin* is set by `rcParams["image.origin"]` (default: `'upper'`) which defaults to `'upper'` to match the matrix indexing conventions in math and computer graphics image indexing conventions.

Explicit extent

By setting *extent* we define the coordinates of the image area. The underlying image data is interpolated/resampled to fill that area.

If the axes is set to autoscale, then the view limits of the axes are set to match the *extent* which ensures that the coordinate set by `(left, bottom)` is at the bottom left of the axes! However, this may invert the axis so they do not increase in the 'natural' direction.

```
extents = [(-0.5, 6.5, -0.5, 5.5),
           (-0.5, 6.5, 5.5, -0.5),
           (6.5, -0.5, -0.5, 5.5),
           (6.5, -0.5, 5.5, -0.5)]

columns = generate_imshow_demo_grid(extents)
set_extent_None_text(columns['upper'][1])
set_extent_None_text(columns['lower'][0])
```

Explicit extent and axes limits

If we fix the axes limits by explicitly setting *set_xlim* / *set_ylim*, we force a certain size and orientation of the axes. This can decouple the 'left-right' and 'top-bottom' sense of the image from the orientation on the screen.

In the example below we have chosen the limits slightly larger than the extent (note the white areas within the Axes).

While we keep the extents as in the examples before, the coordinate (0, 0) is now explicitly put at the bottom left and values increase to up and to the right (from the viewer point of view). We can see that:

- The coordinate `(left, bottom)` anchors the image which then fills the box going towards the `(right, top)` point in data space.
- The first column is always closest to the 'left'.
- *origin* controls if the first row is closest to 'top' or 'bottom'.
- The image may be inverted along either direction.
- The 'left-right' and 'top-bottom' sense of the image may be uncoupled from the orientation on the screen.

```
generate_imshow_demo_grid(extents=[None] + extents,
                          xlim=(-2, 8), ylim=(-1, 6))

plt.show()

2.3 Advanced

These tutorials cover advanced topics for experienced Matplotlib users and developers.

2.3.1 Blitting tutorial

'Blitting' is a standard technique in raster graphics that, in the context of Matplotlib, can be used to (drastically) improve performance of interactive figures. For example, the *animation* and *widgets* modules use blitting internally. Here, we demonstrate how to implement your own blitting, outside of these classes.

The source of the performance gains is simply not re-doing work we do not have to. If the limits of an Axes have not changed, then there is no need to re-draw all of the ticks and tick-labels (particularly because text is one of the more expensive things to render).

The procedure to save our work is roughly:

- draw the figure, but exclude any artists marked as 'animated'
- save a copy of the RBGA buffer

In the future, to update the 'animated' artists we

- restore our copy of the RGBA buffer
- redraw only the animated artists
- show the resulting image on the screen

thus saving us from having to re-draw everything which is _not_ animated. One consequence of this procedure is that your animated artists are always drawn at a higher z-order than the static artists.

Not all backends support blitting. You can check if a given canvas does via the *FigureCanvasBase.supports_blit* property.

Warning: This code does not work with the OSX backend (but does work with other GUI backends on mac).

Minimal example

We can use the *FigureCanvasAgg* methods *copy_from_bbox* and *restore_region* in conjunction with setting `animated=True` on our artist to implement a minimal example that uses blitting to accelerate rendering

```
import matplotlib.pyplot as plt
import numpy as np

x = np.linspace(0, 2 * np.pi, 100)

fig, ax = plt.subplots()

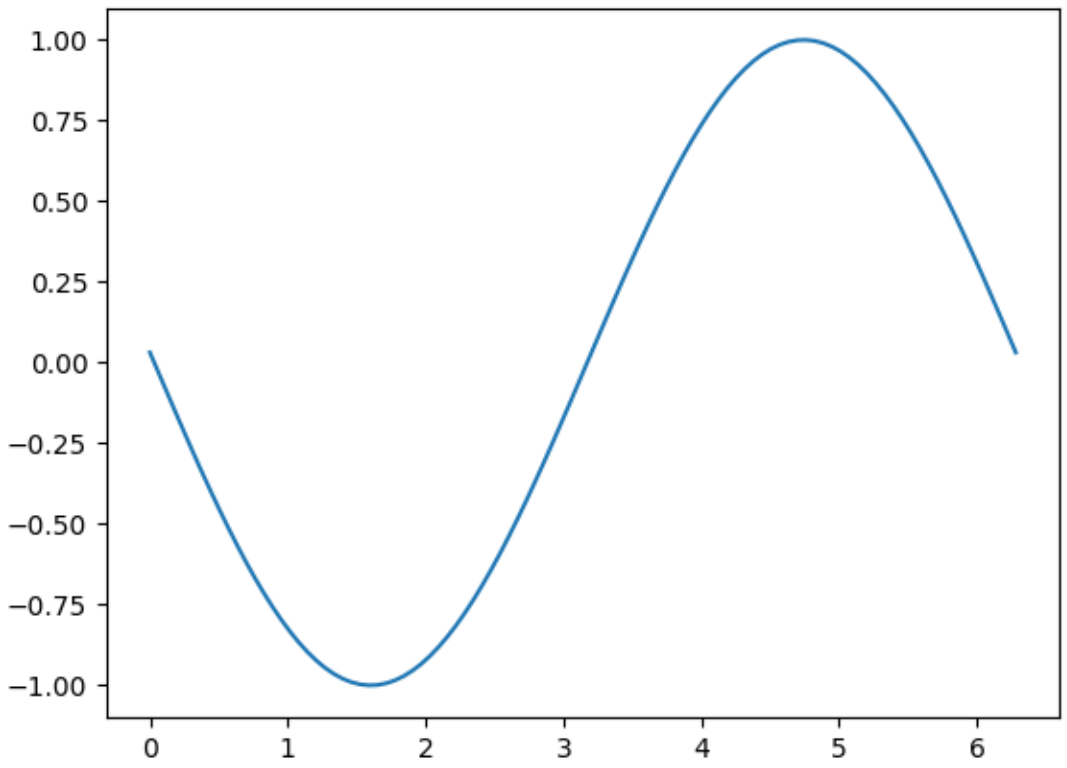
# animated=True tells matplotlib to only draw the artist when we
# explicitly request it
(ln,) = ax.plot(x, np.sin(x), animated=True)

# make sure the window is raised, but the script keeps going
plt.show(block=False)

# stop to admire our empty window axes and ensure it is rendered at
# least once.
#
# We need to fully draw the figure at its final size on the screen
# before we continue on so that :
#  a) we have the correctly sized and drawn background to grab
#  b) we have a cached renderer so that ``ax.draw_artist`` works
# so we spin the event loop to let the backend process any pending operations
plt.pause(0.1)

# get copy of entire figure (everything inside fig.bbox) sans animated artist
bg = fig.canvas.copy_from_bbox(fig.bbox)
# draw the animated artist, this uses a cached renderer
ax.draw_artist(ln)
# show the result to the screen, this pushes the updated RGBA buffer from the
# renderer to the GUI framework so you can see it
fig.canvas.blit(fig.bbox)

for j in range(100):
    # reset the background back in the canvas state, screen unchanged
    fig.canvas.restore_region(bg)
    # update the artist, neither the canvas state nor the screen have changed
    ln.set_ydata(np.sin(x + (j / 100) * np.pi))
    # re-render the artist, updating the canvas state, but not the screen
    ax.draw_artist(ln)
    # copy the image to the GUI state, but screen might not changed yet
    fig.canvas.blit(fig.bbox)
    # flush any pending GUI events, re-painting the screen if needed
    fig.canvas.flush_events()
    # you can put a pause in if you want to slow things down
    # plt.pause(.1)
```



This example works and shows a simple animation, however because we are only grabbing the background once, if the size of the figure in pixels changes (due to either the size or dpi of the figure changing) , the background will be invalid and result in incorrect (but sometimes cool looking!) images. There is also a global variable and a fair amount of boiler plate which suggests we should wrap this in a class.

Class-based example

We can use a class to encapsulate the boilerplate logic and state of restoring the background, drawing the artists, and then blitting the result to the screen. Additionally, we can use the `'draw_event'` callback to capture a new background whenever a full re-draw happens to handle resizes correctly.

```
class BlitManager:
    def __init__(self, canvas, animated_artists=()):
        """
        Parameters
        ----------
        canvas : FigureCanvasAgg
            The canvas to work with, this only works for sub-classes of the Agg
            canvas which have the `~FigureCanvasAgg.copy_from_bbox` and
```

(continues on next page)

(continued from previous page)

```
            `~FigureCanvasAgg.restore_region` methods.

        animated_artists : Iterable[Artist]
            List of the artists to manage
        """
        self.canvas = canvas
        self._bg = None
        self._artists = []

        for a in animated_artists:
            self.add_artist(a)
        # grab the background on every draw
        self.cid = canvas.mpl_connect("draw_event", self.on_draw)

    def on_draw(self, event):
        """Callback to register with 'draw_event'."""
        cv = self.canvas
        if event is not None:
            if event.canvas != cv:
                raise RuntimeError
        self._bg = cv.copy_from_bbox(cv.figure.bbox)
        self._draw_animated()

    def add_artist(self, art):
        """
        Add an artist to be managed.

        Parameters
        ----------
        art : Artist

            The artist to be added.  Will be set to 'animated' (just
            to be safe).  *art* must be in the figure associated with
            the canvas this class is managing.

        """
        if art.figure != self.canvas.figure:
            raise RuntimeError
        art.set_animated(True)
        self._artists.append(art)

    def _draw_animated(self):
        """Draw all of the animated artists."""
        fig = self.canvas.figure
        for a in self._artists:
            fig.draw_artist(a)

    def update(self):
        """Update the screen with animated artists."""
        cv = self.canvas
        fig = cv.figure
```

(continues on next page)

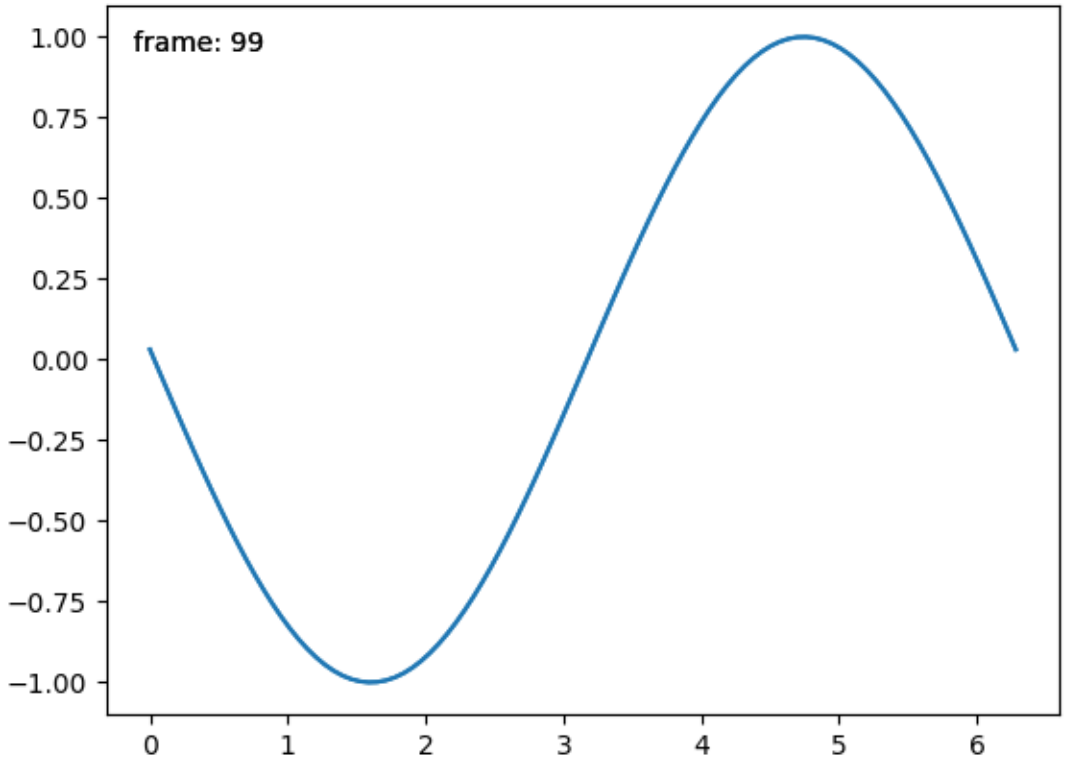
(continued from previous page)

```
        # paranoia in case we missed the draw event,
        if self._bg is None:
            self.on_draw(None)
        else:
            # restore the background
            cv.restore_region(self._bg)
            # draw all of the animated artists
            self._draw_animated()
            # update the GUI state
            cv.blit(fig.bbox)
        # let the GUI event loop process anything it has to do
        cv.flush_events()
```

Here is how we would use our class. This is a slightly more complicated example than the first case as we add a text frame counter as well.

```
# make a new figure
fig, ax = plt.subplots()
# add a line
(ln,) = ax.plot(x, np.sin(x), animated=True)
# add a frame number
fr_number = ax.annotate(
    "0",
    (0, 1),
    xycoords="axes fraction",
    xytext=(10, -10),
    textcoords="offset points",
    ha="left",
    va="top",
    animated=True,
)
bm = BlitManager(fig.canvas, [ln, fr_number])
# make sure our window is on the screen and drawn
plt.show(block=False)
plt.pause(.1)

for j in range(100):
    # update the artists
    ln.set_ydata(np.sin(x + (j / 100) * np.pi))
    fr_number.set_text("frame: {j}".format(j=j))
    # tell the blitting manager to do it's thing
    bm.update()
```



This class does not depend on *pyplot* and is suitable to embed into larger GUI application.

Total running time of the script: (0 minutes 1.143 seconds)

2.3.2 Path Tutorial

Defining paths in your Matplotlib visualization.

The object underlying all of the *matplotlib.patches* objects is the *Path*, which supports the standard set of moveto, lineto, curveto commands to draw simple and compound outlines consisting of line segments and splines. The `Path` is instantiated with a (N, 2) array of (x, y) vertices, and a N-length array of path codes. For example to draw the unit rectangle from (0, 0) to (1, 1), we could use this code:

```
import matplotlib.pyplot as plt
from matplotlib.path import Path
import matplotlib.patches as patches

verts = [
   (0., 0.),  # left, bottom
   (0., 1.),  # left, top
```

(continues on next page)

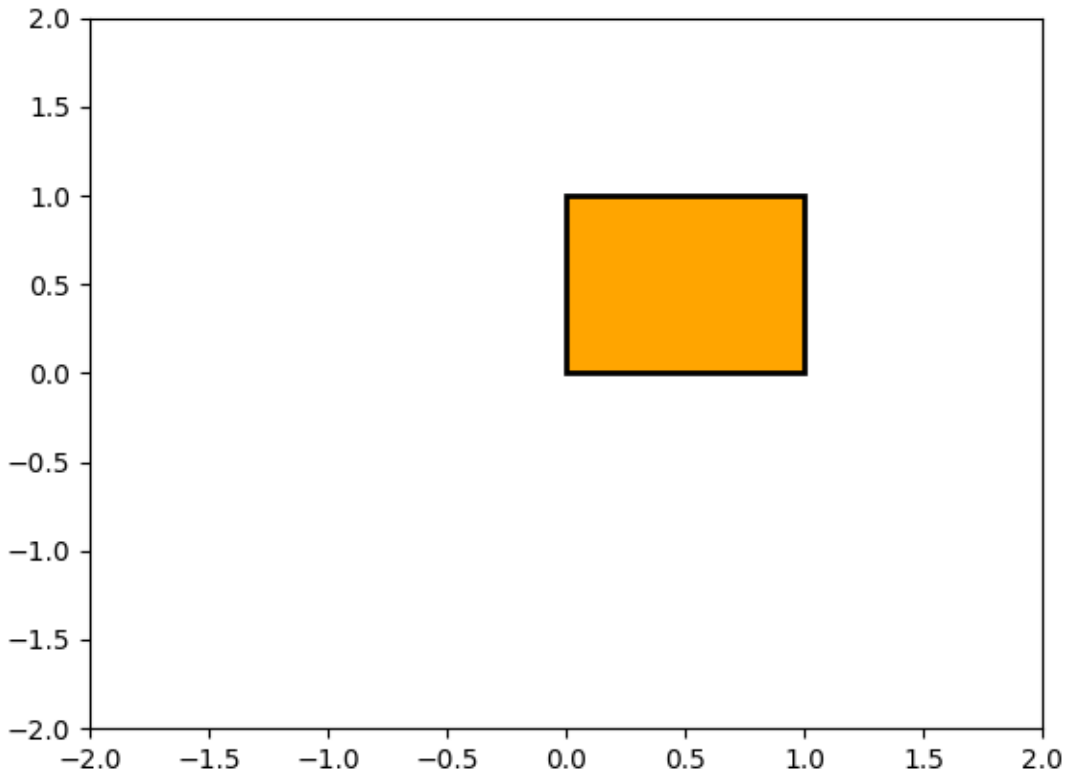
(continued from previous page)

```
    (1., 1.),  # right, top
    (1., 0.),  # right, bottom
    (0., 0.),  # ignored
]

codes = [
    Path.MOVETO,
    Path.LINETO,
    Path.LINETO,
    Path.LINETO,
    Path.CLOSEPOLY,
]

path = Path(verts, codes)

fig, ax = plt.subplots()
patch = patches.PathPatch(path, facecolor='orange', lw=2)
ax.add_patch(patch)
ax.set_xlim(-2, 2)
ax.set_ylim(-2, 2)
plt.show()
```



The following path codes are recognized

Code	Vertices	Description
STOP	1 (ignored)	A marker for the end of the entire path (currently not required and ignored).
MOVETO	1	Pick up the pen and move to the given vertex.
LINETO	1	Draw a line from the current position to the given vertex.
CURVE3	2: 1 control point, 1 end point	Draw a quadratic Bézier curve from the current position, with the given control point, to the given end point.
CURVE4	3: 2 control points, 1 end point	Draw a cubic Bézier curve from the current position, with the given control points, to the given end point.
CLOSEPOLY	1 (the point is ignored)	Draw a line segment to the start point of the current polyline.

Bézier example

Some of the path components require multiple vertices to specify them: for example CURVE 3 is a bézier curve with one control point and one end point, and CURVE4 has three vertices for the two control points and the end point. The example below shows a CURVE4 Bézier spline -- the bézier curve will be contained in the convex hull of the start point, the two control points, and the end point

```
verts = [
   (0., 0.),   # P0
   (0.2, 1.),  # P1
   (1., 0.8),  # P2
   (0.8, 0.),  # P3
]

codes = [
    Path.MOVETO,
    Path.CURVE4,
    Path.CURVE4,
    Path.CURVE4,
]

path = Path(verts, codes)

fig, ax = plt.subplots()
patch = patches.PathPatch(path, facecolor='none', lw=2)
ax.add_patch(patch)

xs, ys = zip(*verts)
ax.plot(xs, ys, 'x--', lw=2, color='black', ms=10)

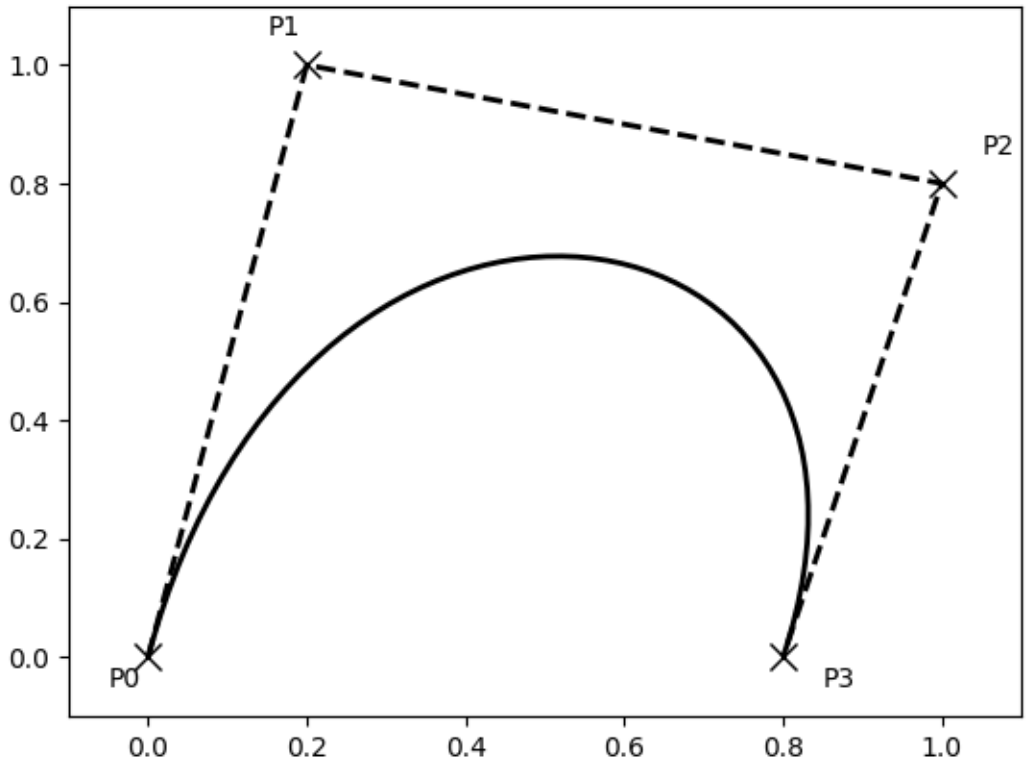
ax.text(-0.05, -0.05, 'P0')
ax.text(0.15, 1.05, 'P1')
ax.text(1.05, 0.85, 'P2')
```

(continues on next page)

(continued from previous page)

```
ax.text(0.85, -0.05, 'P3')

ax.set_xlim(-0.1, 1.1)
ax.set_ylim(-0.1, 1.1)
plt.show()
```



Compound paths

All of the simple patch primitives in matplotlib, Rectangle, Circle, Polygon, etc, are implemented with simple path. Plotting functions like *hist()* and *bar()*, which create a number of primitives, e.g., a bunch of Rectangles, can usually be implemented more efficiently using a compound path. The reason `bar` creates a list of rectangles and not a compound path is largely historical: the *Path* code is comparatively new and `bar` predates it. While we could change it now, it would break old code, so here we will cover how to create compound paths, replacing the functionality in bar, in case you need to do so in your own code for efficiency reasons, e.g., you are creating an animated bar plot.

We will make the histogram chart by creating a series of rectangles for each histogram bar: the rectangle width is the bin width and the rectangle height is the number of

datapoints in that bin. First we'll create some random normally distributed data and compute the histogram. Because numpy returns the bin edges and not centers, the length of `bins` is 1 greater than the length of `n` in the example below:

```
# histogram our data with numpy
data = np.random.randn(1000)
n, bins = np.histogram(data, 100)
```

We'll now extract the corners of the rectangles. Each of the `left`, `bottom`, etc, arrays below is `len(n)`, where `n` is the array of counts for each histogram bar:

```
# get the corners of the rectangles for the histogram
left = np.array(bins[:-1])
right = np.array(bins[1:])
bottom = np.zeros(len(left))
top = bottom + n
```

Now we have to construct our compound path, which will consist of a series of `MOVETO`, `LINETO` and `CLOSEPOLY` for each rectangle. For each rectangle, we need 5 vertices: 1 for the `MOVETO`, 3 for the `LINETO`, and 1 for the `CLOSEPOLY`. As indicated in the table above, the vertex for the closepoly is ignored but we still need it to keep the codes aligned with the vertices:

```
nverts = nrects*(1+3+1)
verts = np.zeros((nverts, 2))
codes = np.ones(nverts, int) * path.Path.LINETO
codes[0::5] = path.Path.MOVETO
codes[4::5] = path.Path.CLOSEPOLY
verts[0::5, 0] = left
verts[0::5, 1] = bottom
verts[1::5, 0] = left
verts[1::5, 1] = top
verts[2::5, 0] = right
verts[2::5, 1] = top
verts[3::5, 0] = right
verts[3::5, 1] = bottom
```

All that remains is to create the path, attach it to a *PathPatch*, and add it to our axes:

```
barpath = path.Path(verts, codes)
patch = patches.PathPatch(barpath, facecolor='green',
  edgecolor='yellow', alpha=0.5)
ax.add_patch(patch)
```

```
import numpy as np
import matplotlib.patches as patches
import matplotlib.path as path

fig, ax = plt.subplots()
# Fixing random state for reproducibility
np.random.seed(19680801)
```

(continues on next page)

(continued from previous page)

```
# histogram our data with numpy
data = np.random.randn(1000)
n, bins = np.histogram(data, 100)

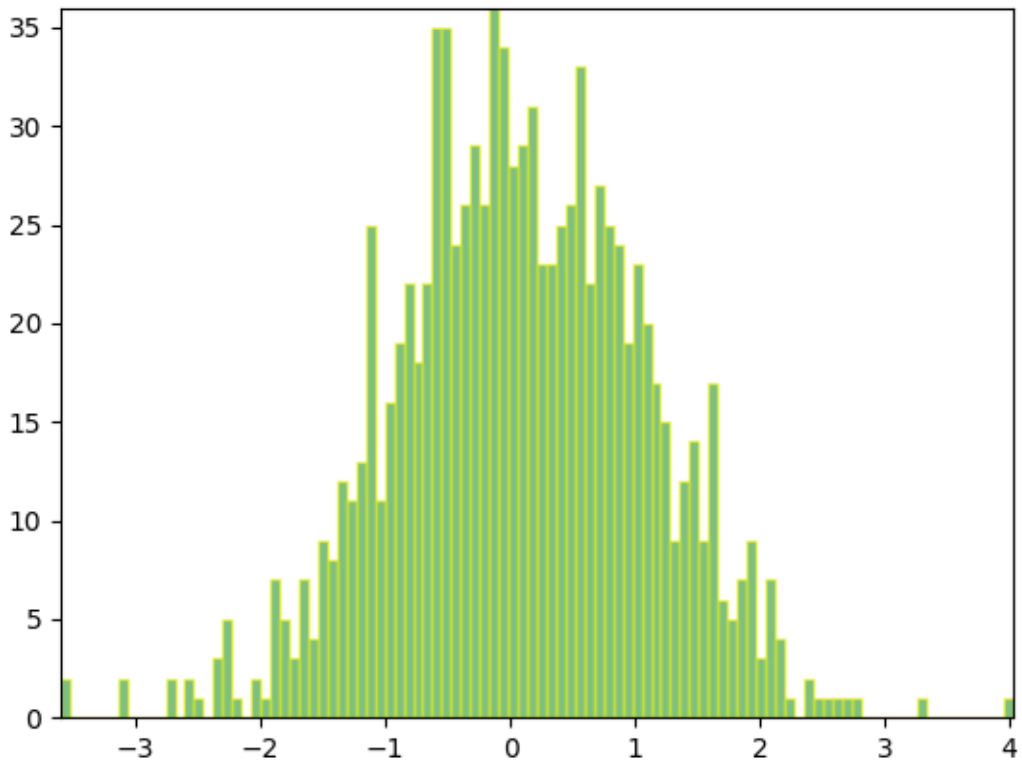
# get the corners of the rectangles for the histogram
left = np.array(bins[:-1])
right = np.array(bins[1:])
bottom = np.zeros(len(left))
top = bottom + n
nrects = len(left)

nverts = nrects*(1+3+1)
verts = np.zeros((nverts, 2))
codes = np.ones(nverts, int) * path.Path.LINETO
codes[0::5] = path.Path.MOVETO
codes[4::5] = path.Path.CLOSEPOLY
verts[0::5, 0] = left
verts[0::5, 1] = bottom
verts[1::5, 0] = left
verts[1::5, 1] = top
verts[2::5, 0] = right
verts[2::5, 1] = top
verts[3::5, 0] = right
verts[3::5, 1] = bottom

barpath = path.Path(verts, codes)
patch = patches.PathPatch(barpath, facecolor='green',
                          edgecolor='yellow', alpha=0.5)
ax.add_patch(patch)

ax.set_xlim(left[0], right[-1])
ax.set_ylim(bottom.min(), top.max())

plt.show()
```



2.3.3 Path effects guide

Defining paths that objects follow on a canvas.

Matplotlib's *patheffects* module provides functionality to apply a multiple draw stage to any Artist which can be rendered via a *path.Path*.

Artists which can have a path effect applied to them include *patches.Patch*, *lines.Line2D*, *collections.Collection* and even *text.Text*. Each artist's path effects can be controlled via the *Artist.set_path_effects* method, which takes an iterable of *AbstractPathEffect* instances.

The simplest path effect is the *Normal* effect, which simply draws the artist without any effect:

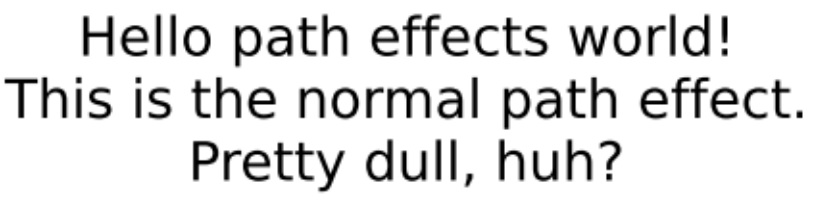
```
import matplotlib.pyplot as plt
import matplotlib.patheffects as path_effects

fig = plt.figure(figsize=(5, 1.5))
text = fig.text(0.5, 0.5, 'Hello path effects world!\nThis is the normal '
                          'path effect.\nPretty dull, huh?',
                ha='center', va='center', size=20)
```

(continues on next page)

(continued from previous page)

```
text.set_path_effects([path_effects.Normal()])
plt.show()
```



Whilst the plot doesn't look any different to what you would expect without any path effects, the drawing of the text has now been changed to use the path effects framework, opening up the possibilities for more interesting examples.

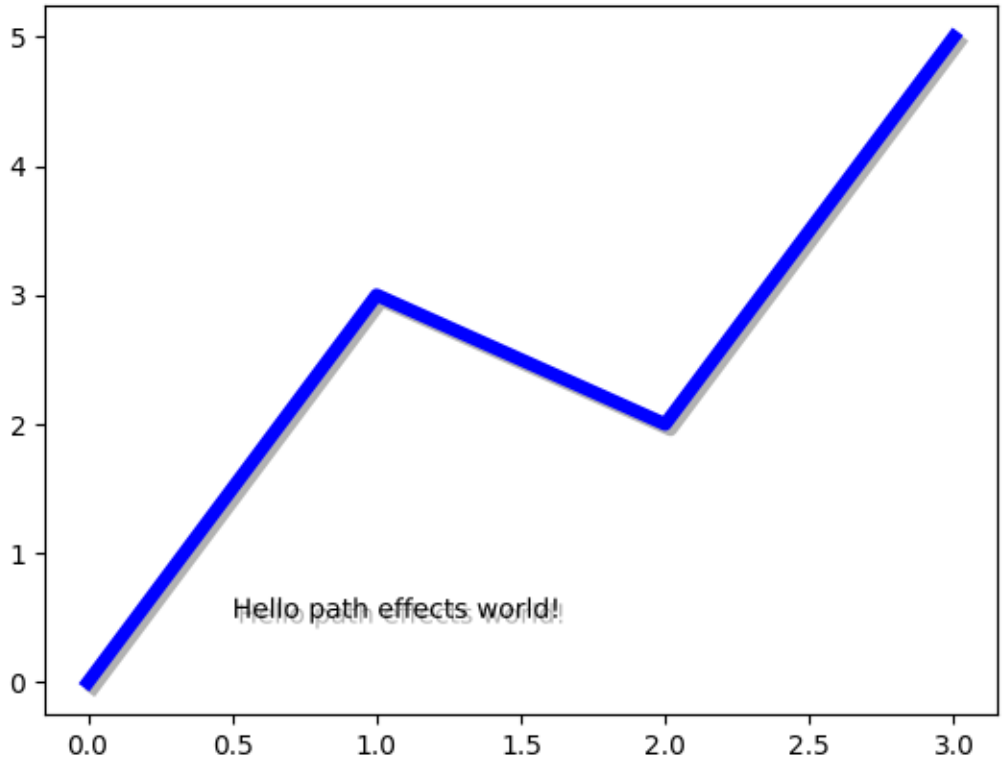
Adding a shadow

A far more interesting path effect than *Normal* is the drop-shadow, which we can apply to any of our path based artists. The classes *SimplePatchShadow* and *SimpleLineShadow* do precisely this by drawing either a filled patch or a line patch below the original artist:

```
import matplotlib.patheffects as path_effects

text = plt.text(0.5, 0.5, 'Hello path effects world!',
                path_effects=[path_effects.withSimplePatchShadow()])

plt.plot([0, 3, 2, 5], linewidth=5, color='blue',
         path_effects=[path_effects.SimpleLineShadow(),
                       path_effects.Normal()])
plt.show()
```



Notice the two approaches to setting the path effects in this example. The first uses the `with*` classes to include the desired functionality automatically followed with the "normal" effect, whereas the latter explicitly defines the two path effects to draw.

Making an artist stand out

One nice way of making artists visually stand out is to draw an outline in a bold color below the actual artist. The *Stroke* path effect makes this a relatively simple task:

```
fig = plt.figure(figsize=(7, 1))
text = fig.text(0.5, 0.5, 'This text stands out because of\n'
                          'its black border.', color='white',
                          ha='center', va='center', size=30)
text.set_path_effects([path_effects.Stroke(linewidth=3, foreground='black'),
                       path_effects.Normal()])
plt.show()
```

It is important to note that this effect only works because we have drawn the text path twice; once with a thick black line, and then once with the original text path on top.

You may have noticed that the keywords to *Stroke* and *SimplePatchShadow* and *SimpleLineShadow* are not the usual Artist keywords (*facecolor* *edgecolor*, etc.). This is because with these path effects we are operating at lower level of Matplotlib. In fact, the keywords which are accepted are those for a *matplotlib.backend_bases.GraphicsContextBase* instance, which have been designed for making it easy to create new backends - and not for its user interface.

Greater control of the path effect artist

As already mentioned, some of the path effects operate at a lower level than most users will be used to, meaning that setting keywords such as *facecolor* and *edgecolor* raise an AttributeError. Luckily there is a generic *PathPatchEffect* path effect which creates a *patches.PathPatch* class with the original path. The keywords to this effect are identical to those of *patches.PathPatch*:

```
fig = plt.figure(figsize=(8, 1))
t = fig.text(0.02, 0.5, 'Hatch shadow', fontsize=75, weight=1000, va='center')
t.set_path_effects([
    path_effects.PathPatchEffect(
        offset=(4, -4), hatch='xxxx', facecolor='gray'),
    path_effects.PathPatchEffect(
        edgecolor='white', linewidth=1.1, facecolor='black')])
plt.show()
```

2.3.4 Transformations Tutorial

Like any graphics packages, Matplotlib is built on top of a transformation framework to easily move between coordinate systems, the userland *data* coordinate system, the *axes* coordinate system, the *figure* coordinate system, and the *display* coordinate system. In 95% of your plotting, you won't need to think about this, as it happens under the hood, but as you push the limits of custom figure generation, it helps to have an understanding of these objects so you can reuse the existing transformations Matplotlib makes available to you, or create your own (see *matplotlib.transforms*). The table below summarizes the some useful coordinate systems, the transformation object you should use to work in that coordinate system, and the description of that system. In the `Transformation Object` column, `ax` is a *Axes* instance, and `fig` is a *Figure* instance.

Co-ordi-nates	Transformation object	Description
"data"	`ax.transData`	The coordinate system for the data, controlled by xlim and ylim.
"axes"	`ax.transAxes`	The coordinate system of the *Axes*; (0, 0) is bottom left of the axes, and (1, 1) is top right of the axes.
"fig-ure"	`fig.transFigure`	The coordinate system of the *Figure*; (0, 0) is bottom left of the figure, and (1, 1) is top right of the figure.
"figure-inches"	`fig.dpi_scale_trans`	The coordinate system of the *Figure* in inches; (0, 0) is bottom left of the figure, and (width, height) is the top right of the figure in inches.
"dis-play"	`None`, or `IdentityTransform()`	The pixel coordinate system of the display window; (0, 0) is bottom left of the window, and (width, height) is top right of the display window in pixels.
"xaxis", "yaxis"	`ax.get_xaxis_transform()`, `ax.get_yaxis_transform()`	Blended coordinate systems; use data coordinates on one of the axis and axes coordinates on the other.

All of the transformation objects in the table above take inputs in their coordinate system, and transform the input to the *display* coordinate system. That is why the *display* coordinate system has `None` for the `Transformation Object` column -- it already is in *display* coordinates. The transformations also know how to invert themselves, to go from *display* back to the native coordinate system. This is particularly useful when processing events from the user interface, which typically occur in display space, and you want to know where the mouse click or key-press occurred in your *data* coordinate system.

Note that specifying objects in *display* coordinates will change their location if the `dpi` of the figure changes. This can cause confusion when printing or changing screen resolution, because the object can change location and size. Therefore it is most common for artists placed in an axes or figure to have their transform set to something *other* than the *IdentityTransform()*; the default when an artist is placed on an axes using *add_artist* is for the transform to be `ax.transData`.

Data coordinates

Let's start with the most commonly used coordinate, the *data* coordinate system. Whenever you add data to the axes, Matplotlib updates the datalimits, most commonly updated with the *set_xlim()* and *set_ylim()* methods. For example, in the figure below, the data limits stretch from 0 to 10 on the x-axis, and -1 to 1 on the y-axis.

```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.patches as mpatches
```

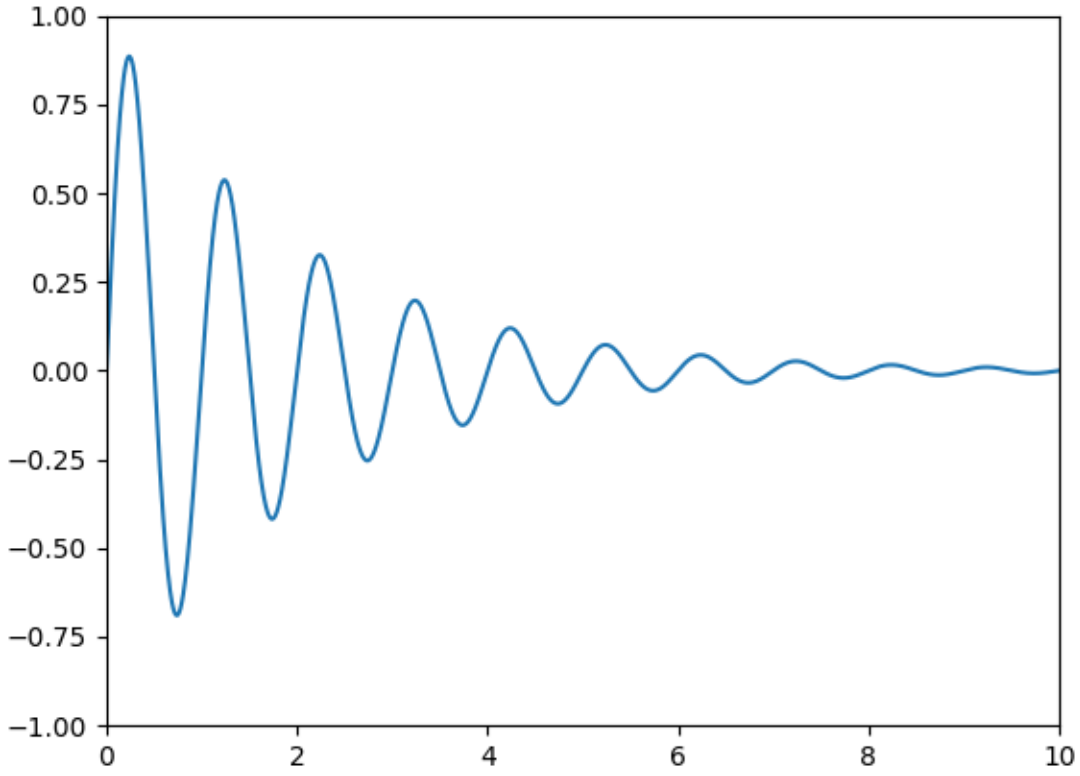
(continues on next page)

(continued from previous page)

```
x = np.arange(0, 10, 0.005)
y = np.exp(-x/2.) * np.sin(2*np.pi*x)

fig, ax = plt.subplots()
ax.plot(x, y)
ax.set_xlim(0, 10)
ax.set_ylim(-1, 1)

plt.show()
```



You can use the `ax.transData` instance to transform from your *data* to your *display* coordinate system, either a single point or a sequence of points as shown below:

```
In [14]: type(ax.transData)
Out[14]: <class 'matplotlib.transforms.CompositeGenericTransform'>

In [15]: ax.transData.transform((5, 0))
Out[15]: array([ 335.175,  247.   ])

In [16]: ax.transData.transform([(5, 0), (1, 2)])
Out[16]:
```

(continues on next page)

(continued from previous page)

```
array([[ 335.175,  247.   ],
       [ 132.435,  642.2  ]])
```

You can use the *inverted()* method to create a transform which will take you from *display* to *data* coordinates:

```
In [41]: inv = ax.transData.inverted()

In [42]: type(inv)
Out[42]: <class 'matplotlib.transforms.CompositeGenericTransform'>

In [43]: inv.transform((335.175,  247.))
Out[43]: array([ 5.,  0.])
```

If your are typing along with this tutorial, the exact values of the *display* coordinates may differ if you have a different window size or dpi setting. Likewise, in the figure below, the display labeled points are probably not the same as in the ipython session because the documentation figure size defaults are different.

```
x = np.arange(0, 10, 0.005)
y = np.exp(-x/2.) * np.sin(2*np.pi*x)

fig, ax = plt.subplots()
ax.plot(x, y)
ax.set_xlim(0, 10)
ax.set_ylim(-1, 1)

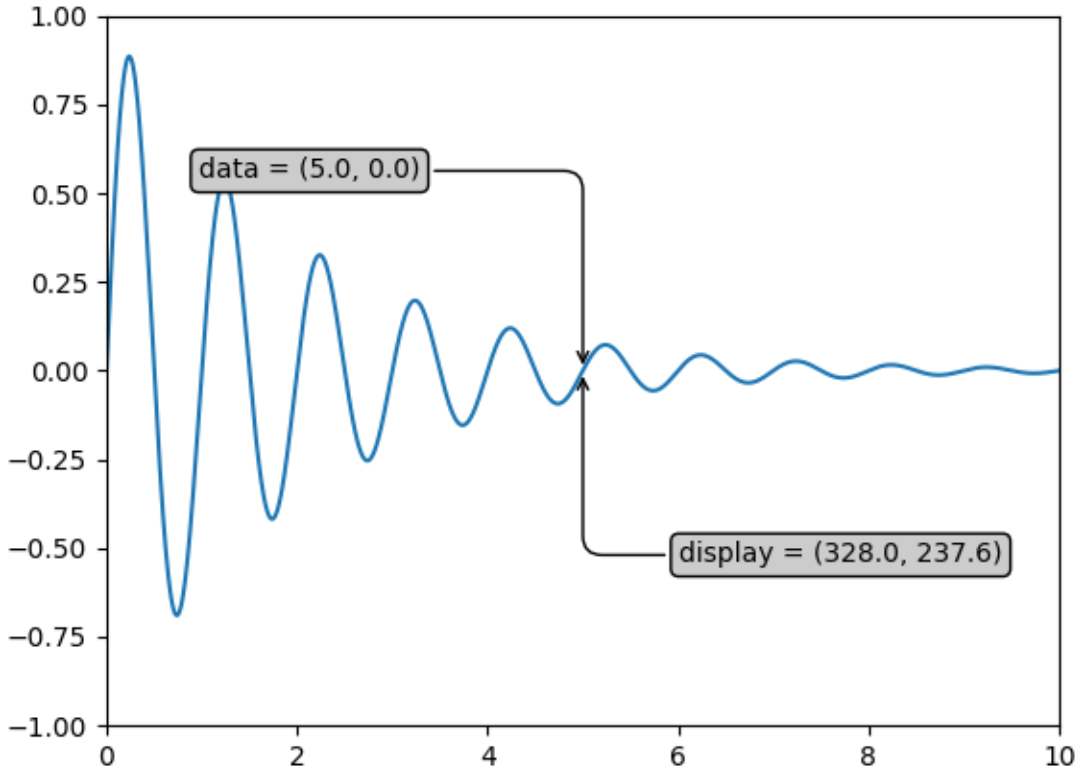
xdata, ydata = 5, 0
xdisplay, ydisplay = ax.transData.transform((xdata, ydata))

bbox = dict(boxstyle="round", fc="0.8")
arrowprops = dict(
    arrowstyle="->",
    connectionstyle="angle,angleA=0,angleB=90,rad=10")

offset = 72
ax.annotate('data = (%.1f, %.1f)' % (xdata, ydata),
            (xdata, ydata), xytext=(-2*offset, offset), textcoords='offset points',
            bbox=bbox, arrowprops=arrowprops)

disp = ax.annotate('display = (%.1f, %.1f)' % (xdisplay, ydisplay),
                   (xdisplay, ydisplay), xytext=(0.5*offset, -offset),
                   xycoords='figure pixels',
                   textcoords='offset points',
                   bbox=bbox, arrowprops=arrowprops)

plt.show()
```



Note: If you run the source code in the example above in a GUI backend, you may also find that the two arrows for the *data* and *display* annotations do not point to exactly the same point. This is because the display point was computed before the figure was displayed, and the GUI backend may slightly resize the figure when it is created. The effect is more pronounced if you resize the figure yourself. This is one good reason why you rarely want to work in *display* space, but you can connect to the `'on_draw'` *Event* to update *figure* coordinates on figure draws; see *Event handling and picking*.

When you change the x or y limits of your axes, the data limits are updated so the transformation yields a new display point. Note that when we just change the ylim, only the y-display coordinate is altered, and when we change the xlim too, both are altered. More on this later when we talk about the *Bbox*.

```
In [54]: ax.transData.transform((5, 0))
Out[54]: array([ 335.175,  247.   ])

In [55]: ax.set_ylim(-1, 2)
Out[55]: (-1, 2)
```

(continues on next page)

(continued from previous page)

```
In [56]: ax.transData.transform((5, 0))
Out[56]: array([ 335.175     ,  181.13333333])

In [57]: ax.set_xlim(10, 20)
Out[57]: (10, 20)

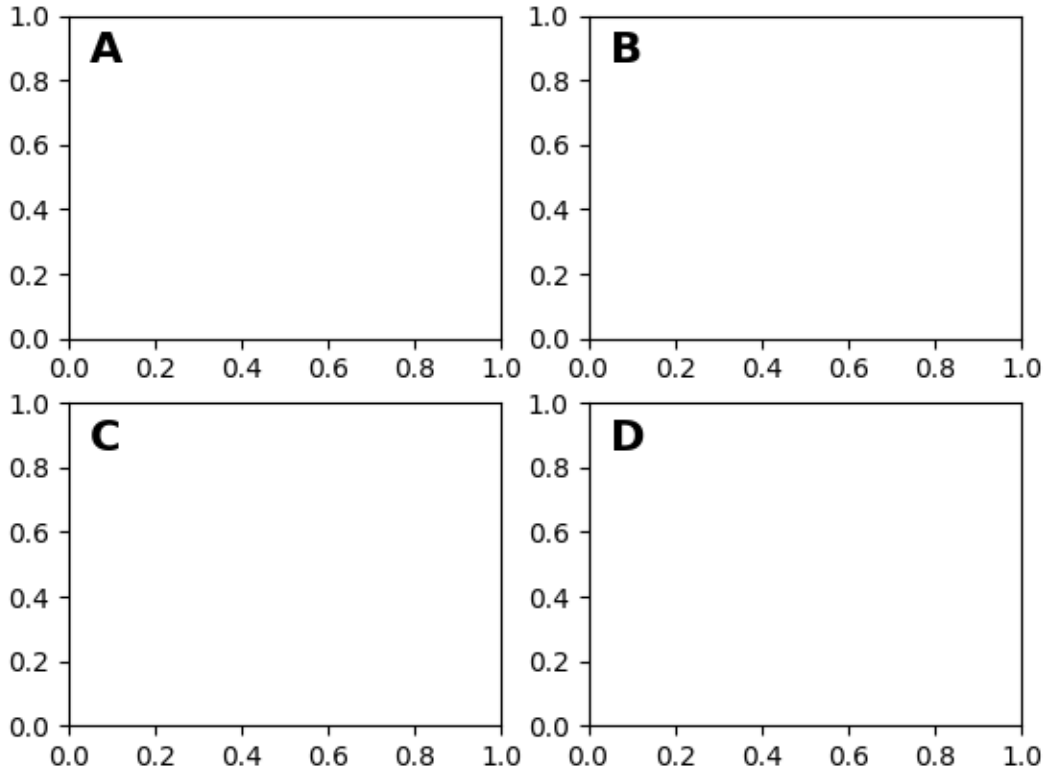
In [58]: ax.transData.transform((5, 0))
Out[58]: array([-171.675     ,  181.13333333])
```

Axes coordinates

After the *data* coordinate system, *axes* is probably the second most useful coordinate system. Here the point (0, 0) is the bottom left of your axes or subplot, (0.5, 0.5) is the center, and (1.0, 1.0) is the top right. You can also refer to points outside the range, so (-0.1, 1.1) is to the left and above your axes. This coordinate system is extremely useful when placing text in your axes, because you often want a text bubble in a fixed, location, e.g., the upper left of the axes pane, and have that location remain fixed when you pan or zoom. Here is a simple example that creates four panels and labels them 'A', 'B', 'C', 'D' as you often see in journals.

```
fig = plt.figure()
for i, label in enumerate(('A', 'B', 'C', 'D')):
    ax = fig.add_subplot(2, 2, i+1)
    ax.text(0.05, 0.95, label, transform=ax.transAxes,
            fontsize=16, fontweight='bold', va='top')

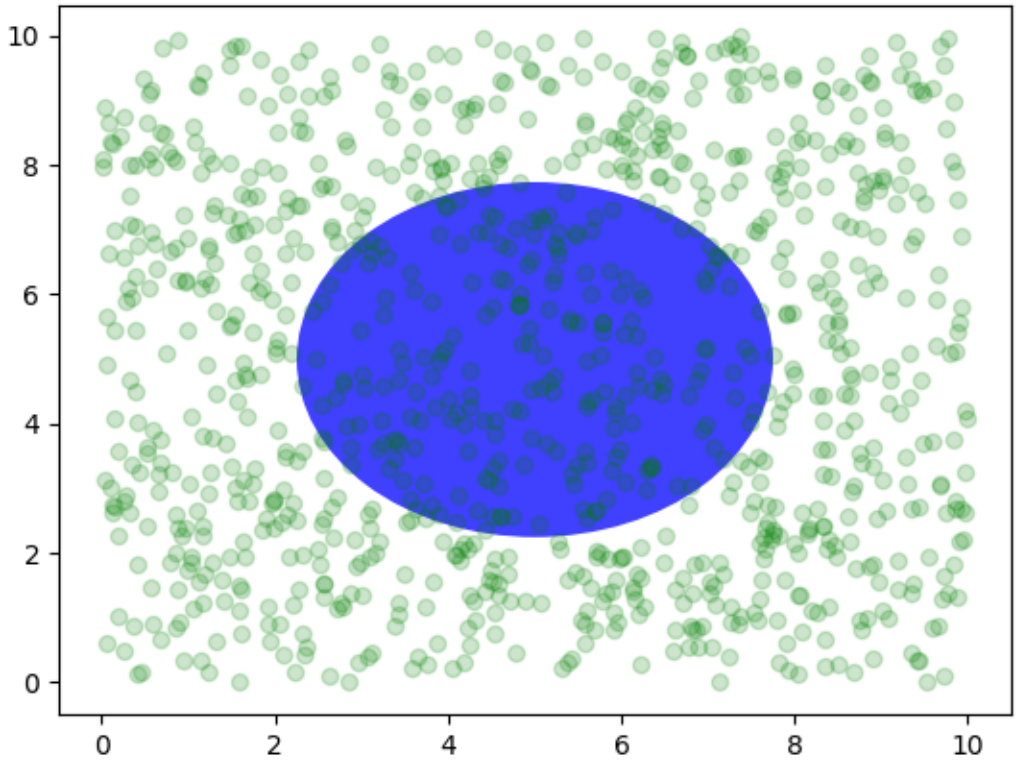
plt.show()
```



You can also make lines or patches in the *axes* coordinate system, but this is less useful in my experience than using `ax.transAxes` for placing text. Nonetheless, here is a silly example which plots some random dots in data space, and overlays a semi-transparent *Circle* centered in the middle of the axes with a radius one quarter of the axes -- if your axes does not preserve aspect ratio (see *set_aspect()*), this will look like an ellipse. Use the pan/zoom tool to move around, or manually change the data xlim and ylim, and you will see the data move, but the circle will remain fixed because it is not in *data* coordinates and will always remain at the center of the axes.

```
fig, ax = plt.subplots()
x, y = 10*np.random.rand(2, 1000)
ax.plot(x, y, 'go', alpha=0.2)  # plot some data in data coordinates

circ = mpatches.Circle((0.5, 0.5), 0.25, transform=ax.transAxes,
                       facecolor='blue', alpha=0.75)
ax.add_patch(circ)
plt.show()
```



Blended transformations

Drawing in *blended* coordinate spaces which mix *axes* with *data* coordinates is extremely useful, for example to create a horizontal span which highlights some region of the y-data but spans across the x-axis regardless of the data limits, pan or zoom level, etc. In fact these blended lines and spans are so useful, we have built in functions to make them easy to plot (see *axhline()*, *axvline()*, *axhspan()*, *axvspan()*) but for didactic purposes we will implement the horizontal span here using a blended transformation. This trick only works for separable transformations, like you see in normal Cartesian coordinate systems, but not on inseparable transformations like the *PolarTransform*.

```
import matplotlib.transforms as transforms

fig, ax = plt.subplots()
x = np.random.randn(1000)

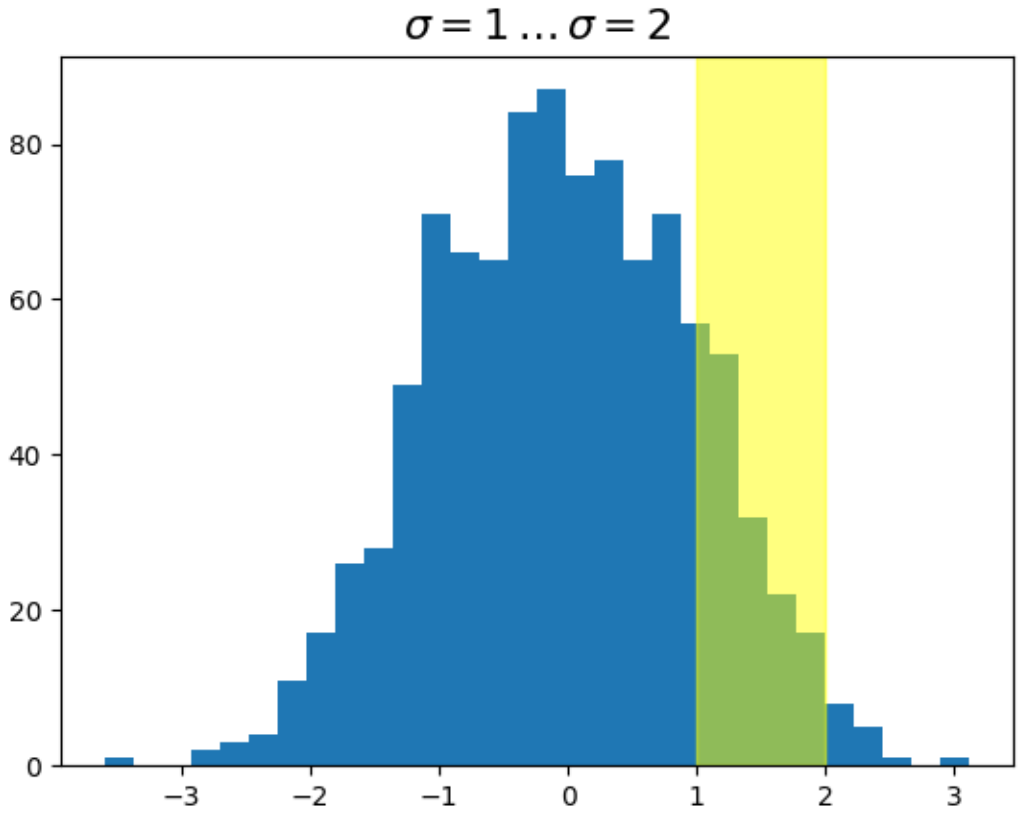
ax.hist(x, 30)
ax.set_title(r'$\sigma=1 \/ \dots \/ \sigma=2$', fontsize=16)
```

(continues on next page)

(continued from previous page)

```
# the x coords of this transformation are data, and the y coord are axes
trans = transforms.blended_transform_factory(
    ax.transData, ax.transAxes)
# highlight the 1..2 stddev region with a span.
# We want x to be in data coordinates and y to span from 0..1 in axes coords.
rect = mpatches.Rectangle((1, 0), width=1, height=1, transform=trans,
                          color='yellow', alpha=0.5)
ax.add_patch(rect)

plt.show()
```



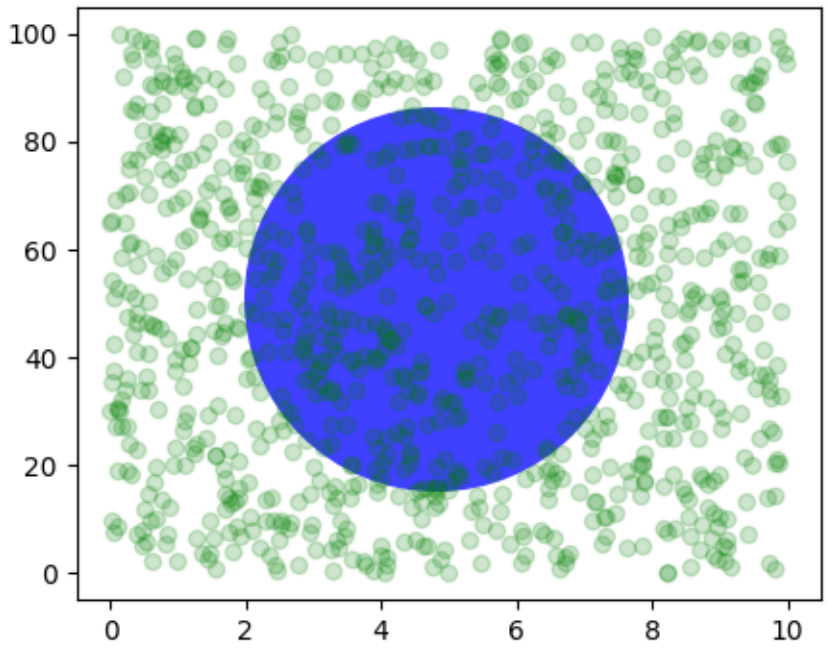
Note: The blended transformations where x is in *data* coords and y in *axes* coordinates is so useful that we have helper methods to return the versions Matplotlib uses internally for drawing ticks, ticklabels, etc. The methods are *matplotlib.axes.Axes.get_xaxis_transform()* and *matplotlib.axes.Axes.get_yaxis_transform()*. So in the example above, the call to *blended_transform_factory()* can be replaced by `get_xaxis_transform`:

```
trans = ax.get_xaxis_transform()
```

Plotting in physical coordinates

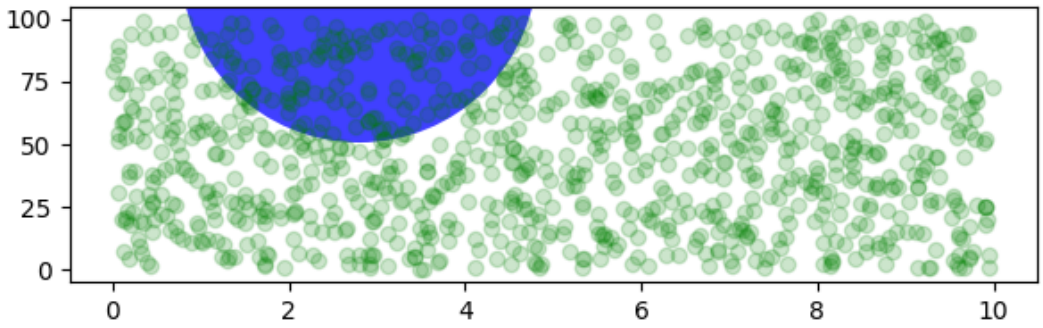
Sometimes we want an object to be a certain physical size on the plot. Here we draw the same circle as above, but in physical coordinates. If done interactively, you can see that changing the size of the figure does not change the offset of the circle from the lower-left corner, does not change its size, and the circle remains a circle regardless of the aspect ratio of the axes.

```
fig, ax = plt.subplots(figsize=(5, 4))
x, y = 10*np.random.rand(2, 1000)
ax.plot(x, y*10., 'go', alpha=0.2)  # plot some data in data coordinates
# add a circle in fixed-coordinates
circ = mpatches.Circle((2.5, 2), 1.0, transform=fig.dpi_scale_trans,
                       facecolor='blue', alpha=0.75)
ax.add_patch(circ)
plt.show()
```



If we change the figure size, the circle does not change its absolute position and is cropped.

```
fig, ax = plt.subplots(figsize=(7, 2))
x, y = 10*np.random.rand(2, 1000)
ax.plot(x, y*10., 'go', alpha=0.2)  # plot some data in data coordinates
# add a circle in fixed-coordinates
circ = mpatches.Circle((2.5, 2), 1.0, transform=fig.dpi_scale_trans,
                       facecolor='blue', alpha=0.75)
ax.add_patch(circ)
plt.show()
```



Another use is putting a patch with a set physical dimension around a data point on the axes. Here we add together two transforms. The first sets the scaling of how large the ellipse should be and the second sets its position. The ellipse is then placed at the origin, and then we use the helper transform *ScaledTranslation* to move it to the right place in the `ax.transData` coordinate system. This helper is instantiated with:

```
trans = ScaledTranslation(xt, yt, scale_trans)
```

where *xt* and *yt* are the translation offsets, and *scale_trans* is a transformation which scales *xt* and *yt* at transformation time before applying the offsets.

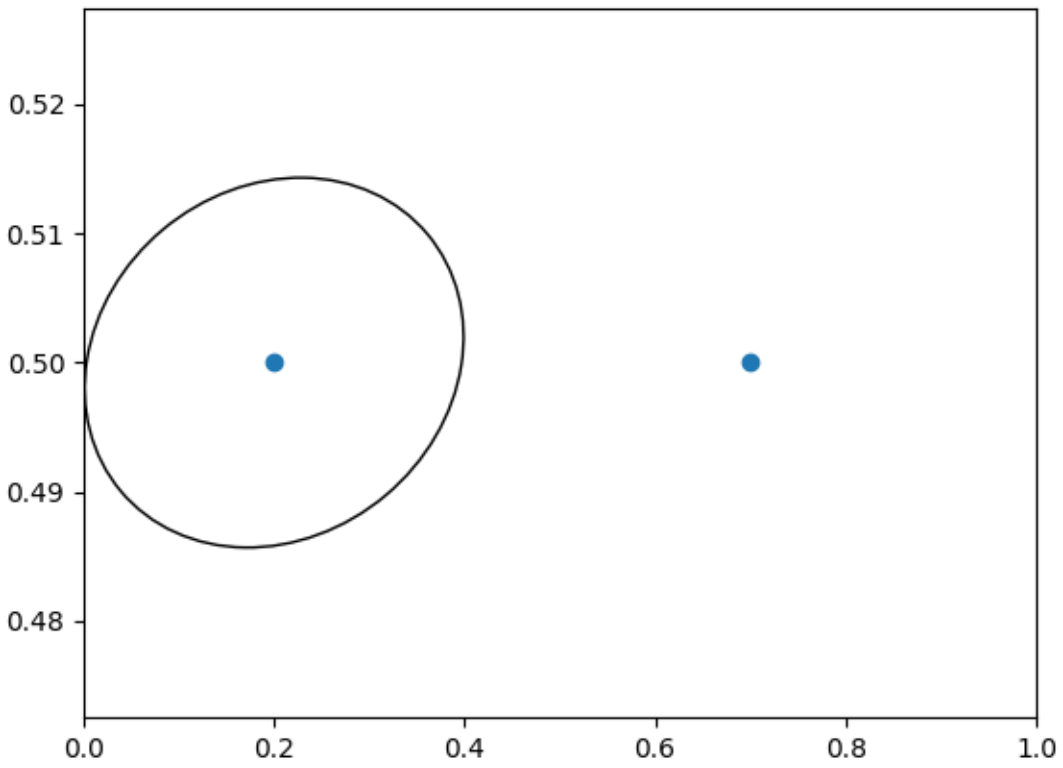
Note the use of the plus operator on the transforms below. This code says: first apply the scale transformation `fig.dpi_scale_trans` to make the ellipse the proper size, but still centered at (0, 0), and then translate the data to `xdata[0]` and `ydata[0]` in data space.

In interactive use, the ellipse stays the same size even if the axes limits are changed via zoom.

```
fig, ax = plt.subplots()
xdata, ydata = (0.2, 0.7), (0.5, 0.5)
ax.plot(xdata, ydata, "o")
ax.set_xlim((0, 1))

trans = (fig.dpi_scale_trans +
         transforms.ScaledTranslation(xdata[0], ydata[0], ax.transData))

# plot an ellipse around the point that is 150 x 130 points in diameter...
circle = mpatches.Ellipse((0, 0), 150/72, 130/72, angle=40,
                          fill=None, transform=trans)
ax.add_patch(circle)
plt.show()
```



Note: The order of transformation matters. Here the ellipse is given the right dimensions in display space *first* and then moved in data space to the correct spot. If we had done the `ScaledTranslation` first, then `xdata[0]` and `ydata[0]` would first be transformed to *display* coordinates (`[ 358.4 475.2]` on a 200-dpi monitor) and then those coordinates would be scaled by `fig.dpi_scale_trans` pushing the center of the ellipse well off the screen (i.e. `[ 71680. 95040.]`).

Using offset transforms to create a shadow effect

Another use of *`ScaledTranslation`* is to create a new transformation that is offset from another transformation, e.g., to place one object shifted a bit relative to another object. Typically you want the shift to be in some physical dimension, like points or inches rather than in *data* coordinates, so that the shift effect is constant at different zoom levels and dpi settings.

One use for an offset is to create a shadow effect, where you draw one object identical to the first just to the right of it, and just below it, adjusting the zorder to make sure the shadow is drawn first and then the object it is shadowing above it.

Here we apply the transforms in the *opposite* order to the use of *ScaledTranslation* above. The plot is first made in data coordinates (`ax.transData`) and then shifted by `dx` and `dy` points using `fig.dpi_scale_trans`. (In typography, a point is 1/72 inches, and by specifying your offsets in points, your figure will look the same regardless of the dpi resolution it is saved in.)

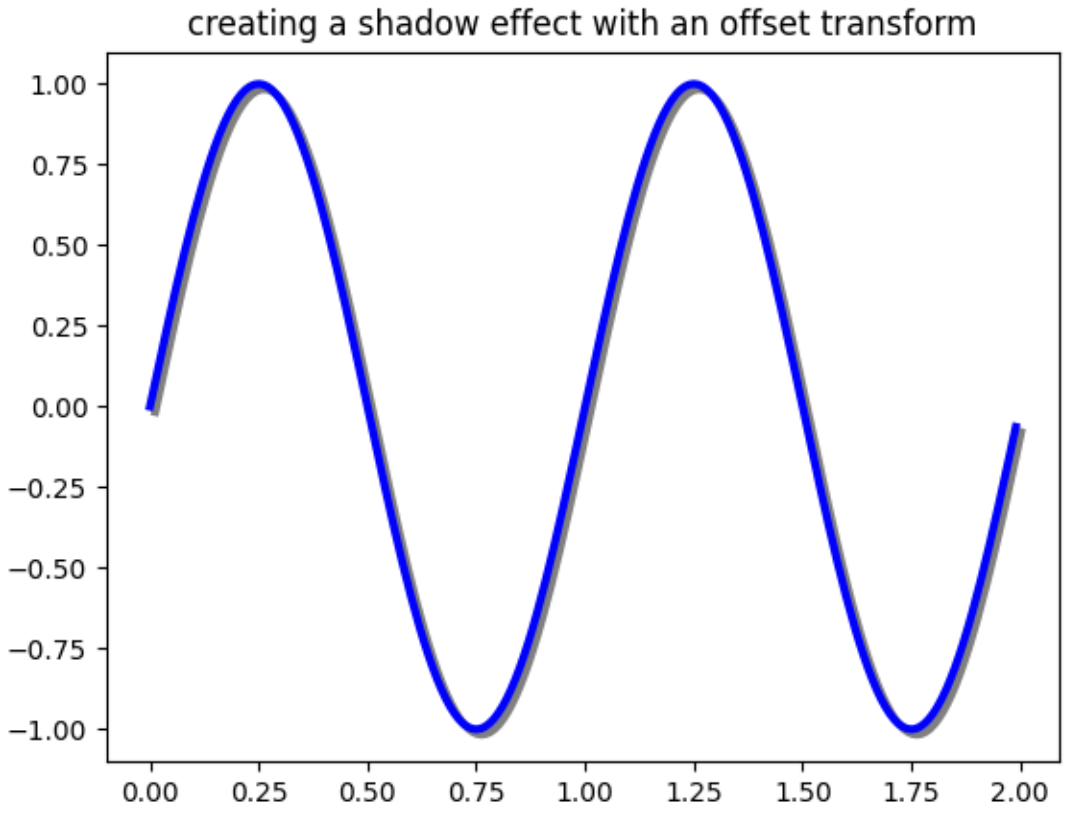
```
fig, ax = plt.subplots()

# make a simple sine wave
x = np.arange(0., 2., 0.01)
y = np.sin(2*np.pi*x)
line, = ax.plot(x, y, lw=3, color='blue')

# shift the object over 2 points, and down 2 points
dx, dy = 2/72., -2/72.
offset = transforms.ScaledTranslation(dx, dy, fig.dpi_scale_trans)
shadow_transform = ax.transData + offset

# now plot the same data with our offset transform;
# use the zorder to make sure we are below the line
ax.plot(x, y, lw=3, color='gray',
        transform=shadow_transform,
        zorder=0.5*line.get_zorder())

ax.set_title('creating a shadow effect with an offset transform')
plt.show()
```



Note: The dpi and inches offset is a common-enough use case that we have a special helper function to create it in *matplotlib.transforms.offset_copy()*, which returns a new transform with an added offset. So above we could have done:

```
shadow_transform = transforms.offset_copy(ax.transData,
        fig=fig, dx, dy, units='inches')
```

The transformation pipeline

The `ax.transData` transform we have been working with in this tutorial is a composite of three different transformations that comprise the transformation pipeline from *data -> display* coordinates. Michael Droettboom implemented the transformations framework, taking care to provide a clean API that segregated the nonlinear projections and scales that happen in polar and logarithmic plots, from the linear affine transformations that happen when you pan and zoom. There is an efficiency here, because you can pan and zoom in your axes which affects the affine transformation, but you may not need to compute the potentially expensive nonlinear scales or projections on simple navigation events. It is also possible to multiply affine transformation

matrices together, and then apply them to coordinates in one step. This is not true of all possible transformations.

Here is how the `ax.transData` instance is defined in the basic separable axis *Axes* class:

```
self.transData = self.transScale + (self.transLimits + self.transAxes)
```

We've been introduced to the `transAxes` instance above in *Axes coordinates*, which maps the (0, 0), (1, 1) corners of the axes or subplot bounding box to *display* space, so let's look at these other two pieces.

`self.transLimits` is the transformation that takes you from *data* to *axes* coordinates; i.e., it maps your view xlim and ylim to the unit space of the axes (and `transAxes` then takes that unit space to display space). We can see this in action here

```
In [80]: ax = subplot(111)

In [81]: ax.set_xlim(0, 10)
Out[81]: (0, 10)

In [82]: ax.set_ylim(-1, 1)
Out[82]: (-1, 1)

In [84]: ax.transLimits.transform((0, -1))
Out[84]: array([ 0.,  0.])

In [85]: ax.transLimits.transform((10, -1))
Out[85]: array([ 1.,  0.])

In [86]: ax.transLimits.transform((10, 1))
Out[86]: array([ 1.,  1.])

In [87]: ax.transLimits.transform((5, 0))
Out[87]: array([ 0.5,  0.5])
```

and we can use this same inverted transformation to go from the unit *axes* coordinates back to *data* coordinates.

```
In [90]: inv.transform((0.25, 0.25))
Out[90]: array([ 2.5, -0.5])
```

The final piece is the `self.transScale` attribute, which is responsible for the optional non-linear scaling of the data, e.g., for logarithmic axes. When an Axes is initially setup, this is just set to the identity transform, since the basic Matplotlib axes has linear scale, but when you call a logarithmic scaling function like *semilogx()* or explicitly set the scale to logarithmic with *set_xscale()*, then the `ax.transScale` attribute is set to handle the nonlinear projection. The scales transforms are properties of the respective `xaxis` and `yaxis` *Axis* instances. For example, when you call `ax.set_xscale('log')`, the xaxis updates its scale to a *matplotlib.scale.LogScale* instance.

For non-separable axes the PolarAxes, there is one more piece to consider, the projection transformation. The `transData` *matplotlib.projections.polar.PolarAxes* is

similar to that for the typical separable matplotlib Axes, with one additional piece `transProjection`:

```
self.transData = self.transScale + self.transProjection + \
    (self.transProjectionAffine + self.transAxes)
```

`transProjection` handles the projection from the space, e.g., latitude and longitude for map data, or radius and theta for polar data, to a separable Cartesian coordinate system. There are several projection examples in the *matplotlib.projections* package, and the best way to learn more is to open the source for those packages and see how to make your own, since Matplotlib supports extensible axes and projections. Michael Droettboom has provided a nice tutorial example of creating a Hammer projection axes; see /gallery/misc/custom_projection.

Total running time of the script: (0 minutes 2.835 seconds)

2.4 Colors

Matplotlib has support for visualizing information with a wide array of colors and colormaps. These tutorials cover the basics of how these colormaps look, how you can create your own, and how you can customize colormaps for your use case.

For even more information see the examples page.

2.4.1 Specifying Colors

Matplotlib recognizes the following formats to specify a color:

- an RGB or RGBA (red, green, blue, alpha) tuple of float values in closed interval `[0, 1]` (e.g., `(0.1, 0.2, 0.5)` or `(0.1, 0.2, 0.5, 0.3)`);
- a hex RGB or RGBA string (e.g., `'#0f0f0f'` or `'#0f0f0f80'`; case-insensitive);
- a shorthand hex RGB or RGBA string, equivalent to the hex RGB or RGBA string obtained by duplicating each character, (e.g., `'#abc'`, equivalent to `'#aabbcc'`, or `'#abcd'`, equivalent to `'#aabbccdd'`; case-insensitive);
- a string representation of a float value in `[0, 1]` inclusive for gray level (e.g., `'0.5'`);
- one of the characters `{'b', 'g', 'r', 'c', 'm', 'y', 'k', 'w'}`, which are short-hand notations for shades of blue, green, red, cyan, magenta, yellow, black, and white. Note that the colors `'g'`, `'c'`, `'m'`, `'y'` do not coincide with the X11/CSS4 colors. Their particular shades were chosen for better visibility of colored lines against typical backgrounds.
- a X11/CSS4 color name (case-insensitive);
- a name from the xkcd color survey, prefixed with `'xkcd:'` (e.g., `'xkcd:sky blue'`; case insensitive);

- one of the Tableau Colors from the 'T10' categorical palette (the default color cycle): `{'tab:blue', 'tab:orange', 'tab:green', 'tab:red', 'tab:purple', 'tab:brown', 'tab:pink', 'tab:gray', 'tab:olive', 'tab:cyan'}` (case-insensitive);
- a "CN" color spec, i.e. `'C'` followed by a number, which is an index into the default property cycle (`rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`); the indexing is intended to occur at rendering time, and defaults to black if the cycle does not include color.

"Red", "Green", and "Blue" are the intensities of those colors, the combination of which span the colorspace.

How "Alpha" behaves depends on the `zorder` of the Artist. Higher `zorder` Artists are drawn on top of lower Artists, and "Alpha" determines whether the lower artist is covered by the higher. If the old RGB of a pixel is `RGBold` and the RGB of the pixel of the Artist being added is `RGBnew` with Alpha `alpha`, then the RGB of the pixel is updated to: `RGB = RGBOld * (1 - Alpha) + RGBnew * Alpha`. Alpha of 1 means the old color is completely covered by the new Artist, Alpha of 0 means that pixel of the Artist is transparent.

For more information on colors in matplotlib see

- the /gallery/color/color_demo example;
- the *matplotlib.colors* API;
- the /gallery/color/named_colors example.

"CN" color selection

"CN" colors are converted to RGBA as soon as the artist is created. For example,

```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib as mpl

th = np.linspace(0, 2*np.pi, 128)

def demo(sty):
    mpl.style.use(sty)
    fig, ax = plt.subplots(figsize=(3, 3))

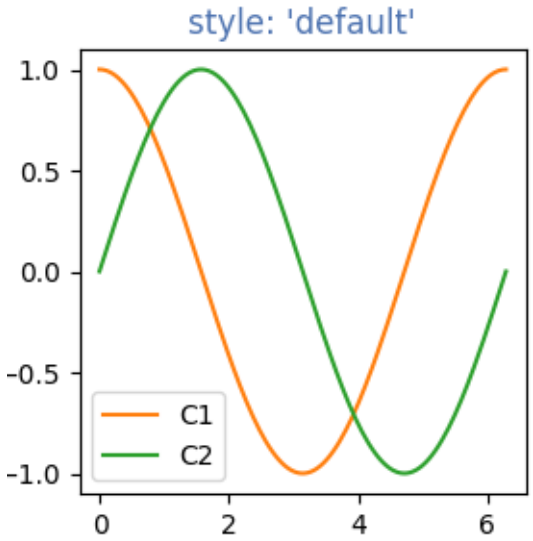
    ax.set_title('style: {!r}'.format(sty), color='C0')

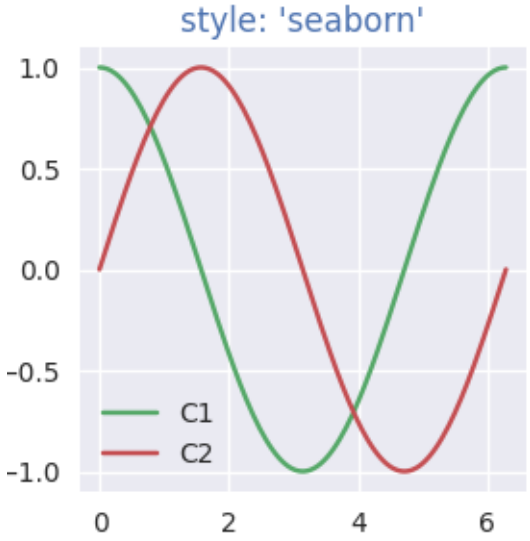
    ax.plot(th, np.cos(th), 'C1', label='C1')
    ax.plot(th, np.sin(th), 'C2', label='C2')
    ax.legend()
```

(continues on next page)

(continued from previous page)

```
demo('default')
demo('seaborn')
```





will use the first color for the title and then plot using the second and third colors of each style's `rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`).

xkcd v X11/CSS4

The xkcd colors are derived from a user survey conducted by the webcomic xkcd. Details of the survey are available on the xkcd blog.

Out of 148 colors in the CSS color list, there are 95 name collisions between the X11/CSS4 names and the xkcd names, all but 3 of which have different hex values. For example `'blue'` maps to `'#0000FF'` where as `'xkcd:blue'` maps to `'#0343DF'`. Due to these name collisions all of the xkcd colors have `'xkcd:'` prefixed. As noted in the blog post, while it might be interesting to re-define the X11/CSS4 names based on such a survey, we do not do so unilaterally.

The name collisions are shown in the table below; the color names where the hex values agree are shown in bold.

```
import matplotlib._color_data as mcd
import matplotlib.patches as mpatch

overlap = {name for name in mcd.CSS4_COLORS
           if "xkcd:" + name in mcd.XKCD_COLORS}

fig = plt.figure(figsize=[4.8, 16])
ax = fig.add_axes([0, 0, 1, 1])

for j, n in enumerate(sorted(overlap, reverse=True)):
    weight = None
    cn = mcd.CSS4_COLORS[n]
    xkcd = mcd.XKCD_COLORS["xkcd:" + n].upper()
    if cn == xkcd:
        weight = 'bold'

    r1 = mpatch.Rectangle((0, j), 1, 1, color=cn)
    r2 = mpatch.Rectangle((1, j), 1, 1, color=xkcd)
    txt = ax.text(2, j+.5, '  ' + n, va='center', fontsize=10,
                  weight=weight)
    ax.add_patch(r1)
    ax.add_patch(r2)
    ax.axhline(j, color='k')

ax.text(.5, j + 1.5, 'X11', ha='center', va='center')
ax.text(1.5, j + 1.5, 'xkcd', ha='center', va='center')
ax.set_xlim(0, 3)
ax.set_ylim(0, j + 2)
ax.axis('off')
```

X11

2.4.2 Customized Colorbars Tutorial

This tutorial shows how to build and customize standalone colorbars, i.e. without an attached plot.

Customized Colorbars

A *colorbar* needs a "mappable" (*matplotlib.cm.ScalarMappable*) object (typically, an image) which indicates the colormap and the norm to be used. In order to create a colorbar without an attached image, one can instead use a *ScalarMappable* with no associated data.

Basic continuous colorbar

Here we create a basic continuous colorbar with ticks and labels.

The arguments to the *colorbar* call are the *ScalarMappable* (constructed using the *norm* and *cmap* arguments), the axes where the colorbar should be drawn, and the colorbar's orientation.

For more information see the *colorbar* API.

```
import matplotlib.pyplot as plt
import matplotlib as mpl

fig, ax = plt.subplots(figsize=(6, 1))
fig.subplots_adjust(bottom=0.5)

cmap = mpl.cm.cool
norm = mpl.colors.Normalize(vmin=5, vmax=10)

fig.colorbar(mpl.cm.ScalarMappable(norm=norm, cmap=cmap),
             cax=ax, orientation='horizontal', label='Some Units')
```

Out:

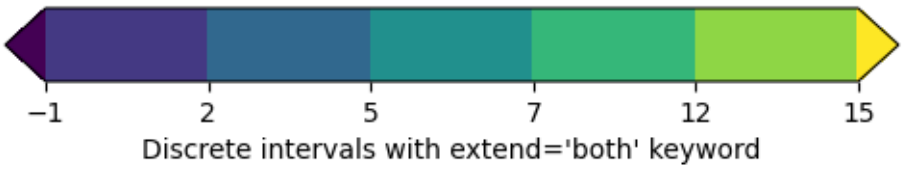
```
<matplotlib.colorbar.Colorbar object at 0x7f53ff7ba220>
```

Extended colorbar with continuous colorscale

The second example shows how to make a discrete colorbar based on a continuous cmap. With the "extend" keyword argument the appropriate colors are chosen to fill the colorspace, including the extensions:

```
fig, ax = plt.subplots(figsize=(6, 1))
fig.subplots_adjust(bottom=0.5)

cmap = mpl.cm.viridis
bounds = [-1, 2, 5, 7, 12, 15]
norm = mpl.colors.BoundaryNorm(bounds, cmap.N, extend='both')
cb2 = mpl.colorbar.ColorbarBase(ax, cmap=cmap,
                                norm=norm,
                                orientation='horizontal')
cb2.set_label("Discrete intervals with extend='both' keyword")
fig.show()
```



Discrete intervals colorbar

The third example illustrates the use of a *ListedColormap* which generates a colormap from a set of listed colors, *colors.BoundaryNorm* which generates a colormap index based on discrete intervals and extended ends to show the "over" and "under" value colors. Over and under are used to display data outside of the normalized [0, 1] range. Here we pass colors as gray shades as a string encoding a float in the 0-1 range.

If a *ListedColormap* is used, the length of the bounds array must be one greater than the length of the color list. The bounds must be monotonically increasing.

This time we pass additional arguments to *colorbar*. For the out-of-range values to display on the colorbar without using the *extend* keyword with *colors.BoundaryNorm*, we have to use the *extend* keyword argument directly in the colorbar call, and supply an additional boundary on each end of the range. Here we also use the spacing argument to make the length of each colorbar segment proportional to its corresponding interval.

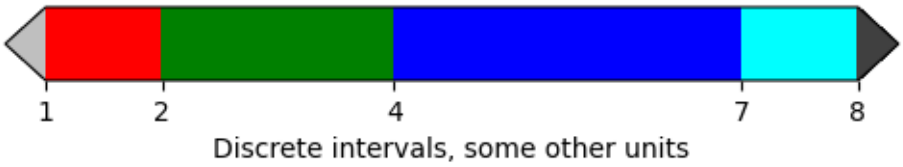
```
fig, ax = plt.subplots(figsize=(6, 1))
fig.subplots_adjust(bottom=0.5)
```

(continues on next page)

(continued from previous page)

```
cmap = mpl.colors.ListedColormap(['red', 'green', 'blue', 'cyan'])
cmap.set_over('0.25')
cmap.set_under('0.75')

bounds = [1, 2, 4, 7, 8]
norm = mpl.colors.BoundaryNorm(bounds, cmap.N)
fig.colorbar(
    mpl.cm.ScalarMappable(cmap=cmap, norm=norm),
    cax=ax,
    boundaries=[0] + bounds + [13],  # Adding values for extensions.
    extend='both',
    ticks=bounds,
    spacing='proportional',
    orientation='horizontal',
    label='Discrete intervals, some other units',
)
```



Out:

```
<matplotlib.colorbar.Colorbar object at 0x7f54005f6e20>
```

Colorbar with custom extension lengths

Here we illustrate the use of custom length colorbar extensions, on a colorbar with discrete intervals. To make the length of each extension the same as the length of the interior colors, use `extendfrac='auto'`.

```
fig, ax = plt.subplots(figsize=(6, 1))
fig.subplots_adjust(bottom=0.5)

cmap = mpl.colors.ListedColormap(['royalblue', 'cyan',
                                  'yellow', 'orange'])
cmap.set_over('red')
cmap.set_under('blue')

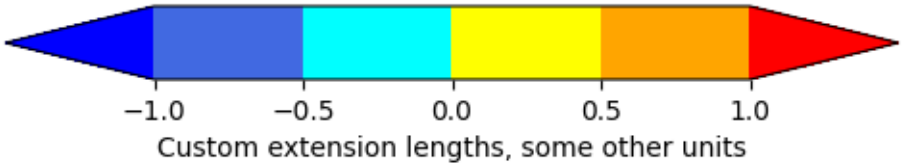
bounds = [-1.0, -0.5, 0.0, 0.5, 1.0]
norm = mpl.colors.BoundaryNorm(bounds, cmap.N)
fig.colorbar(
    mpl.cm.ScalarMappable(cmap=cmap, norm=norm),
    cax=ax,
    boundaries=[-10] + bounds + [10],
```

(continues on next page)

(continued from previous page)

```
    extend='both',
    extendfrac='auto',
    ticks=bounds,
    spacing='uniform',
    orientation='horizontal',
    label='Custom extension lengths, some other units',
)

plt.show()
```



2.4.3 Creating Colormaps in Matplotlib

Matplotlib has a number of built-in colormaps accessible via *matplotlib.cm.get_cmap*. There are also external libraries like palettable that have many extra colormaps.

However, we often want to create or manipulate colormaps in Matplotlib. This can be done using the class *ListedColormap* or *LinearSegmentedColormap*. Seen from the outside, both colormap classes map values between 0 and 1 to a bunch of colors. There are, however, slight differences, some of which are shown in the following.

Before manually creating or manipulating colormaps, let us first see how we can obtain colormaps and their colors from existing colormap classes.

Getting colormaps and accessing their values

First, getting a named colormap, most of which are listed in *Choosing Colormaps in Matplotlib*, may be done using *matplotlib.cm.get_cmap*, which returns a colormap object. The second argument gives the size of the list of colors used to define the colormap, and below we use a modest value of 8 so there are not a lot of values to look at.

```
import numpy as np
import matplotlib.pyplot as plt
from matplotlib import cm
from matplotlib.colors import ListedColormap, LinearSegmentedColormap

viridis = cm.get_cmap('viridis', 8)
```

The object `viridis` is a callable, that when passed a float between 0 and 1 returns an RGBA value from the colormap:

```
print(viridis(0.56))
```

Out:

```
(0.122312, 0.633153, 0.530398, 1.0)
```

ListedColormap

ListedColormap s store their color values in a `.colors` attribute. The list of colors that comprise the colormap can be directly accessed using the `colors` property, or it can be accessed indirectly by calling `viridis` with an array of values matching the length of the colormap. Note that the returned list is in the form of an RGBA Nx4 array, where N is the length of the colormap.

```
print('viridis.colors', viridis.colors)
print('viridis(range(8))', viridis(range(8)))
print('viridis(np.linspace(0, 1, 8))', viridis(np.linspace(0, 1, 8)))
```

Out:

```
viridis.colors [[0.267004 0.004874 0.329415 1.      ]
 [0.275191 0.194905 0.496005 1.      ]
 [0.212395 0.359683 0.55171  1.      ]
 [0.153364 0.497    0.557724 1.      ]
 [0.122312 0.633153 0.530398 1.      ]
 [0.288921 0.758394 0.428426 1.      ]
 [0.626579 0.854645 0.223353 1.      ]
 [0.993248 0.906157 0.143936 1.      ]]
viridis(range(8)) [[0.267004 0.004874 0.329415 1.      ]
 [0.275191 0.194905 0.496005 1.      ]
 [0.212395 0.359683 0.55171  1.      ]
 [0.153364 0.497    0.557724 1.      ]
 [0.122312 0.633153 0.530398 1.      ]
 [0.288921 0.758394 0.428426 1.      ]
 [0.626579 0.854645 0.223353 1.      ]
 [0.993248 0.906157 0.143936 1.      ]]
viridis(np.linspace(0, 1, 8)) [[0.267004 0.004874 0.329415 1.      ]
 [0.275191 0.194905 0.496005 1.      ]
 [0.212395 0.359683 0.55171  1.      ]
 [0.153364 0.497    0.557724 1.      ]
 [0.122312 0.633153 0.530398 1.      ]
 [0.288921 0.758394 0.428426 1.      ]
 [0.626579 0.854645 0.223353 1.      ]
 [0.993248 0.906157 0.143936 1.      ]]
```

The colormap is a lookup table, so "oversampling" the colormap returns nearest-neighbor interpolation (note the repeated colors in the list below)

```
print('viridis(np.linspace(0, 1, 12))', viridis(np.linspace(0, 1, 12)))
```

Out:

```
viridis(np.linspace(0, 1, 12)) [[0.267004 0.004874 0.329415 1.      ]
 [0.267004 0.004874 0.329415 1.      ]
 [0.275191 0.194905 0.496005 1.      ]
 [0.212395 0.359683 0.55171  1.      ]
 [0.212395 0.359683 0.55171  1.      ]
 [0.153364 0.497    0.557724 1.      ]
 [0.122312 0.633153 0.530398 1.      ]

 [0.288921 0.758394 0.428426 1.      ]
 [0.626579 0.854645 0.223353 1.      ]
 [0.993248 0.906157 0.143936 1.      ]
 [0.993248 0.906157 0.143936 1.      ]]
```

LinearSegmentedColormap

LinearSegmentedColormap s do not have a `.colors` attribute. However, one may still call the colormap with an integer array, or with a float array between 0 and 1.

```
copper = cm.get_cmap('copper', 8)

print('copper(range(8))', copper(range(8)))
print('copper(np.linspace(0, 1, 8))', copper(np.linspace(0, 1, 8)))
```

Out:

```
copper(range(8)) [[0.         0.         0.         1.        ]
 [0.17647055 0.1116     0.07107143 1.        ]
 [0.35294109 0.2232     0.14214286 1.        ]
 [0.52941164 0.3348     0.21321429 1.        ]
 [0.70588219 0.4464     0.28428571 1.        ]
 [0.88235273 0.558      0.35535714 1.        ]
 [1.         0.6696     0.42642857 1.        ]
 [1.         0.7812     0.4975     1.        ]]
copper(np.linspace(0, 1, 8)) [[0.         0.         0.         1.        ]
 [0.17647055 0.1116     0.07107143 1.        ]
 [0.35294109 0.2232     0.14214286 1.        ]
 [0.52941164 0.3348     0.21321429 1.        ]
 [0.70588219 0.4464     0.28428571 1.        ]
 [0.88235273 0.558      0.35535714 1.        ]
 [1.         0.6696     0.42642857 1.        ]
 [1.         0.7812     0.4975     1.        ]]
```

Creating listed colormaps

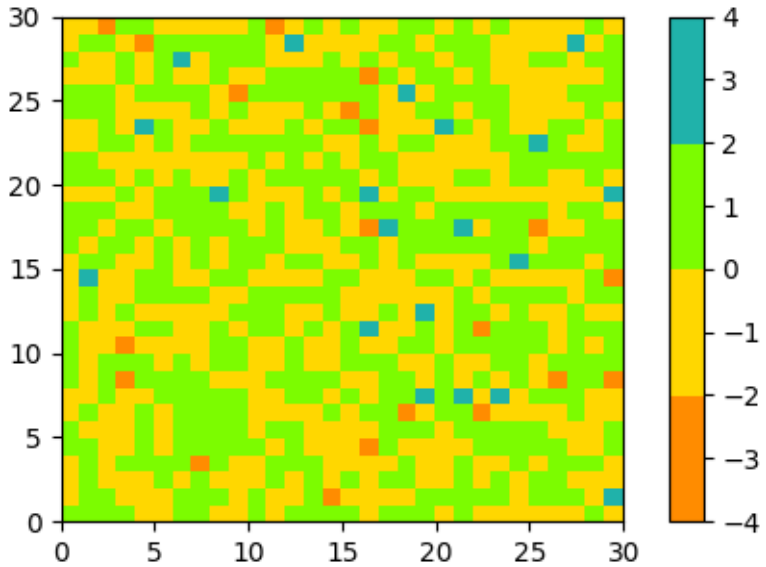
Creating a colormap is essentially the inverse operation of the above where we supply a list or array of color specifications to *ListedColormap* to make a new colormap.

Before continuing with the tutorial, let us define a helper function that takes one of more colormaps as input, creates some random data and applies the colormap(s) to an image plot of that dataset.

```
def plot_examples(colormaps):
    """
    Helper function to plot data with associated colormap.
    """
    np.random.seed(19680801)
    data = np.random.randn(30, 30)
    n = len(colormaps)
    fig, axs = plt.subplots(1, n, figsize=(n * 2 + 2, 3),
                            constrained_layout=True, squeeze=False)
    for [ax, cmap] in zip(axs.flat, colormaps):
        psm = ax.pcolormesh(data, cmap=cmap, rasterized=True, vmin=-4, vmax=4)
        fig.colorbar(psm, ax=ax)
    plt.show()
```

In the simplest case we might type in a list of color names to create a colormap from those.

```
cmap = ListedColormap(["darkorange", "gold", "lawngreen", "lightseagreen"])
plot_examples([cmap])
```

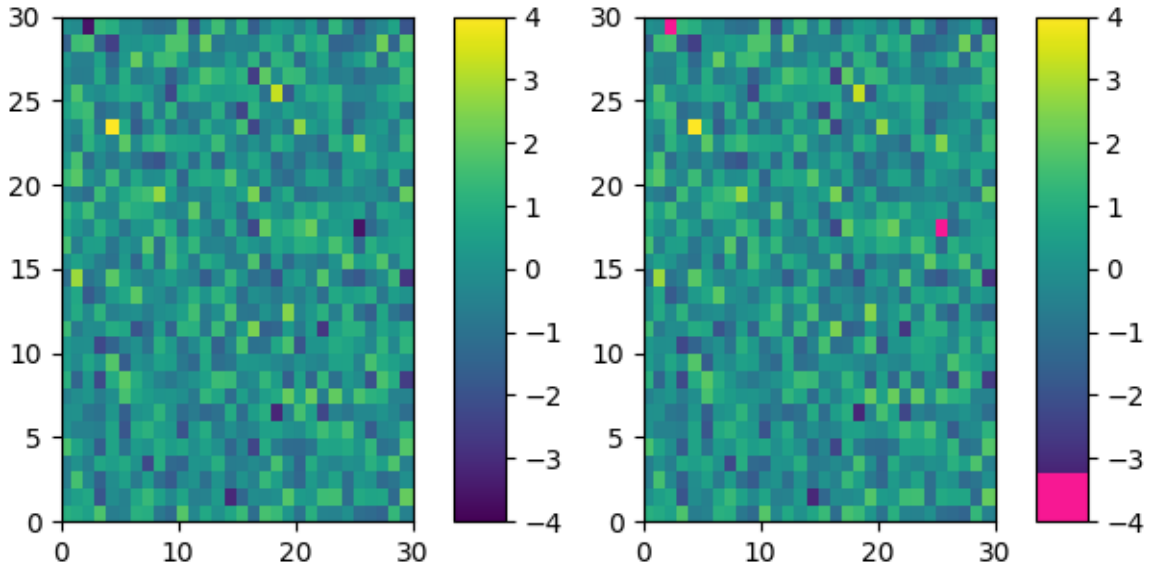


In fact, that list may contain any valid *matplotlib color specification*. Particularly useful for creating custom colormaps are Nx4 numpy arrays. Because with the variety of numpy operations that we can do on a such an array, carpentry of new colormaps from existing colormaps become quite straight forward.

For example, suppose we want to make the first 25 entries of a 256-length "viridis" colormap pink for some reason:

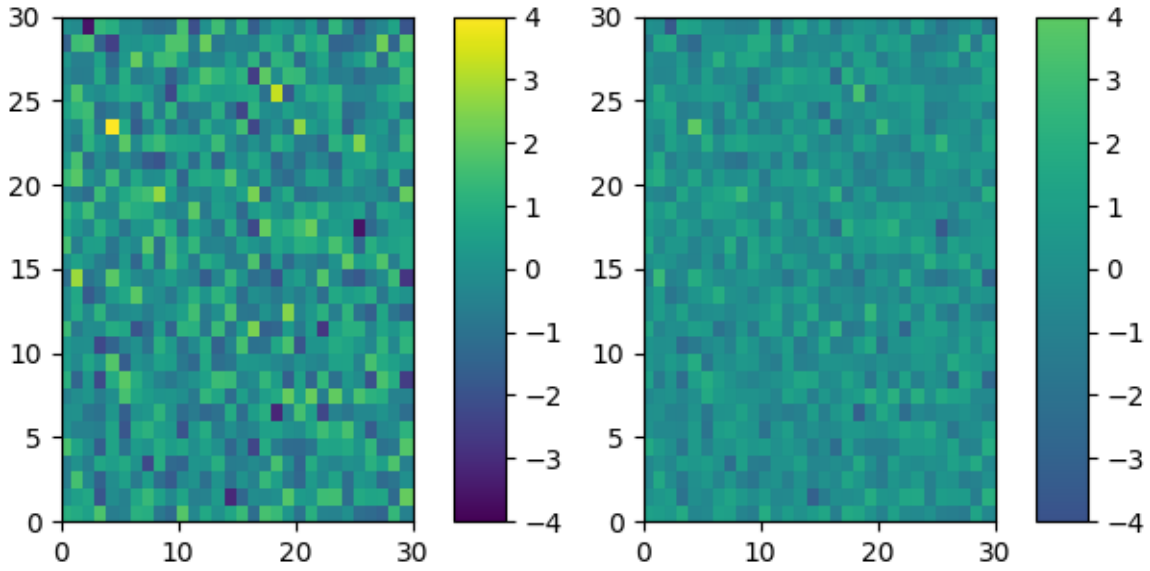
```
viridis = cm.get_cmap('viridis', 256)
newcolors = viridis(np.linspace(0, 1, 256))
pink = np.array([248/256, 24/256, 148/256, 1])
newcolors[:25, :] = pink
newcmp = ListedColormap(newcolors)

plot_examples([viridis, newcmp])
```



We can easily reduce the dynamic range of a colormap; here we choose the middle 0.5 of the colormap. However, we need to interpolate from a larger colormap, otherwise the new colormap will have repeated values.

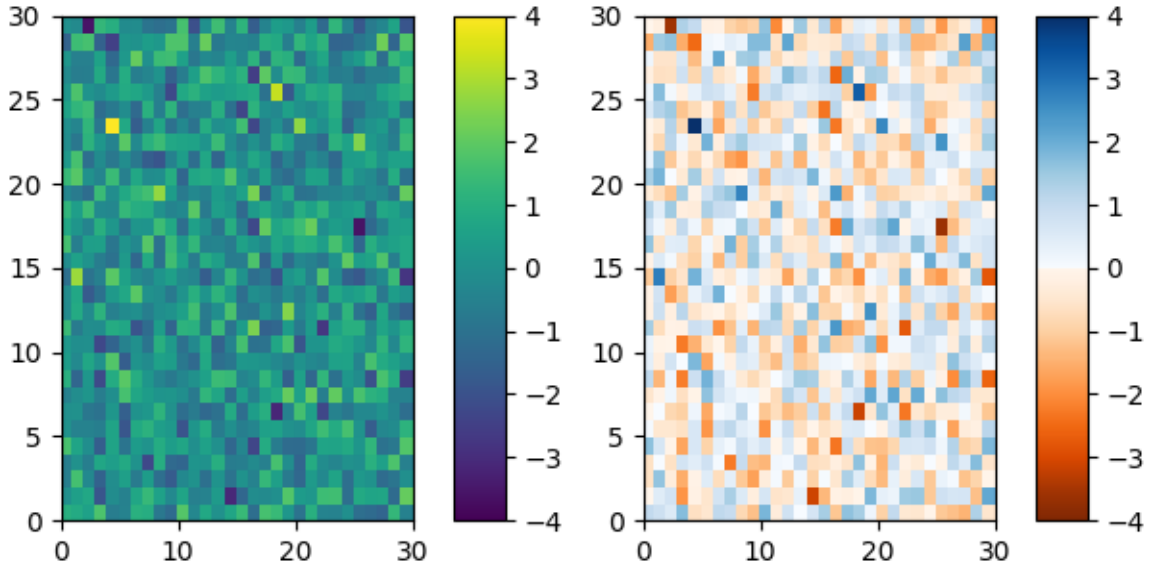
```
viridis_big = cm.get_cmap('viridis', 512)
newcmp = ListedColormap(viridis_big(np.linspace(0.25, 0.75, 256)))
plot_examples([viridis, newcmp])
```



and we can easily concatenate two colormaps:

```
top = cm.get_cmap('Oranges_r', 128)
bottom = cm.get_cmap('Blues', 128)

newcolors = np.vstack((top(np.linspace(0, 1, 128)),
                       bottom(np.linspace(0, 1, 128))))
newcmp = ListedColormap(newcolors, name='OrangeBlue')
plot_examples([viridis, newcmp])
```



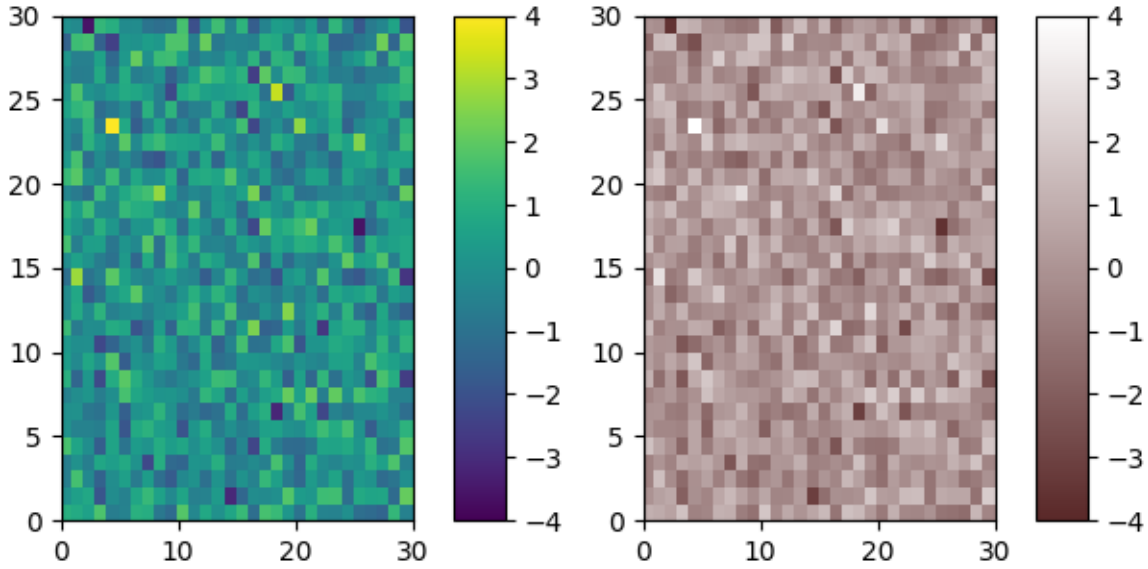
Of course we need not start from a named colormap, we just need to create the Nx4 array to pass to *ListedColormap*. Here we create a colormap that goes from brown (RGB: 90, 40, 40) to white (RGB: 255, 255, 255).

```
N = 256
```

(continues on next page)

(continued from previous page)

```
vals = np.ones((N, 4))
vals[:, 0] = np.linspace(90/256, 1, N)
vals[:, 1] = np.linspace(40/256, 1, N)
vals[:, 2] = np.linspace(40/256, 1, N)
newcmp = ListedColormap(vals)
plot_examples([viridis, newcmp])
```



Creating linear segmented colormaps

LinearSegmentedColormap class specifies colormaps using anchor points between which RGB(A) values are interpolated.

The format to specify these colormaps allows discontinuities at the anchor points. Each anchor point is specified as a row in a matrix of the form `[x[i] yleft[i] yright[i]]`, where `x[i]` is the anchor, and `yleft[i]` and `yright[i]` are the values of the color on either side of the anchor point.

If there are no discontinuities, then `yleft[i]=yright[i]`:

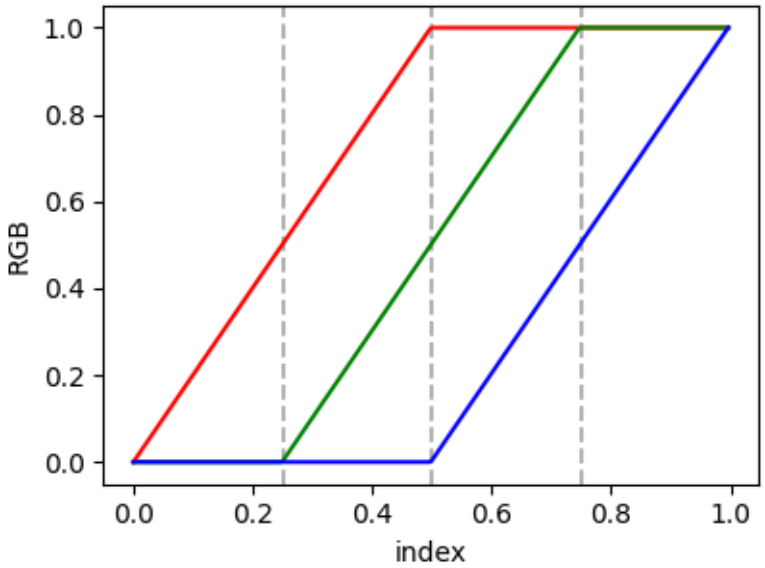
```
cdict = {'red':   [[0.0,  0.0, 0.0],
                   [0.5,  1.0, 1.0],
                   [1.0,  1.0, 1.0]],
         'green': [[0.0,  0.0, 0.0],
                   [0.25, 0.0, 0.0],
                   [0.75, 1.0, 1.0],
                   [1.0,  1.0, 1.0]],
         'blue':  [[0.0,  0.0, 0.0],
                   [0.5,  0.0, 0.0],
                   [1.0,  1.0, 1.0]]}
```

(continues on next page)

(continued from previous page)

```
def plot_linearmap(cdict):
    newcmp = LinearSegmentedColormap('testCmap', segmentdata=cdict, N=256)
    rgba = newcmp(np.linspace(0, 1, 256))
    fig, ax = plt.subplots(figsize=(4, 3), constrained_layout=True)
    col = ['r', 'g', 'b']
    for xx in [0.25, 0.5, 0.75]:
        ax.axvline(xx, color='0.7', linestyle='--')
    for i in range(3):
        ax.plot(np.arange(256)/256, rgba[:, i], color=col[i])
    ax.set_xlabel('index')
    ax.set_ylabel('RGB')
    plt.show()

plot_linearmap(cdict)
```



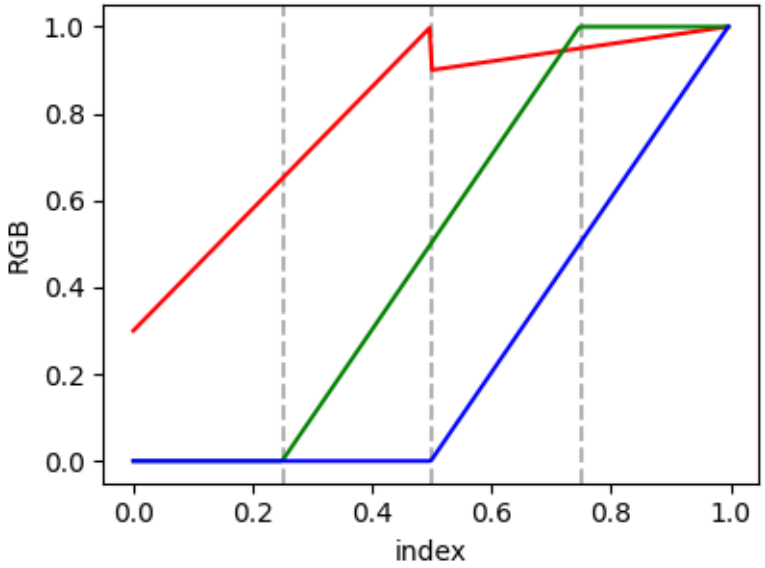
In order to make a discontinuity at an anchor point, the third column is different than the second. The matrix for each of "red", "green", "blue", and optionally "alpha" is set up as:

```
cdict['red'] = [...
                [x[i]      yleft[i]     yright[i]],
                [x[i+1]    yleft[i+1]   yright[i+1]],
               ...]
```

and for values passed to the colormap between `x[i]` and `x[i+1]`, the interpolation is between `yright[i]` and `yleft[i+1]`.

In the example below there is a discontinuity in red at 0.5. The interpolation between 0 and 0.5 goes from 0.3 to 1, and between 0.5 and 1 it goes from 0.9 to 1. Note that red[0, 1], and red[2, 2] are both superfluous to the interpolation because red[0, 1] is the value to the left of 0, and red[2, 2] is the value to the right of 1.0.

```
cdict['red'] = [[0.0,  0.0, 0.3],
                [0.5,  1.0, 0.9],
                [1.0,  1.0, 1.0]]
plot_linearmap(cdict)
```



Directly creating a segmented colormap from a list

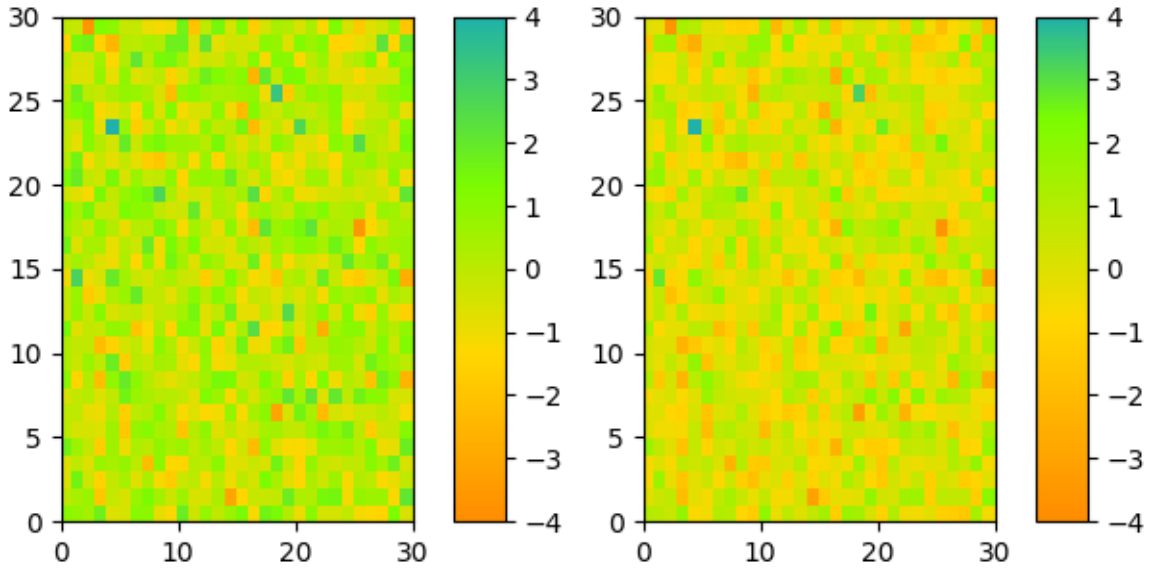
The above described is a very versatile approach, but admittedly a bit cumbersome to implement. For some basic cases, the use of *LinearSegmentedColormap.from_list* may be easier. This creates a segmented colormap with equal spacings from a supplied list of colors.

```
colors = ["darkorange", "gold", "lawngreen", "lightseagreen"]
cmap1 = LinearSegmentedColormap.from_list("mycmap", colors)
```

If desired, the nodes of the colormap can be given as numbers between 0 and 1. E.g. one could have the reddish part take more space in the colormap.

```
nodes = [0.0, 0.4, 0.8, 1.0]
cmap2 = LinearSegmentedColormap.from_list("mycmap", list(zip(nodes, colors)))

plot_examples([cmap1, cmap2])
```



References

The use of the following functions, methods, classes and modules is shown in this example:

```
import matplotlib
matplotlib.axes.Axes.pcolormesh
matplotlib.figure.Figure.colorbar
matplotlib.colors
matplotlib.colors.LinearSegmentedColormap
matplotlib.colors.ListedColormap
matplotlib.cm
matplotlib.cm.get_cmap
```

Out:

```
<function get_cmap at 0x7f5434bc43a0>
```

Total running time of the script: (0 minutes 2.681 seconds)

2.4.4 Colormap Normalization

Objects that use colormaps by default linearly map the colors in the colormap from data values *vmin* to *vmax*. For example:

```
pcm = ax.pcolormesh(x, y, Z, vmin=-1., vmax=1., cmap='RdBu_r')
```

will map the data in *Z* linearly from -1 to +1, so *Z=0* will give a color at the center of the colormap *RdBu_r* (white in this case).

Matplotlib does this mapping in two steps, with a normalization from the input data to [0, 1] occurring first, and then mapping onto the indices in the colormap. Normalizations are classes defined in the *matplotlib.colors()* module. The default, linear normalization is *matplotlib.colors.Normalize()*.

Artists that map data to color pass the arguments *vmin* and *vmax* to construct a *matplotlib.colors.Normalize()* instance, then call it:

```
In [1]: import matplotlib as mpl

In [2]: norm = mpl.colors.Normalize(vmin=-1, vmax=1)

In [3]: norm(0)
Out[3]: 0.5
```

However, there are sometimes cases where it is useful to map data to colormaps in a non-linear fashion.

Logarithmic

One of the most common transformations is to plot data by taking its logarithm (to the base-10). This transformation is useful to display changes across disparate scales. Using *colors.LogNorm* normalizes the data via log_{10}. In the example below, there are two bumps, one much smaller than the other. Using *colors.LogNorm*, the shape and location of each bump can clearly be seen:

```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.colors as colors
import matplotlib.cbook as cbook

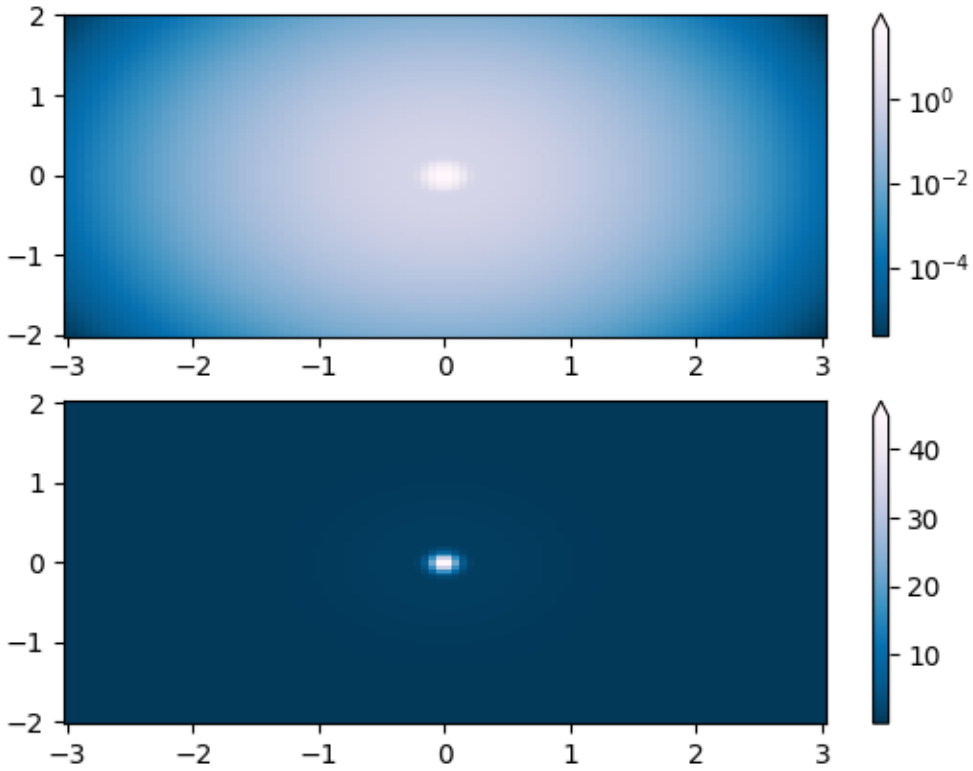
N = 100
X, Y = np.mgrid[-3:3:complex(0, N), -2:2:complex(0, N)]

# A low hump with a spike coming out of the top right.  Needs to have
# z/colour axis on a log scale so we see both hump and spike.  linear
# scale only shows the spike.
Z1 = np.exp(-X**2 - Y**2)
Z2 = np.exp(-(X * 10)**2 - (Y * 10)**2)
Z = Z1 + 50 * Z2

fig, ax = plt.subplots(2, 1)

pcm = ax[0].pcolor(X, Y, Z,
                   norm=colors.LogNorm(vmin=Z.min(), vmax=Z.max()),
                   cmap='PuBu_r', shading='auto')
fig.colorbar(pcm, ax=ax[0], extend='max')

pcm = ax[1].pcolor(X, Y, Z, cmap='PuBu_r', shading='auto')
fig.colorbar(pcm, ax=ax[1], extend='max')
plt.show()
```



Symmetric logarithmic

Similarly, it sometimes happens that there is data that is positive and negative, but we would still like a logarithmic scaling applied to both. In this case, the negative numbers are also scaled logarithmically, and mapped to smaller numbers; e.g., if `vmin=-vmax`, then the negative numbers are mapped from 0 to 0.5 and the positive from 0.5 to 1.

Since the logarithm of values close to zero tends toward infinity, a small range around zero needs to be mapped linearly. The parameter *linthresh* allows the user to specify the size of this range (*-linthresh*, *linthresh*). The size of this range in the colormap is set by *linscale*. When *linscale* == 1.0 (the default), the space used for the positive and negative halves of the linear range will be equal to one decade in the logarithmic range.

```
N = 100
X, Y = np.mgrid[-3:3:complex(0, N), -2:2:complex(0, N)]
Z1 = np.exp(-X**2 - Y**2)
Z2 = np.exp(-(X - 1)**2 - (Y - 1)**2)
Z = (Z1 - Z2) * 2
```

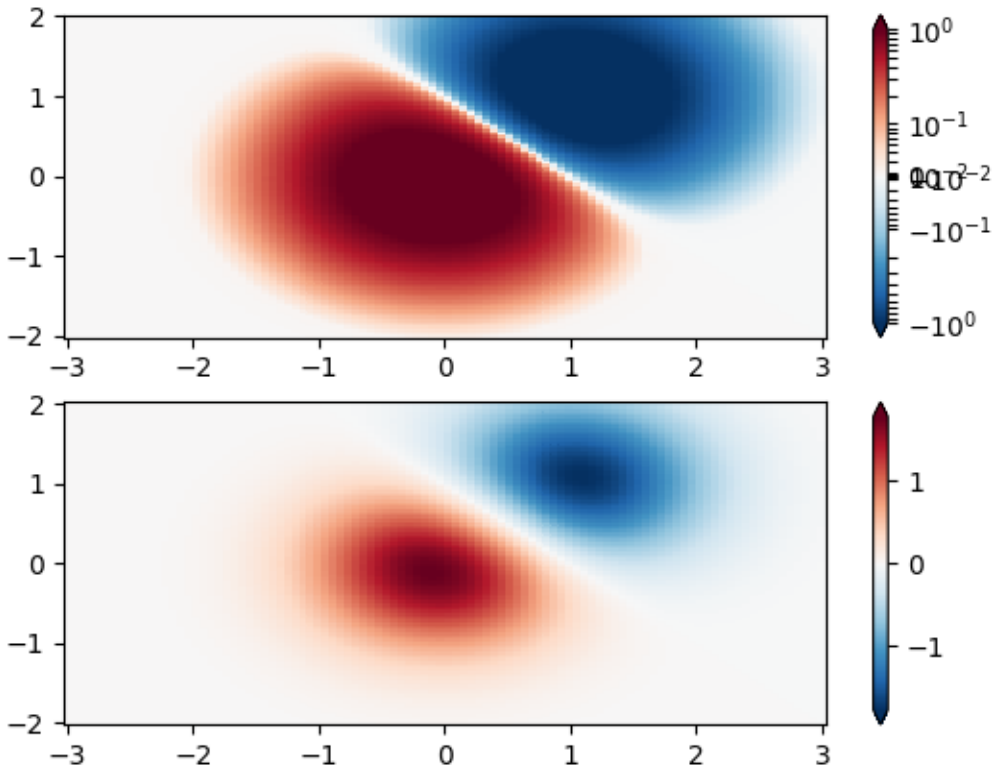
(continues on next page)

(continued from previous page)

```
fig, ax = plt.subplots(2, 1)

pcm = ax[0].pcolormesh(X, Y, Z,
                       norm=colors.SymLogNorm(linthresh=0.03, linscale=0.03,
                                              vmin=-1.0, vmax=1.0, base=10),
                       cmap='RdBu_r', shading='auto')
fig.colorbar(pcm, ax=ax[0], extend='both')

pcm = ax[1].pcolormesh(X, Y, Z, cmap='RdBu_r', vmin=-np.max(Z), shading='auto')
fig.colorbar(pcm, ax=ax[1], extend='both')
plt.show()
```



Power-law

Sometimes it is useful to remap the colors onto a power-law relationship (i.e. $y = x^{\gamma}$, where γ is the power). For this we use the *colors.PowerNorm*. It takes as an argument *gamma* (*gamma* == 1.0 will just yield the default linear normalization):

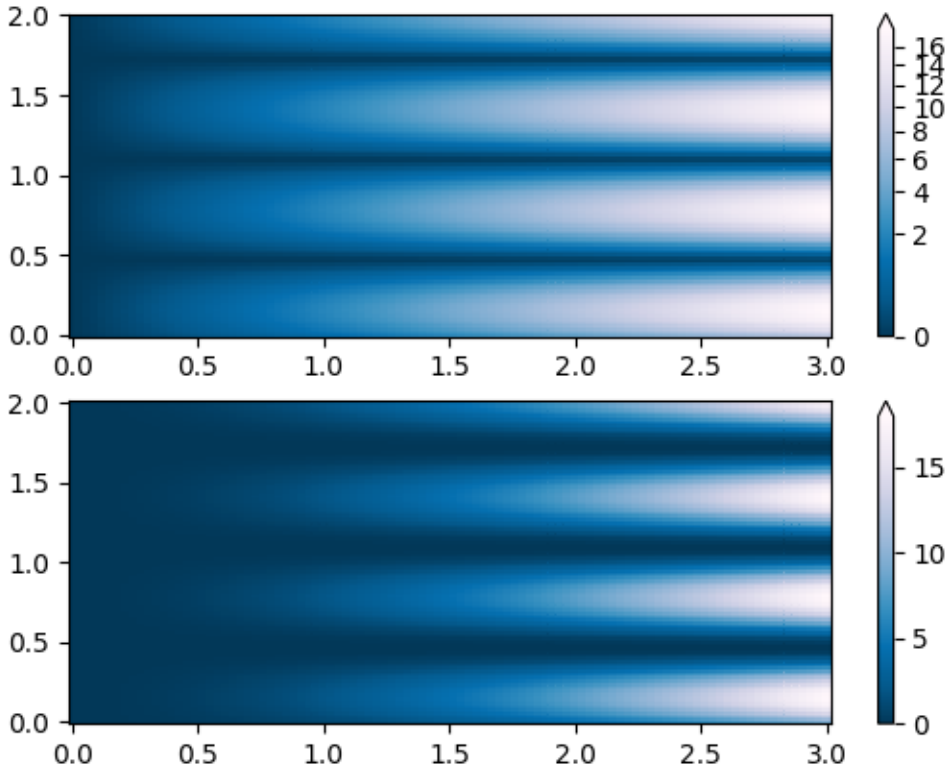
Note: There should probably be a good reason for plotting the data using this type of transformation. Technical viewers are used to linear and logarithmic axes and data transformations. Power laws are less common, and viewers should explicitly be made aware that they have been used.

```
N = 100
X, Y = np.mgrid[0:3:complex(0, N), 0:2:complex(0, N)]
Z1 = (1 + np.sin(Y * 10.)) * X**2

fig, ax = plt.subplots(2, 1)

pcm = ax[0].pcolormesh(X, Y, Z1, norm=colors.PowerNorm(gamma=0.5),
                       cmap='PuBu_r', shading='auto')
fig.colorbar(pcm, ax=ax[0], extend='max')

pcm = ax[1].pcolormesh(X, Y, Z1, cmap='PuBu_r', shading='auto')
fig.colorbar(pcm, ax=ax[1], extend='max')
plt.show()
```



Discrete bounds

Another normalization that comes with Matplotlib is *colors.BoundaryNorm*. In addition to *vmin* and *vmax*, this takes as arguments boundaries between which data is to be mapped. The colors are then linearly distributed between these "bounds". It can also take an *extend* argument to add upper and/or lower out-of-bounds values to the range over which the colors are distributed. For instance:

```
In [4]: import matplotlib.colors as colors

In [5]: bounds = np.array([-0.25, -0.125, 0, 0.5, 1])

In [6]: norm = colors.BoundaryNorm(boundaries=bounds, ncolors=4)

In [7]: print(norm([-0.2, -0.15, -0.02, 0.3, 0.8, 0.99]))
[0 0 1 2 3 3]
```

Note: Unlike the other norms, this norm returns values from 0 to *ncolors*-1.

```
N = 100
X, Y = np.meshgrid(np.linspace(-3, 3, N), np.linspace(-2, 2, N))
```

(continues on next page)

(continued from previous page)

```
Z1 = np.exp(-X**2 - Y**2)
Z2 = np.exp(-(X - 1)**2 - (Y - 1)**2)
Z = ((Z1 - Z2) * 2)[:-1, :-1]

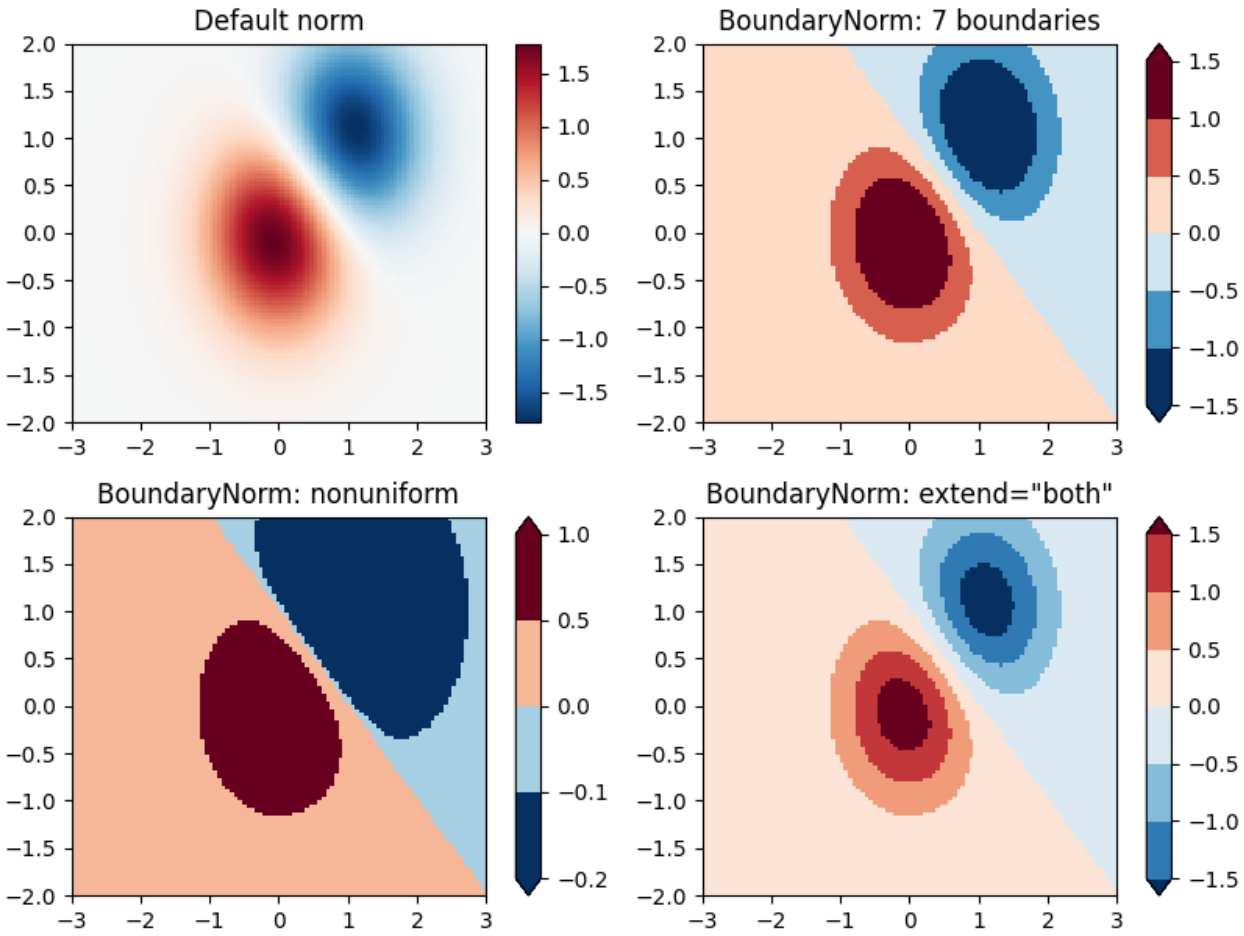
fig, ax = plt.subplots(2, 2, figsize=(8, 6), constrained_layout=True)
ax = ax.flatten()

# Default norm:
pcm = ax[0].pcolormesh(X, Y, Z, cmap='RdBu_r')
fig.colorbar(pcm, ax=ax[0], orientation='vertical')
ax[0].set_title('Default norm')

# Even bounds give a contour-like effect:
bounds = np.linspace(-1.5, 1.5, 7)
norm = colors.BoundaryNorm(boundaries=bounds, ncolors=256)
pcm = ax[1].pcolormesh(X, Y, Z, norm=norm, cmap='RdBu_r')
fig.colorbar(pcm, ax=ax[1], extend='both', orientation='vertical')
ax[1].set_title('BoundaryNorm: 7 boundaries')

# Bounds may be unevenly spaced:
bounds = np.array([-0.2, -0.1, 0, 0.5, 1])
norm = colors.BoundaryNorm(boundaries=bounds, ncolors=256)
pcm = ax[2].pcolormesh(X, Y, Z, norm=norm, cmap='RdBu_r')
fig.colorbar(pcm, ax=ax[2], extend='both', orientation='vertical')
ax[2].set_title('BoundaryNorm: nonuniform')

# With out-of-bounds colors:
bounds = np.linspace(-1.5, 1.5, 7)
norm = colors.BoundaryNorm(boundaries=bounds, ncolors=256, extend='both')
pcm = ax[3].pcolormesh(X, Y, Z, norm=norm, cmap='RdBu_r')
# The colorbar inherits the "extend" argument from BoundaryNorm.
fig.colorbar(pcm, ax=ax[3], orientation='vertical')
ax[3].set_title('BoundaryNorm: extend="both"')
plt.show()
```



TwoSlopeNorm: Different mapping on either side of a center

Sometimes we want to have a different colormap on either side of a conceptual center point, and we want those two colormaps to have different linear scales. An example is a topographic map where the land and ocean have a center at zero, but land typically has a greater elevation range than the water has depth range, and they are often represented by a different colormap.

```
dem = cbook.get_sample_data('topobathy.npz', np_load=True)
topo = dem['topo']
longitude = dem['longitude']
latitude = dem['latitude']

fig, ax = plt.subplots()
# make a colormap that has land and ocean clearly delineated and of the
# same length (256 + 256)
colors_undersea = plt.cm.terrain(np.linspace(0, 0.17, 256))
colors_land = plt.cm.terrain(np.linspace(0.25, 1, 256))
all_colors = np.vstack((colors_undersea, colors_land))
terrain_map = colors.LinearSegmentedColormap.from_list(
```

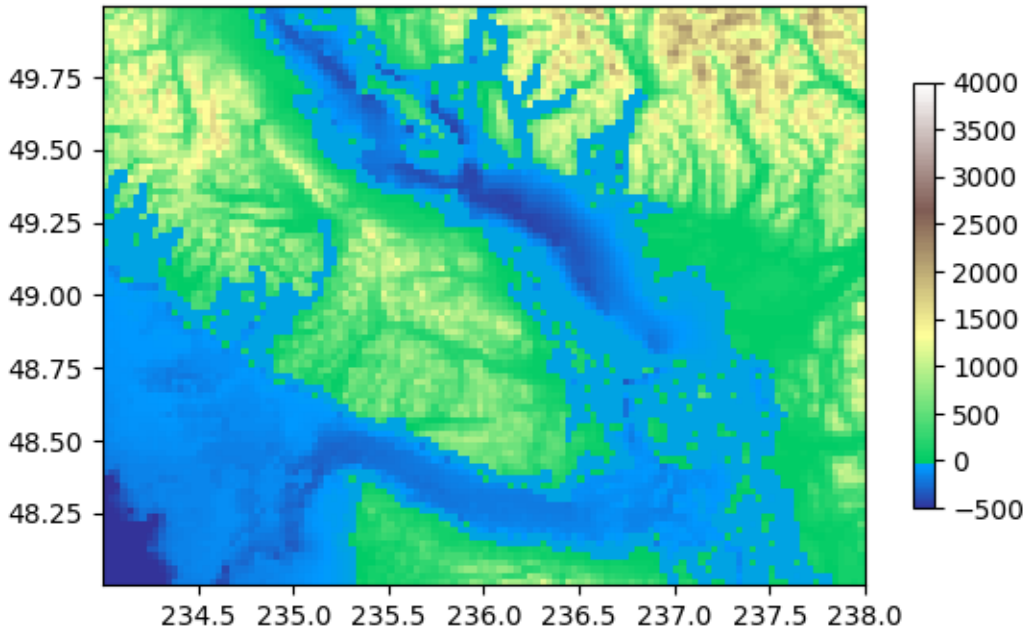
(continues on next page)

(continued from previous page)

```
    'terrain_map', all_colors)

# make the norm:  Note the center is offset so that the land has more
# dynamic range:
divnorm = colors.TwoSlopeNorm(vmin=-500., vcenter=0, vmax=4000)

pcm = ax.pcolormesh(longitude, latitude, topo, rasterized=True, norm=divnorm,
                    cmap=terrain_map, shading='auto')
# Simple geographic plot, set aspect ratio beecause distance between lines of
# longitude depends on latitude.
ax.set_aspect(1 / np.cos(np.deg2rad(49)))
fig.colorbar(pcm, shrink=0.6)
plt.show()
```



Custom normalization: Manually implement two linear ranges

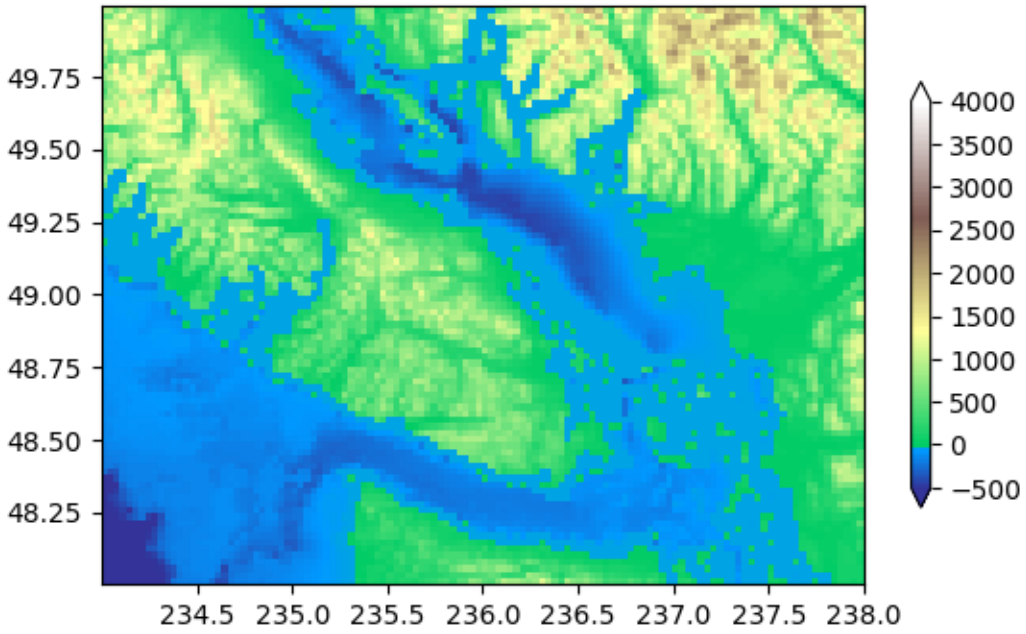
The *TwoSlopeNorm* described above makes a useful example for defining your own norm.

```
class MidpointNormalize(colors.Normalize):
    def __init__(self, vmin=None, vmax=None, vcenter=None, clip=False):
        self.vcenter = vcenter
        colors.Normalize.__init__(self, vmin, vmax, clip)

    def __call__(self, value, clip=None):
        # I'm ignoring masked values and all kinds of edge cases to make a
        # simple example...
        x, y = [self.vmin, self.vcenter, self.vmax], [0, 0.5, 1]
        return np.ma.masked_array(np.interp(value, x, y))

fig, ax = plt.subplots()
midnorm = MidpointNormalize(vmin=-500., vcenter=0, vmax=4000)

pcm = ax.pcolormesh(longitude, latitude, topo, rasterized=True, norm=midnorm,
                    cmap=terrain_map, shading='auto')
ax.set_aspect(1 / np.cos(np.deg2rad(49)))
fig.colorbar(pcm, shrink=0.6, extend='both')
plt.show()
```



Total running time of the script: (0 minutes 3.466 seconds)

2.4.5 Choosing Colormaps in Matplotlib

Matplotlib has a number of built-in colormaps accessible via *matplotlib.cm.get_cmap*. There are also external libraries like [palettable] and [colorcet] that have many extra colormaps. Here we briefly discuss how to choose between the many options. For help on creating your own colormaps, see *Creating Colormaps in Matplotlib*.

Overview

The idea behind choosing a good colormap is to find a good representation in 3D colorspace for your data set. The best colormap for any given data set depends on many things including:

- Whether representing form or metric data ([Ware])
- Your knowledge of the data set (*e.g.*, is there a critical value from which the other values deviate?)
- If there is an intuitive color scheme for the parameter you are plotting

- If there is a standard in the field the audience may be expecting

For many applications, a perceptually uniform colormap is the best choice; i.e. a colormap in which equal steps in data are perceived as equal steps in the color space. Researchers have found that the human brain perceives changes in the lightness parameter as changes in the data much better than, for example, changes in hue. Therefore, colormaps which have monotonically increasing lightness through the colormap will be better interpreted by the viewer. A wonderful example of perceptually uniform colormaps is [colorcet].

Color can be represented in 3D space in various ways. One way to represent color is using CIELAB. In CIELAB, color space is represented by lightness, L^*; red-green, a^*; and yellow-blue, b^*. The lightness parameter L^* can then be used to learn more about how the matplotlib colormaps will be perceived by viewers.

An excellent starting resource for learning about human perception of colormaps is from [IBM].

Classes of colormaps

Colormaps are often split into several categories based on their function (see, *e.g.*, [Moreland]):

1. Sequential: change in lightness and often saturation of color incrementally, often using a single hue; should be used for representing information that has ordering.
2. Diverging: change in lightness and possibly saturation of two different colors that meet in the middle at an unsaturated color; should be used when the information being plotted has a critical middle value, such as topography or when the data deviates around zero.
3. Cyclic: change in lightness of two different colors that meet in the middle and beginning/end at an unsaturated color; should be used for values that wrap around at the endpoints, such as phase angle, wind direction, or time of day.
4. Qualitative: often are miscellaneous colors; should be used to represent information which does not have ordering or relationships.

```
import numpy as np
import matplotlib as mpl
import matplotlib.pyplot as plt
from matplotlib import cm
from colorspacious import cspace_converter
from collections import OrderedDict

cmaps = OrderedDict()
```

Sequential

For the Sequential plots, the lightness value increases monotonically through the colormaps. This is good. Some of the L^* values in the colormaps span from 0 to 100 (binary and the other grayscale), and others start around $L^* = 20$. Those that have a smaller range of L^* will accordingly have a smaller perceptual range. Note also that the L^* function varies amongst the colormaps: some are approximately linear in L^* and others are more curved.

```
cmaps['Perceptually Uniform Sequential'] = [
            'viridis', 'plasma', 'inferno', 'magma', 'cividis']

cmaps['Sequential'] = [
            'Greys', 'Purples', 'Blues', 'Greens', 'Oranges', 'Reds',
            'YlOrBr', 'YlOrRd', 'OrRd', 'PuRd', 'RdPu', 'BuPu',
            'GnBu', 'PuBu', 'YlGnBu', 'PuBuGn', 'BuGn', 'YlGn']
```

Sequential2

Many of the L^* values from the Sequential2 plots are monotonically increasing, but some (autumn, cool, spring, and winter) plateau or even go both up and down in L^* space. Others (afmhot, copper, gist_heat, and hot) have kinks in the L^* functions. Data that is being represented in a region of the colormap that is at a plateau or kink will lead to a perception of banding of the data in those values in the colormap (see [mycarta-banding] for an excellent example of this).

```
cmaps['Sequential (2)'] = [
            'binary', 'gist_yarg', 'gist_gray', 'gray', 'bone', 'pink',
            'spring', 'summer', 'autumn', 'winter', 'cool', 'Wistia',
            'hot', 'afmhot', 'gist_heat', 'copper']
```

Diverging

For the Diverging maps, we want to have monotonically increasing L^* values up to a maximum, which should be close to $L^* = 100$, followed by monotonically decreasing L^* values. We are looking for approximately equal minimum L^* values at opposite ends of the colormap. By these measures, BrBG and RdBu are good options. coolwarm is a good option, but it doesn't span a wide range of L^* values (see grayscale section below).

```
cmaps['Diverging'] = [
            'PiYG', 'PRGn', 'BrBG', 'PuOr', 'RdGy', 'RdBu',
            'RdYlBu', 'RdYlGn', 'Spectral', 'coolwarm', 'bwr', 'seismic']
```

Cyclic

For Cyclic maps, we want to start and end on the same color, and meet a symmetric center point in the middle. L^* should change monotonically from start to middle, and inversely from middle to end. It should be symmetric on the increasing and decreasing side, and only differ in hue. At the ends and middle, L^* will reverse direction, which should be smoothed in L^* space to reduce artifacts. See [kovesi-colormaps] for more information on the design of cyclic maps.

The often-used HSV colormap is included in this set of colormaps, although it is not symmetric to a center point. Additionally, the L^* values vary widely throughout the colormap, making it a poor choice for representing data for viewers to see perceptually. See an extension on this idea at [mycarta-jet].

```
cmaps['Cyclic'] = ['twilight', 'twilight_shifted', 'hsv']
```

Qualitative

Qualitative colormaps are not aimed at being perceptual maps, but looking at the lightness parameter can verify that for us. The L^* values move all over the place throughout the colormap, and are clearly not monotonically increasing. These would not be good options for use as perceptual colormaps.

```
cmaps['Qualitative'] = ['Pastel1', 'Pastel2', 'Paired', 'Accent',
                        'Dark2', 'Set1', 'Set2', 'Set3',
                        'tab10', 'tab20', 'tab20b', 'tab20c']
```

Miscellaneous

Some of the miscellaneous colormaps have particular uses for which they have been created. For example, gist_earth, ocean, and terrain all seem to be created for plotting topography (green/brown) and water depths (blue) together. We would expect to see a divergence in these colormaps, then, but multiple kinks may not be ideal, such as in gist_earth and terrain. CMRmap was created to convert well to grayscale, though it does appear to have some small kinks in L^*. cubehelix was created to vary smoothly in both lightness and hue, but appears to have a small hump in the green hue area. turbo was created to display depth and disparity data.

The often-used jet colormap is included in this set of colormaps. We can see that the L^* values vary widely throughout the colormap, making it a poor choice for representing data for viewers to see perceptually. See an extension on this idea at [mycarta-jet] and [turbo].

```
cmaps['Miscellaneous'] = [
            'flag', 'prism', 'ocean', 'gist_earth', 'terrain', 'gist_stern',
            'gnuplot', 'gnuplot2', 'CMRmap', 'cubehelix', 'brg',
```

(continues on next page)

(continued from previous page)

```
            'gist_rainbow', 'rainbow', 'jet', 'turbo', 'nipy_spectral',
            'gist_ncar']
```

First, we'll show the range of each colormap. Note that some seem to change more "quickly" than others.

```
nrows = max(len(cmap_list) for cmap_category, cmap_list in cmaps.items())
gradient = np.linspace(0, 1, 256)
gradient = np.vstack((gradient, gradient))

def plot_color_gradients(cmap_category, cmap_list, nrows):
    fig, axes = plt.subplots(nrows=nrows)
    fig.subplots_adjust(top=0.95, bottom=0.01, left=0.2, right=0.99)
    axes[0].set_title(cmap_category + ' colormaps', fontsize=14)

    for ax, name in zip(axes, cmap_list):
        ax.imshow(gradient, aspect='auto', cmap=plt.get_cmap(name))
        pos = list(ax.get_position().bounds)
        x_text = pos[0] - 0.01
        y_text = pos[1] + pos[3]/2.
        fig.text(x_text, y_text, name, va='center', ha='right', fontsize=10)

    # Turn off *all* ticks & spines, not just the ones with colormaps.
    for ax in axes:
        ax.set_axis_off()

for cmap_category, cmap_list in cmaps.items():
    plot_color_gradients(cmap_category, cmap_list, nrows)

plt.show()
```

Lightness of Matplotlib colormaps

Here we examine the lightness values of the matplotlib colormaps. Note that some documentation on the colormaps is available ([list-colormaps]).

```
mpl.rcParams.update({'font.size': 12})

# Number of colormap per subplot for particular cmap categories
_DSUBS = {'Perceptually Uniform Sequential': 5, 'Sequential': 6,
          'Sequential (2)': 6, 'Diverging': 6, 'Cyclic': 3,
          'Qualitative': 4, 'Miscellaneous': 6}

# Spacing between the colormaps of a subplot
_DC = {'Perceptually Uniform Sequential': 1.4, 'Sequential': 0.7,
       'Sequential (2)': 1.4, 'Diverging': 1.4, 'Cyclic': 1.4,
       'Qualitative': 1.4, 'Miscellaneous': 1.4}

# Indices to step through colormap
x = np.linspace(0.0, 1.0, 100)

# Do plot
for cmap_category, cmap_list in cmaps.items():
```

(continues on next page)

(continued from previous page)

```
    # Do subplots so that colormaps have enough space.
    # Default is 6 colormaps per subplot.
    dsub = _DSUBS.get(cmap_category, 6)
    nsubplots = int(np.ceil(len(cmap_list) / dsub))

    # squeeze=False to handle similarly the case of a single subplot
    fig, axes = plt.subplots(nrows=nsubplots, squeeze=False,
                             figsize=(7, 2.6*nsubplots))

    for i, ax in enumerate(axes.flat):

        locs = []  # locations for text labels

        for j, cmap in enumerate(cmap_list[i*dsub:(i+1)*dsub]):

            # Get RGB values for colormap and convert the colormap in
            # CAM02-UCS colorspace.  lab[0, :, 0] is the lightness.
            rgb = cm.get_cmap(cmap)(x)[np.newaxis, :, :3]
            lab = cspace_converter("sRGB1", "CAM02-UCS")(rgb)

Grayscale conversion

It is important to pay attention to conversion to grayscale for color plots, since they may be printed on black and white printers. If not carefully considered, your readers may end up with indecipherable plots because the grayscale changes unpredictably through the colormap.

Conversion to grayscale is done in many different ways [bw]. Some of the better ones use a linear combination of the rgb values of a pixel, but weighted according to how we perceive color intensity. A nonlinear method of conversion to grayscale is to use

the L^* values of the pixels. In general, similar principles apply for this question as they do for presenting one's information perceptually; that is, if a colormap is chosen that is monotonically increasing in L^* values, it will print in a reasonable manner to grayscale.

With this in mind, we see that the Sequential colormaps have reasonable representations in grayscale. Some of the Sequential2 colormaps have decent enough grayscale representations, though some (autumn, spring, summer, winter) have very little grayscale change. If a colormap like this was used in a plot and then the plot was printed to grayscale, a lot of the information may map to the same gray values. The Diverging colormaps mostly vary from darker gray on the outer edges to white in the middle. Some (PuOr and seismic) have noticeably darker gray on one side than the other and therefore are not very symmetric. coolwarm has little range of gray scale and would print to a more uniform plot, losing a lot of detail. Note that overlaid, labeled contours could help differentiate between one side of the colormap vs. the other since color cannot be used once a plot is printed to grayscale. Many of the Qualitative and Miscellaneous colormaps, such as Accent, hsv, jet and turbo, change from darker to lighter and back to darker grey throughout the colormap. This would make it impossible for a viewer to interpret the information in a plot once it is printed in grayscale.

```
mpl.rcParams.update({'font.size': 14})

# Indices to step through colormap.
x = np.linspace(0.0, 1.0, 100)

gradient = np.linspace(0, 1, 256)

Color vision deficiencies

There is a lot of information available about color blindness (*e.g.*, [colorblindness]). Additionally, there are tools available to convert images to how they look for different types of color vision deficiencies.

The most common form of color vision deficiency involves differentiating between red and green. Thus, avoiding colormaps with both red and green will avoid many problems in general.

2.5 Provisional

These tutorials cover proposed APIs of any complexity. These are here to document features that we have released, but want to get user feedback on before committing to them. Please have a look, try them out and give us feedback on gitter, discourse, or the the mailing list! But, be aware that we may change the APIs without warning in subsequent versions.

2.5.1 Complex and semantic figure composition

Warning: This tutorial documents experimental / provisional API. We are releasing this in v3.3 to get user feedback. We may make breaking changes in future versions with no warning.

Laying out Axes in a Figure in a non uniform grid can be both tedious and verbose. For dense, even grids we have *Figure.subplots* but for more complex layouts, such as Axes that span multiple columns / rows of the layout or leave some areas of the Figure blank, you can use *gridspec.GridSpec* (see *Customizing Figure Layouts Using GridSpec and Other Functions*) or manually place your axes. *Figure.subplot_mosaic* aims to provide an interface to visually lay out your axes (as either ASCII art or nested lists) to streamline this process.

This interface naturally supports naming your axes. *Figure.subplot_mosaic* returns a dictionary keyed on the labels used to lay out the Figure. By returning data structures with names, it is easier to write plotting code that is independent of the Figure layout.

This is inspired by a proposed MEP and the patchwork library for R. While we do not implement the operator overloading style, we do provide a Pythonic API for specifying (nested) Axes layouts.

```
import matplotlib.pyplot as plt
import numpy as np

# Helper function used for visualization in the following examples
def identify_axes(ax_dict, fontsize=48):
    """
    Helper to identify the Axes in the examples below.

    Draws the label in a large font in the center of the Axes.
```

(continues on next page)

(continued from previous page)

```
    Parameters
    ----------
    ax_dict : Dict[str, Axes]
        Mapping between the title / label and the Axes.

    fontsize : int, optional
        How big the label should be
    """
    kw = dict(ha="center", va="center", fontsize=fontsize, color="darkgrey")
    for k, ax in ax_dict.items():
        ax.text(0.5, 0.5, k, transform=ax.transAxes, **kw)
```

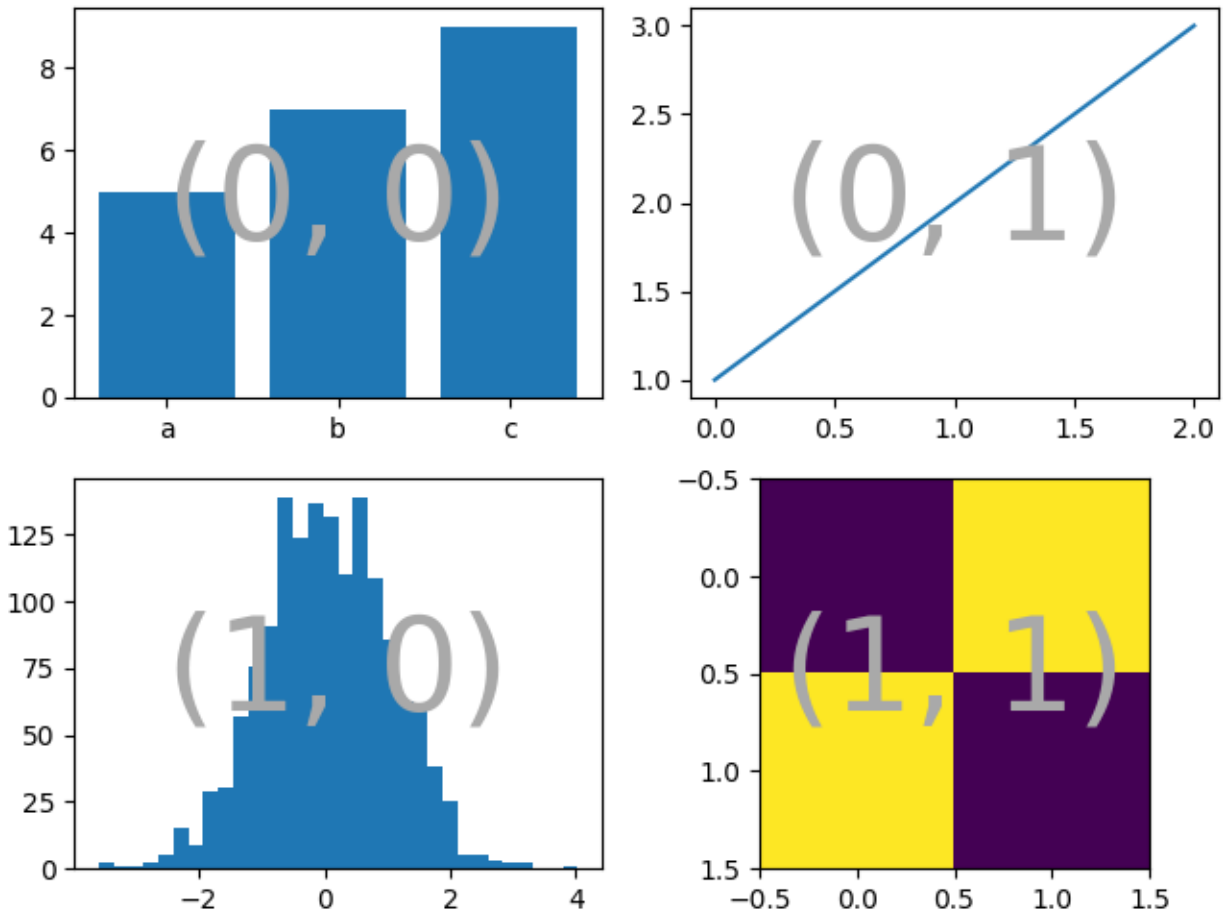
If we want a 2x2 grid we can use *Figure.subplots* which returns a 2D array of *axes.Axes* which we can index into to do our plotting.

```
np.random.seed(19680801)
hist_data = np.random.randn(1_500)

fig = plt.figure(constrained_layout=True)
ax_array = fig.subplots(2, 2, squeeze=False)

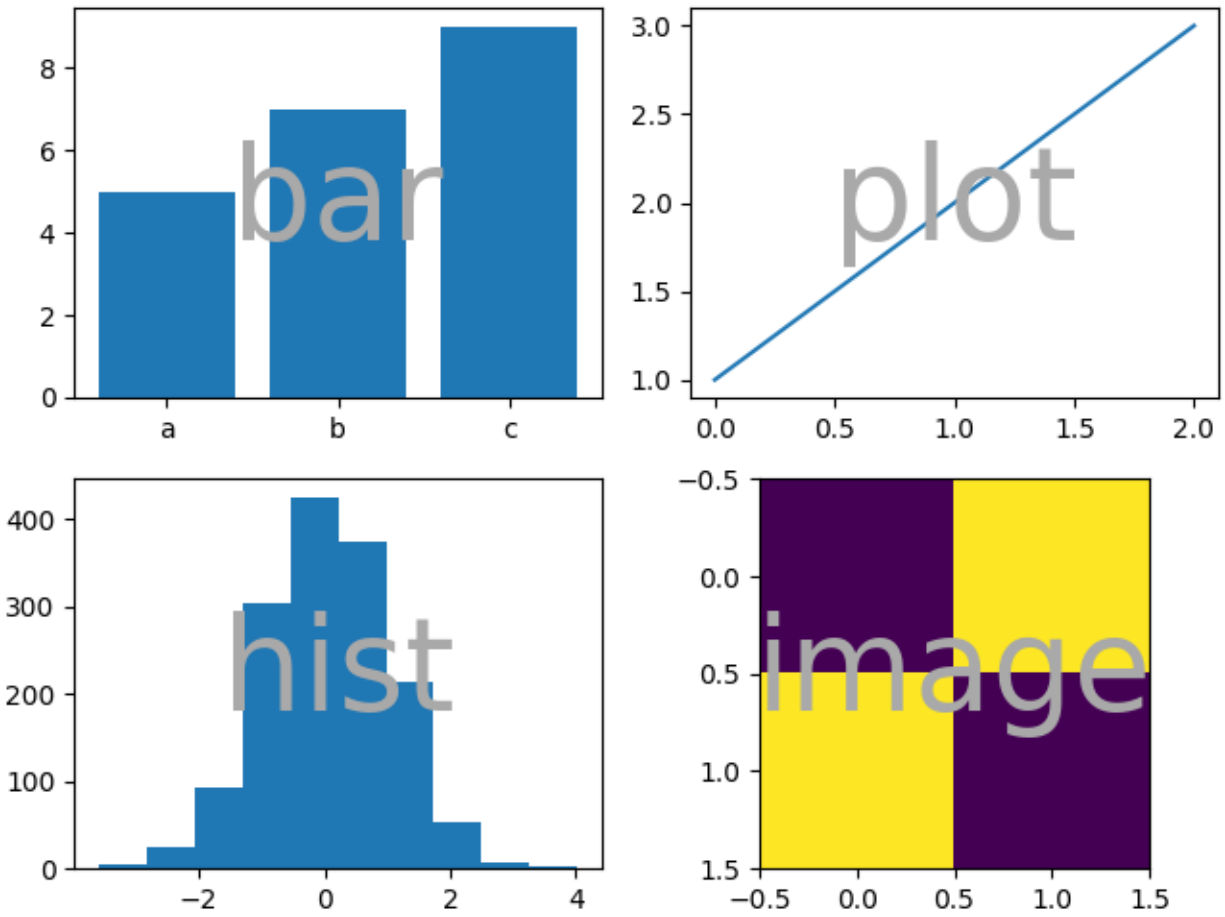
ax_array[0, 0].bar(['a', 'b', 'c'], [5, 7, 9])
ax_array[0, 1].plot([1, 2, 3])
ax_array[1, 0].hist(hist_data, bins='auto')
ax_array[1, 1].imshow([[1, 2], [2, 1]])

identify_axes(
    {(j, k): a for j, r in enumerate(ax_array) for k, a in enumerate(r)}
)
```



Using *Figure.subplot_mosaic* we can produce the same layout but give the axes semantic names

```
fig = plt.figure(constrained_layout=True)
ax_dict = fig.subplot_mosaic(
    [['bar',  'plot'],
     ['hist', 'image']])
ax_dict['bar'].bar(['a', 'b', 'c'], [5, 7, 9])
ax_dict['plot'].plot([1, 2, 3])
ax_dict['hist'].hist(hist_data)
ax_dict['image'].imshow([[1, 2], [2, 1]])
identify_axes(ax_dict)
```



A key difference between *Figure.subplots* and *Figure.subplot_mosaic* is the return value. While the former returns an array for index access, the latter returns a dictionary mapping the labels to the *axes.Axes* instances created

```
print(ax_dict)
```

Out:

```
{'hist': <AxesSubplot:label='hist'>, 'plot': <AxesSubplot:label='plot'>, 'image':
↪<AxesSubplot:label='image'>, 'bar': <AxesSubplot:label='bar'>}
```

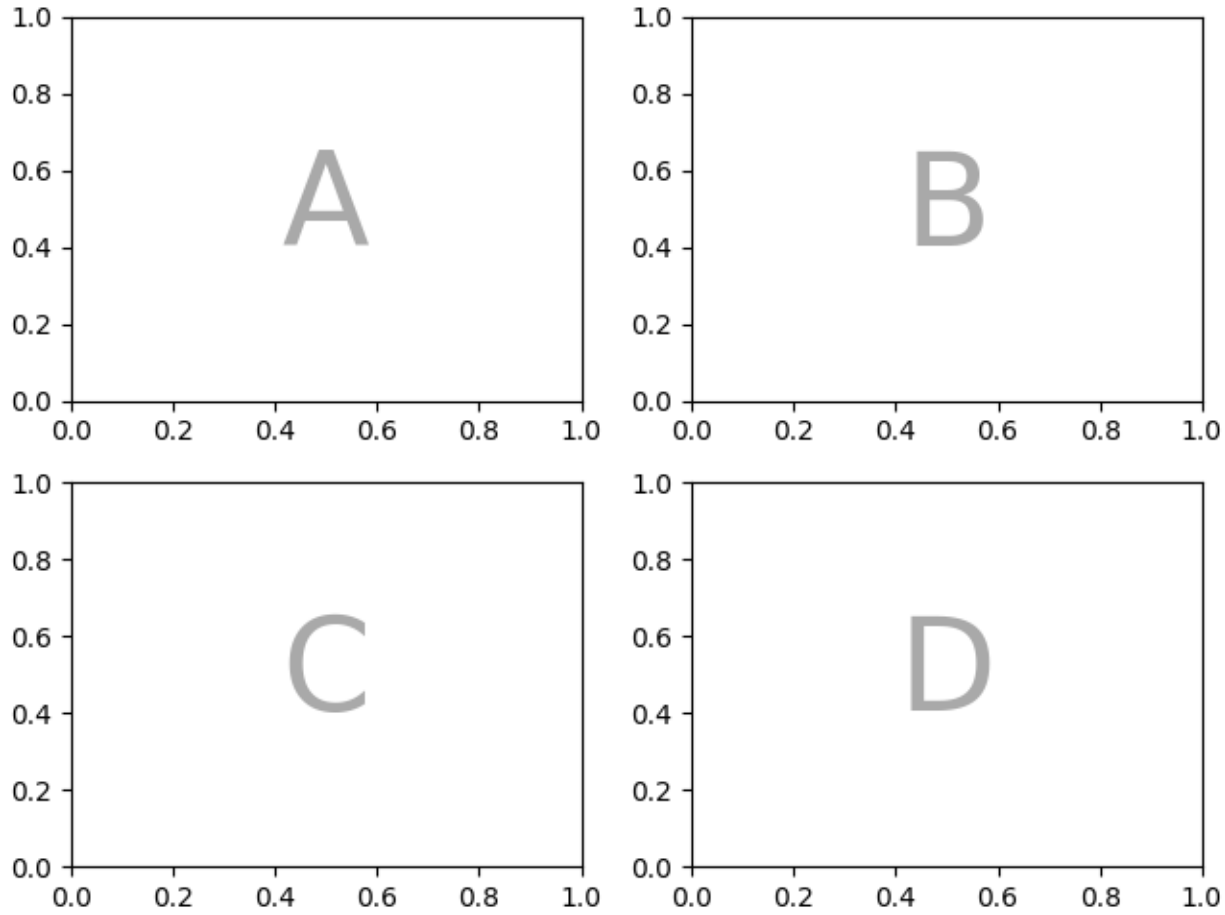
String short-hand

By restricting our axes labels to single characters we can use Using we can "draw" the Axes we want as "ASCII art". The following

```
layout = """
    AB
    CD
    """
```

will give us 4 Axes laid out in a 2x2 grid and generates the same figure layout as above (but now labeled with `{"A", "B", "C", "D"}` rather than `{"bar", "plot", "hist", "image"}`).

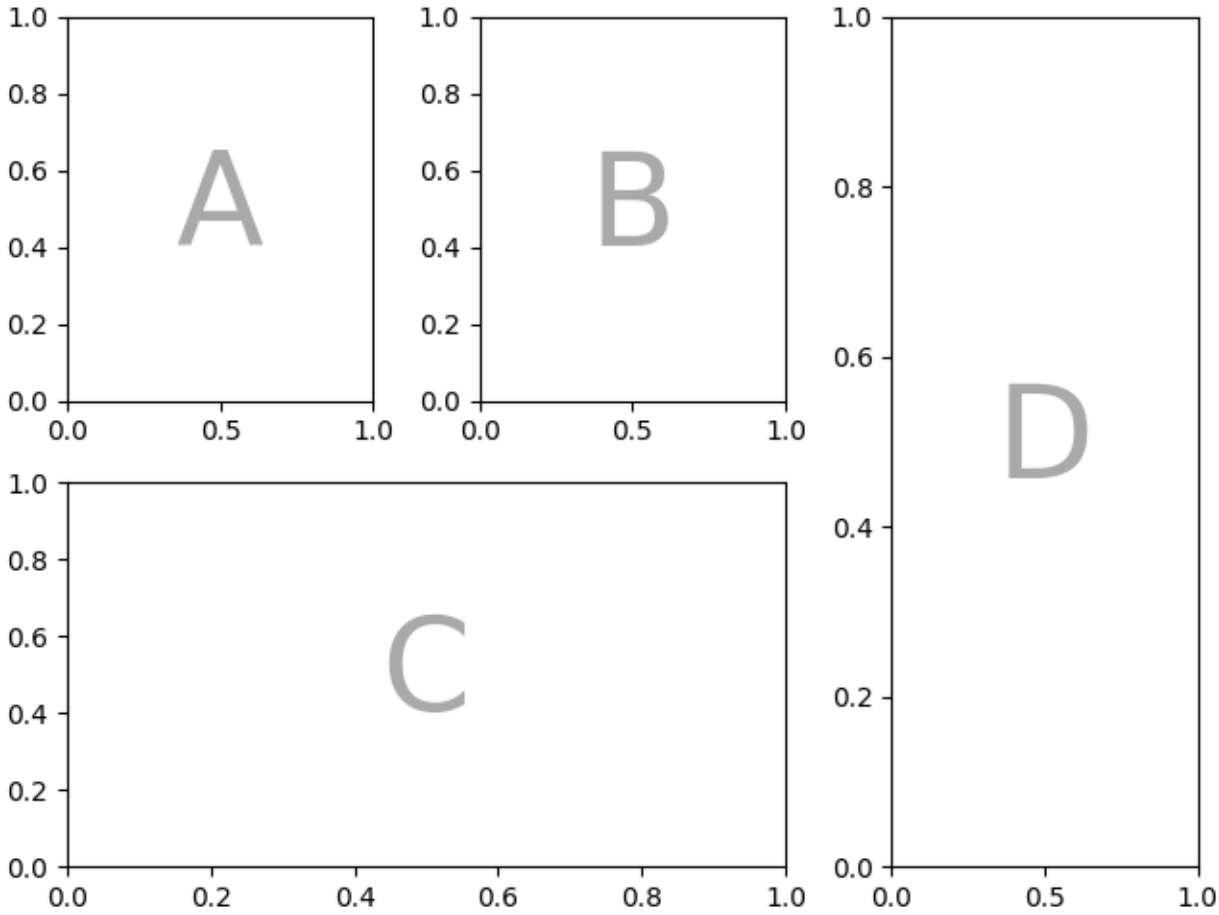
```
fig = plt.figure(constrained_layout=True)
ax_dict = fig.subplot_mosaic(layout)
identify_axes(ax_dict)
```



Something we can do with *Figure.subplot_mosaic* that you can not do with *Figure.subplots* is specify that an Axes should span several rows or columns.

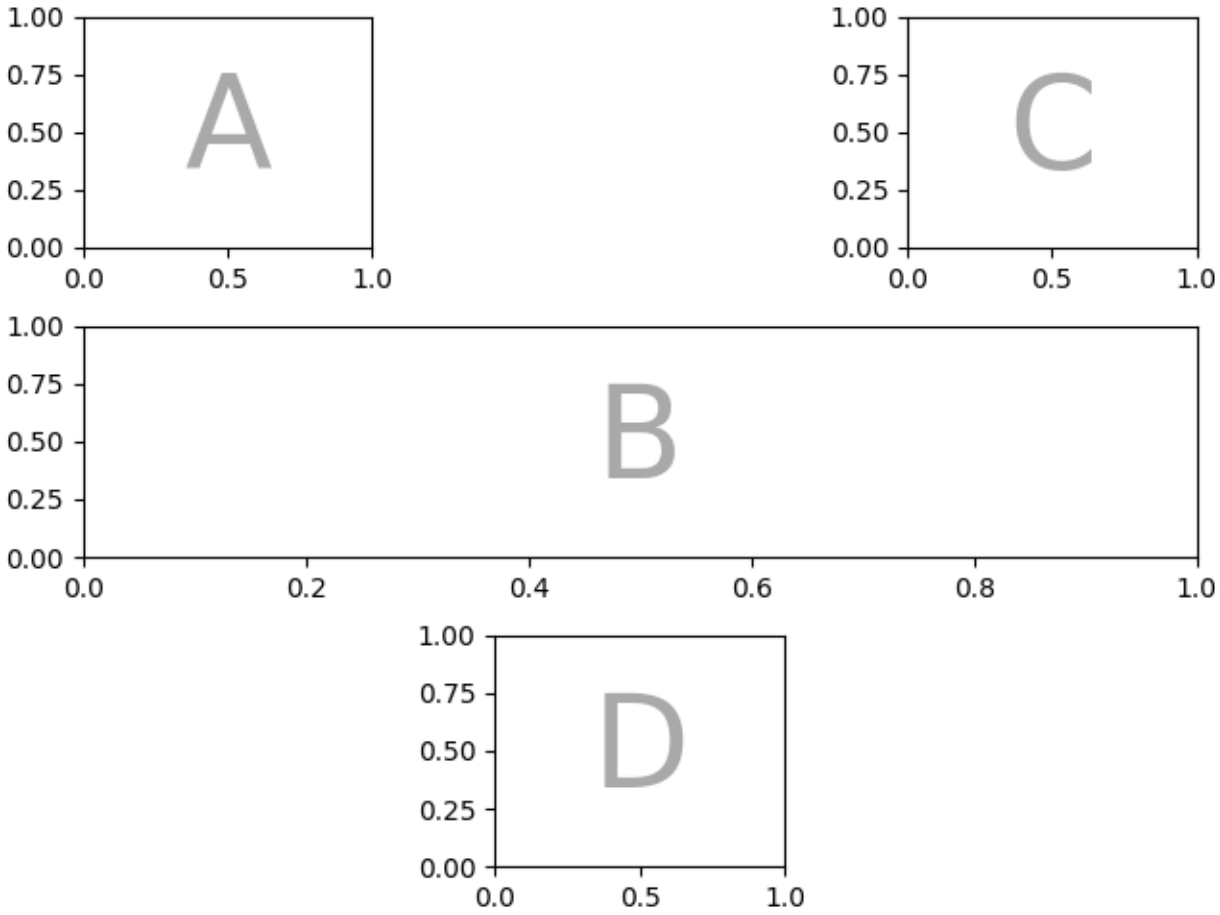
If we want to re-arrange our four Axes to have C be a horizontal span on the bottom and D be a vertical span on the right we would do

```
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    """
    ABD
    CCD
    """
)
identify_axes(axd)
```



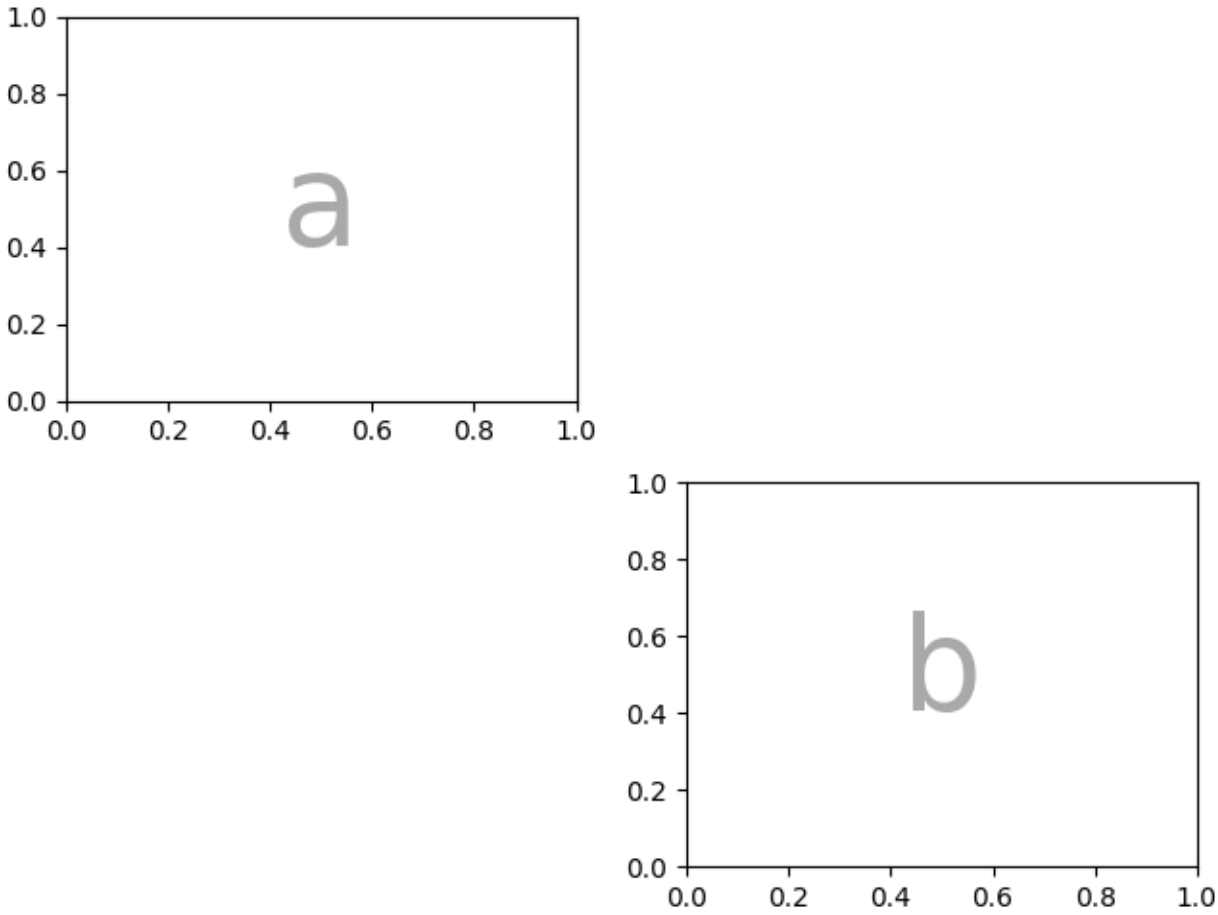
If we do not want to fill in all the spaces in the Figure with Axes, we can specify some spaces in the grid to be blank

```
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    """
    A.C
    BBB
    .D.
    """
)
identify_axes(axd)
```



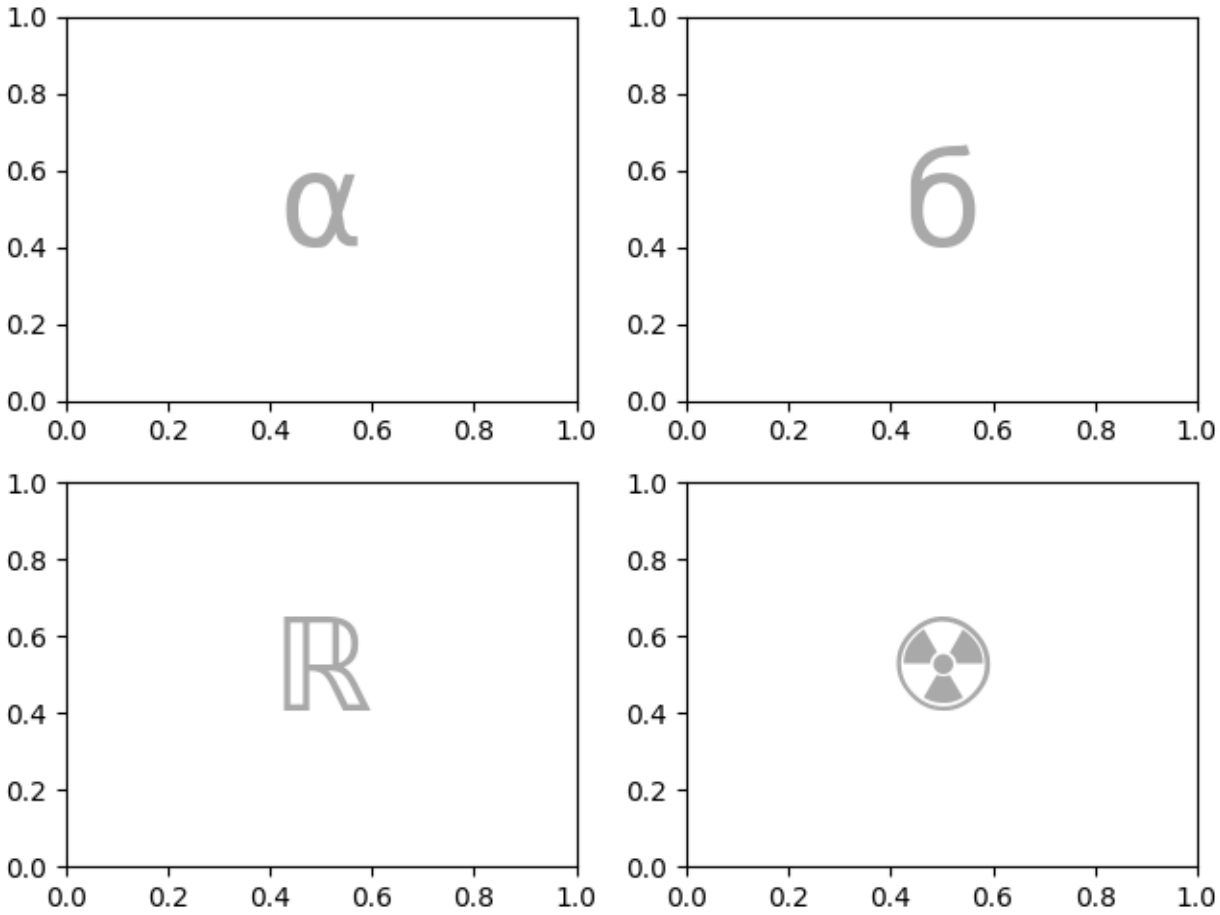
If we prefer to use another character (rather than a period `"."`) to mark the empty space, we can use *empty_sentinel* to specify the character to use.

```
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    """
    aX
    Xb
    """,
    empty_sentinel="X",
)
identify_axes(axd)
```



Internally there is no meaning attached to the letters we use, any Unicode code point is valid!

```
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    """
        """
)
identify_axes(axd)
```



It is not recommended to use white space as either a label or an empty sentinel with the string shorthand because it may be stripped while processing the input.

Controlling layout and subplot creation

This feature is built on top of *gridspec* and you can pass the keyword arguments through to the underlying *gridspec.GridSpec* (the same as *Figure.subplots*).

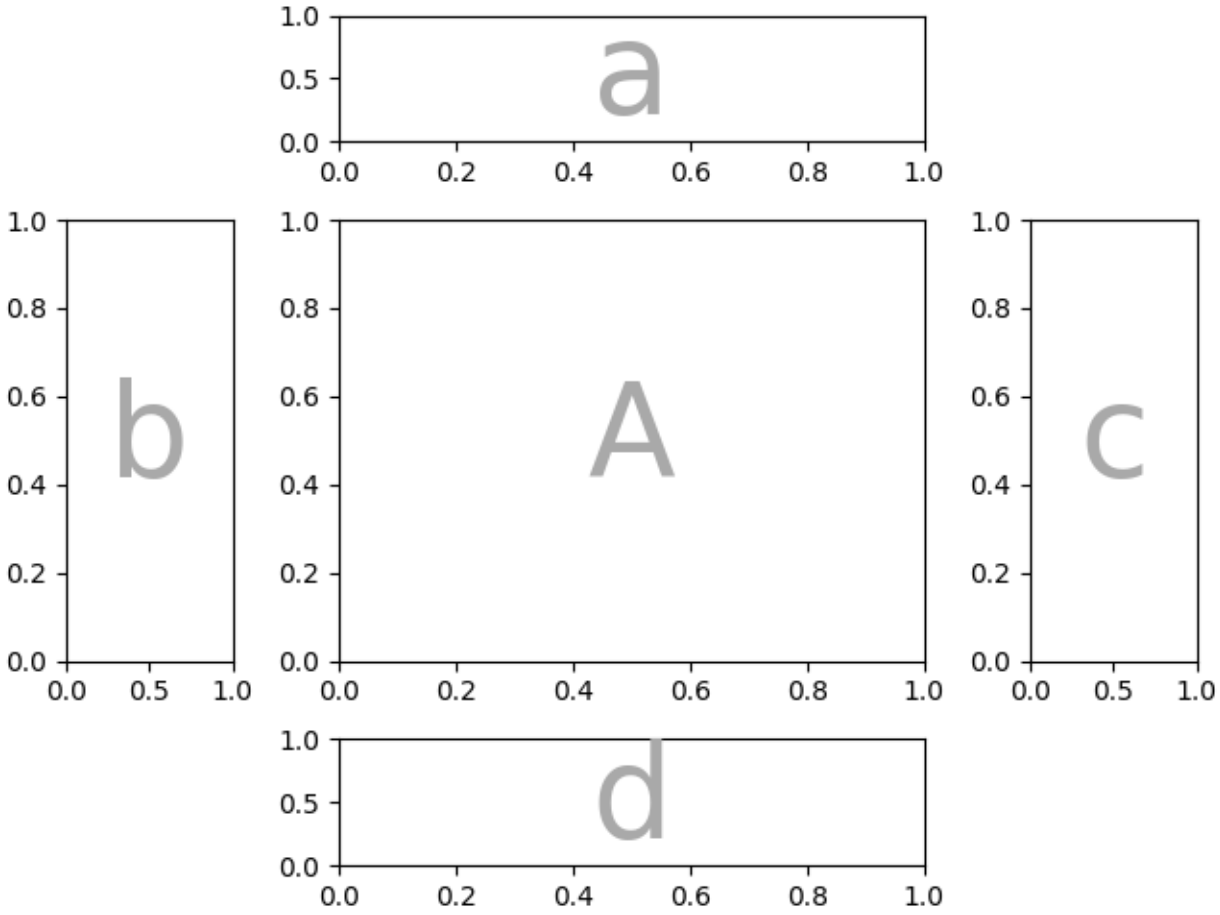
In this case we want to use the input to specify the arrangement, but set the relative widths of the rows / columns via *gridspec_kw*.

```
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    """
    .a.
    bAc
    .d.
    """,
    gridspec_kw={
        # set the height ratios between the rows
        "height_ratios": [1, 3.5, 1],
        # set the width ratios between the columns
        "width_ratios": [1, 3.5, 1],
```

(continues on next page)

(continued from previous page)

```
    },
)
identify_axes(axd)
```



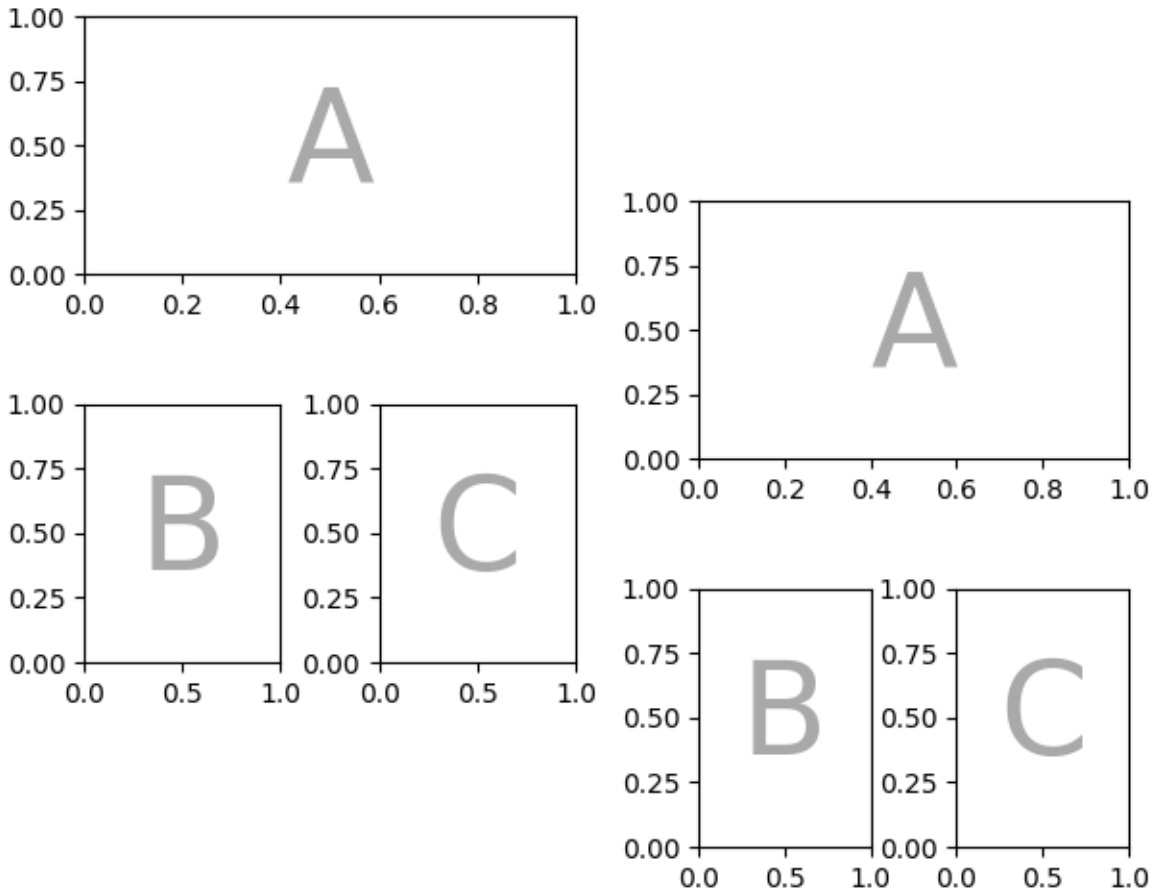
Or use the {*left*, *right*, *bottom*, *top*} keyword arguments to position the overall layout to put multiple versions of the same layout in a figure

```
layout = """AA
            BC"""
fig = plt.figure()
axd = fig.subplot_mosaic(
    layout,
    gridspec_kw={
        "bottom": 0.25,
        "top": 0.95,
        "left": 0.1,
        "right": 0.5,
        "wspace": 0.5,
        "hspace": 0.5,
    },
)
identify_axes(axd)
```

(continues on next page)

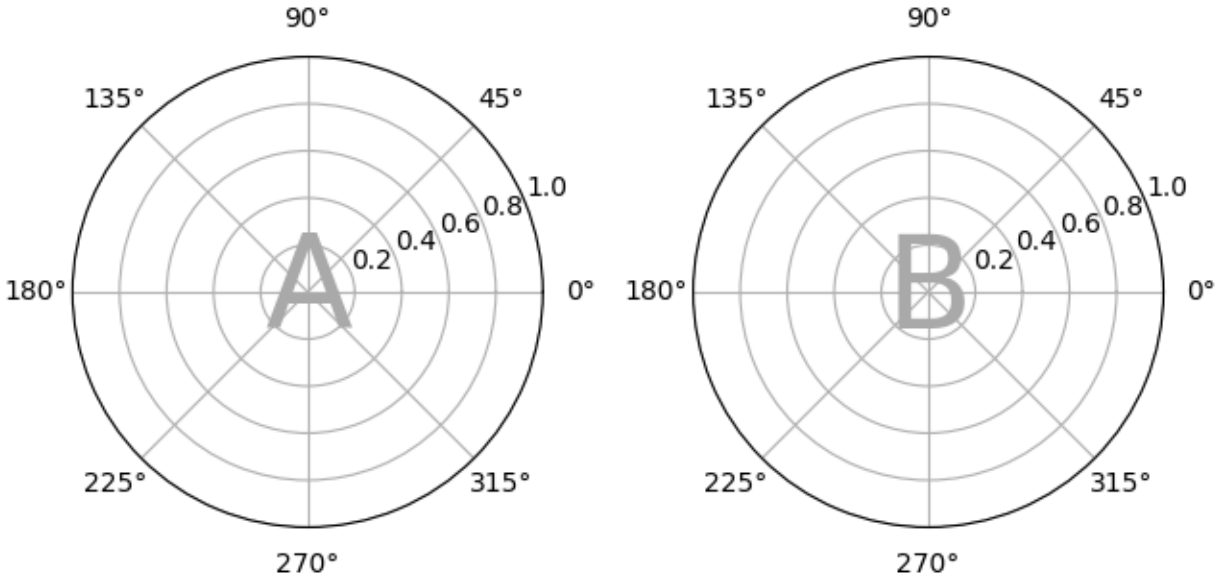
(continued from previous page)

```
axd = fig.subplot_mosaic(
    layout,
    gridspec_kw={
        "bottom": 0.05,
        "top": 0.75,
        "left": 0.6,
        "right": 0.95,
        "wspace": 0.5,
        "hspace": 0.5,
    },
)
identify_axes(axd)
```



We can also pass through arguments used to create the subplots (again, the same as *Figure.subplots*).

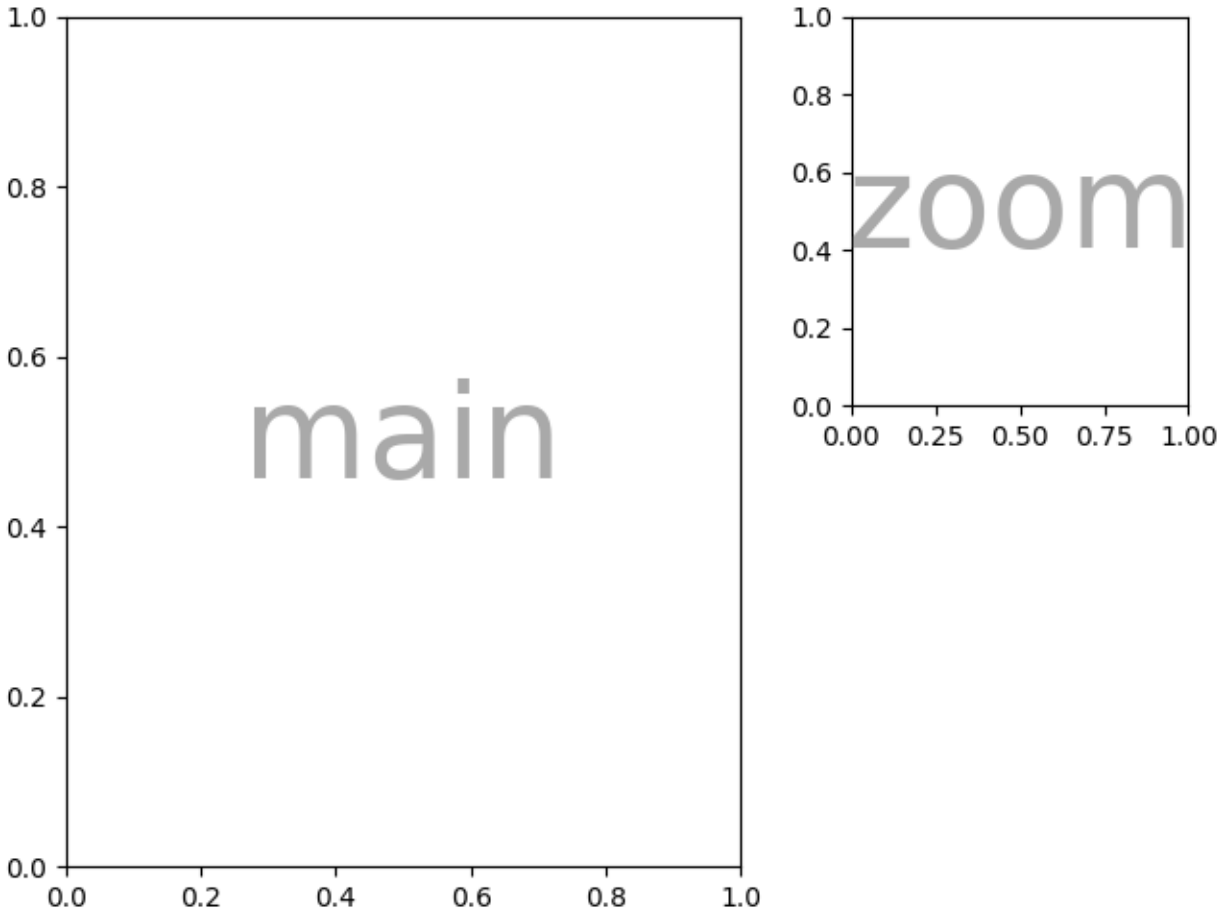
```
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    "AB", subplot_kw={"projection": "polar"}
)
identify_axes(axd)
```



Nested List input

Everything we can do with the string short-hand we can also do when passing in a list (internally we convert the string shorthand to a nested list), for example using spans, blanks, and *gridspec_kw*:

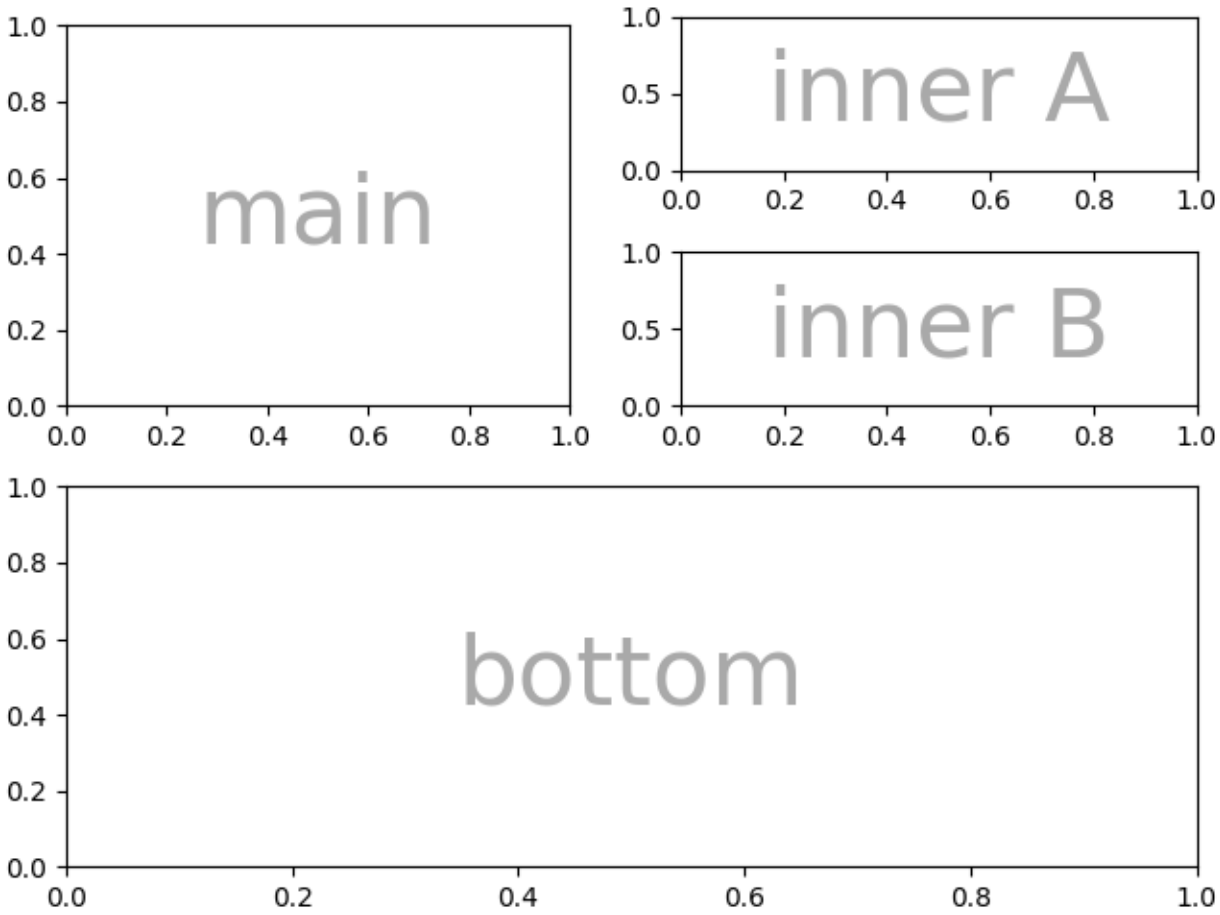
```
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    [["main", "zoom"],
     ["main", "BLANK"]
     ],
    empty_sentinel="BLANK",
    gridspec_kw={"width_ratios": [2, 1]}
)
identify_axes(axd)
```



In addition, using the list input we can specify nested layouts. Any element of the inner list can be another set of nested lists:

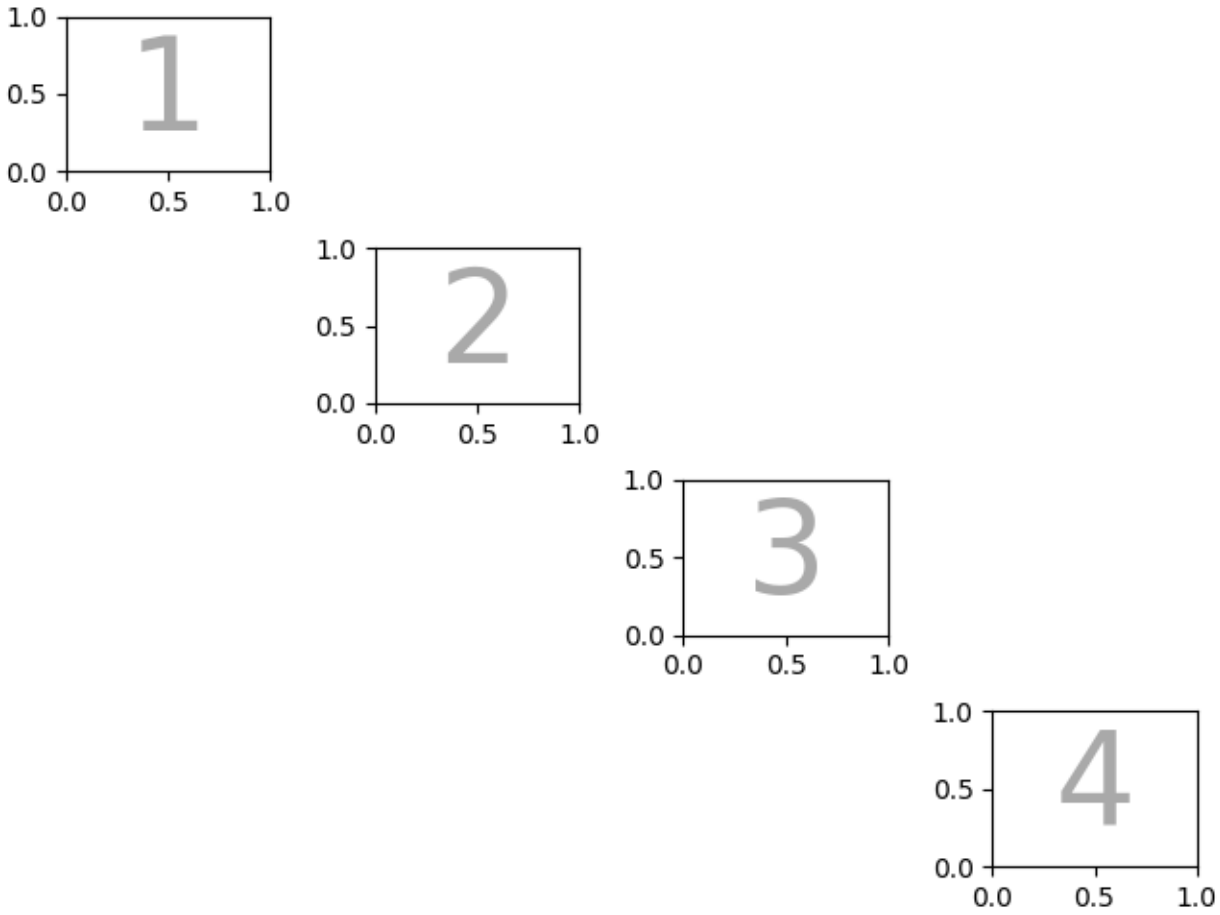
```
inner = [
    ["inner A"],
    ["inner B"],
]

outer_nested_layout = [
    ["main", inner],
    ["bottom", "bottom"],
]
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    outer_nested_layout, empty_sentinel=None
)
identify_axes(axd, fontsize=36)
```



We can also pass in a 2D NumPy array to do things like

```
layout = np.zeros((4, 4), dtype=int)
for j in range(4):
    layout[j, j] = j + 1
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    layout, empty_sentinel=0
)
identify_axes(axd)
```



Total running time of the script: (0 minutes 5.518 seconds)

2.6 Text

matplotlib has extensive text support, including support for mathematical expressions, truetype support for raster and vector outputs, newline separated text with arbitrary rotations, and unicode support. These tutorials cover the basics of working with text in Matplotlib.

2.6.1 Text in Matplotlib Plots

Introduction to plotting and working with text in Matplotlib.

Matplotlib has extensive text support, including support for mathematical expressions, truetype support for raster and vector outputs, newline separated text with arbitrary rotations, and unicode support.

Because it embeds fonts directly in output documents, e.g., for postscript or PDF, what you see on the screen is what you get in the hardcopy. FreeType support produces very nice, antialiased fonts, that look good even at small raster sizes. Matplotlib

includes its own *matplotlib.font_manager* (thanks to Paul Barrett), which implements a cross platform, W3C compliant font finding algorithm.

The user has a great deal of control over text properties (font size, font weight, text location and color, etc.) with sensible defaults set in the *rc file*. And significantly, for those interested in mathematical or scientific figures, Matplotlib implements a large number of TeX math symbols and commands, supporting *mathematical expressions* anywhere in your figure.

Basic text commands

The following commands are used to create text in the pyplot interface and the object-oriented API:

pyplot API	OO API	description
text	*text*	Add text at an arbitrary location of the *Axes*.
annotate	*annotate*	Add an annotation, with an optional arrow, at an arbitrary location of the *Axes*.
xlabel	*set_xlabel*	Add a label to the *Axes*'s x-axis.
ylabel	*set_ylabel*	Add a label to the *Axes*'s y-axis.
title	*set_title*	Add a title to the *Axes*.
figtext	*text*	Add text at an arbitrary location of the *Figure*.
suptitle	*suptitle*	Add a title to the *Figure*.

All of these functions create and return a *Text* instance, which can be configured with a variety of font and other properties. The example below shows all of these commands in action, and more detail is provided in the sections that follow.

```
import matplotlib
import matplotlib.pyplot as plt

fig = plt.figure()
ax = fig.add_subplot(111)
fig.subplots_adjust(top=0.85)

# Set titles for the figure and the subplot respectively
fig.suptitle('bold figure suptitle', fontsize=14, fontweight='bold')
ax.set_title('axes title')

ax.set_xlabel('xlabel')
ax.set_ylabel('ylabel')

# Set both x- and y-axis limits to [0, 10] instead of default [0, 1]
ax.axis([0, 10, 0, 10])

ax.text(3, 8, 'boxed italics text in data coords', style='italic',
        bbox={'facecolor': 'red', 'alpha': 0.5, 'pad': 10})
```

(continues on next page)

(continued from previous page)

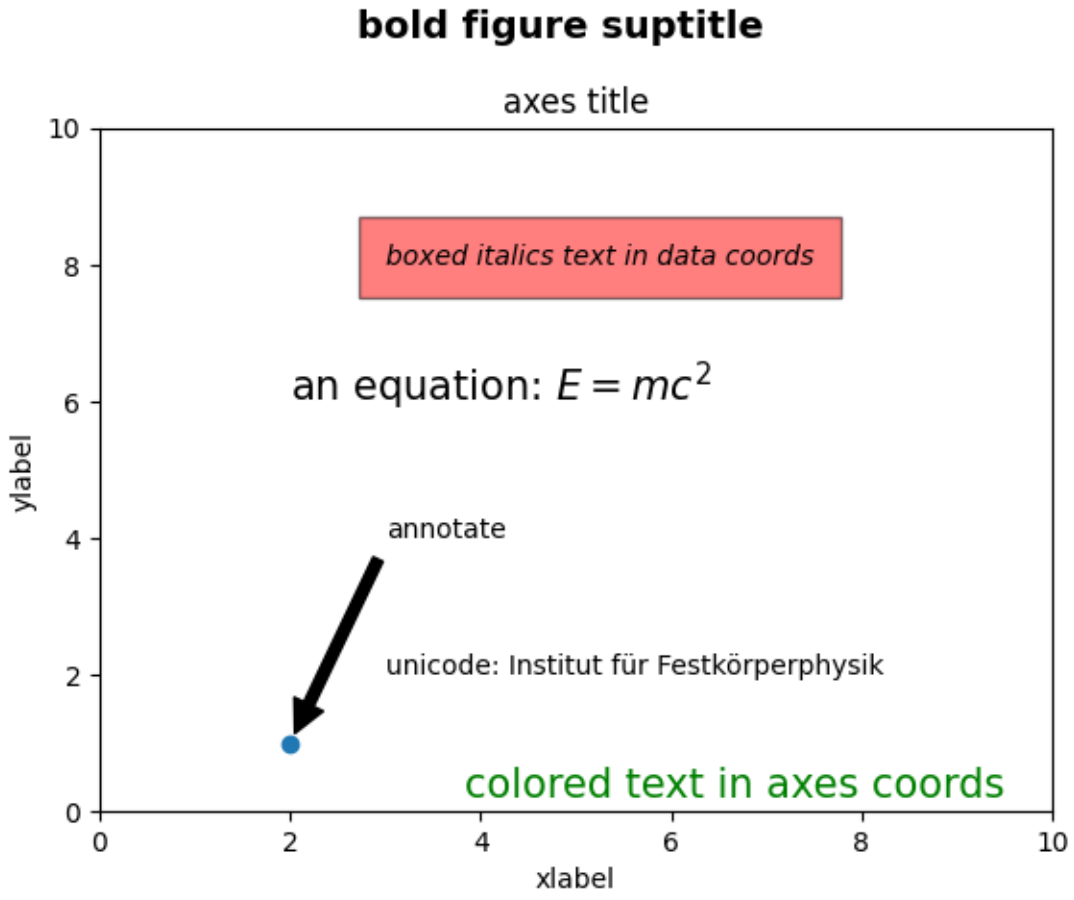
```
ax.text(2, 6, r'an equation: $E=mc^2$', fontsize=15)

ax.text(3, 2, 'unicode: Institut für Festkörperphysik')

ax.text(0.95, 0.01, 'colored text in axes coords',
        verticalalignment='bottom', horizontalalignment='right',
        transform=ax.transAxes,
        color='green', fontsize=15)

ax.plot([2], [1], 'o')
ax.annotate('annotate', xy=(2, 1), xytext=(3, 4),
            arrowprops=dict(facecolor='black', shrink=0.05))

plt.show()
```



Labels for x- and y-axis

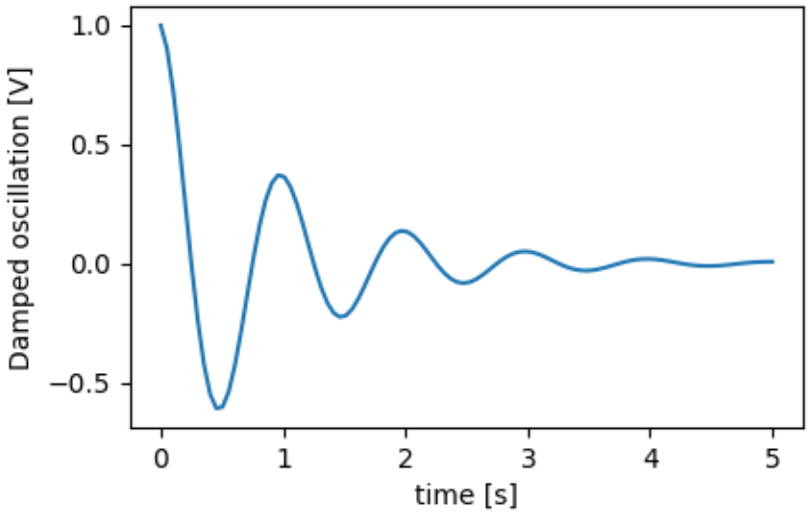
Specifying the labels for the x- and y-axis is straightforward, via the *set_xlabel* and *set_ylabel* methods.

```
import matplotlib.pyplot as plt
import numpy as np

x1 = np.linspace(0.0, 5.0, 100)
y1 = np.cos(2 * np.pi * x1) * np.exp(-x1)

fig, ax = plt.subplots(figsize=(5, 3))
fig.subplots_adjust(bottom=0.15, left=0.2)
ax.plot(x1, y1)
ax.set_xlabel('time [s]')
ax.set_ylabel('Damped oscillation [V]')

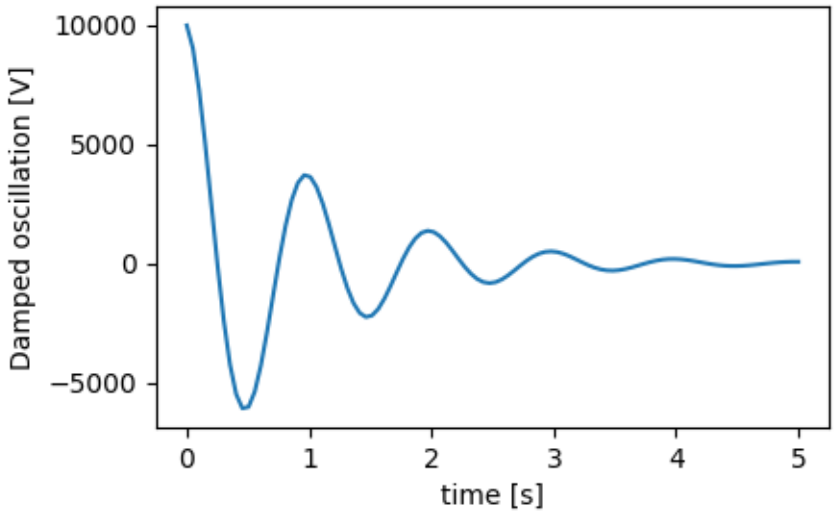
plt.show()
```



The x- and y-labels are automatically placed so that they clear the x- and y-ticklabels. Compare the plot below with that above, and note the y-label is to the left of the one above.

```
fig, ax = plt.subplots(figsize=(5, 3))
fig.subplots_adjust(bottom=0.15, left=0.2)
ax.plot(x1, y1*10000)
ax.set_xlabel('time [s]')
ax.set_ylabel('Damped oscillation [V]')

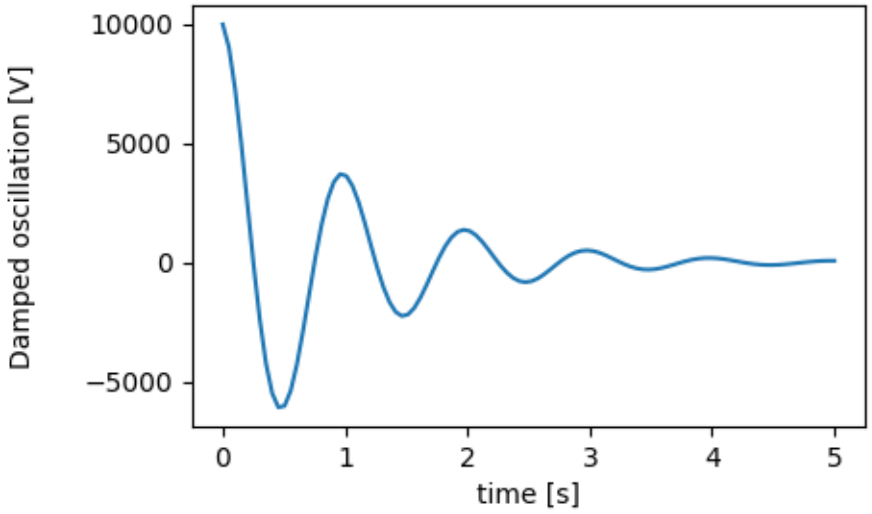
plt.show()
```



If you want to move the labels, you can specify the *labelpad* keyword argument, where the value is points (1/72", the same unit used to specify fontsizes).

```
fig, ax = plt.subplots(figsize=(5, 3))
fig.subplots_adjust(bottom=0.15, left=0.2)
ax.plot(x1, y1*10000)
ax.set_xlabel('time [s]')
ax.set_ylabel('Damped oscillation [V]', labelpad=18)

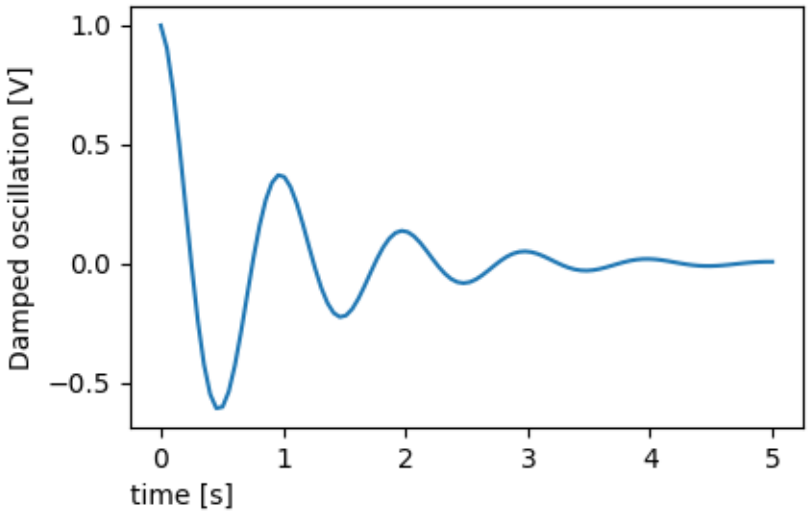
plt.show()
```



Or, the labels accept all the *Text* keyword arguments, including *position*, via which we can manually specify the label positions. Here we put the xlabel to the far left of the axis. Note, that the y-coordinate of this position has no effect - to adjust the y-position we need to use the *labelpad* kwarg.

```
fig, ax = plt.subplots(figsize=(5, 3))
fig.subplots_adjust(bottom=0.15, left=0.2)
ax.plot(x1, y1)
ax.set_xlabel('time [s]', position=(0., 1e6), horizontalalignment='left')
ax.set_ylabel('Damped oscillation [V]')

plt.show()
```



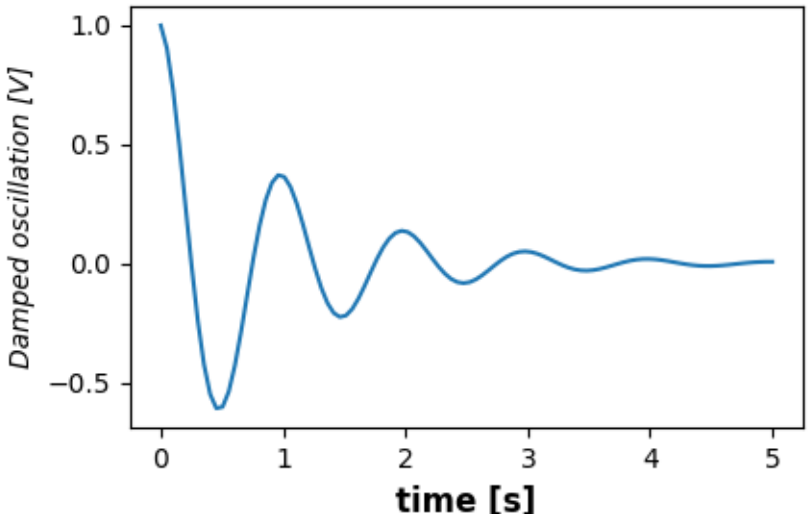
All the labelling in this tutorial can be changed by manipulating the *matplotlib.font_manager.FontProperties* method, or by named kwargs to *set_xlabel*

```
from matplotlib.font_manager import FontProperties

font = FontProperties()
font.set_family('serif')
font.set_name('Times New Roman')
font.set_style('italic')

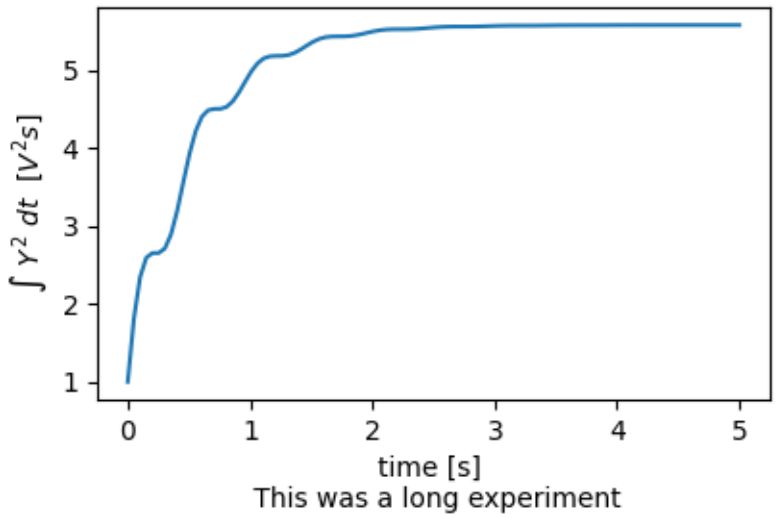
fig, ax = plt.subplots(figsize=(5, 3))
fig.subplots_adjust(bottom=0.15, left=0.2)
ax.plot(x1, y1)
ax.set_xlabel('time [s]', fontsize='large', fontweight='bold')
ax.set_ylabel('Damped oscillation [V]', fontproperties=font)

plt.show()
```



Finally, we can use native TeX rendering in all text objects and have multiple lines:

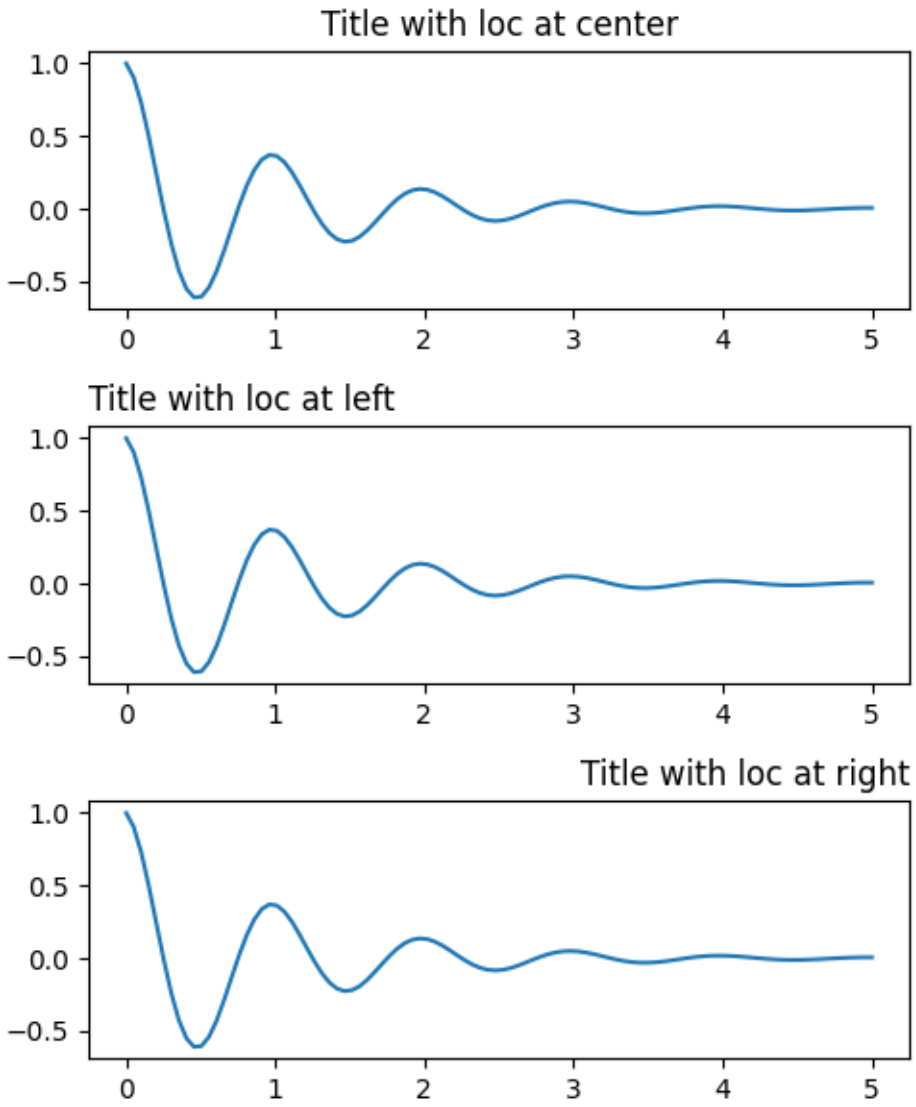
```
fig, ax = plt.subplots(figsize=(5, 3))
fig.subplots_adjust(bottom=0.2, left=0.2)
ax.plot(x1, np.cumsum(y1**2))
ax.set_xlabel('time [s] \n This was a long experiment')
ax.set_ylabel(r'$\int\ Y^2\ dt\ \ [V^2 s]$')
plt.show()
```



Titles

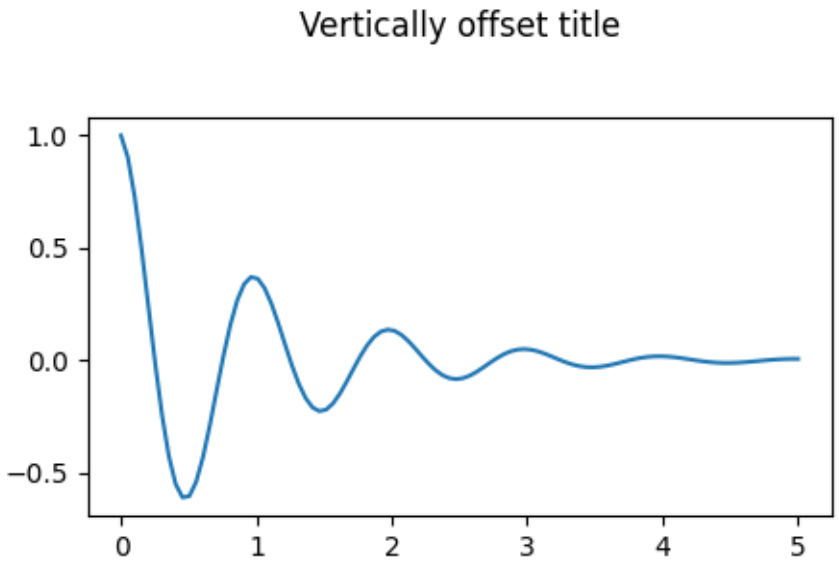
Subplot titles are set in much the same way as labels, but there is the *loc* keyword arguments that can change the position and justification from the default value of `loc=center`.

```
fig, axs = plt.subplots(3, 1, figsize=(5, 6), tight_layout=True)
locs = ['center', 'left', 'right']
for ax, loc in zip(axs, locs):
    ax.plot(x1, y1)
    ax.set_title('Title with loc at '+loc, loc=loc)
plt.show()
```



Vertical spacing for titles is controlled via `rcParams["axes.titlepad"]` (default: `6.0`), which defaults to 5 points. Setting to a different value moves the title.

```
fig, ax = plt.subplots(figsize=(5, 3))
fig.subplots_adjust(top=0.8)
ax.plot(x1, y1)
ax.set_title('Vertically offset title', pad=30)
plt.show()
```



Ticks and ticklabels

Placing ticks and ticklabels is a very tricky aspect of making a figure. Matplotlib does its best to accomplish the task automatically, but it also offers a very flexible framework for determining the choices for tick locations, and how they are labelled.

Terminology

Axes have an *matplotlib.axis.Axis* object for the `ax.xaxis` and `ax.yaxis` that contain the information about how the labels in the axis are laid out.

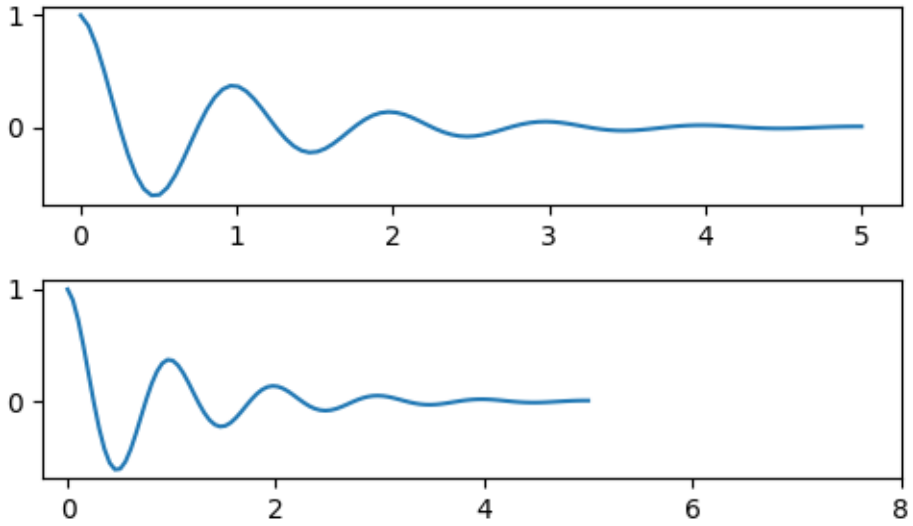
The axis API is explained in detail in the documentation to *axis*.

An Axis object has major and minor ticks. The Axis has *Axis.set_major_locator* and *Axis.set_minor_locator* methods that use the data being plotted to determine the location of major and minor ticks. There are also *Axis.set_major_formatter* and *Axis.set_minor_formatter* methods that format the tick labels.

Simple ticks

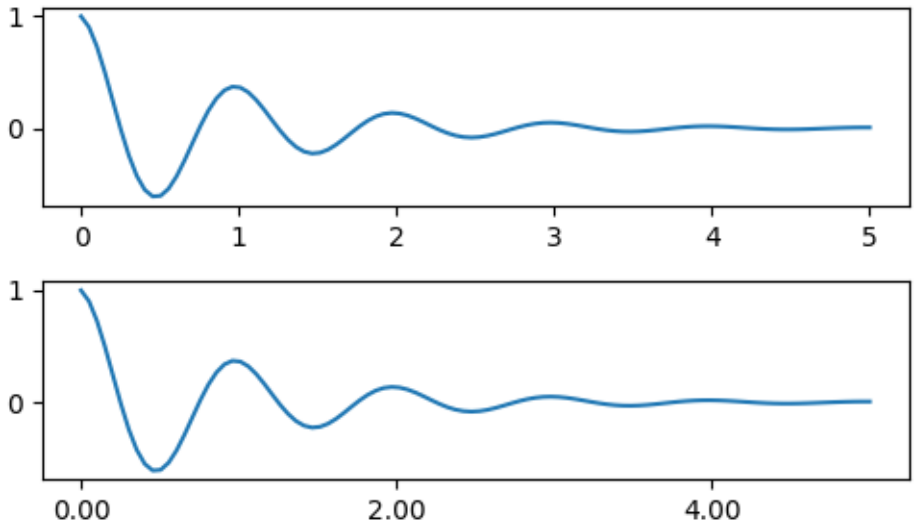
It often is convenient to simply define the tick values, and sometimes the tick labels, overriding the default locators and formatters. This is discouraged because it breaks interactive navigation of the plot. It also can reset the axis limits: note that the second plot has the ticks we asked for, including ones that are well outside the automatic view limits.

```
fig, axs = plt.subplots(2, 1, figsize=(5, 3), tight_layout=True)
axs[0].plot(x1, y1)
axs[1].plot(x1, y1)
axs[1].xaxis.set_ticks(np.arange(0., 8.1, 2.))
plt.show()
```



We can of course fix this after the fact, but it does highlight a weakness of hard-coding the ticks. This example also changes the format of the ticks:

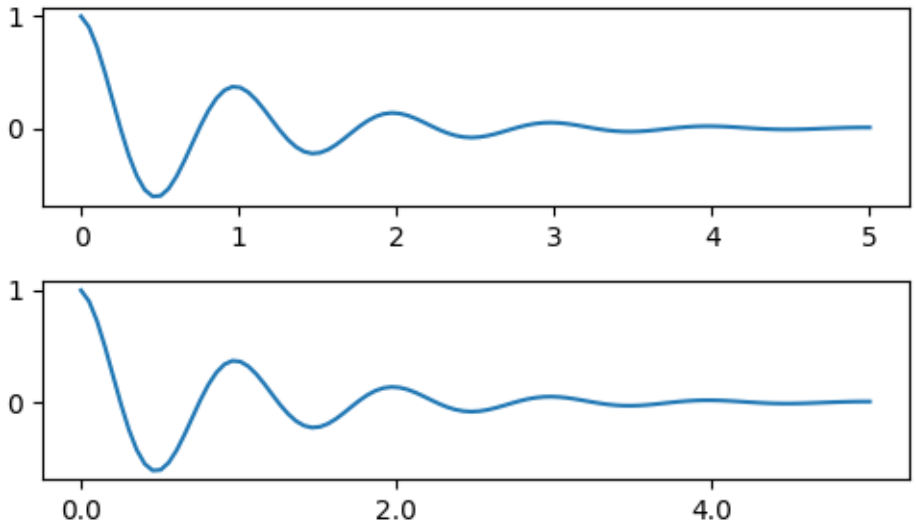
```
fig, axs = plt.subplots(2, 1, figsize=(5, 3), tight_layout=True)
axs[0].plot(x1, y1)
axs[1].plot(x1, y1)
ticks = np.arange(0., 8.1, 2.)
# list comprehension to get all tick labels...
tickla = [f'{tick:1.2f}' for tick in ticks]
axs[1].xaxis.set_ticks(ticks)
axs[1].xaxis.set_ticklabels(tickla)
axs[1].set_xlim(axs[0].get_xlim())
plt.show()
```



Tick Locators and Formatters

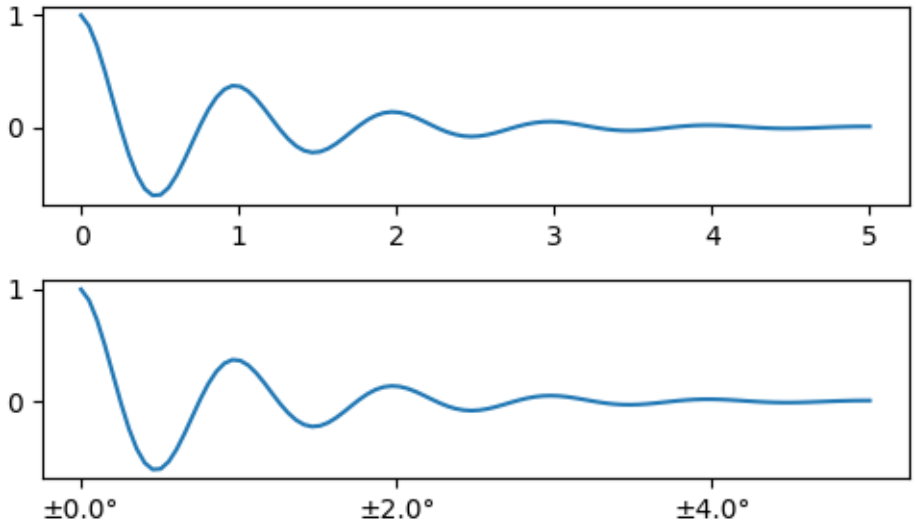
Instead of making a list of all the tickalbels, we could have used *matplotlib.ticker.StrMethodFormatter* (new-style `str.format()` format string) or *matplotlib.ticker.FormatStrFormatter* (old-style '%' format string) and passed it to the `ax.xaxis`. A *matplotlib.ticker.StrMethodFormatter* can also be created by passing a `str` without having to explicitly create the formatter.

```
fig, axs = plt.subplots(2, 1, figsize=(5, 3), tight_layout=True)
axs[0].plot(x1, y1)
axs[1].plot(x1, y1)
ticks = np.arange(0., 8.1, 2.)
axs[1].xaxis.set_ticks(ticks)
axs[1].xaxis.set_major_formatter('{x:1.1f}')
axs[1].set_xlim(axs[0].get_xlim())
plt.show()
```



And of course we could have used a non-default locator to set the tick locations. Note we still pass in the tick values, but the x-limit fix used above is *not* needed.

```
fig, axs = plt.subplots(2, 1, figsize=(5, 3), tight_layout=True)
axs[0].plot(x1, y1)
axs[1].plot(x1, y1)
locator = matplotlib.ticker.FixedLocator(ticks)
axs[1].xaxis.set_major_locator(locator)
axs[1].xaxis.set_major_formatter('±{x}°')
plt.show()
```



The default formatter is the *matplotlib.ticker.MaxNLocator* called as `ticker.MaxNLocator(self, nbins='auto', steps=[1, 2, 2.5, 5, 10])` The *steps* keyword contains a list of multiples that can be used for tick values. i.e. in this case, 2, 4, 6 would be acceptable ticks, as would 20, 40, 60 or 0.2, 0.4, 0.6. However, 3, 6, 9

would not be acceptable because 3 doesn't appear in the list of steps.

`nbins=auto` uses an algorithm to determine how many ticks will be acceptable based on how long the axis is. The fontsize of the ticklabel is taken into account, but the length of the tick string is not (because its not yet known.) In the bottom row, the ticklabels are quite large, so we set `nbins=4` to make the labels fit in the right-hand plot.

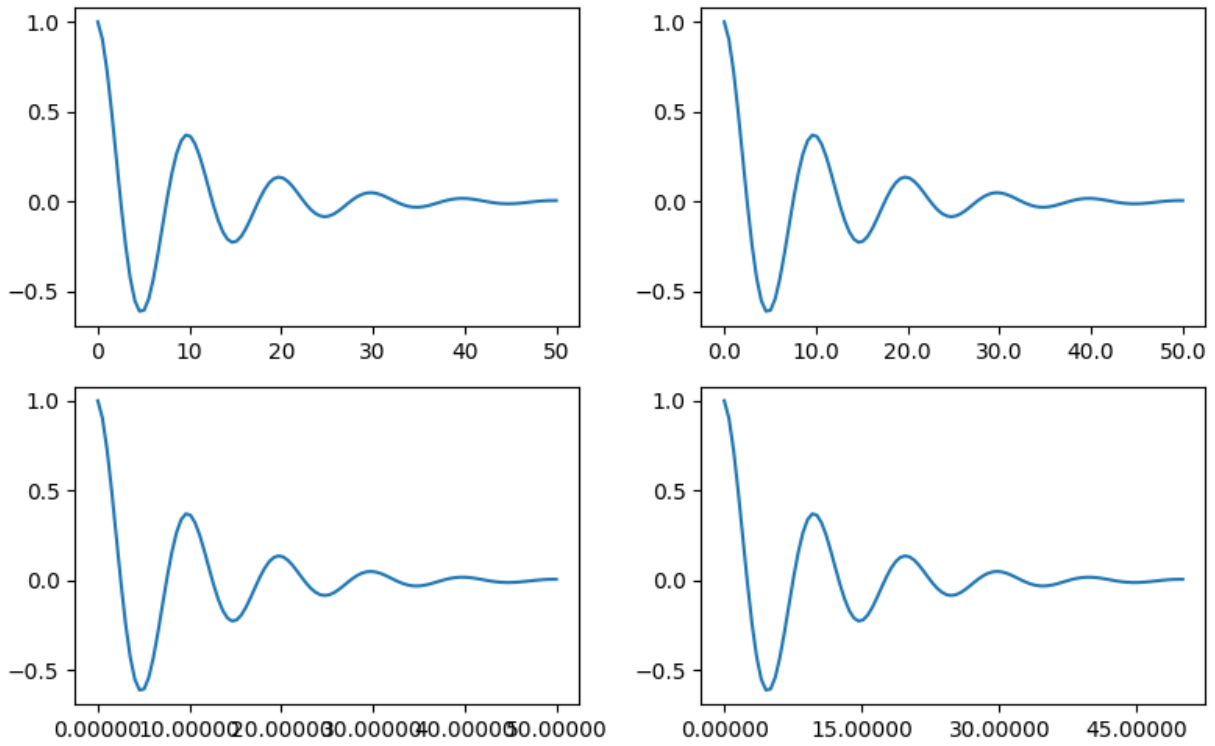
```
fig, axs = plt.subplots(2, 2, figsize=(8, 5), tight_layout=True)
for n, ax in enumerate(axs.flat):
    ax.plot(x1*10., y1)

formatter = matplotlib.ticker.FormatStrFormatter('%1.1f')
locator = matplotlib.ticker.MaxNLocator(nbins='auto', steps=[1, 4, 10])
axs[0, 1].xaxis.set_major_locator(locator)
axs[0, 1].xaxis.set_major_formatter(formatter)

formatter = matplotlib.ticker.FormatStrFormatter('%1.5f')
locator = matplotlib.ticker.AutoLocator()
axs[1, 0].xaxis.set_major_formatter(formatter)
axs[1, 0].xaxis.set_major_locator(locator)

formatter = matplotlib.ticker.FormatStrFormatter('%1.5f')
locator = matplotlib.ticker.MaxNLocator(nbins=4)
axs[1, 1].xaxis.set_major_formatter(formatter)
axs[1, 1].xaxis.set_major_locator(locator)

plt.show()
```

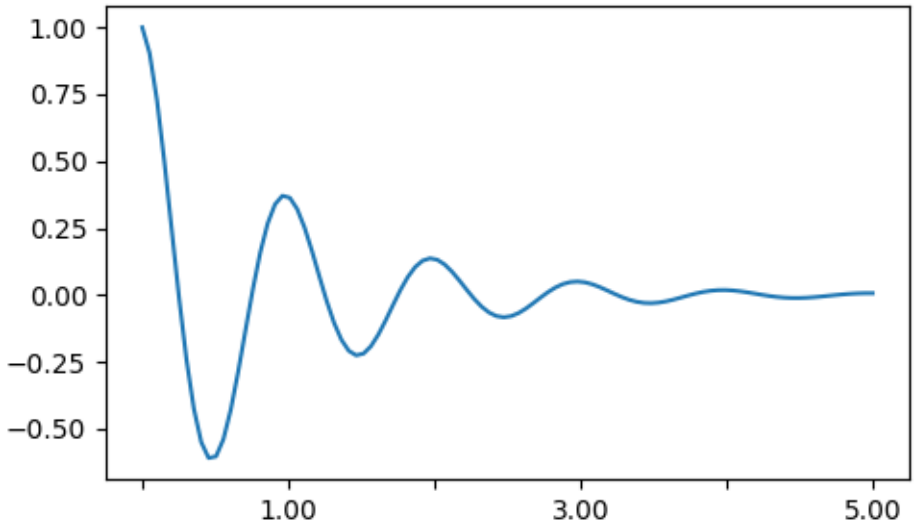


Finally, we can specify functions for the formatter using *matplotlib.ticker.FuncFormatter*. Further, like *matplotlib.ticker.StrMethodFormatter*, passing a function will automatically create a *matplotlib.ticker.FuncFormatter*.

```
def formatoddticks(x, pos):
    """Format odd tick positions."""
    if x % 2:
        return f'{x:1.2f}'
    else:
        return ''

fig, ax = plt.subplots(figsize=(5, 3), tight_layout=True)
ax.plot(x1, y1)
locator = matplotlib.ticker.MaxNLocator(nbins=6)
ax.xaxis.set_major_formatter(formatoddticks)
ax.xaxis.set_major_locator(locator)

plt.show()
```



Dateticks

Matplotlib can accept `datetime.datetime` and `numpy.datetime64` objects as plotting arguments. Dates and times require special formatting, which can often benefit from manual intervention. In order to help, dates have special Locators and Formatters, defined in the *matplotlib.dates* module.

A simple example is as follows. Note how we have to rotate the tick labels so that they don't over-run each other.

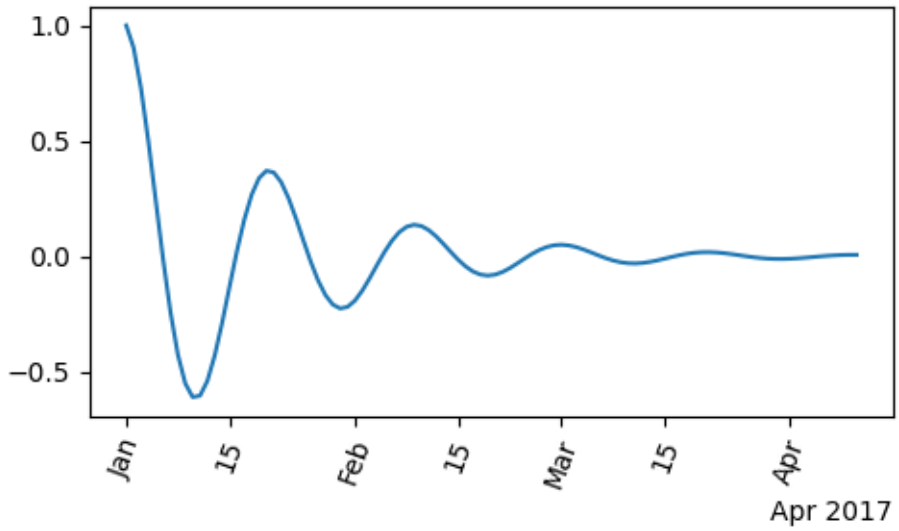
```
import datetime
```

(continues on next page)

(continued from previous page)

```
fig, ax = plt.subplots(figsize=(5, 3), tight_layout=True)
base = datetime.datetime(2017, 1, 1, 0, 0, 1)
time = [base + datetime.timedelta(days=x) for x in range(len(x1))]

ax.plot(time, y1)
ax.tick_params(axis='x', rotation=70)
plt.show()
```



We can pass a format to *matplotlib.dates.DateFormatter*. Also note that the 29th and the next month are very close together. We can fix this by using the *dates.DayLocator* class, which allows us to specify a list of days of the month to use. Similar formatters are listed in the *matplotlib.dates* module.

```
import matplotlib.dates as mdates

locator = mdates.DayLocator(bymonthday=[1, 15])
formatter = mdates.DateFormatter('%b %d')

fig, ax = plt.subplots(figsize=(5, 3), tight_layout=True)
ax.xaxis.set_major_locator(locator)
ax.xaxis.set_major_formatter(formatter)
ax.plot(time, y1)
ax.tick_params(axis='x', rotation=70)
plt.show()
```

Total running time of the script: (0 minutes 4.725 seconds)

2.6.2 Text properties and layout

Controlling properties of text and its layout with Matplotlib.

matplotlib.text.Text instances have a variety of properties which can be configured via keyword arguments to *set_title*, *set_xlabel*, *text*, etc.

Property	Value Type
alpha	float
backgroundcolor	any matplotlib *color*
bbox	*Rectangle* prop dict plus key 'pad' which is a pad in points
clip_box	a matplotlib.transform.Bbox instance
clip_on	bool
clip_path	a *Path* instance and a *Transform* instance, a *Patch*
color	any matplotlib *color*
family	['serif' | 'sans-serif' | 'cursive' | 'fantasy' | 'monospace']
fontproperties	*FontProperties*
horizontalalignment or ha	['center' | 'right' | 'left']
label	any string
linespacing	float
multialignment	['left' | 'right' | 'center']
name or fontname	string e.g., ['Sans' | 'Courier' | 'Helvetica' ...]
picker	[None|float|bool|callable]
position	(x, y)
rotation	[angle in degrees | 'vertical' | 'horizontal']
size or fontsize	[size in points | relative size, e.g., 'smaller', 'x-large']
style or fontstyle	['normal' | 'italic' | 'oblique']
text	string or anything printable with '%s' conversion
transform	*Transform* subclass
variant	['normal' | 'small-caps']
verticalalignment or va	['center' | 'top' | 'bottom' | 'baseline']
visible	bool
weight or fontweight	['normal' | 'bold' | 'heavy' | 'light' | 'ultrabold' | 'ultralight']
x	float
y	float
zorder	any number

You can lay out text with the alignment arguments `horizontalalignment`, `verticalalignment`, and `multialignment`. `horizontalalignment` controls whether the x positional argument for the text indicates the left, center or right side of the text bounding box. `verticalalignment` controls whether the y positional argument for the text indicates the bottom, center or top side of the text bounding box. `multialignment`, for newline separated strings only, controls whether the different lines are left, center or right justified. Here is an example which uses the *text()* command to show the various alignment possibilities. The use of `transform=ax.transAxes` throughout the code indicates that the coordinates are given relative to the axes bounding box, with (0, 0) being the lower left of the axes and (1, 1) the upper right.

```
import matplotlib.pyplot as plt
```

(continues on next page)

(continued from previous page)

```
import matplotlib.patches as patches

# build a rectangle in axes coords
left, width = .25, .5
bottom, height = .25, .5
right = left + width
top = bottom + height

fig = plt.figure()
ax = fig.add_axes([0, 0, 1, 1])

# axes coordinates: (0, 0) is bottom left and (1, 1) is upper right
p = patches.Rectangle(
    (left, bottom), width, height,
    fill=False, transform=ax.transAxes, clip_on=False
    )

ax.add_patch(p)

ax.text(left, bottom, 'left top',
        horizontalalignment='left',
        verticalalignment='top',
        transform=ax.transAxes)

ax.text(left, bottom, 'left bottom',
        horizontalalignment='left',
        verticalalignment='bottom',
        transform=ax.transAxes)

ax.text(right, top, 'right bottom',
        horizontalalignment='right',
        verticalalignment='bottom',
        transform=ax.transAxes)

ax.text(right, top, 'right top',
        horizontalalignment='right',
        verticalalignment='top',
        transform=ax.transAxes)

ax.text(right, bottom, 'center top',
        horizontalalignment='center',
        verticalalignment='top',
        transform=ax.transAxes)

ax.text(left, 0.5*(bottom+top), 'right center',
        horizontalalignment='right',
        verticalalignment='center',
        rotation='vertical',
        transform=ax.transAxes)

ax.text(left, 0.5*(bottom+top), 'left center',
```

(continues on next page)

(continued from previous page)

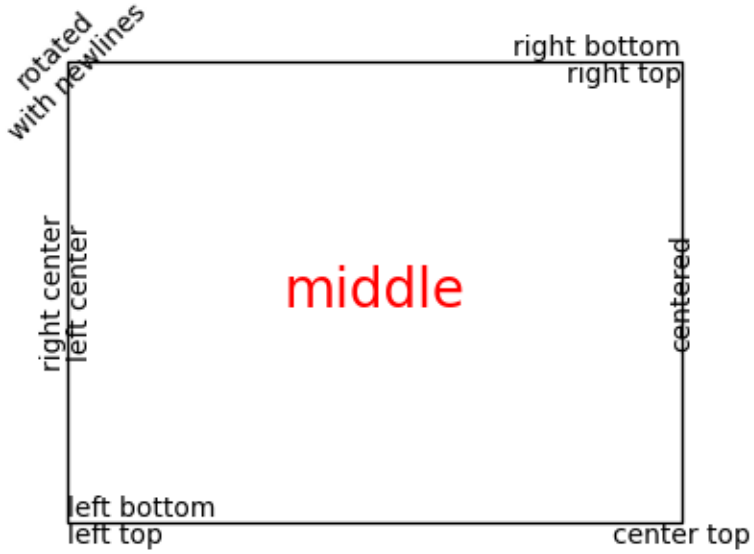
```
        horizontalalignment='left',
        verticalalignment='center',
        rotation='vertical',
        transform=ax.transAxes)

ax.text(0.5*(left+right), 0.5*(bottom+top), 'middle',
        horizontalalignment='center',
        verticalalignment='center',
        fontsize=20, color='red',
        transform=ax.transAxes)

ax.text(right, 0.5*(bottom+top), 'centered',
        horizontalalignment='center',
        verticalalignment='center',
        rotation='vertical',
        transform=ax.transAxes)

ax.text(left, top, 'rotated\nwith newlines',
        horizontalalignment='center',
        verticalalignment='center',
        rotation=45,
        transform=ax.transAxes)

ax.set_axis_off()
plt.show()
```



2.6.3 Default Font

The base default font is controlled by a set of rcParams. To set the font for mathematical expressions, use the rcParams beginning with `mathtext` (see *mathtext*).

rcParam	usage
`'font.family'`	List of either names of font or `{'cursive', 'fantasy', 'monospace', 'sans', 'sans serif', 'sans-serif', 'serif'}`.
`'font.style'`	The default style, ex `'normal'`, `'italic'`.
`'font.variant'`	Default variant, ex `'normal'`, `'small-caps'` (untested)
`'font.stretch'`	Default stretch, ex `'normal'`, `'condensed'` (incomplete)
`'font.weight'`	Default weight. Either string or integer
`'font.size'`	Default font size in points. Relative font sizes (`'large'`, `'x-small'`) are computed against this size.

The mapping between the family aliases ({'cursive', 'fantasy', 'monospace', 'sans', 'sans serif', 'sans-serif', 'serif'}) and actual font names is controlled by the following rcParams:

family alias	rcParam with mappings
'serif'	'font.serif'
'monospace'	'font.monospace'
'fantasy'	'font.fantasy'
'cursive'	'font.cursive'
{'sans', 'sans serif', 'sans-serif'}	'font.sans-serif'

which are lists of font names.

Text with non-latin glyphs

As of v2.0 the *default font*, DejaVu, contains glyphs for many western alphabets, but not other scripts, such as Chinese, Korean, or Japanese.

To set the default font to be one that supports the code points you need, prepend the font name to 'font.family' or the desired alias lists

```
matplotlib.rcParams['font.sans-serif'] = ['Source Han Sans TW', 'sans-serif']
```

or set it in your .matplotlibrc file:

```
font.sans-serif: Source Han Sans TW, Arial, sans-serif
```

To control the font used on per-artist basis use the 'name', 'fontname' or 'fontproperties' kwargs documented *above*.

On linux, fc-list can be a useful tool to discover the font name; for example

```
$ fc-list :lang=zh family
Noto to Sans Mono CJK TC,Noto Sans Mono CJK TC Bold
Noto Sans CJK TC,Noto Sans CJK TC Medium
Noto Sans CJK TC,Noto Sans CJK TC DemiLight
Noto Sans CJK KR,Noto Sans CJK KR Black
Noto Sans CJK TC,Noto Sans CJK TC Black
Noto Sans Mono CJK TC,Noto Sans Mono CJK TC Regular
Noto Sans CJK SC,Noto Sans CJK SC Light
```

lists all of the fonts that support Chinese.

2.6.4 Annotations

Annotating text with Matplotlib.

Table of Contents

Basic annotation

The uses of the basic *text()* will place text at an arbitrary position on the Axes. A common use case of text is to annotate some feature of the plot, and the *annotate()* method provides helper functionality to make annotations easy. In an annotation, there are two points to consider: the location being annotated represented by the argument *xy* and the location of the text *xytext*. Both of these arguments are `(x, y)` tuples.

In this example, both the *xy* (arrow tip) and *xytext* locations (text location) are in data coordinates. There are a variety of other coordinate systems one can choose -- you can specify the coordinate system of *xy* and *xytext* with one of the following strings for *xycoords* and *textcoords* (default is 'data')

argument	coordinate system
'figure points'	points from the lower left corner of the figure
'figure pixels'	pixels from the lower left corner of the figure
'figure fraction'	(0, 0) is lower left of figure and (1, 1) is upper right
'axes points'	points from lower left corner of axes
'axes pixels'	pixels from lower left corner of axes
'axes fraction'	(0, 0) is lower left of axes and (1, 1) is upper right
'data'	use the axes data coordinate system

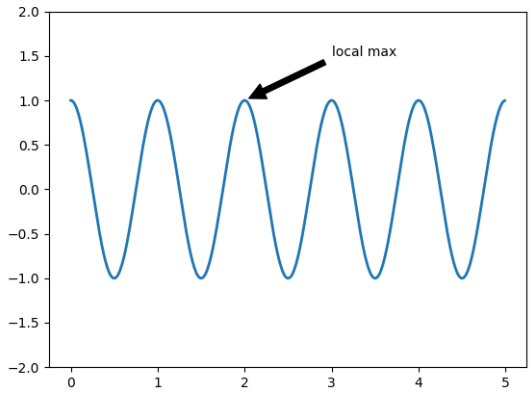


Fig. 23: Annotation Basic

For example to place the text coordinates in fractional axes coordinates, one could do:

```
ax.annotate('local max', xy=(3, 1),  xycoords='data',
            xytext=(0.8, 0.95), textcoords='axes fraction',
            arrowprops=dict(facecolor='black', shrink=0.05),
            horizontalalignment='right', verticalalignment='top',
            )
```

For physical coordinate systems (points or pixels) the origin is the bottom-left of the figure or axes.

Optionally, you can enable drawing of an arrow from the text to the annotated point by giving a dictionary of arrow properties in the optional keyword argument *arrowprops*.

arrowprops key	description
width	the width of the arrow in points
frac	the fraction of the arrow length occupied by the head
headwidth	the width of the base of the arrow head in points
shrink	move the tip and base some percent away from the annotated point and text
**kwargs	any key for *matplotlib.patches.Polygon*, e.g., `facecolor`

In the example below, the *xy* point is in native coordinates (*xycoords* defaults to 'data'). For a polar axes, this is in (theta, radius) space. The text in this example is placed in the fractional figure coordinate system. *matplotlib.text.Text* keyword arguments like *horizontalalignment*, *verticalalignment* and *fontsize* are passed from *annotate* to the `Text` instance.

For more on all the wild and wonderful things you can do with annotations, including fancy arrows, see *Advanced Annotations* and /gallery/text_labels_and_annotations/annotation_demo.

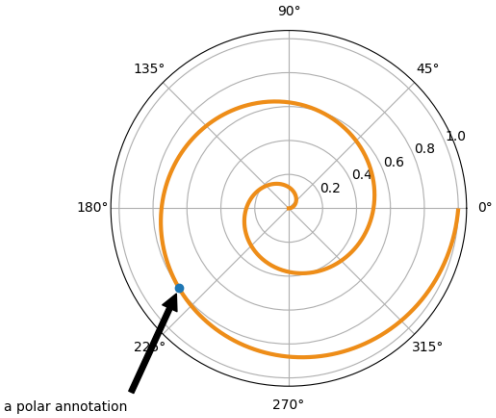

Fig. 24: Annotation Polar

Do not proceed unless you have already read *Basic annotation*, *text()* and *annotate()*!

Advanced Annotations

Annotating with Text with Box

Let's start with a simple example.

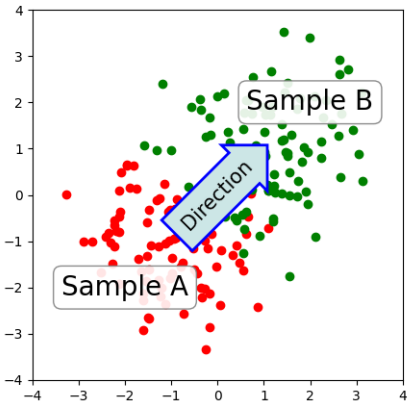

Fig. 25: Annotate Text Arrow

text takes a *bbox* keyword argument, which draws a box around the text:

```
t = ax.text(
    0, 0, "Direction", ha="center", va="center", rotation=45, size=15,
    bbox=dict(boxstyle="rarrow,pad=0.3", fc="cyan", ec="b", lw=2))
```

The patch object associated with the text can be accessed by:

```
bb = t.get_bbox_patch()
```

The return value is a *FancyBboxPatch*; patch properties (facecolor, edgewidth, etc.) can be accessed and modified as usual. *FancyBboxPatch.set_boxstyle* sets the box shape:

```
bb.set_boxstyle("rarrow", pad=0.6)
```

The arguments are the name of the box style with its attributes as keyword arguments. Currently, following box styles are implemented.

Class	Name	Attrs
Circle	`circle`	pad=0.3
DArrow	`darrow`	pad=0.3
LArrow	`larrow`	pad=0.3
RArrow	`rarrow`	pad=0.3
Round	`round`	pad=0.3,rounding_size=None
Round4	`round4`	pad=0.3,rounding_size=None
Roundtooth	`roundtooth`	pad=0.3,tooth_size=None
Sawtooth	`sawtooth`	pad=0.3,tooth_size=None
Square	`square`	pad=0.3

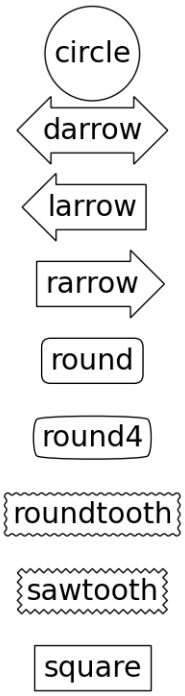

Fig. 26: Fancybox Demo

Note that the attribute arguments can be specified within the style name with separating comma (this form can be used as "boxstyle" value of bbox argument when initializing the text instance)

```
bb.set_boxstyle("rarrow,pad=0.6")
```

Annotating with Arrow

annotate draws an arrow connecting two points in an axes:

```
ax.annotate("Annotation",
            xy=(x1, y1), xycoords='data',
            xytext=(x2, y2), textcoords='offset points',
            )
```

This annotates a point at *xy* in the given coordinate (*xycoords*) with the text at *xytext* given in *textcoords*. Often, the annotated point is specified in the *data* coordinate and the annotating text in *offset points*. See *annotate* for available coordinate systems.

An arrow connecting *xy* to *xytext* can be optionally drawn by specifying the *arrowprops* argument. To draw only an arrow, use empty string as the first argument.

```
ax.annotate("",
            xy=(0.2, 0.2), xycoords='data',
            xytext=(0.8, 0.8), textcoords='data',
            arrowprops=dict(arrowstyle="->",
                            connectionstyle="arc3"),
            )
```

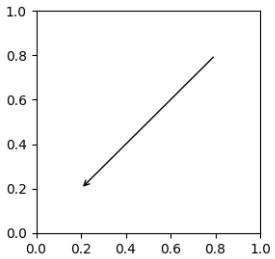

Fig. 27: Annotate Simple01

The arrow is drawn as follows:

1. A path connecting the two points is created, as specified by the *connectionstyle* parameter.
2. The path is clipped to avoid patches *patchA* and *patchB*, if these are set.
3. The path is further shrunk by *shrinkA* and *shrinkB* (in pixels).
4. The path is transmuted to an arrow patch, as specified by the *arrowstyle* parameter.

The creation of the connecting path between two points is controlled by `connectionstyle` key and the following styles are available.

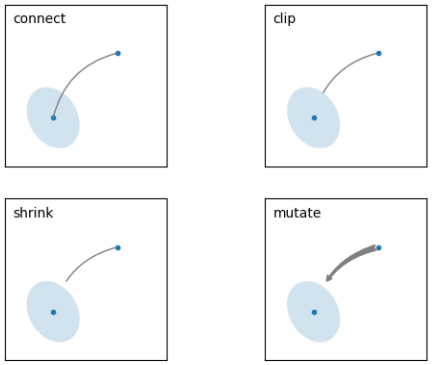

Fig. 28: Annotate Explain

Name	Attrs
`angle`	angleA=90,angleB=0,rad=0.0
`angle3`	angleA=90,angleB=0
`arc`	angleA=0,angleB=0,armA=None,armB=None,rad=0.0
`arc3`	rad=0.0
`bar`	armA=0.0,armB=0.0,fraction=0.3,angle=None

Note that "3" in `angle3` and `arc3` is meant to indicate that the resulting path is a quadratic spline segment (three control points). As will be discussed below, some arrow style options can only be used when the connecting path is a quadratic spline.

The behavior of each connection style is (limitedly) demonstrated in the example below. (Warning: The behavior of the `bar` style is currently not well defined, it may be changed in the future).

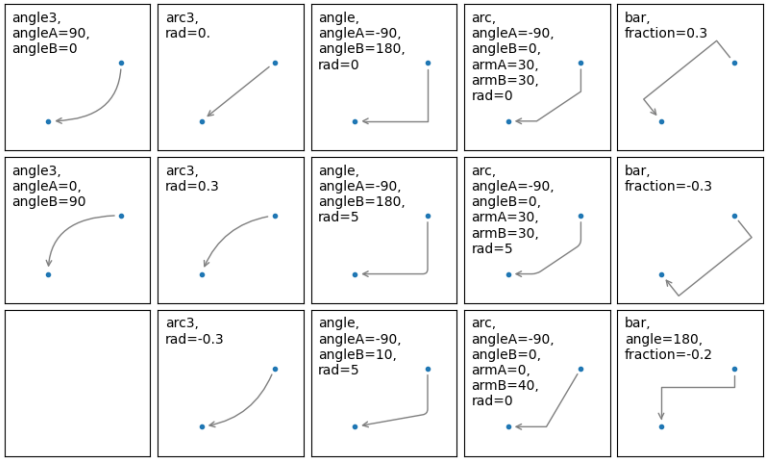

Fig. 29: Connectionstyle Demo

The connecting path (after clipping and shrinking) is then mutated to an arrow patch,

according to the given `arrowstyle`.

Name	Attrs
`-`	None
`->`	head_length=0.4,head_width=0.2
`-[`	widthB=1.0,lengthB=0.2,angleB=None
`|-|`	widthA=1.0,widthB=1.0
`-|>`	head_length=0.4,head_width=0.2
`<-`	head_length=0.4,head_width=0.2
`<->`	head_length=0.4,head_width=0.2
`<|-`	head_length=0.4,head_width=0.2
`<|-|>`	head_length=0.4,head_width=0.2
`fancy`	head_length=0.4,head_width=0.4,tail_width=0.4
`simple`	head_length=0.5,head_width=0.5,tail_width=0.2
`wedge`	tail_width=0.3,shrink_factor=0.5

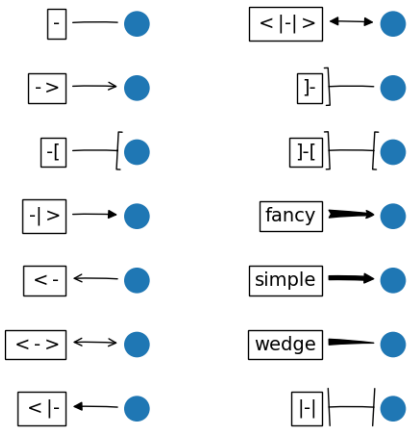

Fig. 30: Fancyarrow Demo

Some arrowstyles only work with connection styles that generate a quadratic-spline segment. They are `fancy`, `simple`, and `wedge`. For these arrow styles, you must use the "angle3" or "arc3" connection style.

If the annotation string is given, the patchA is set to the bbox patch of the text by default.

As with *text*, a box around the text can be drawn using the *bbox* argument.

By default, the starting point is set to the center of the text extent. This can be adjusted with `relpos` key value. The values are normalized to the extent of the text. For example, (0, 0) means lower-left corner and (1, 1) means top-right.

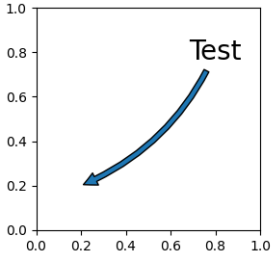

Fig. 31: Annotate Simple02

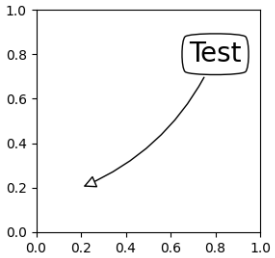

Fig. 32: Annotate Simple03

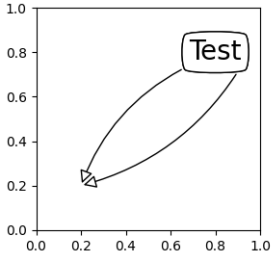

Fig. 33: Annotate Simple04

Placing Artist at the anchored location of the Axes

There are classes of artists that can be placed at an anchored location in the Axes. A common example is the legend. This type of artist can be created by using the *OffsetBox* class. A few predefined classes are available in *matplotlib.offsetbox* and in *mpl_toolkits.axes_grid1.anchored_artists*.

```
from matplotlib.offsetbox import AnchoredText
at = AnchoredText("Figure 1a",
                  prop=dict(size=15), frameon=True,
                  loc='upper left',
                  )
at.patch.set_boxstyle("round,pad=0.,rounding_size=0.2")
ax.add_artist(at)
```

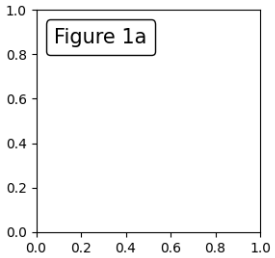

Fig. 34: Anchored Box01

The *loc* keyword has same meaning as in the legend command.

A simple application is when the size of the artist (or collection of artists) is known in pixel size during the time of creation. For example, If you want to draw a circle with fixed size of 20 pixel x 20 pixel (radius = 10 pixel), you can utilize `AnchoredDrawingArea`. The instance is created with a size of the drawing area (in pixels), and arbitrary artists can added to the drawing area. Note that the extents of the artists that are added to the drawing area are not related to the placement of the drawing area itself. Only the initial size matters.

```
from mpl_toolkits.axes_grid1.anchored_artists import AnchoredDrawingArea

ada = AnchoredDrawingArea(20, 20, 0, 0,
                          loc='upper right', pad=0., frameon=False)
p1 = Circle((10, 10), 10)
ada.drawing_area.add_artist(p1)
p2 = Circle((30, 10), 5, fc="r")
ada.drawing_area.add_artist(p2)
```

The artists that are added to the drawing area should not have a transform set (it will be overridden) and the dimensions of those artists are interpreted as a pixel coordinate, i.e., the radius of the circles in above example are 10 pixels and 5 pixels, respectively.

Sometimes, you want your artists to scale with the data coordinate (or coordinates

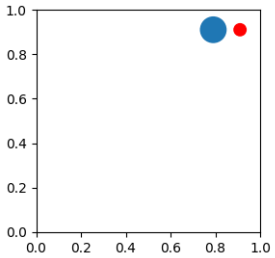

Fig. 35: Anchored Box02

other than canvas pixels). You can use `AnchoredAuxTransformBox` class. This is similar to `AnchoredDrawingArea` except that the extent of the artist is determined during the drawing time respecting the specified transform.

```
from mpl_toolkits.axes_grid1.anchored_artists import AnchoredAuxTransformBox

box = AnchoredAuxTransformBox(ax.transData, loc='upper left')
el = Ellipse((0, 0), width=0.1, height=0.4, angle=30)  # in data coordinates!
box.drawing_area.add_artist(el)
```

The ellipse in the above example will have width and height corresponding to 0.1 and 0.4 in data coordinates and will be automatically scaled when the view limits of the axes change.

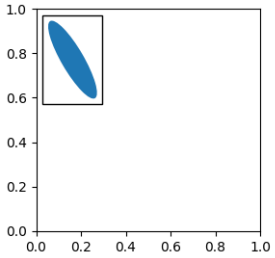

Fig. 36: Anchored Box03

As in the legend, the bbox_to_anchor argument can be set. Using the HPacker and VPacker, you can have an arrangement(?) of artist as in the legend (as a matter of fact, this is how the legend is created).

Note that unlike the legend, the `bbox_transform` is set to IdentityTransform by default.

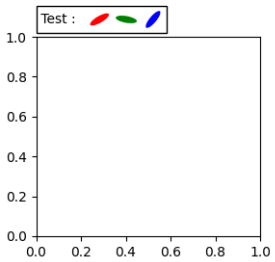

Fig. 37: Anchored Box04

Using Complex Coordinates with Annotations

The Annotation in matplotlib supports several types of coordinates as described in *Basic annotation*. For an advanced user who wants more control, it supports a few other options.

1. A *Transform* instance. For example,

```
ax.annotate("Test", xy=(0.5, 0.5), xycoords=ax.transAxes)
```

   is identical to

```
ax.annotate("Test", xy=(0.5, 0.5), xycoords="axes fraction")
```

   This allows annotating a point in another axes:

```
ax1, ax2 = subplot(121), subplot(122)
ax2.annotate("Test", xy=(0.5, 0.5), xycoords=ax1.transData,
             xytext=(0.5, 0.5), textcoords=ax2.transData,
             arrowprops=dict(arrowstyle="->"))
```

2. An *Artist* instance. The *xy* value (or *xytext*) is interpreted as a fractional coordinate of the bbox (return value of *get_window_extent*) of the artist:

```
an1 = ax.annotate("Test 1", xy=(0.5, 0.5), xycoords="data",
                  va="center", ha="center",
                  bbox=dict(boxstyle="round", fc="w"))
an2 = ax.annotate("Test 2", xy=(1, 0.5), xycoords=an1,  # (1, 0.5) of the an1's bbox
                  xytext=(30, 0), textcoords="offset points",
                  va="center", ha="left",
                  bbox=dict(boxstyle="round", fc="w"),
                  arrowprops=dict(arrowstyle="->"))
```

   Note that you must ensure that the extent of the coordinate artist (*an1* in above example) is determined before *an2* gets drawn. Usually, this means that *an2* needs to be drawn after *an1*.

3. A callable object that takes the renderer instance as single argument, and returns either a *Transform* or a *BboxBase*. The return value is then handled as in (1), for transforms, or in (2), for bboxes. For example,

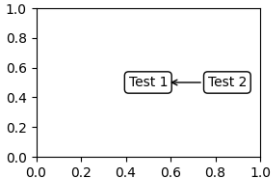

Fig. 38: Annotation with Simple Coordinates

```
an2 = ax.annotate("Test 2", xy=(1, 0.5), xycoords=an1,
                  xytext=(30, 0), textcoords="offset points")
```

is identical to:

```
an2 = ax.annotate("Test 2", xy=(1, 0.5), xycoords=an1.get_window_extent,
                  xytext=(30, 0), textcoords="offset points")
```

4. A pair of coordinate specifications -- the first for the x-coordinate, and the second is for the y-coordinate; e.g.

```
annotate("Test", xy=(0.5, 1), xycoords=("data", "axes fraction"))
```

Here, 0.5 is in data coordinates, and 1 is in normalized axes coordinates. Each of the coordinate specifications can also be an artist or a transform. For example,

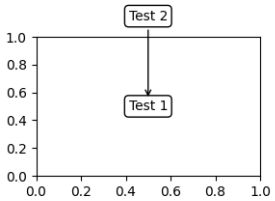

Fig. 39: Annotation with Simple Coordinates 2

5. Sometimes, you want your annotation with some "offset points", not from the annotated point but from some other point. *text.OffsetFrom* is a helper for such cases.

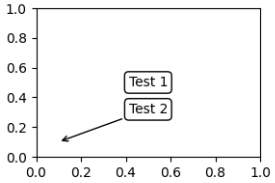

Fig. 40: Annotation with Simple Coordinates 3

You may take a look at this example /gallery/text_labels_and_annotations/annotation_demo.

Using ConnectionPatch

ConnectionPatch is like an annotation without text. While *annotate* is sufficient in most situations, ConnectionPatch is useful when you want to connect points in different axes.

```
from matplotlib.patches import ConnectionPatch
xy = (0.2, 0.2)
con = ConnectionPatch(xyA=xy, coordsA=ax1.transData,
                      xyB=xy, coordsB=ax2.transData)
fig.add_artist(con)
```

The above code connects point *xy* in the data coordinates of `ax1` to point *xy* in the data coordinates of `ax2`. Here is a simple example.

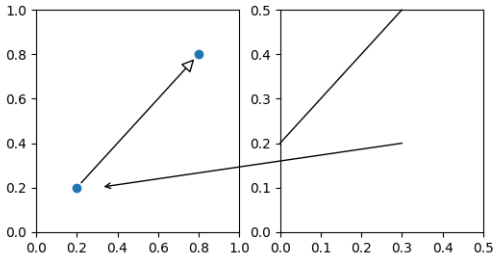

Fig. 41: Connect Simple01

Here, we added the ConnectionPatch to the *figure* (with *add_artist*) rather than to either axes: this ensures that it is drawn on top of both axes, and is also necessary if using *constrained_layout* for positioning the axes.

Advanced Topics

Zoom effect between Axes

`mpl_toolkits.axes_grid1.inset_locator` defines some patch classes useful for interconnecting two axes. Understanding the code requires some knowledge of Matplotlib's transform system.

Define Custom BoxStyle

You can use a custom box style. The value for the `boxstyle` can be a callable object in the following forms.:

```
def __call__(self, x0, y0, width, height, mutation_size,
             aspect_ratio=1.):
    '''
```

(continues on next page)

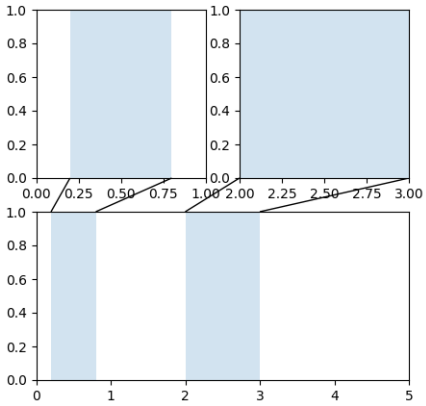

Fig. 42: Axes Zoom Effect

(continued from previous page)

```
    Given the location and size of the box, return the path of
    the box around it.

      - *x0*, *y0*, *width*, *height* : location and size of the box
      - *mutation_size* : a reference scale for the mutation.
      - *aspect_ratio* : aspect-ratio for the mutation.
    '''
    path = ...
    return path
```

Here is a complete example.

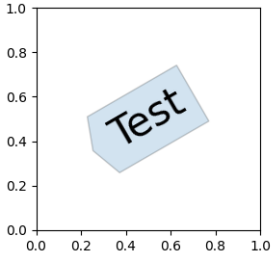

Fig. 43: Custom Boxstyle01

Similarly, you can define a custom ConnectionStyle and a custom ArrowStyle. See the source code of `lib/matplotlib/patches.py` and check how each style class is defined.

2.6.5 Writing mathematical expressions

An introduction to writing mathematical expressions in Matplotlib.

You can use a subset TeX markup in any matplotlib text string by placing it inside a pair of dollar signs ($).

Note that you do not need to have TeX installed, since Matplotlib ships its own TeX expression parser, layout engine, and fonts. The layout engine is a fairly direct adaptation of the layout algorithms in Donald Knuth's TeX, so the quality is quite good (matplotlib also provides a `usetex` option for those who do want to call out to TeX to generate their text (see *Text rendering With LaTeX*).

Any text element can use math text. You should use raw strings (precede the quotes with an `'r'`), and surround the math text with dollar signs ($), as in TeX. Regular text and mathtext can be interleaved within the same string. Mathtext can use DejaVu Sans (default), DejaVu Serif, the Computer Modern fonts (from (La)TeX), STIX fonts (with are designed to blend well with Times), or a Unicode font that you provide. The mathtext font can be selected with the customization variable `mathtext.fontset` (see *Customizing Matplotlib with style sheets and rcParams*)

Here is a simple example:

```
# plain text
plt.title('alpha > beta')
```

produces "alpha > beta".

Whereas this:

```
# math text
plt.title(r'$\alpha > \beta$')
```

produces "$\alpha > \beta$".

Note: Mathtext should be placed between a pair of dollar signs ($). To make it easy to display monetary values, e.g., "$100.00", if a single dollar sign is present in the entire string, it will be displayed verbatim as a dollar sign. This is a small change from regular TeX, where the dollar sign in non-math text would have to be escaped ('\$').

Note: While the syntax inside the pair of dollar signs ($) aims to be TeX-like, the text outside does not. In particular, characters such as:

```
# $ % & ~ _ ^ \ { } \( \) \[ \]
```

have special meaning outside of math mode in TeX. Therefore, these characters will behave differently depending on `rcParams["text.usetex"]` (default: `False`). See the

usetex tutorial for more information.

Subscripts and superscripts

To make subscripts and superscripts, use the `'_'` and `'^'` symbols:

```
r'$\alpha_i > \beta_i$'
```

$$\alpha_i > \beta_i$$

To display multi-letter subscripts or superscripts correctly, you should put them in curly braces `{...}`:

```
r'$\alpha^{ic} > \beta_{ic}$'
```

$$\alpha^{ic} > \beta_{ic}$$

Some symbols automatically put their sub/superscripts under and over the operator. For example, to write the sum of x_i from 0 to ∞, you could do:

```
r'$\sum_{i=0}^\infty x_i$'
```

$$\sum_{i=0}^{\infty} x_i$$

Fractions, binomials, and stacked numbers

Fractions, binomials, and stacked numbers can be created with the `\frac{}{}`, `\binom{}{}` and `\genfrac{}{}{}{}{}{}` commands, respectively:

```
r'$\frac{3}{4} \binom{3}{4} \genfrac{}{}{0}{}{3}{4}$'
```

produces

$$\frac{3}{4}\binom{3}{4}\genfrac{}{}{0}{}{3}{4}$$

Fractions can be arbitrarily nested:

```
r'$\frac{5 - \frac{1}{x}}{4}$'
```

produces

$$\frac{5 - \frac{1}{x}}{4}$$

Note that special care needs to be taken to place parentheses and brackets around fractions. Doing things the obvious way produces brackets that are too small:

```
r'$(\frac{5 - \frac{1}{x}}{4})$'
```

$$(\frac{5 - \frac{1}{x}}{4})$$

The solution is to precede the bracket with `\left` and `\right` to inform the parser that those brackets encompass the entire object.:

```
r'$\left(\frac{5 - \frac{1}{x}}{4}\right)$'
```

$$\left(\frac{5 - \frac{1}{x}}{4}\right)$$

Radicals

Radicals can be produced with the `\sqrt[]{}` command. For example:

```
r'$\sqrt{2}$'
```

$$\sqrt{2}$$

Any base can (optionally) be provided inside square brackets. Note that the base must be a simple expression, and can not contain layout commands such as fractions or sub/superscripts:

```
r'$\sqrt[3]{x}$'
```

$$\sqrt[3]{x}$$

Fonts

The default font is *italics* for mathematical symbols.

Note: This default can be changed using `rcParams["mathtext.default"]` (default: `'it'`). This is useful, for example, to use the same font as regular non-math text for math text, by setting it to `regular`.

To change fonts, e.g., to write "sin" in a Roman font, enclose the text in a font command:

```
r'$s(t) = \mathcal{A}\mathrm{sin}(2 \omega t)$'
```

$$s(t) = \mathcal{A}\mathrm{sin}(2\omega t)$$

More conveniently, many commonly used function names that are typeset in a Roman font have shortcuts. So the expression above could be written as follows:

```
r'$s(t) = \mathcal{A}\sin(2 \omega t)$'
```

$$s(t) = \mathcal{A}\sin(2\omega t)$$

Here "s" and "t" are variable in italics font (default), "sin" is in Roman font, and the amplitude "A" is in calligraphy font. Note in the example above the calligraphy `A` is squished into the `sin`. You can use a spacing command to add a little whitespace between them:

```
r's(t) = \mathcal{A}\/\sin(2 \omega t)'
```

$$s(t) = \mathcal{A}\,\sin(2\omega t)$$

The choices available with all fonts are:

Command	Result
`\mathrm{Roman}`	Roman
`\mathit{Italic}`	*Italic*
`\mathtt{Typewriter}`	`Typewriter`
`\mathcal{CALLIGRAPHY}`	$\mathcal{CALLIGRAPHY}$

When using the STIX fonts, you also have the choice of:

Command	Result
`\mathbb{blackboard}`	$\mathbb{blackboard}$
`\mathrm{\mathbb{blackboard}}`	$\mathrm{\mathbb{blackboard}}$
`\mathfrak{Fraktur}`	$\mathfrak{Fraktur}$
`\mathsf{sansserif}`	sansserif
`\mathrm{\mathsf{sansserif}}`	sansserif

There are also five global "font sets" to choose from, which are selected using the `mathtext.fontset` parameter in *matplotlibrc*.

`dejavusans`: DejaVu Sans

$$\mathcal{R}\prod_{i=\alpha}^{\infty} a_i \sin\left(2\pi f x_i\right) \tag{2.1}$$

`dejavuserif`: DejaVu Serif

$$\mathcal{R}\prod_{i=\alpha}^{\infty} a_i \sin\left(2\pi f x_i\right) \tag{2.2}$$

`cm`: Computer Modern (TeX)

$$\mathcal{R}\prod_{i=\alpha}^{\infty} a_i \sin\left(2\pi f x_i\right) \tag{2.3}$$

`stix`: STIX (designed to blend well with Times)

$$\mathcal{R}\prod_{i=\alpha}^{\infty} a_i \sin\left(2\pi f x_i\right) \tag{2.4}$$

`stixsans`: STIX sans-serif

$$\mathcal{R}\prod_{i=\alpha}^{\infty} a_i \sin\left(2\pi f x_i\right) \tag{2.5}$$

Additionally, you can use `\mathdefault{...}` or its alias `\mathregular{...}` to use the font used for regular text outside of mathtext. There are a number of limitations to this approach, most notably that far fewer symbols will be available, but it can be useful to make math expressions blend well with other text in the plot.

Custom fonts

mathtext also provides a way to use custom fonts for math. This method is fairly tricky to use, and should be considered an experimental feature for patient users only. By setting `rcParams["mathtext.fontset"]` (default: `'dejavusans'`) to `custom`, you can then set the following parameters, which control which font file to use for a particular set of math characters.

Parameter	Corresponds to
`mathtext.it`	`\mathit{}` or default italic
`mathtext.rm`	`\mathrm{}` Roman (upright)
`mathtext.tt`	`\mathtt{}` Typewriter (monospace)
`mathtext.bf`	`\mathbf{}` bold italic
`mathtext.cal`	`\mathcal{}` calligraphic
`mathtext.sf`	`\mathsf{}` sans-serif

Each parameter should be set to a fontconfig font descriptor (as defined in the yet-to-be-written font chapter).

The fonts used should have a Unicode mapping in order to find any non-Latin characters, such as Greek. If you want to use a math symbol that is not contained in your custom fonts, you can set `rcParams["mathtext.fallback"]` (default: `'cm'`) to either `'cm'`, `'stix'` or `'stixsans'` which will cause the mathtext system to use characters from an alternative font whenever a particular character can not be found in the custom font.

Note that the math glyphs specified in Unicode have evolved over time, and many fonts may not have glyphs in the correct place for mathtext.

Accents

An accent command may precede any symbol to add an accent above it. There are long and short forms for some of them.

Command	Result
`\acute a` or `\'a`	$\acute{a}$
`\bar a`	$\bar{a}$
`\breve a`	$\breve{a}$
`\ddot a` or `\''a`	$\ddot{a}$
`\dot a` or `\.a`	$\dot{a}$
`\grave a` or `\`a`	$\grave{a}$
`\hat a` or `\^a`	$\hat{a}$
`\tilde a` or `\~a`	$\tilde{a}$
`\vec a`	$\vec{a}$
`\overline{abc}`	$\overline{abc}$

In addition, there are two special accents that automatically adjust to the width of the symbols below:

Command	Result
`\widehat{xyz}`	$\widehat{xyz}$
`\widetilde{xyz}`	$\widetilde{xyz}$

Care should be taken when putting accents on lower-case i's and j's. Note that in the following `\imath` is used to avoid the extra dot over the i:

```
r"$\hat i\ \ \hat \imath$"
```

$\hat{i}\ \hat{\imath}$

Symbols

You can also use a large number of the TeX symbols, as in `\infty`, `\leftarrow`, `\sum`, `\int`.

If a particular symbol does not have a name (as is true of many of the more obscure symbols in the STIX fonts), Unicode characters can also be used:

```
r'$\u23ce$'
```

Example

Here is an example illustrating many of these features in context.

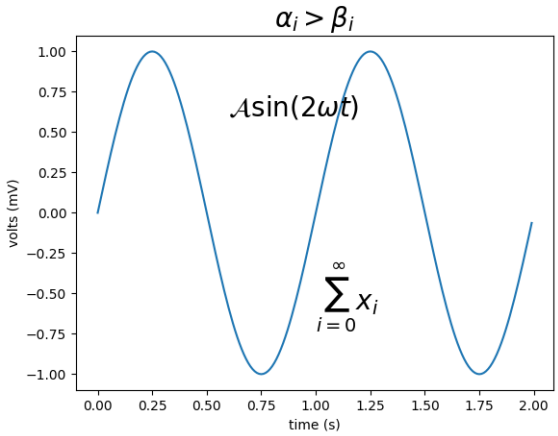

Fig. 44: Pyplot Mathtext

2.6.6 Typesetting With XeLaTeX/LuaLaTeX

How to typeset text with the `pgf` backend in Matplotlib.

Using the `pgf` backend, Matplotlib can export figures as pgf drawing commands that can be processed with pdflatex, xelatex or lualatex. XeLaTeX and LuaLaTeX have full Unicode support and can use any font that is installed in the operating system, making use of advanced typographic features of OpenType, AAT and Graphite. Pgf pictures created by `plt.savefig('figure.pgf')` can be embedded as raw commands in LaTeX documents. Figures can also be directly compiled and saved to PDF with `plt.savefig('figure.pdf')` by switching the backend

```
matplotlib.use('pgf')
```

or by explicitly requesting the use of the `pgf` backend

```
plt.savefig('figure.pdf', backend='pgf')
```

or by registering it for handling pdf output

```
from matplotlib.backends.backend_pgf import FigureCanvasPgf
matplotlib.backend_bases.register_backend('pdf', FigureCanvasPgf)
```

The last method allows you to keep using regular interactive backends and to save xelatex, lualatex or pdflatex compiled PDF files from the graphical user interface.

Matplotlib's pgf support requires a recent LaTeX installation that includes the TikZ/PGF packages (such as TeXLive), preferably with XeLaTeX or LuaLaTeX installed. If either pdftocairo or ghostscript is present on your system, figures can optionally be saved to PNG images as well. The executables for all applications must be located on your *PATH*.

rcParams that control the behavior of the pgf backend:

Parameter	Documentation
pgf.preamble	Lines to be included in the LaTeX preamble
pgf.rcfonts	Setup fonts from rc params using the fontspec package
pgf.texsystem	Either "xelatex" (default), "lualatex" or "pdflatex"

Note: TeX defines a set of special characters, such as:

```
# $ % & ~ _ ^ \ { }
```

Generally, these characters must be escaped correctly. For convenience, some characters (_, ^, %) are automatically escaped outside of math environments.

Multi-Page PDF Files

The pgf backend also supports multipage pdf files using *PdfPages*

```
from matplotlib.backends.backend_pgf import PdfPages
import matplotlib.pyplot as plt

with PdfPages('multipage.pdf', metadata={'author': 'Me'}) as pdf:

    fig1, ax1 = plt.subplots()
    ax1.plot([1, 5, 3])
    pdf.savefig(fig1)

    fig2, ax2 = plt.subplots()
    ax2.plot([1, 5, 3])
    pdf.savefig(fig2)
```

Font specification

The fonts used for obtaining the size of text elements or when compiling figures to PDF are usually defined in the *rcParams*. You can also use the LaTeX default Computer Modern fonts by clearing the lists for `rcParams["font.serif"]` (default: `['DejaVu Serif', 'Bitstream Vera Serif', 'Computer Modern Roman', 'New Century Schoolbook', 'Century Schoolbook L', 'Utopia', 'ITC Bookman', 'Bookman', 'Nimbus Roman No9 L', 'Times New Roman', 'Times', 'Palatino', 'Charter', 'serif']`), `rcParams["font.sans-serif"]` (default: `['DejaVu Sans', 'Bitstream Vera Sans', 'Computer Modern Sans Serif', 'Lucida Grande', 'Verdana', 'Geneva', 'Lucid', 'Arial', 'Helvetica', 'Avant Garde', 'sans-serif']`) or `rcParams["font.monospace"]` (default: `['DejaVu Sans Mono', 'Bitstream Vera Sans Mono', 'Computer Modern Typewriter', 'Andale Mono', 'Nimbus Mono L', 'Courier New', 'Courier', 'Fixed', 'Terminal', 'monospace']`). Please note that the glyph coverage of these fonts is very limited. If you want to keep the Computer Modern font face but require extended Unicode support, consider installing the Computer Modern Unicode fonts *CMU Serif*, *CMU Sans Serif*, etc.

When saving to `.pgf`, the font configuration Matplotlib used for the layout of the figure is included in the header of the text file.

```
"""
*********
Pgf Fonts
*********

"""

import matplotlib.pyplot as plt
plt.rcParams.update({
    "font.family": "serif",
    "font.serif": [],                   # use latex default serif font
```

(continues on next page)

(continued from previous page)

```
    "font.sans-serif": ["DejaVu Sans"],  # use a specific sans-serif font
})

plt.figure(figsize=(4.5, 2.5))
plt.plot(range(5))
plt.text(0.5, 3., "serif")
plt.text(0.5, 2., "monospace", family="monospace")
plt.text(2.5, 2., "sans-serif", family="sans-serif")
plt.text(2.5, 1., "comic sans", family="Comic Sans MS")
plt.xlabel("µ is not $\\mu$")
plt.tight_layout(.5)
```

Custom preamble

Full customization is possible by adding your own commands to the preamble. Use `rcParams["pgf.preamble"]` (default: `''`) if you want to configure the math fonts, using `unicode-math` for example, or for loading additional packages. Also, if you want to do the font configuration yourself instead of using the fonts specified in the rc parameters, make sure to disable `rcParams["pgf.rcfonts"]` (default: `True`).

```
"""
============
Pgf Preamble
============

"""

import matplotlib as mpl
mpl.use("pgf")
```

Choosing the TeX system

The TeX system to be used by Matplotlib is chosen by `rcParams["pgf.texsystem"]` (default: `'xelatex'`). Possible values are `'xelatex'` (default), `'lualatex'` and `'pdflatex'`. Please note that when selecting pdflatex, the fonts and Unicode handling must be configured in the preamble.

```
"""
=============
Pgf Texsystem
=============

"""

import matplotlib.pyplot as plt
```

(continues on next page)

(continued from previous page)

```
plt.rcParams.update({
    "pgf.texsystem": "pdflatex",
    "pgf.preamble": "\n".join([
         r"\usepackage[utf8x]{inputenc}",
         r"\usepackage[T1]{fontenc}",
         r"\usepackage{cmbright}",
    ]),
})

plt.figure(figsize=(4.5, 2.5))
plt.plot(range(5))
plt.text(0.5, 3., "serif", family="serif")
plt.text(0.5, 2., "monospace", family="monospace")
plt.text(2.5, 2., "sans-serif", family="sans-serif")
plt.xlabel(r"µ is not $\mu$")
plt.tight_layout(.5)
```

Troubleshooting

- Please note that the TeX packages found in some Linux distributions and MiKTeX installations are dramatically outdated. Make sure to update your package catalog and upgrade or install a recent TeX distribution.
- On Windows, the *PATH* environment variable may need to be modified to include the directories containing the latex, dvipng and ghostscript executables. See *Environment Variables* and *Setting environment variables in Windows* for details.
- A limitation on Windows causes the backend to keep file handles that have been opened by your application open. As a result, it may not be possible to delete the corresponding files until the application closes (see #1324).
- Sometimes the font rendering in figures that are saved to png images is very bad. This happens when the pdftocairo tool is not available and ghostscript is used for the pdf to png conversion.
- Make sure what you are trying to do is possible in a LaTeX document, that your LaTeX syntax is valid and that you are using raw strings if necessary to avoid unintended escape sequences.
- `rcParams["pgf.preamble"]` (default: `''`) provides lots of flexibility, and lots of ways to cause problems. When experiencing problems, try to minimalize or disable the custom preamble.
- Configuring an `unicode-math` environment can be a bit tricky. The TeXLive distribution for example provides a set of math fonts which are usually not installed system-wide. XeTeX, unlike LuaLatex, cannot find these fonts by their name, which is why you might have to specify `\setmathfont{xits-math.otf}` instead of `\setmathfont{XITS Math}` or alternatively make the fonts available to your OS. See this tex.stackexchange.com question for more details.

- If the font configuration used by Matplotlib differs from the font setting in yout LaTeX document, the alignment of text elements in imported figures may be off. Check the header of your `.pgf` file if you are unsure about the fonts Matplotlib used for the layout.
- Vector images and hence `.pgf` files can become bloated if there are a lot of objects in the graph. This can be the case for image processing or very big scatter graphs. In an extreme case this can cause TeX to run out of memory: "TeX capacity exceeded, sorry" You can configure latex to increase the amount of memory available to generate the `.pdf` image as discussed on tex.stackexchange.com. Another way would be to "rasterize" parts of the graph causing problems using either the `rasterized=True` keyword, or `.set_rasterized(True)` as per this example.
- If you still need help, please see *Getting help*

2.6.7 Text rendering With LaTeX

Rendering text with LaTeX in Matplotlib.

Matplotlib has the option to use LaTeX to manage all text layout. This option is available with the following backends:

- Agg
- PS
- PDF

The LaTeX option is activated by setting `text.usetex : True` in your rc settings. Text handling with matplotlib's LaTeX support is slower than matplotlib's very capable *mathtext*, but is more flexible, since different LaTeX packages (font packages, math packages, etc.) can be used. The results can be striking, especially when you take care to use the same fonts in your figures as in the main document.

Matplotlib's LaTeX support requires a working LaTeX installation, dvipng (which may be included with your LaTeX installation), and Ghostscript (GPL Ghostscript 9.0 or later is required). The executables for these external dependencies must all be located on your *PATH*.

There are a couple of options to mention, which can be changed using *rc settings*. Here is an example matplotlibrc file:

```
font.family        : serif
font.serif         : Times, Palatino, New Century Schoolbook, Bookman, Computer Modern␣
↪Roman
font.sans-serif    : Helvetica, Avant Garde, Computer Modern Sans serif
font.cursive       : Zapf Chancery
font.monospace     : Courier, Computer Modern Typewriter

text.usetex        : true
```

The first valid font in each family is the one that will be loaded. If the fonts are not specified, the Computer Modern fonts are used by default. All of the other fonts are Adobe fonts. Times and Palatino each have their own accompanying math fonts, while the other Adobe serif fonts make use of the Computer Modern math fonts. See the PSNFSS documentation for more details.

To use LaTeX and select Helvetica as the default font, without editing matplotlibrc use:

```
import matplotlib as mpl
plt.rcParams.update({
    "text.usetex": True,
    "font.family": "sans-serif",
    "font.sans-serif": ["Helvetica"]})
## for Palatino and other serif fonts use:
plt.rcParams.update({
    "text.usetex": True,
    "font.family": "serif",
    "font.serif": ["Palatino"],
})
```

Here is the standard example, `/gallery/text_labels_and_annotations/tex_demo`:

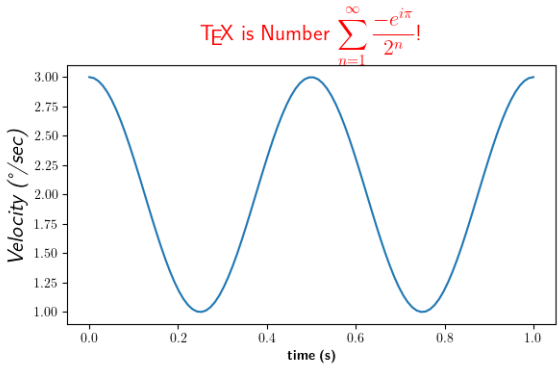

Fig. 45: TeX Demo

Note that display math mode (`$$ e=mc^2 $$`) is not supported, but adding the command `\displaystyle`, as in the above demo, will produce the same results.

Note: Certain characters require special escaping in TeX, such as:

```
# $ % & ~ _ ^ \ { } \( \) \[ \]
```

Therefore, these characters will behave differently depending on `rcParams["text.usetex"]` (default: `False`).

---

usetex with unicode

It is also possible to use unicode strings with the LaTeX text manager, here is an example taken from `/gallery/text_labels_and_annotations/tex_demo`. The axis labels include Unicode text:

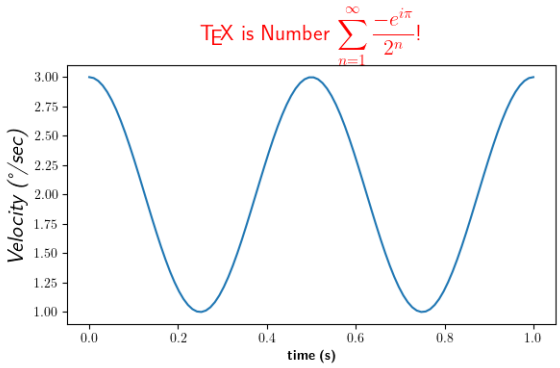

Fig. 46: TeX Unicode Demo

Postscript options

In order to produce encapsulated postscript files that can be embedded in a new LaTeX document, the default behavior of matplotlib is to distill the output, which removes some postscript operators used by LaTeX that are illegal in an eps file. This step produces results which may be unacceptable to some users, because the text is coarsely rasterized and converted to bitmaps, which are not scalable like standard postscript, and the text is not searchable. One workaround is to set `ps.distiller.res` to a higher value (perhaps 6000) in your rc settings, which will produce larger files but may look better and scale reasonably. A better workaround, which requires Poppler or Xpdf, can be activated by changing the `ps.usedistiller` rc setting to `xpdf`. This alternative produces postscript without rasterizing text, so it scales properly, can be edited in Adobe Illustrator, and searched text in pdf documents.

Possible hangups

- On Windows, the *PATH* environment variable may need to be modified to include the directories containing the latex, dvipng and ghostscript executables. See *Environment Variables* and *Setting environment variables in Windows* for details.
- Using MiKTeX with Computer Modern fonts, if you get odd *Agg and PNG results, go to MiKTeX/Options and update your format files
- On Ubuntu and Gentoo, the base texlive install does not ship with the type1cm package. You may need to install some of the extra packages to get all the goodies that come bundled with other latex distributions.

- Some progress has been made so matplotlib uses the dvi files directly for text layout. This allows latex to be used for text layout with the pdf and svg backends, as well as the *Agg and PS backends. In the future, a latex installation may be the only external dependency.

Troubleshooting

- Try deleting your `.matplotlib/tex.cache` directory. If you don't know where to find `.matplotlib`, see *matplotlib configuration and cache directory locations*.
- Make sure LaTeX, dvipng and ghostscript are each working and on your *PATH*.
- Make sure what you are trying to do is possible in a LaTeX document, that your LaTeX syntax is valid and that you are using raw strings if necessary to avoid unintended escape sequences.
- Most problems reported on the mailing list have been cleared up by upgrading Ghostscript. If possible, please try upgrading to the latest release before reporting problems to the list.
- The `text.latex.preamble` rc setting is not officially supported. This option provides lots of flexibility, and lots of ways to cause problems. Please disable this option before reporting problems to the mailing list.
- If you still need help, please see *Getting help*

2.7 Toolkits

These tutorials cover toolkits designed to extend the functionality of Matplotlib in order to accomplish specific goals.

2.7.1 Overview of axes_grid1 toolkit

Controlling the layout of plots with the *mpl_toolkits.axes_grid1* toolkit.

What is axes_grid1 toolkit?

mpl_toolkits.axes_grid1 is a collection of helper classes to ease displaying (multiple) images with matplotlib. In matplotlib, the axes location (and size) is specified in the normalized figure coordinates, which may not be ideal for displaying images that needs to have a given aspect ratio. For example, it helps if you have a colorbar whose height always matches that of the image. *ImageGrid*, *RGB Axes* and *AxesDivider* are helper classes that deal with adjusting the location of (multiple) Axes. They provides a framework to adjust the position of multiple axes at the drawing time. *ParasiteAxes*

provides twinx(or twiny)-like features so that you can plot different data (e.g., different y-scale) in a same Axes. *AnchoredArtists* includes custom artists which are placed at some anchored position, like the legend.

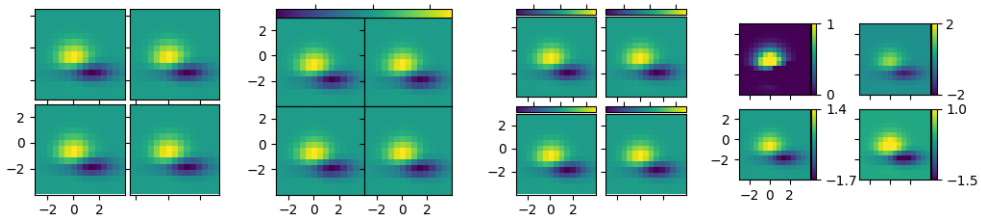

Fig. 47: Demo Axes Grid

axes_grid1

ImageGrid

A grid of Axes.

In Matplotlib, the axes location (and size) is specified in normalized figure coordinates. This may not be ideal for images that needs to be displayed with a given aspect ratio; for example, it is difficult to display multiple images of a same size with some fixed padding between them. *ImageGrid* can be used in such a case; see its docs for a detailed list of the parameters it accepts.

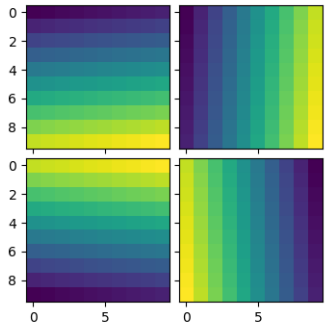

Fig. 48: Simple Axesgrid

- The position of each axes is determined at the drawing time (see *AxesDivider*), so that the size of the entire grid fits in the given rectangle (like the aspect of axes). Note that in this example, the paddings between axes are fixed even if you changes the figure size.
- axes in the same column has a same axes width (in figure coordinate), and similarly, axes in the same row has a same height. The widths (height) of the axes in the same row (column) are scaled according to their view limits (xlim or ylim).

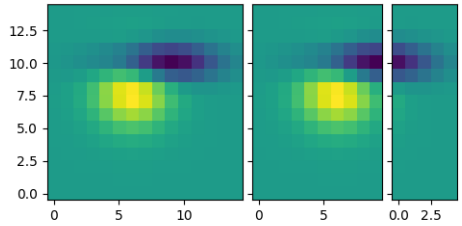

Fig. 49: Simple Axes Grid

- xaxis are shared among axes in a same column. Similarly, yaxis are shared among axes in a same row. Therefore, changing axis properties (view limits, tick location, etc. either by plot commands or using your mouse in interactive backends) of one axes will affect all other shared axes.

The examples below show what you can do with ImageGrid.

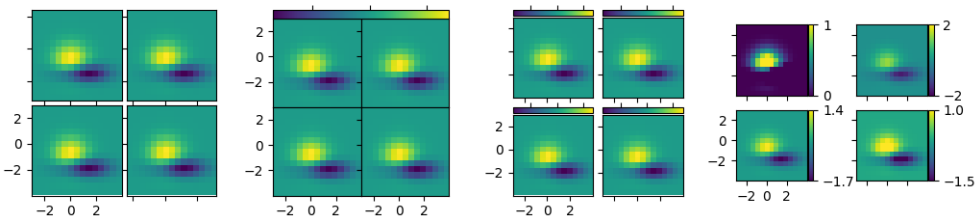

Fig. 50: Demo Axes Grid

AxesDivider Class

Behind the scene, the ImageGrid class and the RGBAxes class utilize the *AxesDivider* class, whose role is to calculate the location of the axes at drawing time. Direct use of the AxesDivider class will not be necessary for most users. The axes_divider module provides a helper function *make_axes_locatable*, which can be useful. It takes a existing axes instance and create a divider for it.

```
ax = subplot(1, 1, 1)
divider = make_axes_locatable(ax)
```

make_axes_locatable returns an instance of the *AxesDivider* class. It provides an *append_axes* method that creates a new axes on the given side of ("top", "right", "bottom" and "left") of the original axes.

colorbar whose height (or width) in sync with the master axes

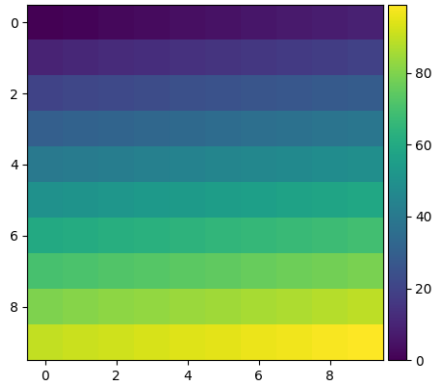

Fig. 51: Simple Colorbar

scatter_hist.py with AxesDivider

The /gallery/lines_bars_and_markers/scatter_hist example can be rewritten using *make_axes_locatable*:

```
axScatter = subplot(111)
axScatter.scatter(x, y)
axScatter.set_aspect(1.)

# create new axes on the right and on the top of the current axes.
divider = make_axes_locatable(axScatter)
axHistx = divider.append_axes("top", size=1.2, pad=0.1, sharex=axScatter)
axHisty = divider.append_axes("right", size=1.2, pad=0.1, sharey=axScatter)

# the scatter plot:
# histograms
bins = np.arange(-lim, lim + binwidth, binwidth)
axHistx.hist(x, bins=bins)
axHisty.hist(y, bins=bins, orientation='horizontal')
```

See the full source code below.

The /gallery/axes_grid1/scatter_hist_locatable_axes using the AxesDivider has some advantage over the original /gallery/lines_bars_and_markers/scatter_hist in Matplotlib. For example, you can set the aspect ratio of the scatter plot, even with the x-axis or y-axis is shared accordingly.

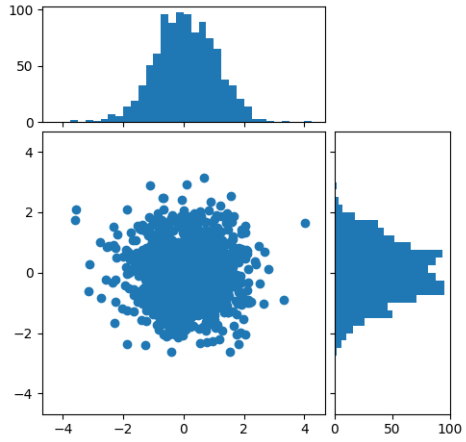

Fig. 52: Scatter Hist

ParasiteAxes

The ParasiteAxes is an axes whose location is identical to its host axes. The location is adjusted in the drawing time, thus it works even if the host change its location (e.g., images).

In most cases, you first create a host axes, which provides a few method that can be used to create parasite axes. They are *twinx*, *twiny* (which are similar to twinx and twiny in the matplotlib) and *twin*. *twin* takes an arbitrary transformation that maps between the data coordinates of the host axes and the parasite axes. *draw* method of the parasite axes are never called. Instead, host axes collects artists in parasite axes and draw them as if they belong to the host axes, i.e., artists in parasite axes are merged to those of the host axes and then drawn according to their zorder. The host and parasite axes modifies some of the axes behavior. For example, color cycle for plot lines are shared between host and parasites. Also, the legend command in host, creates a legend that includes lines in the parasite axes. To create a host axes, you may use *host_subplot* or *host_axes* command.

Example 1. twinx

Example 2. twin

twin without a transform argument assumes that the parasite axes has the same data transform as the host. This can be useful when you want the top(or right)-axis to have different tick-locations, tick-labels, or tick-formatter for bottom(or left)-axis.

```
ax2 = ax.twin() # now, ax2 is responsible for "top" axis and "right" axis
ax2.set_xticks([0., .5*np.pi, np.pi, 1.5*np.pi, 2*np.pi])
```

(continues on next page)

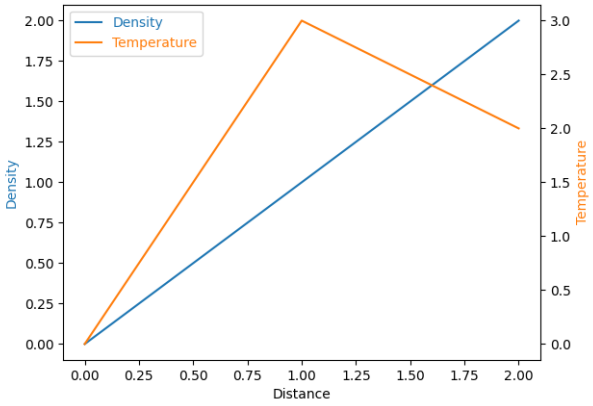

Fig. 53: Parasite Simple

(continued from previous page)

```
ax2.set_xticklabels(["0", r"$\frac{1}{2}\pi$",
                     r"$\pi$", r"$\frac{3}{2}\pi$", r"$2\pi$"])
```

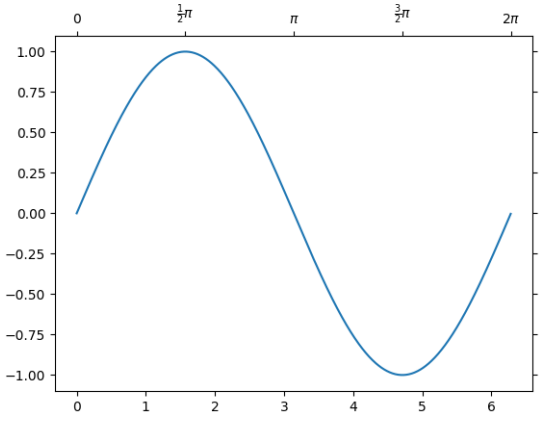

Fig. 54: Simple Axisline4

A more sophisticated example using twin. Note that if you change the x-limit in the host axes, the x-limit of the parasite axes will change accordingly.

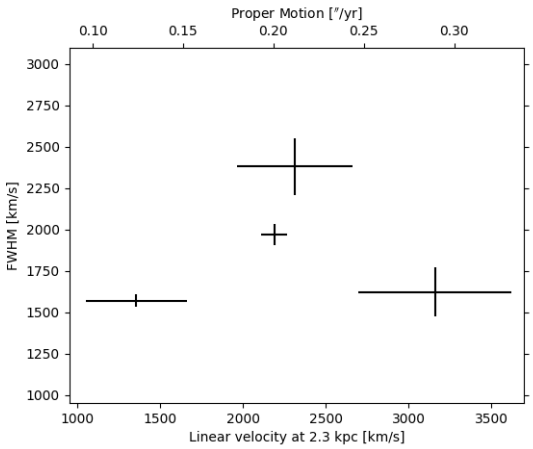

Fig. 55: Parasite Simple2

AnchoredArtists

It's a collection of artists whose location is anchored to the (axes) bbox, like the legend. It is derived from *OffsetBox* in Matplotlib, and artist need to be drawn in the canvas coordinate. But, there is a limited support for an arbitrary transform. For example, the ellipse in the example below will have width and height in the data coordinate.

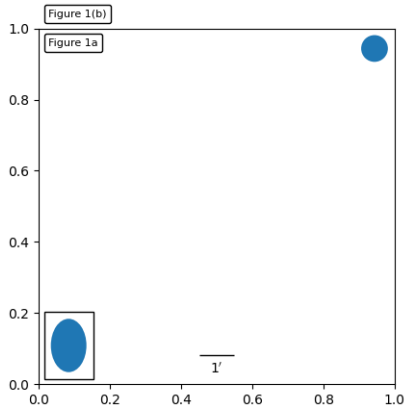

Fig. 56: Simple Anchored Artists

InsetLocator

mpl_toolkits.axes_grid1.inset_locator provides helper classes and functions to place your (inset) axes at the anchored position of the parent axes, similarly to AnchoredArtist.

Using *mpl_toolkits.axes_grid1.inset_locator.inset_axes()*, you can have inset axes whose size is either fixed, or a fixed proportion of the parent axes:

```
inset_axes = inset_axes(parent_axes,
                        width="30%", # width = 30% of parent_bbox
                        height=1., # height : 1 inch
                        loc='lower left')
```

creates an inset axes whose width is 30% of the parent axes and whose height is fixed at 1 inch.

You may creates your inset whose size is determined so that the data scale of the inset axes to be that of the parent axes multiplied by some factor. For example,

```
inset_axes = zoomed_inset_axes(ax,
                               0.5, # zoom = 0.5
                               loc='upper right')
```

creates an inset axes whose data scale is half of the parent axes. Here is complete examples.

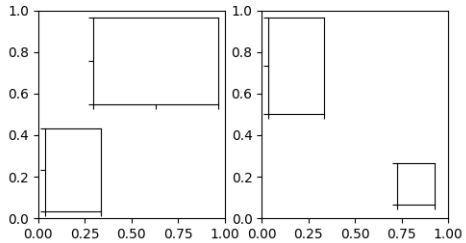

Fig. 57: Inset Locator Demo

For example, *zoomed_inset_axes()* can be used when you want the inset represents the zoom-up of the small portion in the parent axes. And *inset_locator* provides a helper function *mark_inset()* to mark the location of the area represented by the inset axes.

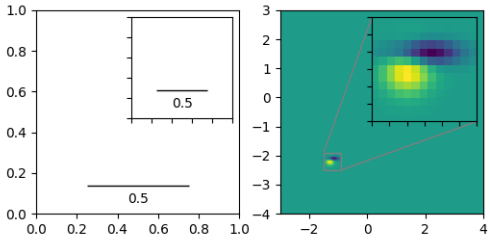

Fig. 58: Inset Locator Demo2

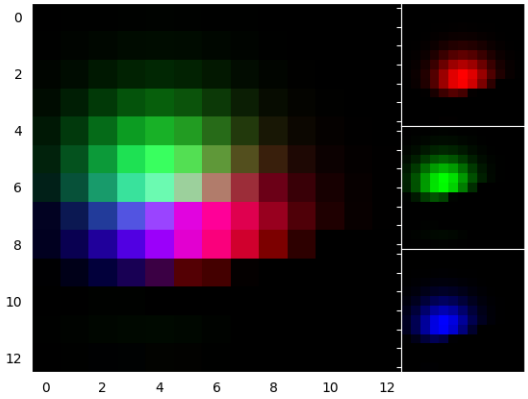
RGB Axes

RGBAxes is a helper class to conveniently show RGB composite images. Like ImageGrid, the location of axes are adjusted so that the area occupied by them fits in a given rectangle. Also, the xaxis and yaxis of each axes are shared.

```
from mpl_toolkits.axes_grid1.axes_rgb import RGBAxes

fig = plt.figure()
ax = RGBAxes(fig, [0.1, 0.1, 0.8, 0.8], pad=0.0)
r, g, b = get_rgb()  # r, g, b are 2D images.
ax.imshow_rgb(r, g, b)
```



AxesDivider

The *mpl_toolkits.axes_grid1.axes_divider* module provides helper classes to adjust the axes positions of a set of images at drawing time.

- *axes_size* provides a class of units that are used to determine the size of each axes. For example, you can specify a fixed size.
- *Divider* is the class that calculates the axes position. It divides the given rectangular area into several areas. The divider is initialized by setting the lists

of horizontal and vertical sizes on which the division will be based. Then use *new_locator()*, which returns a callable object that can be used to set the axes_locator of the axes.

Here, we demonstrate how to achieve the following layout: we want to position axes in a 3x4 grid (note that *Divider* makes row indices start from the *bottom*(!) of the grid):

```
+--------+--------+--------+--------+
| (2, 0) | (2, 1) | (2, 2) | (2, 3) |
+--------+--------+--------+--------+
| (1, 0) | (1, 1) | (1, 2) | (1, 3) |
+--------+--------+--------+--------+
| (0, 0) | (0, 1) | (0, 2) | (0, 3) |
+--------+--------+--------+--------+
```

such that the bottom row has a fixed height of 2 (inches) and the top two rows have a height ratio of 2 (middle) to 3 (top). (For example, if the grid has a size of 7 inches, the bottom row will be 2 inches, the middle row also 2 inches, and the top row 3 inches.)

These constraints are specified using classes from the *axes_size* module, namely:

```
from mpl_toolkits.axes_grid1.axes_size import Fixed, Scaled
vert = [Fixed(2), Scaled(2), Scaled(3)]
```

(More generally, *axes_size* classes define a `get_size(renderer)` method that returns a pair of floats -- a relative size, and an absolute size. `Fixed(2).get_size(renderer)` returns `(0, 2)`; `Scaled(2).get_size(renderer)` returns `(2, 0)`.)

We use these constraints to initialize a *Divider* object:

```
rect = [0.2, 0.2, 0.6, 0.6]  # Position of the grid in the figure.
vert = [Fixed(2), Scaled(2), Scaled(3)]  # As above.
horiz = [...]  # Some other horizontal constraints.
divider = Divider(fig, rect, horiz, vert)
```

then use *Divider.new_locator* to create an *AxesLocator* instance for a given grid entry:

```
locator = divider.new_locator(nx=0, ny=1)  # Grid entry (1, 0).
```

and make it responsible for locating the axes:

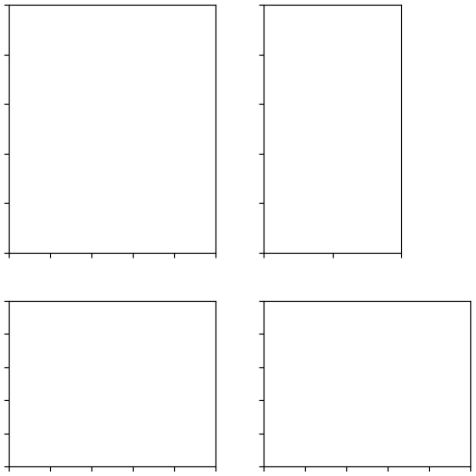
```
ax.set_axes_locator(locator)
```

The *AxesLocator* is a callable object that returns the location and size of the cell at the first column and the second row.

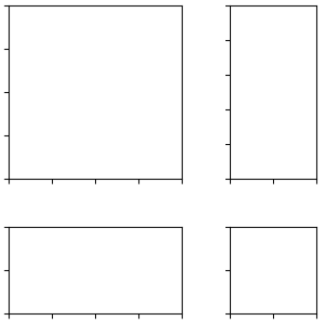
Locators that spans over multiple cells can be created with, e.g.:

```
# Columns #0 and #1 ("0-2 range"), row #1.
locator = divider.new_locator(nx=0, nx1=2, ny=1)
```

See the example,



You can also adjust the size of each axes according to its x or y data limits (AxesX and AxesY).



2.7.2 Overview of axisartist toolkit

The axisartist toolkit tutorial.

Warning: *axisartist* uses a custom Axes class (derived from the Matplotlib's original Axes class). As a side effect, some commands (mostly tick-related) do not work.

The *axisartist* contains a custom Axes class that is meant to support curvilinear grids (e.g., the world coordinate system in astronomy). Unlike Matplotlib's original Axes class which uses Axes.xaxis and Axes.yaxis to draw ticks, ticklines, etc., axisartist uses a special artist (AxisArtist) that can handle ticks, ticklines, etc. for curved coordinate systems.

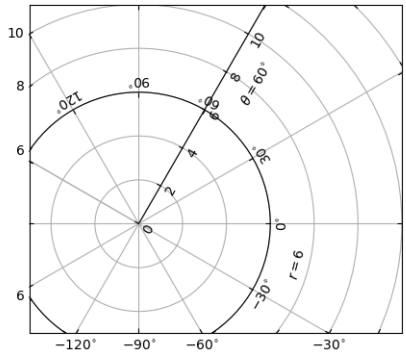


Fig. 59: Demo Floating Axis

Since it uses special artists, some Matplotlib commands that work on Axes.xaxis and Axes.yaxis may not work.

axisartist

The *axisartist* module provides a custom (and very experimental) Axes class, where each axis (left, right, top, and bottom) have a separate associated artist which is responsible for drawing the axis-line, ticks, ticklabels, and labels. You can also create your own axis, which can pass through a fixed position in the axes coordinate, or a fixed position in the data coordinate (i.e., the axis floats around when viewlimit changes).

The axes class, by default, has its xaxis and yaxis invisible, and has 4 additional artists which are responsible for drawing the 4 axis spines in "left", "right", "bottom", and "top". They are accessed as ax.axis["left"], ax.axis["right"], and so on, i.e., ax.axis is a dictionary that contains artists (note that ax.axis is still a callable method and it behaves as an original Axes.axis method in Matplotlib).

To create an axes,

```
import mpl_toolkits.axisartist as AA
fig = plt.figure()
ax = AA.Axes(fig, [0.1, 0.1, 0.8, 0.8])
fig.add_axes(ax)
```

or to create a subplot

```
ax = AA.Subplot(fig, 111)
fig.add_subplot(ax)
```

For example, you can hide the right and top spines using:

```
ax.axis["right"].set_visible(False)
ax.axis["top"].set_visible(False)
```

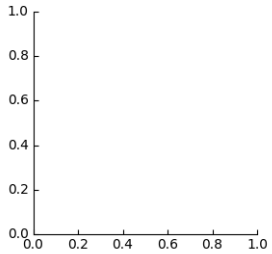

Fig. 60: Simple Axisline3

It is also possible to add a horizontal axis. For example, you may have an horizontal axis at y=0 (in data coordinate).

```
ax.axis["y=0"] = ax.new_floating_axis(nth_coord=0, value=0)
```

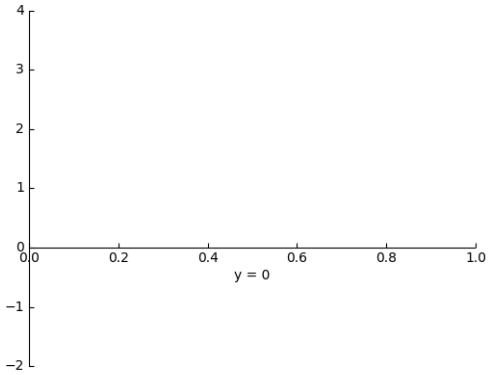

Fig. 61: Simple Axisartist1

Or a fixed axis with some offset

```
# make new (right-side) yaxis, but with some offset
ax.axis["right2"] = ax.new_fixed_axis(loc="right", offset=(20, 0))
```

axisartist with ParasiteAxes

Most commands in the axes_grid1 toolkit can take an axes_class keyword argument, and the commands create an axes of the given class. For example, to create a host subplot with axisartist.Axes,

```
import mpl_toolkits.axisartist as AA
from mpl_toolkits.axes_grid1 import host_subplot

host = host_subplot(111, axes_class=AA.Axes)
```

Here is an example that uses ParasiteAxes.

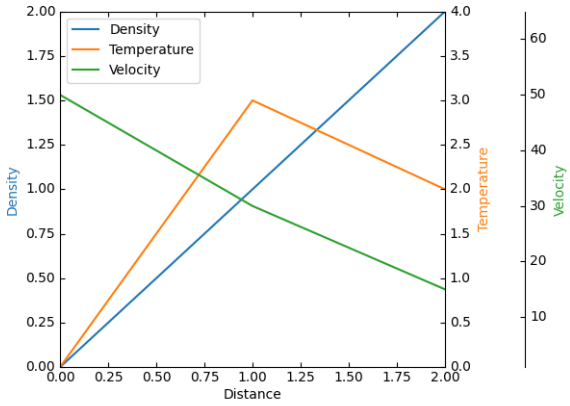

Fig. 62: Demo Parasite Axes2

Curvilinear Grid

The motivation behind the AxisArtist module is to support a curvilinear grid and ticks.

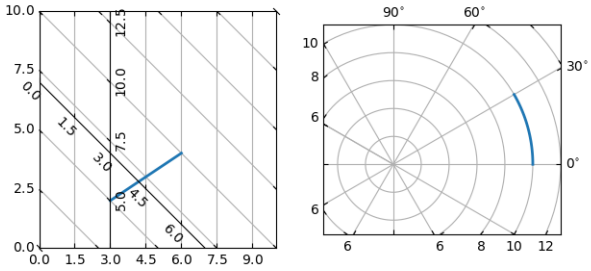

Fig. 63: Demo Curvelinear Grid

Floating Axes

AxisArtist also supports a Floating Axes whose outer axes are defined as floating axis.

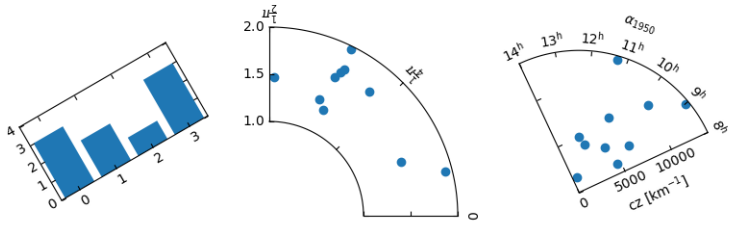

Fig. 64: Demo Floating Axes

axisartist namespace

The *axisartist* namespace includes a derived Axes implementation. The biggest difference is that the artists responsible to draw axis line, ticks, ticklabel and axis labels are separated out from the Matplotlib's Axis class, which are much more than artists in the original Matplotlib. This change was strongly motivated to support curvilinear grid. Here are a few things that mpl_toolkits.axisartist.Axes is different from original Axes from Matplotlib.

- Axis elements (axis line(spine), ticks, ticklabel and axis labels) are drawn by a AxisArtist instance. Unlike Axis, left, right, top and bottom axis are drawn by separate artists. And each of them may have different tick location and different tick labels.
- gridlines are drawn by a Gridlines instance. The change was motivated that in curvilinear coordinate, a gridline may not cross axis-lines (i.e., no associated ticks). In the original Axes class, gridlines are tied to ticks.
- ticklines can be rotated if necessary (i.e, along the gridlines)

In summary, all these changes was to support

- a curvilinear grid.
- a floating axis

mpl_toolkits.axisartist.Axes class defines a *axis* attribute, which is a dictionary of AxisArtist instances. By default, the dictionary has 4 AxisArtist instances, responsible for drawing of left, right, bottom and top axis.

xaxis and yaxis attributes are still available, however they are set to not visible. As separate artists are used for rendering axis, some axis-related method in Matplotlib may have no effect. In addition to AxisArtist instances, the

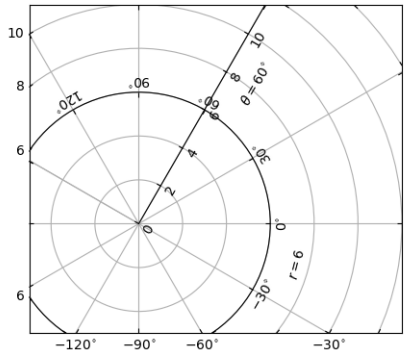

Fig. 65: Demo Floating Axis

mpl_toolkits.axisartist.Axes will have *gridlines* attribute (Gridlines), which obviously draws grid lines.

In both AxisArtist and Gridlines, the calculation of tick and grid location is delegated to an instance of GridHelper class. mpl_toolkits.axisartist.Axes class uses GridHelperRectlinear as a grid helper. The GridHelperRectlinear class is a wrapper around the *xaxis* and *yaxis* of Matplotlib's original Axes, and it was meant to work as the way how Matplotlib's original axes works. For example, tick location changes using set_ticks method and etc. should work as expected. But change in artist properties (e.g., color) will not work in general, although some effort has been made so that some often-change attributes (color, etc.) are respected.

AxisArtist

AxisArtist can be considered as a container artist with following attributes which will draw ticks, labels, etc.

- line
- major_ticks, major_ticklabels
- minor_ticks, minor_ticklabels
- offsetText
- label

line

Derived from Line2D class. Responsible for drawing a spinal(?) line.

major_ticks, minor_ticks

Derived from Line2D class. Note that ticks are markers.

major_ticklabels, minor_ticklabels

Derived from Text. Note that it is not a list of Text artist, but a single artist (similar to a collection).

axislabel

Derived from Text.

Default AxisArtists

By default, following for axis artists are defined.:

```
ax.axis["left"], ax.axis["bottom"], ax.axis["right"], ax.axis["top"]
```

The ticklabels and axislabel of the top and the right axis are set to not visible.

For example, if you want to change the color attributes of major_ticklabels of the bottom x-axis

```
ax.axis["bottom"].major_ticklabels.set_color("b")
```

Similarly, to make ticklabels invisible

```
ax.axis["bottom"].major_ticklabels.set_visible(False)
```

AxisArtist provides a helper method to control the visibility of ticks, ticklabels, and label. To make ticklabel invisible,

```
ax.axis["bottom"].toggle(ticklabels=False)
```

To make all of ticks, ticklabels, and (axis) label invisible

```
ax.axis["bottom"].toggle(all=False)
```

To turn all off but ticks on

```
ax.axis["bottom"].toggle(all=False, ticks=True)
```

To turn all on but (axis) label off

```
ax.axis["bottom"].toggle(all=True, label=False)
```

ax.axis's __getitem__ method can take multiple axis names. For example, to turn ticklabels of "top" and "right" axis on,

```
ax.axis["top", "right"].toggle(ticklabels=True)
```

Note that `ax.axis["top", "right"]` returns a simple proxy object that translate above code to something like below.

```
for n in ["top", "right"]:
    ax.axis[n].toggle(ticklabels=True)
```

So, any return values in the for loop are ignored. And you should not use it anything more than a simple method.

Like the list indexing ":" means all items, i.e.,

```
ax.axis[:].major_ticks.set_color("r")
```

changes tick color in all axis.

HowTo

1. Changing tick locations and label.

   Same as the original Matplotlib's axes:

   ```
   ax.set_xticks([1, 2, 3])
   ```

2. Changing axis properties like color, etc.

   Change the properties of appropriate artists. For example, to change the color of the ticklabels:

   ```
   ax.axis["left"].major_ticklabels.set_color("r")
   ```

3. To change the attributes of multiple axis:

   ```
   ax.axis["left", "bottom"].major_ticklabels.set_color("r")
   ```

   or to change the attributes of all axis:

   ```
   ax.axis[:].major_ticklabels.set_color("r")
   ```

4. To change the tick size (length), you need to use axis.major_ticks.set_ticksize method. To change the direction of the ticks (ticks are in opposite direction of ticklabels by default), use axis.major_ticks.set_tick_out method.

   To change the pad between ticks and ticklabels, use axis.major_ticklabels.set_pad method.

   To change the pad between ticklabels and axis label, axis.label.set_pad method.

Rotation and Alignment of TickLabels

This is also quite different from standard Matplotlib and can be confusing. When you want to rotate the ticklabels, first consider using "set_axis_direction" method.

```
ax1.axis["left"].major_ticklabels.set_axis_direction("top")
ax1.axis["right"].label.set_axis_direction("left")
```

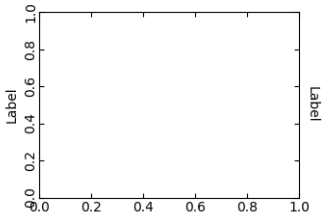

Fig. 66: Simple Axis Direction01

The parameter for set_axis_direction is one of ["left", "right", "bottom", "top"].

You must understand some underlying concept of directions.

1. There is a reference direction which is defined as the direction of the axis line with increasing coordinate. For example, the reference direction of the left x-axis is from bottom to top.

Fig. 67: Axis Direction Demo - Step 01

   The direction, text angle, and alignments of the ticks, ticklabels and axis-label is determined with respect to the reference direction

2. *ticklabel_direction* is either the right-hand side (+) of the reference direction or the left-hand side (-).

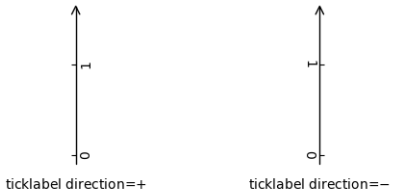

Fig. 68: Axis Direction Demo - Step 02

Fig. 69: Axis Direction Demo - Step 03

3. same for the *label_direction*
4. ticks are by default drawn toward the opposite direction of the ticklabels.
5. text rotation of ticklabels and label is determined in reference to the *ticklabel_direction* or *label_direction*, respectively. The rotation of ticklabels and label is anchored.

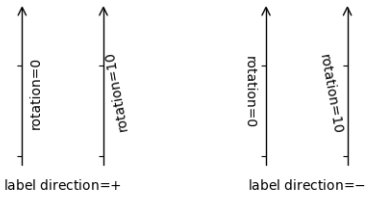

Fig. 70: Axis Direction Demo - Step 04

On the other hand, there is a concept of "axis_direction". This is a default setting of above properties for each, "bottom", "left", "top", and "right" axis.

?	?	left	bottom	right	top
axislabel	direction	'-'	'+'	'+'	'-'
axislabel	rotation	180	0	0	180
axislabel	va	center	top	center	bottom
axislabel	ha	right	center	right	center
ticklabel	direction	'-'	'+'	'+'	'-'
ticklabels	rotation	90	0	-90	180
ticklabel	ha	right	center	right	center
ticklabel	va	center	baseline	center	baseline

And, 'set_axis_direction("top")' means to adjust the text rotation etc, for settings suitable for "top" axis. The concept of axis direction can be more clear with curved axis.

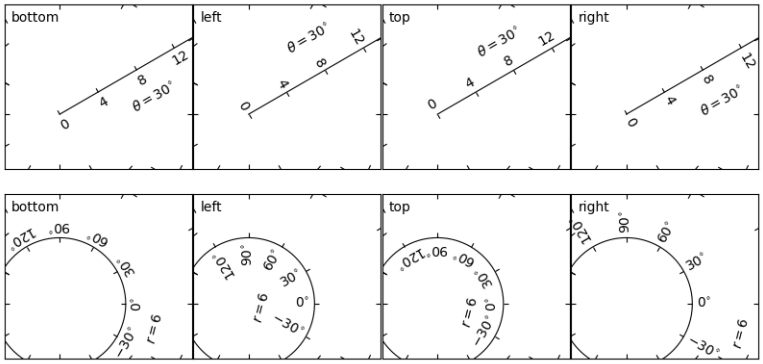

Fig. 71: Demo Axis Direction

The axis_direction can be adjusted in the AxisArtist level, or in the level of its child artists, i.e., ticks, ticklabels, and axis-label.

```
ax1.axis["left"].set_axis_direction("top")
```

changes axis_direction of all the associated artist with the "left" axis, while

```
ax1.axis["left"].major_ticklabels.set_axis_direction("top")
```

changes the axis_direction of only the major_ticklabels. Note that set_axis_direction in the AxisArtist level changes the ticklabel_direction and label_direction, while changing the axis_direction of ticks, ticklabels, and axis-label does not affect them.

If you want to make ticks outward and ticklabels inside the axes, use invert_ticklabel_direction method.

```
ax.axis[:].invert_ticklabel_direction()
```

A related method is "set_tick_out". It makes ticks outward (as a matter of fact, it makes ticks toward the opposite direction of the default direction).

```
ax.axis[:].major_ticks.set_tick_out(True)
```

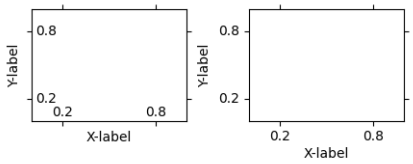

Fig. 72: Simple Axis Direction03

So, in summary,

- AxisArtist's methods
  - set_axis_direction: "left", "right", "bottom", or "top"
  - set_ticklabel_direction: "+" or "-"
  - set_axislabel_direction: "+" or "-"
  - invert_ticklabel_direction
- Ticks' methods (major_ticks and minor_ticks)
  - set_tick_out: True or False
  - set_ticksize: size in points
- TickLabels' methods (major_ticklabels and minor_ticklabels)
  - set_axis_direction: "left", "right", "bottom", or "top"
  - set_rotation: angle with respect to the reference direction
  - set_ha and set_va: see below
- AxisLabels' methods (label)
  - set_axis_direction: "left", "right", "bottom", or "top"
  - set_rotation: angle with respect to the reference direction
  - set_ha and set_va

Adjusting ticklabels alignment

Alignment of TickLabels are treated specially. See below

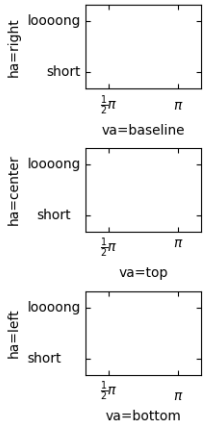

Fig. 73: Demo Ticklabel Alignment

Adjusting pad

To change the pad between ticks and ticklabels

```
ax.axis["left"].major_ticklabels.set_pad(10)
```

Or ticklabels and axis-label

```
ax.axis["left"].label.set_pad(10)
```

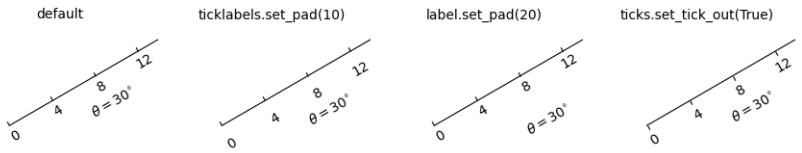

Fig. 74: Simple Axis Pad

GridHelper

To actually define a curvilinear coordinate, you have to use your own grid helper. A generalised version of grid helper class is supplied and this class should suffice in most of cases. A user may provide two functions which defines a transformation (and its inverse pair) from the curved coordinate to (rectilinear) image coordinate. Note that while ticks and grids are drawn for curved coordinate, the data transform of the axes itself (ax.transData) is still rectilinear (image) coordinate.

```
from mpl_toolkits.axisartist.grid_helper_curvelinear \
     import GridHelperCurveLinear
from mpl_toolkits.axisartist import Subplot

# from curved coordinate to rectlinear coordinate.
def tr(x, y):
    x, y = np.asarray(x), np.asarray(y)
    return x, y-x

# from rectlinear coordinate to curved coordinate.
def inv_tr(x, y):
    x, y = np.asarray(x), np.asarray(y)
    return x, y+x

grid_helper = GridHelperCurveLinear((tr, inv_tr))

ax1 = Subplot(fig, 1, 1, 1, grid_helper=grid_helper)

fig.add_subplot(ax1)
```

You may use Matplotlib's Transform instance instead (but a inverse transformation must be defined). Often, coordinate range in a curved coordinate system may have a limited range, or may have cycles. In those cases, a more customized version of grid helper is required.

```
import mpl_toolkits.axisartist.angle_helper as angle_helper

# PolarAxes.PolarTransform takes radian. However, we want our coordinate
# system in degree
tr = Affine2D().scale(np.pi/180., 1.) + PolarAxes.PolarTransform()

# extreme finder: find a range of coordinate.
# 20, 20: number of sampling points along x, y direction
# The first coordinate (longitude, but theta in polar)
#   has a cycle of 360 degree.
# The second coordinate (latitude, but radius in polar)  has a minimum of 0
extreme_finder = angle_helper.ExtremeFinderCycle(20, 20,
                                                 lon_cycle = 360,
                                                 lat_cycle = None,
                                                 lon_minmax = None,
                                                 lat_minmax = (0, np.inf),
                                                 )

# Find a grid values appropriate for the coordinate (degree,
# minute, second). The argument is a approximate number of grids.
grid_locator1 = angle_helper.LocatorDMS(12)

# And also uses an appropriate formatter.  Note that the acceptable Locator
# and Formatter classes are different than that of Matplotlib's, and you
# cannot directly use Matplotlib's Locator and Formatter here (but may be
# possible in the future).
tick_formatter1 = angle_helper.FormatterDMS()
```

(continues on next page)

(continued from previous page)

```
grid_helper = GridHelperCurveLinear(tr,
                                    extreme_finder=extreme_finder,
                                    grid_locator1=grid_locator1,
                                    tick_formatter1=tick_formatter1
                                    )
```

Again, the *transData* of the axes is still a rectilinear coordinate (image coordinate). You may manually do conversion between two coordinates, or you may use Parasite Axes for convenience.:

```
ax1 = SubplotHost(fig, 1, 2, 2, grid_helper=grid_helper)

# A parasite axes with given transform
ax2 = ParasiteAxesAuxTrans(ax1, tr, "equal")
# note that ax2.transData == tr + ax1.transData
# Anything you draw in ax2 will match the ticks and grids of ax1.
ax1.parasites.append(ax2)
```

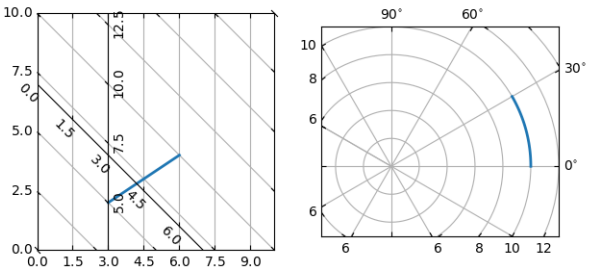

Fig. 75: Demo Curvelinear Grid

FloatingAxis

A floating axis is an axis one of whose data coordinate is fixed, i.e, its location is not fixed in Axes coordinate but changes as axes data limits changes. A floating axis can be created using *new_floating_axis* method. However, it is your responsibility that the resulting AxisArtist is properly added to the axes. A recommended way is to add it as an item of Axes's axis attribute.:

```
# floating axis whose first (index starts from 0) coordinate
# (theta) is fixed at 60

ax1.axis["lat"] = axis = ax1.new_floating_axis(0, 60)
axis.label.set_text(r"$\theta = 60^{\circ}$")
axis.label.set_visible(True)
```

See the first example of this page.

Current Limitations and TODO's

The code need more refinement. Here is a incomplete list of issues and TODO's

- No easy way to support a user customized tick location (for curvilinear grid). A new Locator class needs to be created.
- FloatingAxis may have coordinate limits, e.g., a floating axis of x = 0, but y only spans from 0 to 1.
- The location of axislabel of FloatingAxis needs to be optionally given as a coordinate value. ex, a floating axis of x=0 with label at y=1

2.7.3 The mplot3d Toolkit

Generating 3D plots using the mplot3d toolkit.

Contents

Getting started

3D Axes (of class *Axes3D*) are created by passing the `projection="3d"` keyword argument to *Figure.add_subplot*:

```
import matplotlib.pyplot as plt
fig = plt.figure()
ax = fig.add_subplot(111, projection='3d')
```

Changed in version 1.0.0: Prior to Matplotlib 1.0.0, *Axes3D* needed to be directly instantiated with `from mpl_toolkits.mplot3d import Axes3D; ax = Axes3D(fig)`.

Changed in version 3.2.0: Prior to Matplotlib 3.2.0, it was necessary to explicitly import the *mpl_toolkits.mplot3d* module to make the '3d' projection to *Figure.add_subplot*.

See the *mplot3d FAQ* for more information about the mplot3d toolkit.

Line plots

`Axes3D.plot`(*self*, *xs*, *ys*, **args*, *zdir='z'*, ***kwargs*)

Plot 2D or 3D data.

Parameters

xs

[1D array-like] x coordinates of vertices.

ys

[1D array-like] y coordinates of vertices.

zs

[float or 1D array-like] z coordinates of vertices; either one for all points or one for each point.

zdir

[{'x', 'y', 'z'}, default: 'z'] When plotting 2D data, the direction to use as z ('x', 'y' or 'z').

****kwargs**

Other arguments are forwarded to *matplotlib.axes.Axes.plot*.

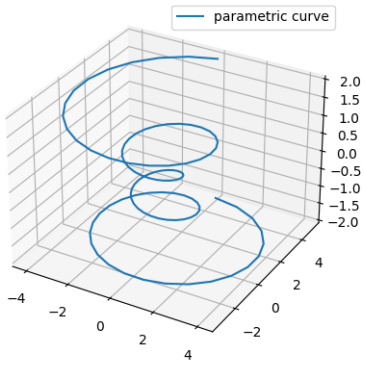

Fig. 76: Lines3d

Scatter plots

`Axes3D.scatter`(*self*, *xs*, *ys*, *zs=0*, *zdir='z'*, *s=20*, *c=None*, *depthshade=True*, **args*, ***kwargs*)

Create a scatter plot.

Parameters

xs, ys

[array-like] The data positions.

zs

[float or array-like, default: 0] The z-positions. Either an array of the same length as *xs* and *ys* or a single value to place all points in the same plane.

zdir

[{'x', 'y', 'z', '-x', '-y', '-z'}, default: 'z'] The axis direction for the *zs*. This is useful when plotting 2D data on a 3D Axes. The data must be passed as *xs*, *ys*. Setting *zdir* to 'y' then plots the data to the x-z-plane.

See also /gallery/mplot3d/2dcollections3d.

s

[float or array-like, default: 20] The marker size in points**2. Either an array of the same length as *xs* and *ys* or a single value to make all markers the same size.

c

[color, sequence, or sequence of colors, optional] The marker color. Possible values:

- A single color format string.
- A sequence of colors of length n.
- A sequence of n numbers to be mapped to colors using *cmap* and *norm*.
- A 2-D array in which the rows are RGB or RGBA.

For more details see the *c* argument of *scatter*.

depthshade

[bool, default: True] Whether to shade the scatter markers to give the appearance of depth. Each call to `scatter()` will perform its depthshading independently.

****kwargs**

All other arguments are passed on to *scatter*.

Returns

paths

[*PathCollection*]

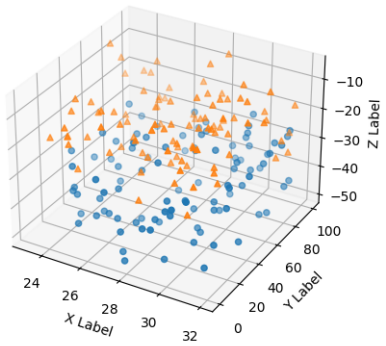

Fig. 77: Scatter3d

Wireframe plots

Axes3D.plot_wireframe(*self*, *X*, *Y*, *Z*, **args*, ***kwargs*)

Plot a 3D wireframe.

Note: The *rcount* and *ccount* kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points.

Parameters

X, Y, Z

[2d arrays] Data values.

rcount, ccount

[int] Maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points. Setting a count to zero causes the data to be not sampled in the corresponding direction, producing a 3D line plot rather than a wireframe plot. Defaults to 50.

New in version 2.0.

rstride, cstride

[int] Downsampling stride in each direction. These arguments are mutually exclusive with *rcount* and *ccount*. If only one of *rstride* or *cstride* is set, the other defaults to 1. Setting a stride to zero causes the data to be not sampled in the corresponding direction, producing a 3D line plot rather than a wireframe plot.

'classic' mode uses a default of `rstride = cstride = 1` instead of the new default of `rcount = ccount = 50`.

****kwargs**

Other arguments are forwarded to *Line3DCollection*.

Surface plots

Axes3D.plot_surface(*self*, *X*, *Y*, *Z*, **args*, *norm=None*, *vmin=None*, *vmax=None*, *lightsource=None*, ***kwargs*)

Create a surface plot.

By default it will be colored in shades of a solid color, but it also supports color mapping by supplying the *cmap* argument.

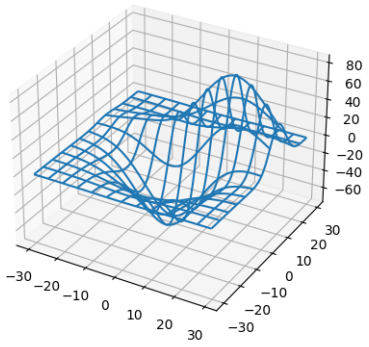

Fig. 78: Wire3d

Note: The *rcount* and *ccount* kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points.

Note: To maximize rendering speed consider setting *rstride* and *cstride* to divisors of the number of rows minus 1 and columns minus 1 respectively. For example, given 51 rows rstride can be any of the divisors of 50.

Similarly, a setting of *rstride* and *cstride* equal to 1 (or *rcount* and *ccount* equal the number of rows and columns) can use the optimized path.

Parameters

X, Y, Z

[2d arrays] Data values.

rcount, ccount

[int] Maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points. Defaults to 50.

New in version 2.0.

rstride, cstride

[int] Downsampling stride in each direction. These arguments are mutually exclusive with *rcount* and *ccount*. If only one of *rstride* or *cstride* is set, the other defaults to 10.

'classic' mode uses a default of `rstride = cstride = 10` instead of the new default of `rcount = ccount = 50`.

color

[color-like] Color of the surface patches.

cmap

[Colormap] Colormap of the surface patches.

facecolors

[array-like of colors.] Colors of each individual patch.

norm

[Normalize] Normalization for the colormap.

vmin, vmax

[float] Bounds for the normalization.

shade

[bool, default: True] Whether to shade the facecolors. Shading is always disabled when *cmap* is specified.

lightsource

[*LightSource*] The lightsource to use when *shade* is True.

****kwargs**

Other arguments are forwarded to *Poly3DCollection*.

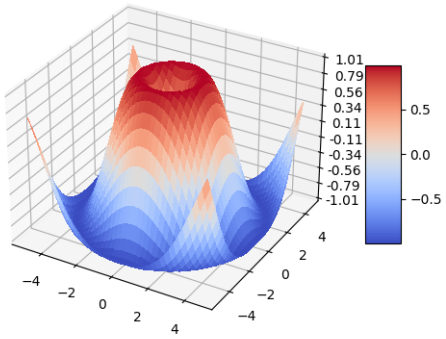

Fig. 79: Surface3d
Surface3d 2
Surface3d 3

Tri-Surface plots

Axes3D.**plot_trisurf**(*self*, **args*, *color=None*, *norm=None*, *vmin=None*, *vmax=None*, *lightsource=None*, ***kwargs*)

Plot a triangulated surface.

The (optional) triangulation can be specified in one of two ways; either:

```
plot_trisurf(triangulation, ...)
```

where triangulation is a *Triangulation* object, or:

```
plot_trisurf(X, Y, ...)
plot_trisurf(X, Y, triangles, ...)
plot_trisurf(X, Y, triangles=triangles, ...)
```

in which case a Triangulation object will be created. See *Triangulation* for a explanation of these possibilities.

The remaining arguments are:

```
plot_trisurf(..., Z)
```

where *Z* is the array of values to contour, one per point in the triangulation.

Parameters

X, Y, Z

[array-like] Data values as 1D arrays.

color

Color of the surface patches.

cmap

A colormap for the surface patches.

norm

[Normalize] An instance of Normalize to map values to colors.

vmin, vmax

[float, default: None] Minimum and maximum value to map.

shade

[bool, default: True] Whether to shade the facecolors. Shading is always disabled when *cmap* is specified.

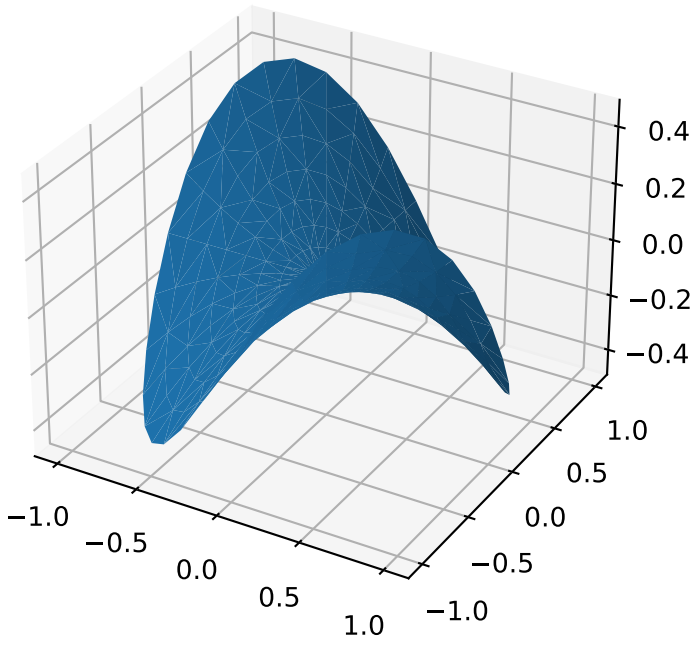
lightsource

[*LightSource*] The lightsource to use when *shade* is True.

****kwargs**

All other arguments are passed on to *Poly3DCollection*

Examples



New in version 1.2.0.

Contour plots

`Axes3D.contour`(*self*, *X*, *Y*, *Z*, **args*, *extend3d=False*, *stride=5*, *zdir='z'*, *offset=None*, ***kwargs*)

Create a 3D contour plot.

Parameters

X, Y, Z

[array-like] Input data.

extend3d

[bool, default: False] Whether to extend contour in 3D.

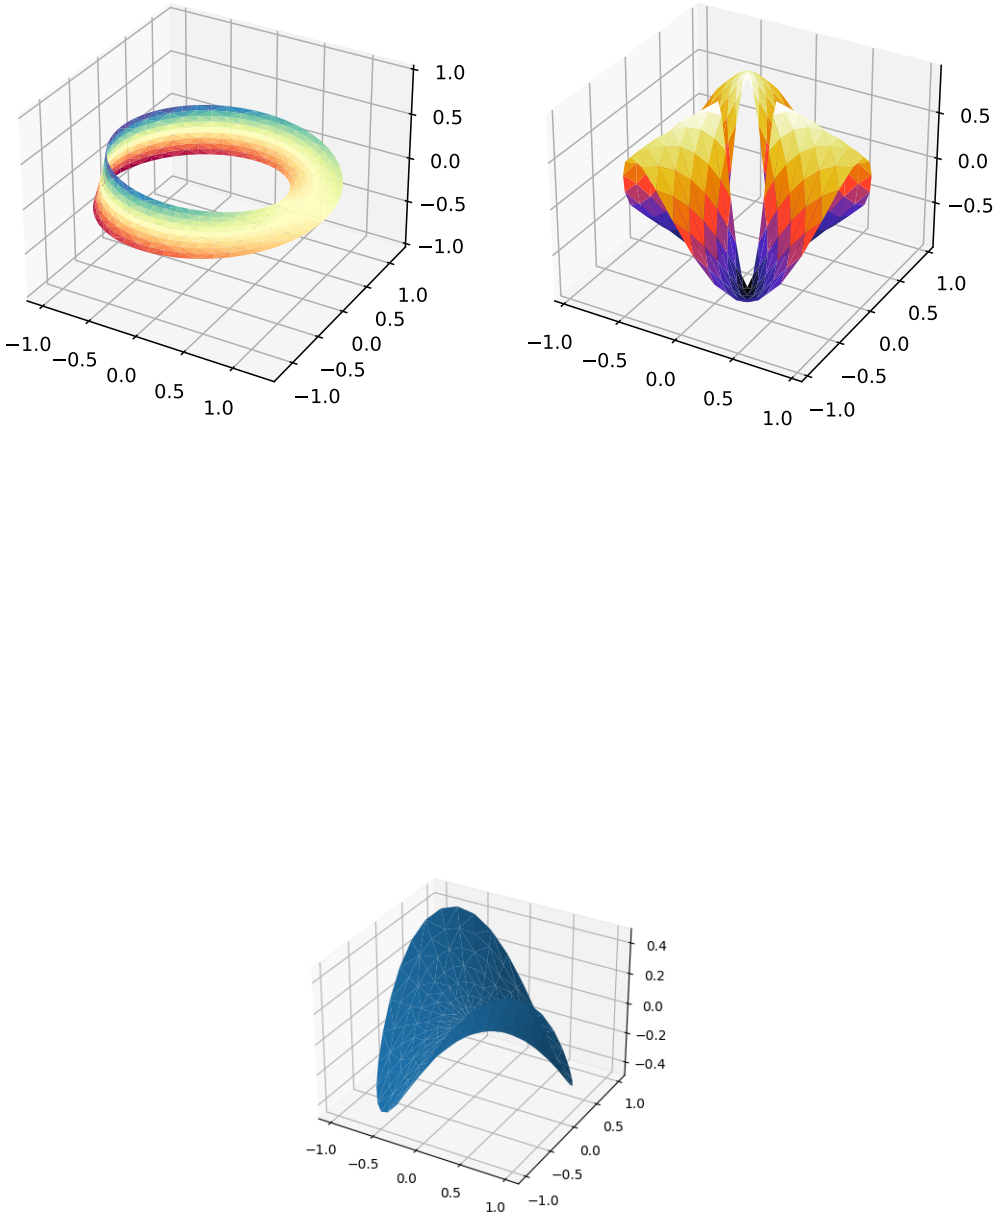


Fig. 80: Trisurf3d

stride

[int] Step size for extending contour.

zdir

[{'x', 'y', 'z'}, default: 'z'] The direction to use.

offset

[float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

***args, **kwargs**

Other arguments are forwarded to *matplotlib.axes.Axes.contour*.

Returns

matplotlib.contour.QuadContourSet

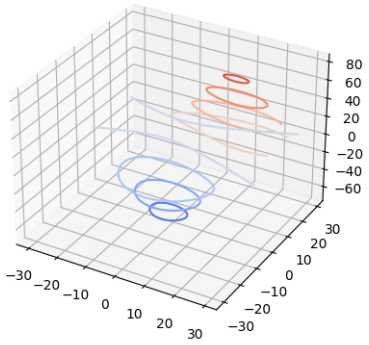

Fig. 81: Contour3d
Contour3d 2
Contour3d 3

Filled contour plots

`Axes3D.contourf`(*self*, *X*, *Y*, *Z*, **args*, *zdir='z'*, *offset=None*, ***kwargs*)

Create a 3D filled contour plot.

Parameters

X, Y, Z

[array-like] Input data.

zdir

[{'x', 'y', 'z'}, default: 'z'] The direction to use.

offset

[float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

***args, **kwargs**

Other arguments are forwarded to *matplotlib.axes.Axes.contourf*.

Returns

matplotlib.contour.QuadContourSet

Notes

New in version 1.1.0: The *zdir* and *offset* parameters.

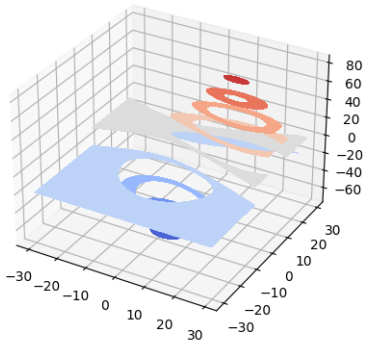

Fig. 82: Contourf3d
Contourf3d 2

New in version 1.1.0: The feature demoed in the second contourf3d example was enabled as a result of a bugfix for version 1.1.0.

Polygon plots

Axes3D.add_collection3d(*self*, *col*, *zs=0*, *zdir='z'*)

Add a 3D collection object to the plot.

2D collection types are converted to a 3D version by modifying the object and adding z coordinate information.

Supported are:

- PolyCollection
- LineCollection
- PatchCollection

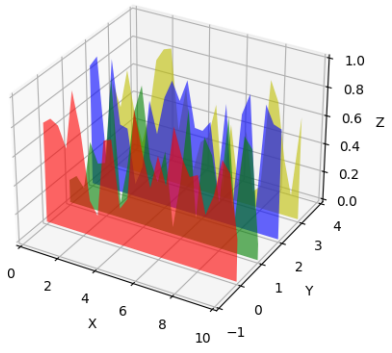

Fig. 83: Polys3d

Bar plots

Axes3D.bar(*self*, *left*, *height*, *zs=0*, *zdir='z'*, **args*, ***kwargs*)

Add 2D bar(s).

Parameters

left

[1D array-like] The x coordinates of the left sides of the bars.

height

[1D array-like] The height of the bars.

zs

[float or 1D array-like] Z coordinate of bars; if a single value is specified, it will be used for all bars.

zdir

[{'x', 'y', 'z'}, default: 'z'] When plotting 2D data, the direction to use as z ('x', 'y' or 'z').

****kwargs**

Other arguments are forwarded to *matplotlib.axes.Axes.bar*.

Returns

mpl_toolkits.mplot3d.art3d.Patch3DCollection

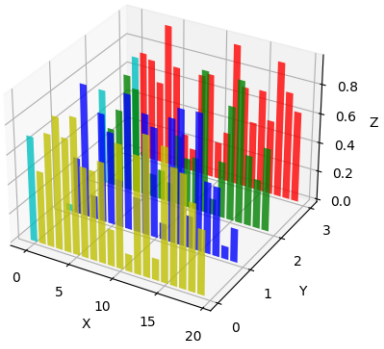

Fig. 84: Bars3d

Quiver

`Axes3D.quiver`(*X, Y, Z, U, V, W, /, length=1, arrow_length_ratio=0.3, pivot='tail', normalize=False, **kwargs*)

Plot a 3D field of arrows.

The arguments could be array-like or scalars, so long as they they can be broadcast together. The arguments can also be masked arrays. If an element in any of argument is masked, then that corresponding quiver element will not be plotted.

Parameters

X, Y, Z

[array-like] The x, y and z coordinates of the arrow locations (default is tail of arrow; see *pivot* kwarg).

U, V, W

[array-like] The x, y and z components of the arrow vectors.

length

[float, default: 1] The length of each quiver.

arrow_length_ratio

[float, default: 0.3] The ratio of the arrow head with respect to the quiver.

pivot

[{'tail', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is at the grid point; the arrow rotates about this point, hence the name *pivot*.

normalize

[bool, default: False] Whether all arrows are normalized to have the same length, or keep the lengths defined by *u*, *v*, and *w*.

****kwargs**

Any additional keyword arguments are delegated to *LineCollection*

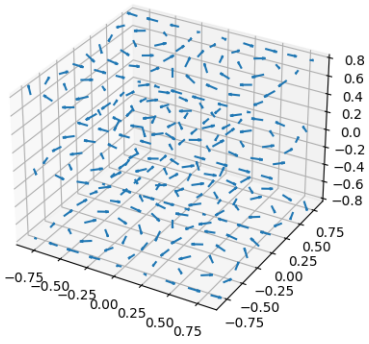

Fig. 85: Quiver3d

2D plots in 3D

Text

`Axes3D.text`(*self*, *x*, *y*, *z*, *s*, *zdir=None*, ***kwargs*)

Add text to the plot. kwargs will be passed on to Axes.text, except for the *zdir* keyword, which sets the direction to be used as the z direction.

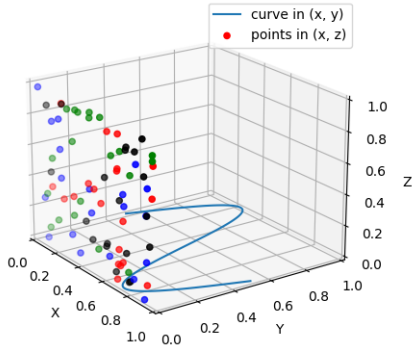

Fig. 86: 2dcollections3d

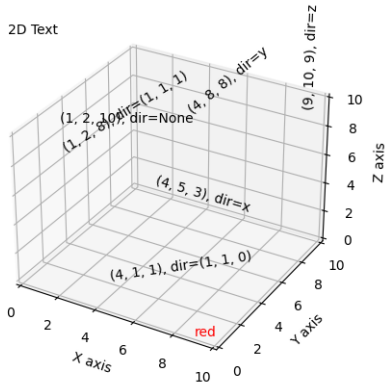

Fig. 87: Text3d

Subplotting

Having multiple 3D plots in a single figure is the same as it is for 2D plots. Also, you can have both 2D and 3D plots in the same figure.

New in version 1.0.0: Subplotting 3D plots was added in v1.0.0. Earlier version can not do this.

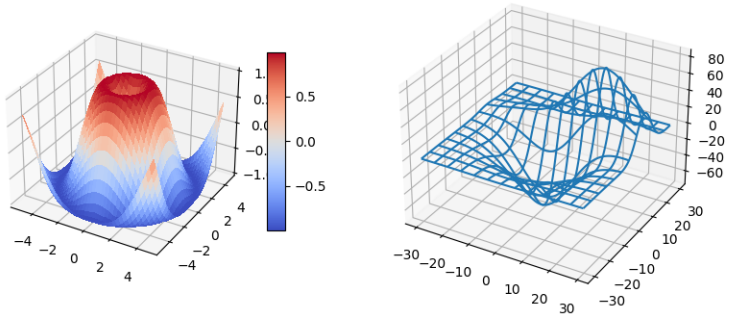

Fig. 88: Subplot3d
Mixed Subplots

CHAPTER

THREE

INTERACTIVE FIGURES

When working with data, interactivity can be invaluable. The pan/zoom and mouse-location tools built into the Matplotlib GUI windows are often sufficient, but you can also use the event system to build customized data exploration tools.

Matplotlib ships with *backends* binding to several GUI toolkits (Qt, Tk, Wx, GTK, macOS, JavaScript) and third party packages provide bindings to kivy and Jupyter Lab. For the figures to be responsive to mouse, keyboard, and paint events, the GUI event loop needs to be integrated with an interactive prompt. We recommend using IPython (see *below*).

The *pyplot* module provides functions for explicitly creating figures that include interactive tools, a toolbar, a tool-tip, and *key bindings*:

pyplot.figure

Creates a new empty *figure.Figure* or selects an existing figure

pyplot.subplots

Creates a new *figure.Figure* and fills it with a grid of *axes.Axes*

pyplot has a notion of "The Current Figure" which can be accessed through *pyplot.gcf* and a notion of "The Current Axes" accessed through *pyplot.gca*. Almost all of the functions in *pyplot* pass through the current *Figure* / *axes.Axes* (or create one) as appropriate.

Matplotlib keeps a reference to all of the open figures created via *pyplot.figure* or *pyplot.subplots* so that the figures will not be garbage collected. *Figure*s can be closed and deregistered from *pyplot* individually via *pyplot.close*; all open *Figure*s can be closed via `plt.close('all')`.

For more discussion of Matplotlib's event system and integrated event loops, please read:

3.1 Interactive Figures and Asynchronous Programming

Matplotlib supports rich interactive figures by embedding figures into a GUI window. The basic interactions of panning and zooming in an Axes to inspect your data is 'baked in' to Matplotlib. This is supported by a full mouse and keyboard event handling system that you can use to build sophisticated interactive graphs.

This guide is meant to be an introduction to the low-level details of how Matplotlib integration with a GUI event loop works. For a more practical introduction to the Matplotlib event API see *event handling system*, Interactive Tutorial, and Interactive Applications using Matplotlib.

3.1.1 Event Loops

Fundamentally, all user interaction (and networking) is implemented as an infinite loop waiting for events from the user (via the OS) and then doing something about it. For example, a minimal Read Evaluate Print Loop (REPL) is

```
exec_count = 0
while True:
    inp = input(f"[{exec_count}] > ")        # Read
    ret = eval(inp)                          # Evaluate
    print(ret)                               # Print
    exec_count += 1                          # Loop
```

This is missing many niceties (for example, it exits on the first exception!), but is representative of the event loops that underlie all terminals, GUIs, and servers[1]. In general the *Read* step is waiting on some sort of I/O -- be it user input or the network -- while the *Evaluate* and *Print* are responsible for interpreting the input and then **doing** something about it.

In practice we interact with a framework that provides a mechanism to register callbacks to be run in response to specific events rather than directly implement the I/O loop[2]. For example "when the user clicks on this button, please run this function" or "when the user hits the 'z' key, please run this other function". This allows users to write reactive, event-driven, programs without having to delve into the nitty-gritty[3] details of I/O. The core event loop is sometimes referred to as "the main loop" and is typically started, depending on the library, by methods with names like `_exec`, `run`, or `start`.

[1] A limitation of this design is that you can only wait for one input, if there is a need to multiplex between multiple sources then the loop would look something like

```
fds = [...]
while True:                     # Loop
    inp = select(fds).read()    # Read
    eval(inp)                   # Evaluate / Print
```

[2] Or you can write your own if you must.

[3] These examples are aggressively dropping many of the complexities that must be dealt with in the real world such as keyboard interrupts, timeouts, bad input, resource allocation and cleanup, etc.

All GUI frameworks (Qt, Wx, Gtk, tk, OSX, or web) have some method of capturing user interactions and passing them back to the application (for example `Signal` / `Slot` framework in Qt) but the exact details depend on the toolkit. Matplotlib has a *backend* for each GUI toolkit we support which uses the toolkit API to bridge the toolkit UI events into Matplotlib's *event handling system*. You can then use *FigureCanvasBase.mpl_connect* to connect your function to Matplotlib's event handling system. This allows you to directly interact with your data and write GUI toolkit agnostic user interfaces.

3.1.2 Command Prompt Integration

So far, so good. We have the REPL (like the IPython terminal) that lets us interactively send code to the interpreter and get results back. We also have the GUI toolkit that runs an event loop waiting for user input and lets us register functions to be run when that happens. However, if we want to do both we have a problem: the prompt and the GUI event loop are both infinite loops that each think *they* are in charge! In order for both the prompt and the GUI windows to be responsive we need a method to allow the loops to 'timeshare' :

1. let the GUI main loop block the python process when you want interactive windows
2. let the CLI main loop block the python process and intermittently run the GUI loop
3. fully embed python in the GUI (but this is basically writing a full application)

Blocking the Prompt

pyplot.show	Display all open figures.
pyplot.pause	Run the GUI event loop for *interval* seconds.
backend_bases.FigureCanvasBase.start_event_loop	Start a blocking event loop.
backend_bases.FigureCanvasBase.stop_event_loop	Stop the current blocking event loop.

The simplest "integration" is to start the GUI event loop in 'blocking' mode and take over the CLI. While the GUI event loop is running you can not enter new commands into the prompt (your terminal may echo the characters typed into the terminal, but they will not be sent to the Python interpreter because it is busy running the GUI event loop), but the figure windows will be responsive. Once the event loop is stopped (leaving any still open figure windows non-responsive) you will be able to use the prompt again. Re-starting the event loop will make any open figure responsive again (and will process any queued up user interaction).

To start the event loop until all open figures are closed use *pyplot.show* as

```
pyplot.show(block=True)
```

To start the event loop for a fixed amount of time (in seconds) use *pyplot.pause*.

If you are not using *pyplot* you can start and stop the event loops via *FigureCanvasBase.start_event_loop* and *FigureCanvasBase.stop_event_loop*. However, in most contexts where you would not be using *pyplot* you are embedding Matplotlib in a large GUI application and the GUI event loop should already be running for the application.

Away from the prompt, this technique can be very useful if you want to write a script that pauses for user interaction, or displays a figure between polling for additional data. See *Scripts and functions* for more details.

Input Hook integration

While running the GUI event loop in a blocking mode or explicitly handling UI events is useful, we can do better! We really want to be able to have a usable prompt **and** interactive figure windows.

We can do this using the 'input hook' feature of the interactive prompt. This hook is called by the prompt as it waits for the user to type (even for a fast typist the prompt is mostly waiting for the human to think and move their fingers). Although the details vary between prompts the logic is roughly

1. start to wait for keyboard input
2. start the GUI event loop
3. as soon as the user hits a key, exit the GUI event loop and handle the key
4. repeat

This gives us the illusion of simultaneously having interactive GUI windows and an interactive prompt. Most of the time the GUI event loop is running, but as soon as the user starts typing the prompt takes over again.

This time-share technique only allows the event loop to run while python is otherwise idle and waiting for user input. If you want the GUI to be responsive during long running code it is necessary to periodically flush the GUI event queue as described *above*. In this case it is your code, not the REPL, which is blocking the process so you need to handle the "time-share" manually. Conversely, a very slow figure draw will block the prompt until it finishes drawing.

3.1.3 Full embedding

It is also possible to go the other direction and fully embed figures (and a Python interpreter) in a rich native application. Matplotlib provides classes for each toolkit which can be directly embedded in GUI applications (this is how the built-in windows are implemented!). See user_interfaces for more details.

3.1.4 Scripts and functions

backend_bases.FigureCanvasBase.flush_events	Flush the GUI events for the figure.
backend_bases.FigureCanvasBase.draw_idle	Request a widget redraw once control returns to the GUI event loop.
figure.Figure.ginput	Blocking call to interact with a figure.
pyplot.ginput	Blocking call to interact with a figure.
pyplot.show	Display all open figures.
pyplot.pause	Run the GUI event loop for *interval* seconds.

There are several use-cases for using interactive figures in scripts:

- capture user input to steer the script
- progress updates as a long running script progresses
- streaming updates from a data source

Blocking functions

If you only need to collect points in an Axes you can use *figure.Figure.ginput* or more generally the tools from *blocking_input* the tools will take care of starting and stopping the event loop for you. However if you have written some custom event handling or are using *widgets* you will need to manually run the GUI event loop using the methods described *above*.

You can also use the methods described in *Blocking the Prompt* to suspend run the GUI event loop. Once the loop exits your code will resume. In general, any place you would use `time.sleep` you can use *pyplot.pause* instead with the added benefit of interactive figures.

For example, if you want to poll for data you could use something like

```
fig, ax = plt.subplots()
ln, = ax.plot([], [])

while True:
    x, y = get_new_data()
```

(continues on next page)

(continued from previous page)

```
    ln.set_data(x, y)
    plt.pause(1)
```

which would poll for new data and update the figure at 1Hz.

Explicitly spinning the Event Loop

backend_bases.FigureCanvasBase.flush_events	Flush the GUI events for the figure.
backend_bases.FigureCanvasBase.draw_idle	Request a widget redraw once control returns to the GUI event loop.

If you have open windows that have pending UI events (mouse clicks, button presses, or draws) you can explicitly process those events by calling *FigureCanvasBase.flush_events*. This will run the GUI event loop until all UI events currently waiting have been processed. The exact behavior is backend-dependent but typically events on all figure are processed and only events waiting to be processed (not those added during processing) will be handled.

For example

```
import time
import matplotlib.pyplot as plt
import numpy as np
plt.ion()

fig, ax = plt.subplots()
th = np.linspace(0, 2*np.pi, 512)
ax.set_ylim(-1.5, 1.5)

ln, = ax.plot(th, np.sin(th))

def slow_loop(N, ln):
    for j in range(N):
        time.sleep(.1)  # to simulate some work
        ln.figure.canvas.flush_events()

slow_loop(100, ln)
```

While this will feel a bit laggy (as we are only processing user input every 100ms whereas 20-30ms is what feels "responsive") it will respond.

If you make changes to the plot and want it re-rendered you will need to call *draw_idle* to request that the canvas be re-drawn. This method can be thought of *draw_soon* in analogy to `asyncio.loop.call_soon`.

We can add this our example above as

```
def slow_loop(N, ln):
    for j in range(N):
        time.sleep(.1)  # to simulate some work
        if j % 10:
            ln.set_ydata(np.sin(((j // 10) % 5 * th)))
            ln.figure.canvas.draw_idle()

        ln.figure.canvas.flush_events()

slow_loop(100, ln)
```

The more frequently you call *FigureCanvasBase.flush_events* the more responsive your figure will feel but at the cost of spending more resources on the visualization and less on your computation.

3.1.5 Stale Artists

Artists (as of Matplotlib 1.5) have a **stale** attribute which is `True` if the internal state of the artist has changed since the last time it was rendered. By default the stale state is propagated up to the Artists parents in the draw tree, e.g., if the color of a *Line2D* instance is changed, the *axes.Axes* and *figure.Figure* that contain it will also be marked as "stale". Thus, `fig.stale` will report if any artist in the figure has been modified and is out of sync with what is displayed on the screen. This is intended to be used to determine if `draw_idle` should be called to schedule a re-rendering of the figure.

Each artist has a `Artist.stale_callback` attribute which holds a callback with the signature

```
def callback(self: Artist, val: bool) -> None:
   ...
```

which by default is set to a function that forwards the stale state to the artist's parent. If you wish to suppress a given artist from propagating set this attribute to None.

figure.Figure instances do not have a containing artist and their default callback is `None`. If you call *pyplot.ion* and are not in `IPython` we will install a callback to invoke *draw_idle* whenever the *figure.Figure* becomes stale. In `IPython` we use the `'post_execute'` hook to invoke *draw_idle* on any stale figures after having executed the user's input, but before returning the prompt to the user. If you are not using *pyplot* you can use the callback `Figure.stale_callback` attribute to be notified when a figure has become stale.

3.1.6 Draw Idle

backend_bases.FigureCanvasBase.draw	Render the *Figure*.
backend_bases.FigureCanvasBase.draw_idle	Request a widget redraw once control returns to the GUI event loop.
backend_bases.FigureCanvasBase.flush_events	Flush the GUI events for the figure.

In almost all cases, we recommend using *backend_bases.FigureCanvasBase.draw_idle* over *backend_bases.FigureCanvasBase.draw*. `draw` forces a rendering of the figure whereas `draw_idle` schedules a rendering the next time the GUI window is going to re-paint the screen. This improves performance by only rendering pixels that will be shown on the screen. If you want to be sure that the screen is updated as soon as possible do

```
fig.canvas.draw_idle()
fig.canvas.flush_events()
```

3.1.7 Threading

Most GUI frameworks require that all updates to the screen, and hence their main event loop, run on the main thread. This makes pushing periodic updates of a plot to a background thread impossible. Although it seems backwards, it is typically easier to push your computations to a background thread and periodically update the figure on the main thread.

In general Matplotlib is not thread safe. If you are going to update *Artist* objects in one thread and draw from another you should make sure that you are locking in the critical sections.

3.1.8 Eventloop integration mechanism

CPython / readline

The Python C API provides a hook, `PyOS_InputHook`, to register a function to be run "The function will be called when Python's interpreter prompt is about to become idle and wait for user input from the terminal.". This hook can be used to integrate a second event loop (the GUI event loop) with the python input prompt loop. The hook functions typically exhaust all pending events on the GUI event queue, run the main loop for a short fixed amount of time, or run the event loop until a key is pressed on stdin.

Matplotlib does not currently do any management of `PyOS_InputHook` due to the wide range of ways that Matplotlib is used. This management is left to downstream libraries -- either user code or the shell. Interactive figures, even with matplotlib

in 'interactive mode', may not work in the vanilla python repl if an appropriate `PyOS_InputHook` is not registered.

Input hooks, and helpers to install them, are usually included with the python bindings for GUI toolkits and may be registered on import. IPython also ships input hook functions for all of the GUI frameworks Matplotlib supports which can be installed via `%matplotlib`. This is the recommended method of integrating Matplotlib and a prompt.

IPython / prompt toolkit

With IPython >= 5.0 IPython has changed from using cpython's readline based prompt to a `prompt_toolkit` based prompt. `prompt_toolkit` has the same conceptual input hook, which is fed into `prompt_toolkit` via the `IPython.terminal.interactiveshell.TerminalInteractiveShell.inputhook()` method. The source for the `prompt_toolkit` input hooks lives at `IPython.terminal.pt_inputhooks`

3.2 Event handling and picking

Matplotlib works with a number of user interface toolkits (wxpython, tkinter, qt4, gtk, and macosx) and in order to support features like interactive panning and zooming of figures, it is helpful to the developers to have an API for interacting with the figure via key presses and mouse movements that is "GUI neutral" so we don't have to repeat a lot of code across the different user interfaces. Although the event handling API is GUI neutral, it is based on the GTK model, which was the first user interface matplotlib supported. The events that are triggered are also a bit richer vis-a-vis matplotlib than standard GUI events, including information like which *matplotlib.axes.Axes* the event occurred in. The events also understand the matplotlib coordinate system, and report event locations in both pixel and data coordinates.

3.2.1 Event connections

To receive events, you need to write a callback function and then connect your function to the event manager, which is part of the *FigureCanvasBase*. Here is a simple example that prints the location of the mouse click and which button was pressed:

```
fig, ax = plt.subplots()
ax.plot(np.random.rand(10))

def onclick(event):
    print('%s click: button=%d, x=%d, y=%d, xdata=%f, ydata=%f' %
          ('double' if event.dblclick else 'single', event.button,
           event.x, event.y, event.xdata, event.ydata))

cid = fig.canvas.mpl_connect('button_press_event', onclick)
```

The `FigureCanvas` method *mpl_connect()* returns a connection id which is simply an integer. When you want to disconnect the callback, just call:

```
fig.canvas.mpl_disconnect(cid)
```

Note: The canvas retains only weak references to instance methods used as callbacks. Therefore, you need to retain a reference to instances owning such methods. Otherwise the instance will be garbage-collected and the callback will vanish.

This does not affect free functions used as callbacks.

Here are the events that you can connect to, the class instances that are sent back to you when the event occurs, and the event descriptions:

Event name	Class	Description
'button_press_event'	*MouseEvent*	mouse button is pressed
'button_release_event'	*MouseEvent*	mouse button is released
'close_event'	*CloseEvent*	figure is closed
'draw_event'	*DrawEvent*	canvas has been drawn (but screen widget not updated yet)
'key_press_event'	*KeyEvent*	key is pressed
'key_release_event'	*KeyEvent*	key is released
'motion_notify_event'	*MouseEvent*	mouse moves
'pick_event'	*PickEvent*	artist in the canvas is selected
'resize_event'	*ResizeEvent*	figure canvas is resized
'scroll_event'	*MouseEvent*	mouse scroll wheel is rolled
'figure_enter_event'	*LocationEvent*	mouse enters a new figure
'figure_leave_event'	*LocationEvent*	mouse leaves a figure
'axes_enter_event'	*LocationEvent*	mouse enters a new axes
'axes_leave_event'	*LocationEvent*	mouse leaves an axes

3.2.2 Event attributes

All matplotlib events inherit from the base class *matplotlib.backend_bases.Event*, which store the attributes:

name

the event name

canvas

the FigureCanvas instance generating the event

guiEvent

the GUI event that triggered the matplotlib event

The most common events that are the bread and butter of event handling are key press/release events and mouse press/release and movement events. The *KeyEvent* and *MouseEvent* classes that handle these events are both derived from the LocationEvent, which has the following attributes

x

x position - pixels from left of canvas

y

y position - pixels from bottom of canvas

inaxes

the *Axes* instance if mouse is over axes

xdata

x coord of mouse in data coords

ydata

y coord of mouse in data coords

Let's look a simple example of a canvas, where a simple line segment is created every time a mouse is pressed:

```
from matplotlib import pyplot as plt

class LineBuilder:
    def __init__(self, line):
        self.line = line
        self.xs = list(line.get_xdata())
        self.ys = list(line.get_ydata())
        self.cid = line.figure.canvas.mpl_connect('button_press_event', self)

    def __call__(self, event):
        print('click', event)
        if event.inaxes!=self.line.axes: return
        self.xs.append(event.xdata)
        self.ys.append(event.ydata)
        self.line.set_data(self.xs, self.ys)
        self.line.figure.canvas.draw()

fig = plt.figure()
ax = fig.add_subplot(111)
ax.set_title('click to build line segments')
line, = ax.plot([0], [0])  # empty line
linebuilder = LineBuilder(line)
```

(continues on next page)

(continued from previous page)

```
plt.show()
```

The *MouseEvent* that we just used is a *LocationEvent*, so we have access to the data and pixel coordinates in event.x and event.xdata. In addition to the `LocationEvent` attributes, it has

button

button pressed None, 1, 2, 3, 'up', 'down' (up and down are used for scroll events)

key

the key pressed: None, any character, 'shift', 'win', or 'control'

Draggable rectangle exercise

Write draggable rectangle class that is initialized with a *Rectangle* instance but will move its x,y location when dragged. Hint: you will need to store the original `xy` location of the rectangle which is stored as rect.xy and connect to the press, motion and release mouse events. When the mouse is pressed, check to see if the click occurs over your rectangle (see `matplotlib.patches.Rectangle.contains()`) and if it does, store the rectangle xy and the location of the mouse click in data coords. In the motion event callback, compute the deltax and deltay of the mouse movement, and add those deltas to the origin of the rectangle you stored. The redraw the figure. On the button release event, just reset all the button press data you stored as None.

Here is the solution:

```
import numpy as np
import matplotlib.pyplot as plt

class DraggableRectangle:
    def __init__(self, rect):
        self.rect = rect
        self.press = None

    def connect(self):
        'connect to all the events we need'
        self.cidpress = self.rect.figure.canvas.mpl_connect(
            'button_press_event', self.on_press)
        self.cidrelease = self.rect.figure.canvas.mpl_connect(
            'button_release_event', self.on_release)

    dr.connect()
    drs.append(dr)

plt.show()
```

3.2.3 Mouse enter and leave

If you want to be notified when the mouse enters or leaves a figure or axes, you can connect to the figure/axes enter/leave events. Here is a simple example that changes the colors of the axes and figure background that the mouse is over:

```
"""
Illustrate the figure and axes enter and leave events by changing the
frame colors on enter and leave
"""
import matplotlib.pyplot as plt

def enter_axes(event):
    print('enter_axes', event.inaxes)
    event.inaxes.patch.set_facecolor('yellow')
    event.canvas.draw()

def leave_axes(event):
    print('leave_axes', event.inaxes)
    event.inaxes.patch.set_facecolor('white')
    event.canvas.draw()

def enter_figure(event):
    print('enter_figure', event.canvas.figure)
    event.canvas.figure.patch.set_facecolor('red')
    event.canvas.draw()

def leave_figure(event):
    print('leave_figure', event.canvas.figure)
    event.canvas.figure.patch.set_facecolor('grey')
    event.canvas.draw()

fig1 = plt.figure()
fig1.suptitle('mouse hover over figure or axes to trigger events')
ax1 = fig1.add_subplot(211)
ax2 = fig1.add_subplot(212)

fig1.canvas.mpl_connect('figure_enter_event', enter_figure)
fig1.canvas.mpl_connect('figure_leave_event', leave_figure)
fig1.canvas.mpl_connect('axes_enter_event', enter_axes)
fig1.canvas.mpl_connect('axes_leave_event', leave_axes)

fig2 = plt.figure()
fig2.suptitle('mouse hover over figure or axes to trigger events')
ax1 = fig2.add_subplot(211)
ax2 = fig2.add_subplot(212)

fig2.canvas.mpl_connect('figure_enter_event', enter_figure)
fig2.canvas.mpl_connect('figure_leave_event', leave_figure)
fig2.canvas.mpl_connect('axes_enter_event', enter_axes)
fig2.canvas.mpl_connect('axes_leave_event', leave_axes)

plt.show()
```

3.2.4 Object picking

You can enable picking by setting the `picker` property of an *Artist* (e.g., a matplotlib *Line2D*, *Text*, *Patch*, *Polygon*, *AxesImage*, etc...)

There are a variety of meanings of the `picker` property:

None

picking is disabled for this artist (default)

boolean

if True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist

float

if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event.

function

if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event. The signature is `hit, props = picker(artist, mouseevent)` to determine the hit test. If the mouse event is over the artist, return `hit=True` and props is a dictionary of properties you want added to the *PickEvent* attributes

After you have enabled an artist for picking by setting the `picker` property, you need to connect to the figure canvas pick_event to get pick callbacks on mouse press events. e.g.:

```
def pick_handler(event):
    mouseevent = event.mouseevent
    artist = event.artist
    # now do something with this...
```

The *PickEvent* which is passed to your callback is always fired with two attributes:

mouseevent **the mouse event that generate the pick event. The**

mouse event in turn has attributes like `x` and `y` (the coords in display space, e.g., pixels from left, bottom) and xdata, ydata (the coords in data space). Additionally, you can get information about which buttons were pressed, which keys were pressed, which *Axes* the mouse is over, etc. See *matplotlib.backend_bases.MouseEvent* for details.

artist

the *Artist* that generated the pick event.

Additionally, certain artists like *Line2D* and *PatchCollection* may attach additional meta data like the indices into the data that meet the picker criteria (e.g., all the points in the line that are within the specified epsilon tolerance)

Simple picking example

In the example below, we set the line picker property to a scalar, so it represents a tolerance in points (72 points per inch). The onpick callback function will be called when the pick event it within the tolerance distance from the line, and has the indices of the data vertices that are within the pick distance tolerance. Our onpick callback function simply prints the data that are under the pick location. Different matplotlib Artists can attach different data to the PickEvent. For example, `Line2D` attaches the ind property, which are the indices into the line data under the pick point. See `pick()` for details on the `PickEvent` properties of the line. Here is the code:

```
import numpy as np
import matplotlib.pyplot as plt

fig = plt.figure()
ax = fig.add_subplot(111)
ax.set_title('click on points')

line, = ax.plot(np.random.rand(100), 'o', picker=5)  # 5 points tolerance

def onpick(event):
    thisline = event.artist
    xdata = thisline.get_xdata()
    ydata = thisline.get_ydata()
    ind = event.ind
    points = tuple(zip(xdata[ind], ydata[ind]))
    print('onpick points:', points)

fig.canvas.mpl_connect('pick_event', onpick)

plt.show()
```

Picking exercise

Create a data set of 100 arrays of 1000 Gaussian random numbers and compute the sample mean and standard deviation of each of them (hint: NumPy arrays have a mean and std method) and make a xy marker plot of the 100 means vs. the 100 standard deviations. Connect the line created by the plot command to the pick event, and plot the original time series of the data that generated the clicked on points. If more than one point is within the tolerance of the clicked on point, you can use multiple subplots to plot the multiple time series.

Exercise solution:

```
"""
compute the mean and stddev of 100 data sets and plot mean vs. stddev.
When you click on one of the mu, sigma points, plot the raw data from
the dataset that generated the mean and stddev
"""
import numpy as np
import matplotlib.pyplot as plt

X = np.random.rand(100, 1000)
xs = np.mean(X, axis=1)
ys = np.std(X, axis=1)

fig = plt.figure()
ax = fig.add_subplot(111)
ax.set_title('click on point to plot time series')
line, = ax.plot(xs, ys, 'o', picker=5)  # 5 points tolerance

def onpick(event):

    if event.artist!=line: return True

    N = len(event.ind)
    if not N: return True

    figi = plt.figure()
    for subplotnum, dataind in enumerate(event.ind):
        ax = figi.add_subplot(N,1,subplotnum+1)
        ax.plot(X[dataind])
        ax.text(0.05, 0.9, 'mu=%1.3f\nsigma=%1.3f'%(xs[dataind], ys[dataind]),
                transform=ax.transAxes, va='top')
        ax.set_ylim(-0.5, 1.5)
    figi.show()
    return True

fig.canvas.mpl_connect('pick_event', onpick)

plt.show()
```

3.3 IPython integration

We recommend using IPython for an interactive shell. In addition to all of its features (improved tab-completion, magics, multiline editing, etc), it also ensures that the GUI toolkit event loop is properly integrated with the command line (see *Command Prompt Integration*).

In this example, we create and modify a figure via an IPython prompt. The figure displays in a Qt5Agg GUI window. To configure the integration and enable *interactive mode* use the `%matplotlib` magic:

::

    In [1]: %matplotlib Using matplotlib backend: Qt5Agg

    In [2]: import matplotlib.pyplot as plt

Create a new figure window:

```
In [3]: fig, ax = plt.subplots()
```

Add a line plot of the data to the window:

```
In [4]: ln, = ax.plot(range(5))
```

Change the color of the line from blue to orange:

```
In [5]: ln.set_color('orange')
```

If you wish to disable automatic redrawing of the plot:

```
In [6]: plt.ioff()
```

If you wish to re-enable automatic redrawing of the plot:

```
In [7]: plt.ion()
```

In recent versions of `Matplotlib` and `IPython`, it is sufficient to import *matplotlib.pyplot* and call *pyplot.ion*. Using the `%` magic is guaranteed to work in all versions of Matplotlib and IPython.

3.4 Interactive mode

pyplot.ion	Turn the interactive mode on.
pyplot.ioff	Turn the interactive mode off.
pyplot.isinteractive	Return if pyplot is in "interactive mode" or not.

pyplot.show	Display all open figures.
pyplot.pause	Run the GUI event loop for *interval* seconds.

Interactive mode controls:

- whether created figures are automatically shown
- whether changes to artists automatically trigger re-drawing existing figures
- when *pyplot.show()* returns if given no arguments: immediately, or after all of

the figures have been closed

If in interactive mode:

- newly created figures will be displayed immediately
- figures will automatically redraw when elements are changed
- *pyplot.show()* displays the figures and immediately returns

If not in interactive mode:

- **newly created figures and changes to figures are not displayed until**
  - *pyplot.show()* is called
  - *pyplot.pause()* is called
  - *FigureCanvasBase.flush_events()* is called
- *pyplot.show()* runs the GUI event loop and does not return until all the plot windows are closed

If you are in non-interactive mode (or created figures while in non-interactive mode) you may need to explicitly call *pyplot.show* to display the windows on your screen. If you only want to run the GUI event loop for a fixed amount of time, you can use *pyplot.pause*. This will block the progress of your code as if you had called `time.sleep`, ensure the current window is shown and re-drawn if needed, and run the GUI event loop for the specified period of time.

The GUI event loop being integrated with your command prompt and the figures being in interactive mode are independent of each other. If you use *pyplot.ion* but have not arranged for the event loop integration, your figures will appear but will not be interactive while the prompt is waiting for input. You will not be able to pan/zoom and the figure may not even render (the window might appear black, transparent, or as a snapshot of the desktop under it). Conversely, if you configure the event loop integration, displayed figures will be responsive while waiting for input at the prompt, regardless of pyplot's "interactive mode".

No matter what combination of interactive mode setting and event loop integration, figures will be responsive if you use `pyplot.show(block=True)`, *pyplot.pause*, or run the GUI main loop in some other way.

Warning: Using *figure.Figure.show* it is possible to display a figure on the screen without starting the event loop and without being in interactive mode. This may work (depending on the GUI toolkit) but will likely result in a non-responsive figure.

3.5 Default UI

The windows created by *pyplot* have an interactive toolbar with navigation buttons and a readout of the data values the cursor is pointing at. A number of helpful keybindings are registered by default.

3.5.1 Navigation Keyboard Shortcuts

The following table holds all the default keys, which can be overwritten by use of your *matplotlibrc*.

Command	Default key binding and rcParam
Home/Reset	`rcParams["keymap.home"]` (default: `['h', 'r', 'home']`)
Back	`rcParams["keymap.back"]` (default: `['left', 'c', 'backspace', 'MouseButton.BACK']`)
Forward	`rcParams["keymap.forward"]` (default: `['right', 'v', 'MouseButton.FORWARD']`)
Pan/Zoom	`rcParams["keymap.pan"]` (default: `['p']`)
Zoom-to-rect	`rcParams["keymap.zoom"]` (default: `['o']`)
Save	`rcParams["keymap.save"]` (default: `['s', 'ctrl+s']`)
Toggle fullscreen	`rcParams["keymap.fullscreen"]` (default: `['f', 'ctrl+f']`)
Toggle major grids	`rcParams["keymap.grid"]` (default: `['g']`)
Toggle minor grids	`rcParams["keymap.grid_minor"]` (default: `['G']`)
Toggle x axis scale (log/linear)	`rcParams["keymap.xscale"]` (default: `['k', 'L']`)
Toggle y axis scale (log/linear)	`rcParams["keymap.yscale"]` (default: `['l']`)
Close Figure	`rcParams["keymap.quit"]` (default: `['ctrl+w', 'cmd+w', 'q']`)
Constrain pan/zoom to x axis	hold **x** when panning/zooming with mouse
Constrain pan/zoom to y axis	hold **y** when panning/zooming with mouse
Preserve aspect ratio	hold **CONTROL** when panning/zooming with mouse

3.6 Other Python prompts

Interactive mode works in the default Python prompt:

```
>>> import matplotlib.pyplot as plt
>>> plt.ion()
>>>
```

however this does not ensure that the event hook is properly installed and your figures may not be responsive. Please consult the documentation of your GUI toolkit for details.

3.6.1 Jupyter Notebooks / Lab

Note: To get the interactive functionality described here, you must be using an interactive backend. The default backend in notebooks, the inline backend, is not. `backend_inline` renders the figure once and inserts a static image into the notebook when the cell is executed. Because the images are static, they can not be panned / zoomed, take user input, or be updated from other cells.

To get interactive figures in the 'classic' notebook or Jupyter lab, use the ipympl backend (must be installed separately) which uses the **ipywidget** framework. If `ipympl` is installed use the magic:

```
%matplotlib widget
```

to select and enable it.

If you only need to use the classic notebook, you can use

```
%matplotlib notebook
```

which uses the *backend_nbagg* backend provided by Matplotlib; however, nbagg does not work in Jupyter Lab.

GUIs + Jupyter

You can also use one of the non-`ipympl` GUI backends in a Jupyter Notebook. If you are running your Jupyter kernel locally, the GUI window will spawn on your desktop adjacent to your web browser. If you run your notebook on a remote server, the kernel will try to open the GUI window on the remote computer. Unless you have arranged to forward the xserver back to your desktop, you will not be able to see or interact with the window. It may also raise an exception.

3.6.2 PyCharm, Spyder, and VSCode

Many IDEs have built-in integration with Matplotlib, please consult their documentation for configuration details.

CHAPTER

FOUR

WHAT'S NEW?

CHAPTER

FIVE

WHAT'S NEW IN MATPLOTLIB 3.3.0

For a list of all of the issues and pull requests since the last revision, see the *GitHub Stats*.

Table of Contents

- *Other changes*
  - *New `Axes.axline` method*
  - *`imshow` now coerces 3D arrays with depth 1 to 2D*
  - *Better control of `Axes.pie` normalization*
  - *Dates use a modern epoch*
  - *Lines now accept `MarkerStyle` instances as input*
- *Fonts*
  - *Simple syntax to select fonts by absolute path*
  - *Improved font weight detection*
- *rcParams improvements*
  - *`matplotlib.rc_context` can be used as a decorator*
  - *rcParams for controlling default "raise window" behavior*
  - *Add generalized `mathtext.fallback` to rcParams*
  - *Add `contour.linewidth` to rcParams*
- *3D Axes improvements*
  - *`Axes3D` no longer distorts the 3D plot to match the 2D aspect ratio*
  - *3D axes now support minor ticks*
  - *Home/Forward/Backward buttons now work with 3D axes*
- *Interactive tool improvements*
  - *More consistent toolbar behavior across backends*
  - *Toolbar icons are now styled for dark themes*
  - *Cursor text now uses a number of significant digits matching pointing precision*
  - *GTK / Qt zoom rectangle now black and white*
  - *Event handler simplifications*
- *Functions to compute a Path's size*
  - *Better interface for Path segment iteration*
  - *Fixed bug that computed a Path's Bbox incorrectly*
- *Backend-specific improvements*
  - *`savefig()` gained a* backend *keyword argument*
  - *The SVG backend can now render hatches with transparency*
  - *SVG supports URLs on more artists*

* *Images in SVG will no longer be blurred in some viewers*
* *Saving SVG now supports adding metadata*
* *Saving PDF metadata via PGF now consistent with PDF backend*
* *NbAgg and WebAgg no longer use jQuery & jQuery UI*

5.1 Figure and Axes creation / management

5.1.1 Provisional API for composing semantic axes layouts from text or nested lists

The *Figure* class has a provisional method to generate complex grids of named *axes.Axes* based on nested list input or ASCII art:

```
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    [['.', 'histx'],
     ['histy', 'scat']]
)
for k, ax in axd.items():
    ax.text(0.5, 0.5, k,
            ha='center', va='center', fontsize=36,
            color='darkgrey')
```

or as a string (with single-character Axes labels):

```
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    """
    TTE
    L.E
    """)
for k, ax in axd.items():
    ax.text(0.5, 0.5, k,
            ha='center', va='center', fontsize=36,
            color='darkgrey')
```

See *Complex and semantic figure composition* for more details and examples.

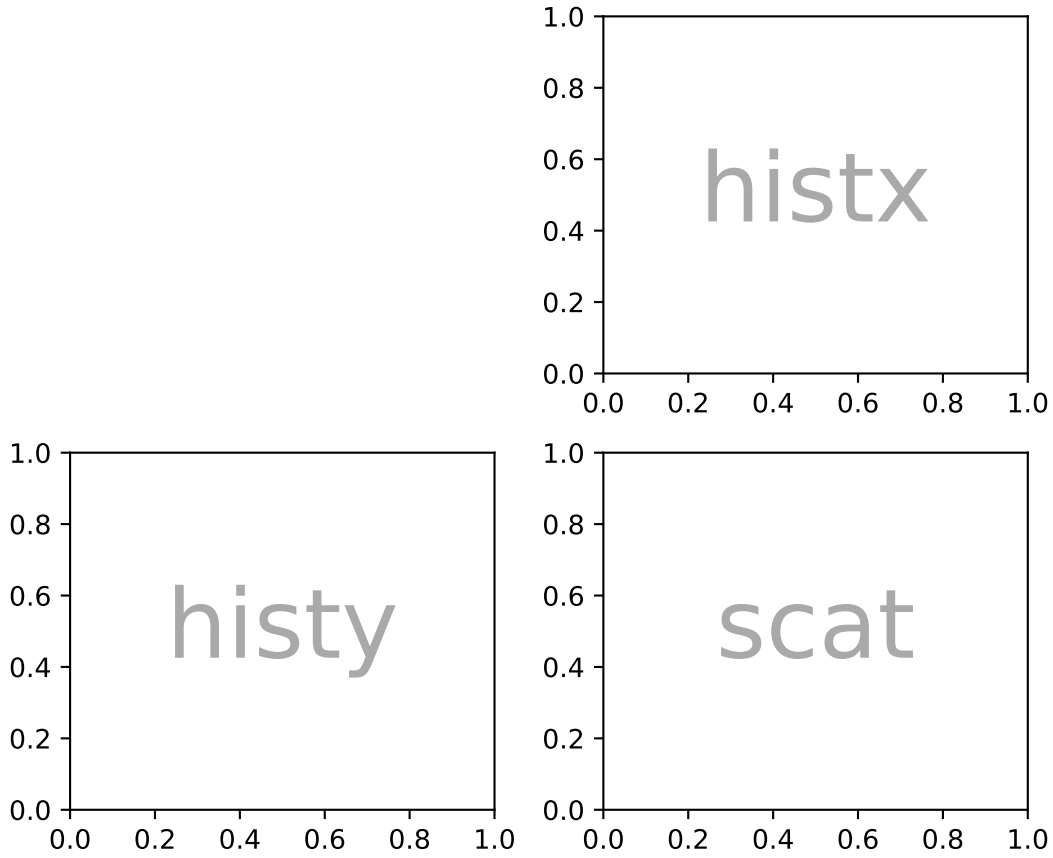
5.1.2 GridSpec.subplots()

The *GridSpec* class gained a *subplots* method, so that one can write

```
fig.add_gridspec(2, 2, height_ratios=[3, 1]).subplots()
```

as an alternative to

```
fig.subplots(2, 2, gridspec_kw={"height_ratios": [3, 1]})
```



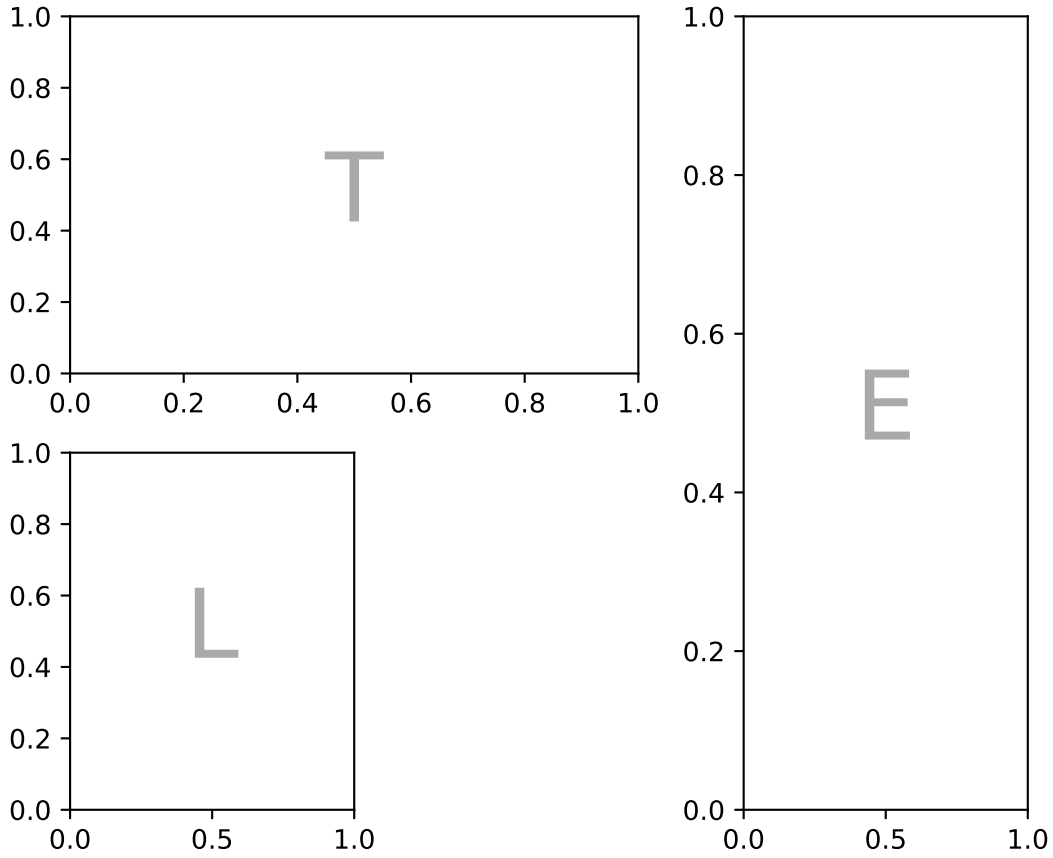
5.1.3 New `Axes.sharex`, `Axes.sharey` methods

These new methods allow sharing axes *immediately* after creating them. Note that behavior is indeterminate if axes are not shared immediately after creation.

For example, they can be used to selectively link some axes created all together using *`subplot_mosaic`*:

```
fig = plt.figure(constrained_layout=True)
axd = fig.subplot_mosaic([['.', 'histx'], ['histy', 'scat']],
                         gridspec_kw={'width_ratios': [1, 7],
                                      'height_ratios': [2, 7]})

axd['histx'].sharex(axd['scat'])
axd['histy'].sharey(axd['scat'])
```



5.1.4 tight_layout now supports suptitle

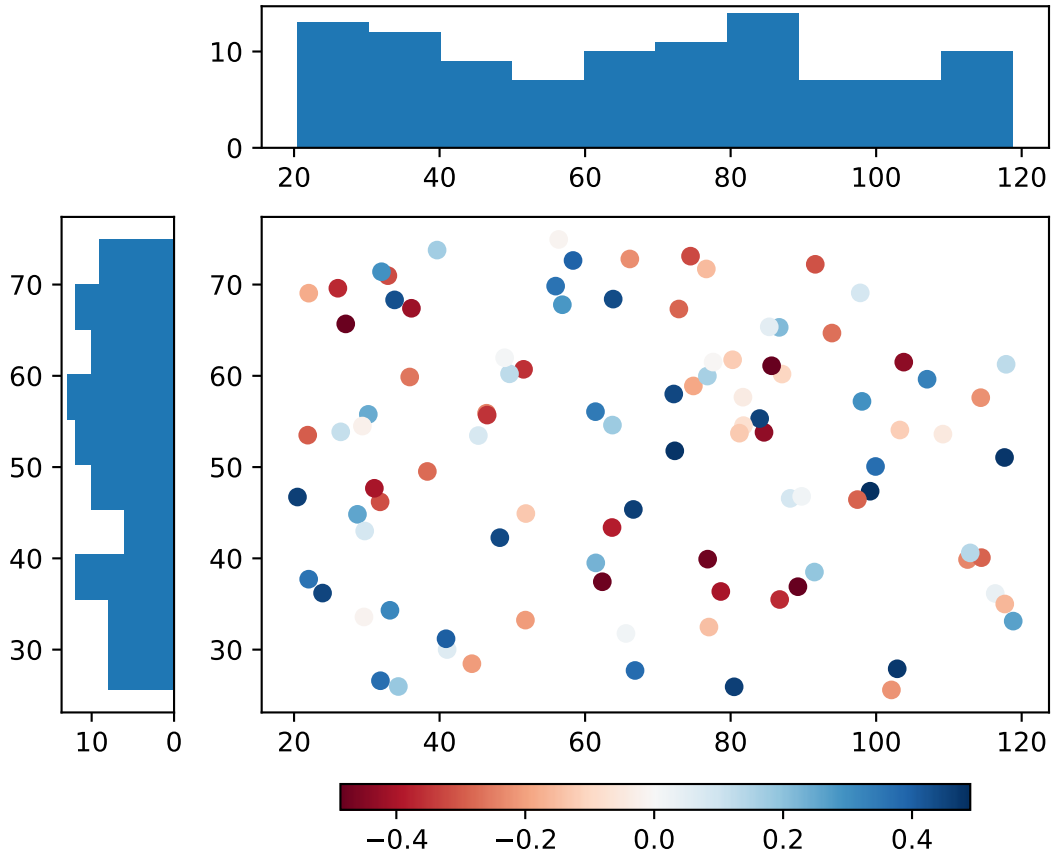
Previous versions did not consider *Figure.suptitle*, so it may overlap with other artists after calling *tight_layout*:

From now on, the `suptitle` will be considered:

5.1.5 Setting axes box aspect

It is now possible to set the aspect of an axes box directly via *set_box_aspect*. The box aspect is the ratio between axes height and axes width in physical units, independent of the data limits. This is useful to, e.g., produce a square plot, independent of the data it contains, or to have a non-image plot with the same axes dimensions next to an image plot with fixed (data-)aspect.

For use cases check out the Axes box aspect example.



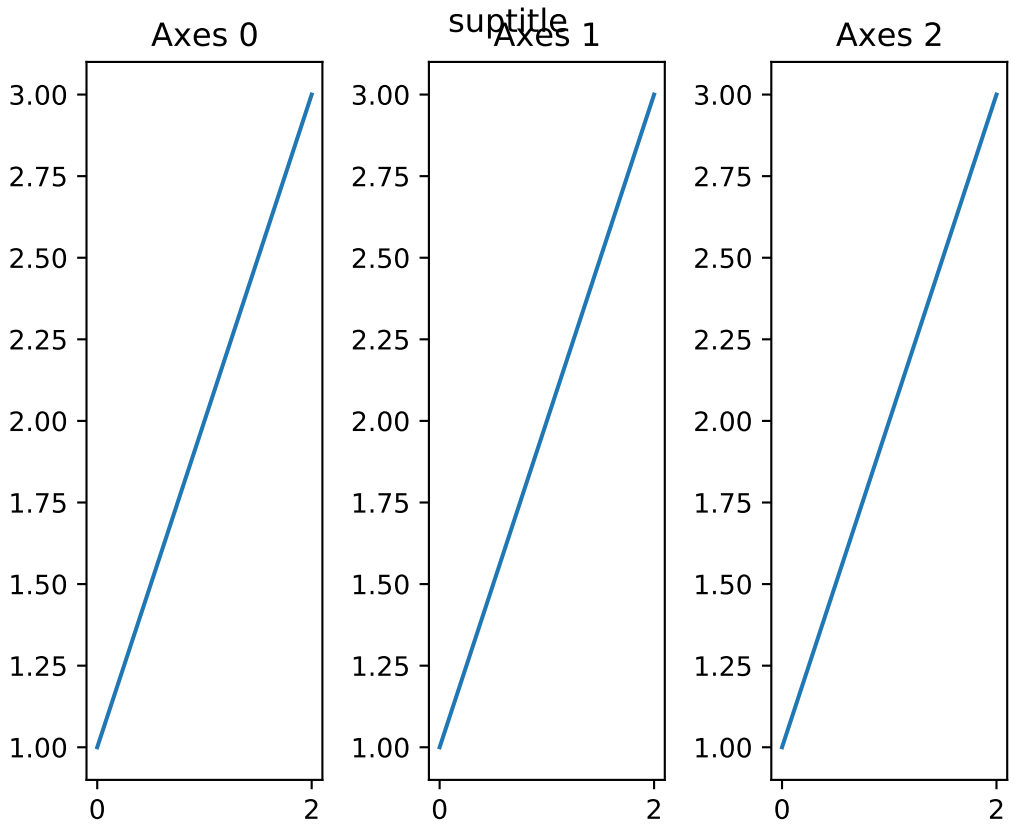
5.2 Colors and colormaps

5.2.1 Turbo colormap

Turbo is an improved rainbow colormap for visualization, created by the Google AI team for computer vision and machine learning. Its purpose is to display depth and disparity data. Please see the Google AI Blog for further details.

5.2.2 `colors.BoundaryNorm` supports *extend* keyword argument

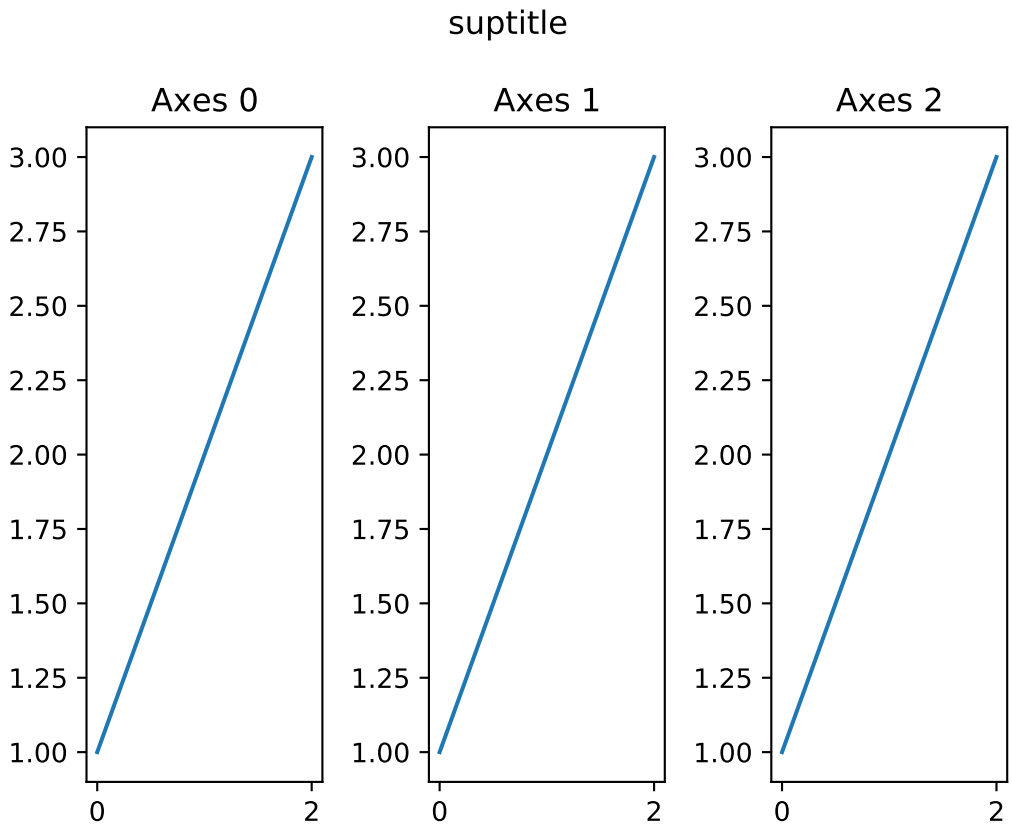
BoundaryNorm now has an *extend* keyword argument, analogous to *extend* in *contourf*. When set to 'both', 'min', or 'max', it maps the corresponding out-of-range values to *Colormap* lookup-table indices near the appropriate ends of their range so that the colors for out-of range values are adjacent to, but distinct from, their in-range neighbors. The colorbar inherits the *extend* argument from the norm, so with `extend='both'`, for example, the colorbar will have triangular extensions for out-of-range values with colors that differ from adjacent in-range colors.



5.2.3 Text color for legend labels

The text color of legend labels can now be set by passing a parameter `labelcolor` to *`legend`*. The `labelcolor` keyword can be:

- A single color (either a string or RGBA tuple), which adjusts the text color of all the labels.
- A list or tuple, allowing the text color of each label to be set individually.
- `linecolor`, which sets the text color of each label to match the corresponding line color.
- `markerfacecolor`, which sets the text color of each label to match the corresponding marker face color.
- `markeredgecolor`, which sets the text color of each label to match the corresponding marker edge color.



5.2.4 Pcolor and Pcolormesh now accept `shading='nearest'` and `'auto'`

Previously *axes.Axes.pcolor* and *axes.Axes.pcolormesh* handled the situation where x and y have the same (respective) size as C by dropping the last row and column of C, and x and y are regarded as the edges of the remaining rows and columns in C. However, many users want x and y centered on the rows and columns of C.

To accommodate this, `shading='nearest'` and `shading='auto'` are new allowed strings for the *shading* keyword argument. `'nearest'` will center the color on x and y if x and y have the same dimensions as C (otherwise an error will be thrown). `shading='auto'` will choose 'flat' or 'nearest' based on the size of X, Y, C.

If `shading='flat'` then X, and Y should have dimensions one larger than C. If X and Y have the same dimensions as C, then the previous behavior is used and the last row and column of C are dropped, and a DeprecationWarning is emitted.

Users can also specify this by the new `rcParams["pcolor.shading"]` (default: `'flat'`) in their `.matplotlibrc` or via *rcParams*.

See pcolormesh for examples.

5.3 Titles, ticks, and labels

5.3.1 Align labels to Axes edges

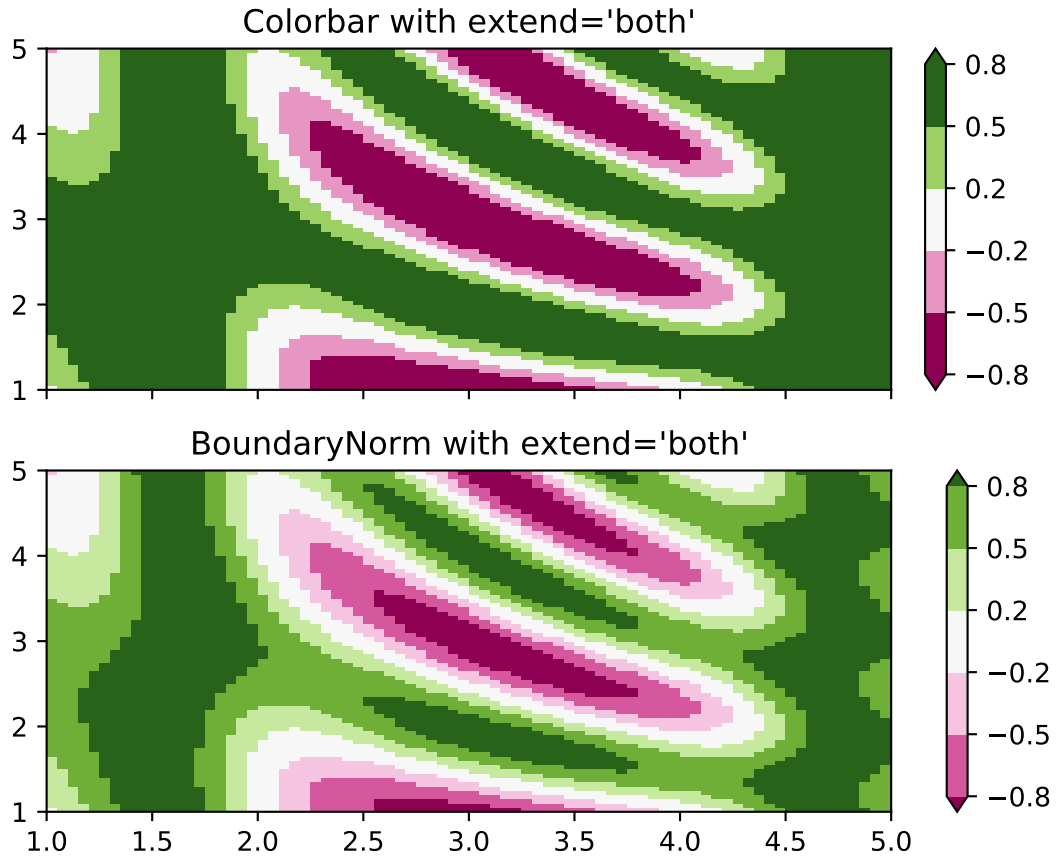
set_xlabel, *set_ylabel* and *ColorbarBase.set_label* support a parameter `loc` for simplified positioning. For the xlabel, the supported values are 'left', 'center', or 'right'. For the ylabel, the supported values are 'bottom', 'center', or 'top'.

The default is controlled via `rcParams["xaxis.labelposition"]` and `rcParams["yaxis.labelposition"]`; the Colorbar label takes the rcParam based on its orientation.

5.3.2 Allow tick formatters to be set with str or function inputs

set_major_formatter and *set_minor_formatter* now accept `str` or function inputs in addition to *Formatter* instances. For a `str` a *StrMethodFormatter* is automatically generated and used. For a function a *FuncFormatter* is automatically generated and used. In other words,

```
ax.xaxis.set_major_formatter('{x} km')
ax.xaxis.set_minor_formatter(lambda x, pos: str(x-5))
```



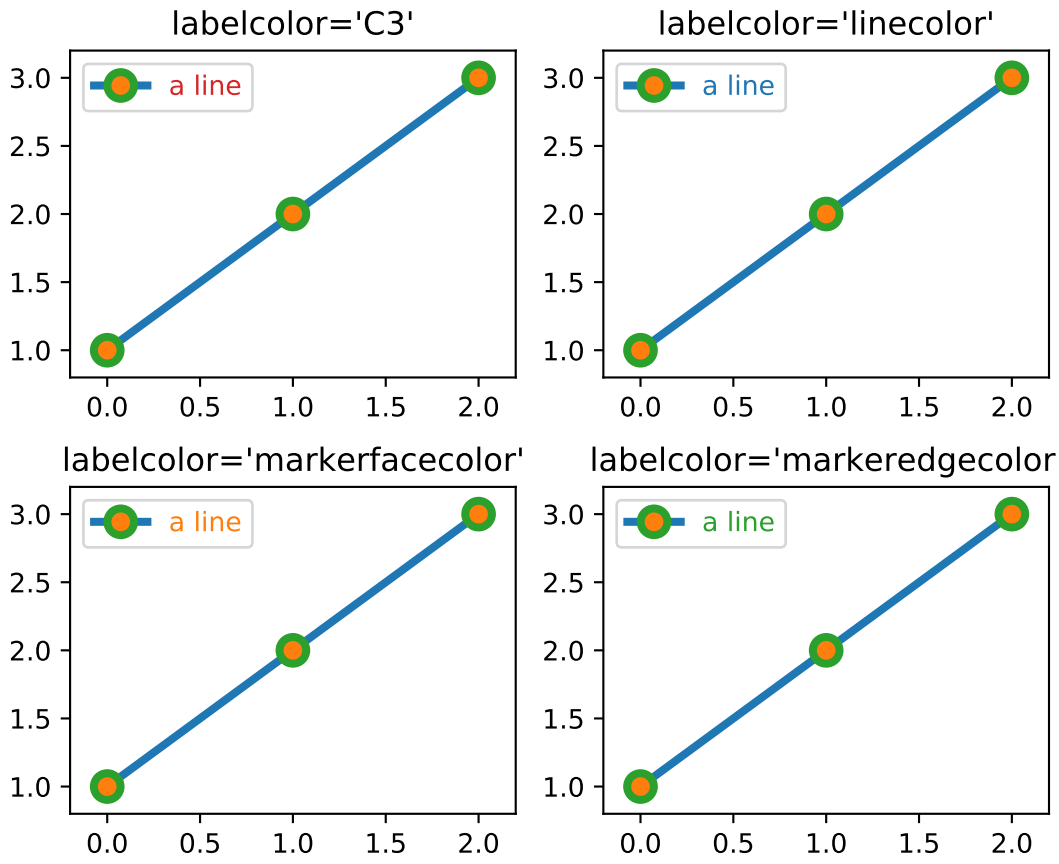
are shortcuts for:

```
import matplotlib.ticker as mticker

ax.xaxis.set_major_formatter(mticker.StrMethodFormatter('{x} km'))
ax.xaxis.set_minor_formatter(
    mticker.FuncFormatter(lambda x, pos: str(x-5))
```

5.3.3 `Axes.set_title` gains a *y* keyword argument to control auto positioning

set_title tries to auto-position the title to avoid any decorators on the top x-axis. This is not always desirable so now *y* is an explicit keyword argument of *set_title*. It defaults to *None* which means to use auto-positioning. If a value is supplied (i.e. the pre-3.0 default was `y=1.0`) then auto-positioning is turned off. This can also be set with the new rcParameter `rcParams["axes.titley"]` (default: `None`).

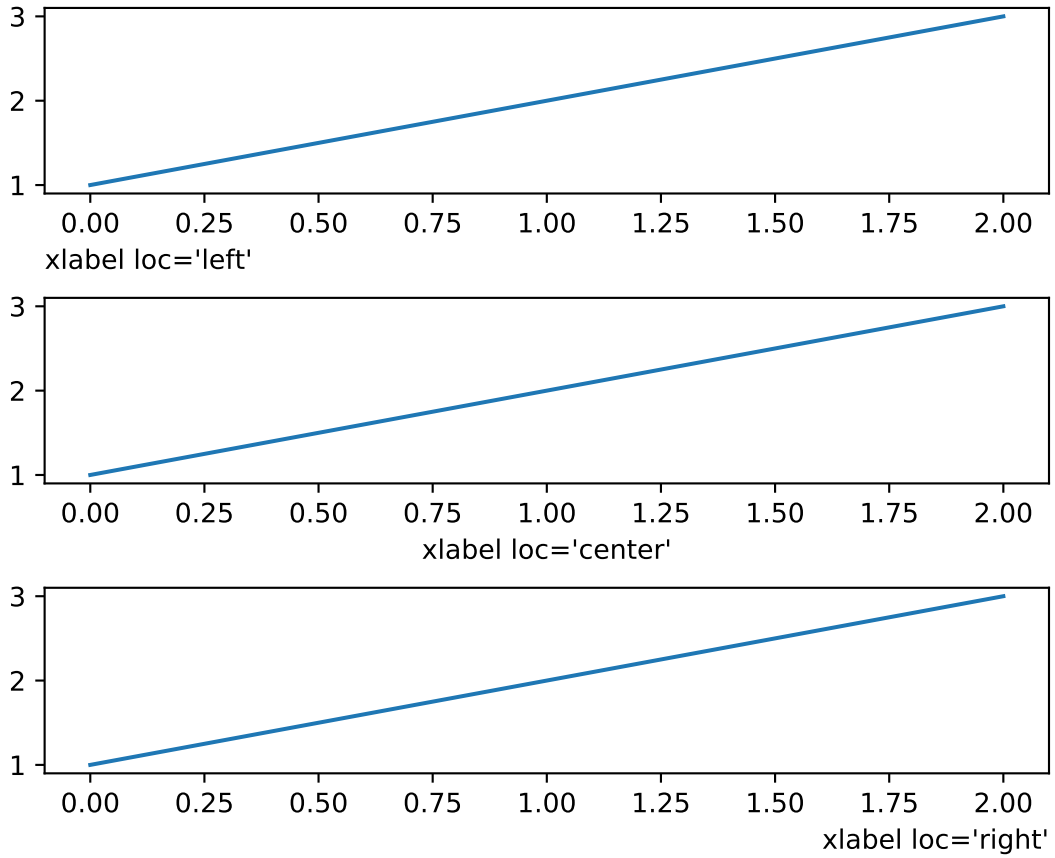


5.3.4 Offset text is now set to the top when using `axis.tick_top()`

Solves the issue that the power indicator (e.g., 1e4) stayed on the bottom, even if the ticks were on the top.

5.3.5 Set zorder of contour labels

clabel now accepts a *zorder* keyword argument making it easier to set the *zorder* of contour labels. If not specified, the default *zorder* of clabels used to always be 3 (i.e. the default *zorder* of *Text*) irrespective of the *zorder* passed to *contour*/*contourf*. The new default *zorder* for clabels has been changed to (`2 + zorder` passed to *contour* / *contourf*).



5.4 Other changes

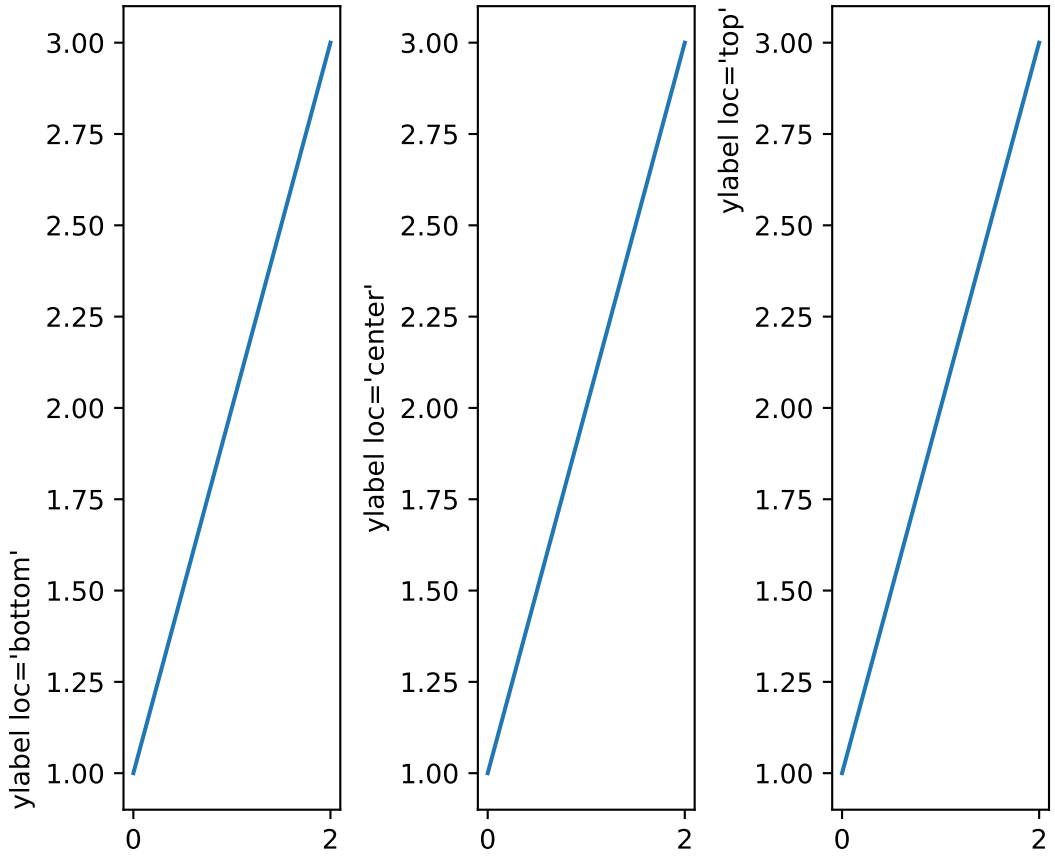
5.4.1 New `Axes.axline` method

A new *axline* method has been added to draw infinitely long lines that pass through two points.

```
fig, ax = plt.subplots()

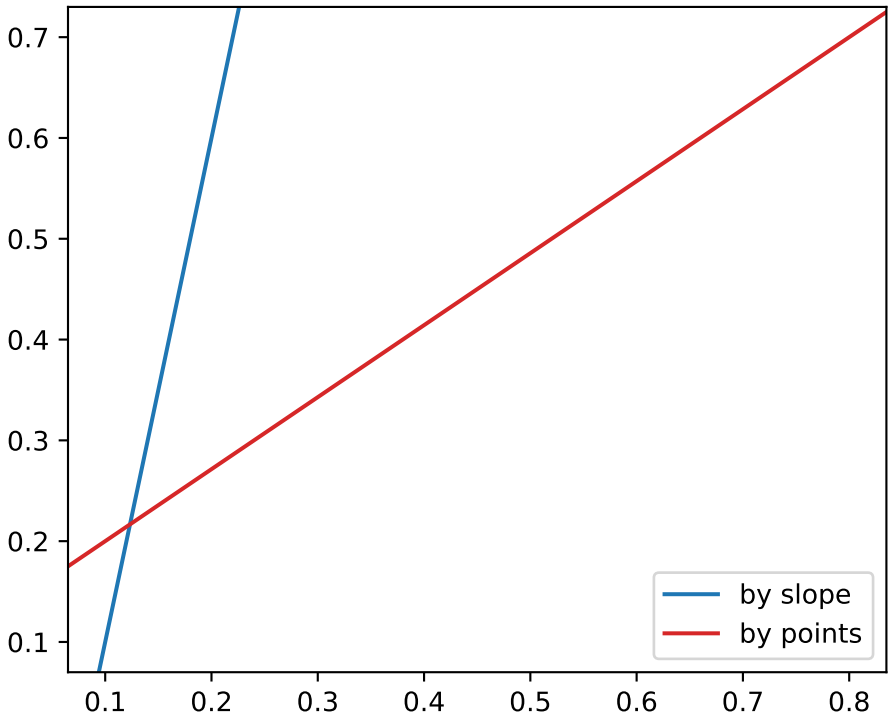
ax.axline((.1, .1), slope=5, color='C0', label='by slope')
ax.axline((.1, .2), (.8, .7), color='C3', label='by points')

ax.legend()
```



```
ax.xaxis.set_major_formatter('{x} km')
```

```
ax.xaxis.set_major_formatter(lambda x, pos: str(x-5))
```



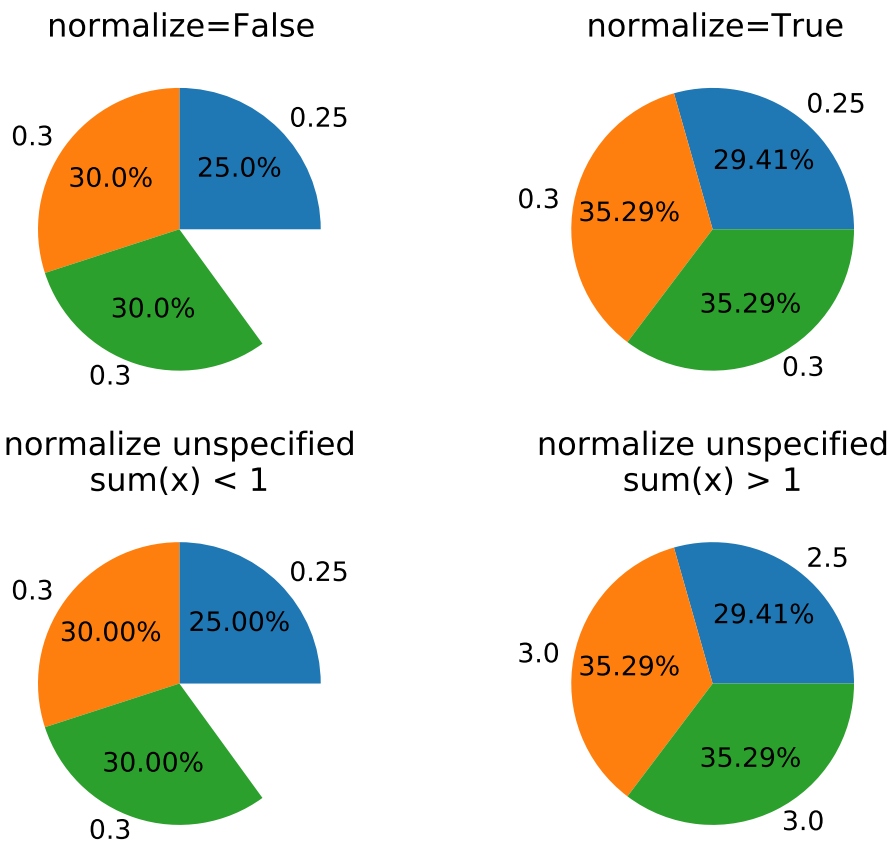
5.4.2 `imshow` now coerces 3D arrays with depth 1 to 2D

Starting from this version arrays of size MxNx1 will be coerced into MxN for displaying. This means commands like `plt.imshow(np.random.rand(3, 3, 1))` will no longer return an error message that the image shape is invalid.

5.4.3 Better control of `Axes.pie` normalization

Previously, *`Axes.pie`* would normalize its input *x* if `sum(x) > 1`, but would do nothing if the sum were less than 1. This can be confusing, so an explicit keyword argument *normalize* has been added. By default, the old behavior is preserved.

By passing *normalize*, one can explicitly control whether any rescaling takes place or whether partial pies should be created. If normalization is disabled, and `sum(x) > 1`, then an error is raised.



5.4.4 Dates use a modern epoch

Matplotlib converts dates to days since an epoch using *dates.date2num* (via *matplotlib.units*). Previously, an epoch of `0000-12-31T00:00:00` was used so that `0001-01-01` was converted to 1.0. An epoch so distant in the past meant that a modern date was not able to preserve microseconds because 2000 years times the 2^(-52) resolution of a 64-bit float gives 14 microseconds.

Here we change the default epoch to the more reasonable UNIX default of `1970-01-01T00:00:00` which for a modern date has 0.35 microsecond resolution. (Finer resolution is not possible because we rely on `datetime.datetime` for the date locators). Access to the epoch is provided by *get_epoch*, and there is a new `rcParams["date.epoch"]` (default: `'1970-01-01T00:00:00'`) rcParam. The user may also call *set_epoch*, but it must be set *before* any date conversion or plotting is used.

If you have data stored as ordinal floats in the old epoch, you can convert them to the new ordinal using the following formula:

```
new_ordinal = old_ordinal + mdates.date2num(np.datetime64('0000-12-31'))
```

5.4.5 Lines now accept `MarkerStyle` instances as input

Similar to *scatter*, *plot* and *Line2D* now accept *MarkerStyle* instances as input for the *marker* parameter:

```
plt.plot(..., marker=matplotlib.markers.MarkerStyle("D"))
```

5.5 Fonts

5.5.1 Simple syntax to select fonts by absolute path

Fonts can now be selected by passing an absolute `pathlib.Path` to the *font* keyword argument of *Text*.

5.5.2 Improved font weight detection

Matplotlib is now better able to determine the weight of fonts from their metadata, allowing to differentiate between fonts within the same family more accurately.

5.6 rcParams improvements

5.6.1 `matplotlib.rc_context` can be used as a decorator

matplotlib.rc_context can now be used as a decorator (technically, it is now implemented as a `contextlib.contextmanager`), e.g.,

```
@rc_context({"lines.linewidth": 2})
def some_function(...):
    ...
```

5.6.2 rcParams for controlling default "raise window" behavior

The new config option `rcParams["figure.raise_window"]` (default: `True`) allows disabling of the raising of the plot window when calling *show* or *pause*. The `MacOSX` backend is currently not supported.

5.6.3 Add generalized `mathtext.fallback` to rcParams

New `rcParams["mathtext.fallback"]` (default: `'cm'`) rcParam. Takes "cm", "stix", "stixsans" or "none" to turn fallback off. The rcParam *mathtext.fallback_to_cm* is deprecated, but if used, will override new fallback.

5.6.4 Add `contour.linewidth` to rcParams

The new config option `rcParams["contour.linewidth"]` (default: `None`) allows to control the default line width of contours as a float. When set to `None`, the line widths fall back to `rcParams["lines.linewidth"]` (default: `1.5`). The config value is overridden as usual by the *linewidths* argument passed to *contour* when it is not set to `None`.

5.7 3D Axes improvements

5.7.1 `Axes3D` no longer distorts the 3D plot to match the 2D aspect ratio

Plots made with *Axes3D* were previously stretched to fit a square bounding box. As this stretching was done after the projection from 3D to 2D, it resulted in distorted images if non-square bounding boxes were used. As of 3.3, this no longer occurs.

Currently, modes of setting the aspect (via *set_aspect*) in data space are not supported for Axes3D but may be in the future. If you want to simulate having equal aspect in data space, set the ratio of your data limits to match the value of *get_box_aspect*. To control these ratios use the *set_box_aspect* method which accepts the ratios as a 3-tuple of X:Y:Z. The default aspect ratio is 4:4:3.

5.7.2 3D axes now support minor ticks

```
ax = plt.figure().add_subplot(projection='3d')

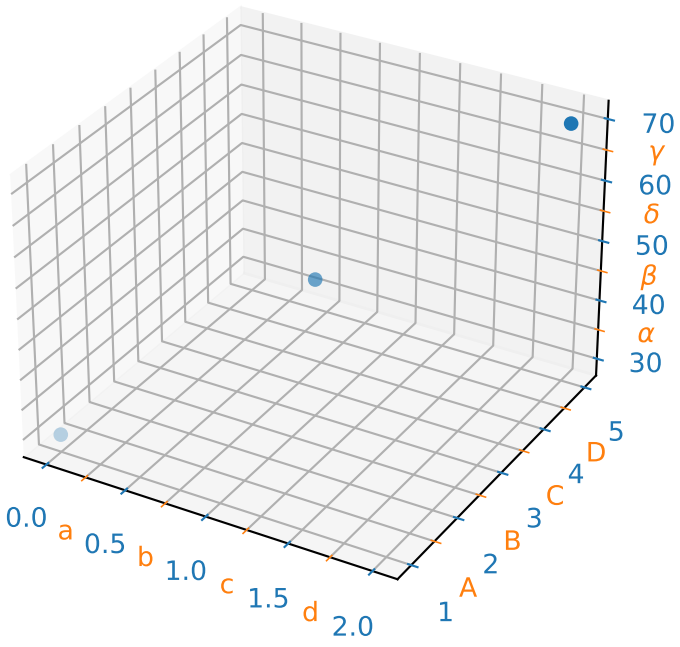
ax.scatter([0, 1, 2], [1, 3, 5], [30, 50, 70])

ax.set_xticks([0.25, 0.75, 1.25, 1.75], minor=True)
ax.set_xticklabels(['a', 'b', 'c', 'd'], minor=True)

ax.set_yticks([1.5, 2.5, 3.5, 4.5], minor=True)
ax.set_yticklabels(['A', 'B', 'C', 'D'], minor=True)

ax.set_zticks([35, 45, 55, 65], minor=True)
ax.set_zticklabels([r'$\alpha$', r'$\beta$', r'$\delta$', r'$\gamma$'],
                   minor=True)

ax.tick_params(which='major', color='C0', labelcolor='C0', width=5)
ax.tick_params(which='minor', color='C1', labelcolor='C1', width=3)
```



5.7.3 Home/Forward/Backward buttons now work with 3D axes

5.8 Interactive tool improvements

5.8.1 More consistent toolbar behavior across backends

Toolbar features are now more consistent across backends. The history buttons will auto-disable when there is no further action in a direction. The pan and zoom buttons will be marked active when they are in use.

In NbAgg and WebAgg, the toolbar buttons are now grouped similarly to other backends. The WebAgg toolbar now uses the same icons as other backends.

5.8.2 Toolbar icons are now styled for dark themes

On dark themes, toolbar icons will now be inverted. When using the GTK3Agg backend, toolbar icons are now symbolic, and both foreground and background colors will follow the theme. Tooltips should also behave correctly.

5.8.3 Cursor text now uses a number of significant digits matching pointing precision

Previously, the x/y position displayed by the cursor text would usually include far more significant digits than the mouse pointing precision (typically one pixel). This is now fixed for linear scales.

5.8.4 GTK / Qt zoom rectangle now black and white

This makes it visible even over a dark background.

5.8.5 Event handler simplifications

The *backend_bases.key_press_handler* and *backend_bases.button_press_handler* event handlers can now be directly connected to a canvas with `canvas.mpl_connect("key_press_event", key_press_handler)` and `canvas.mpl_connect("button_press_event", button_press_handler)`, rather than having to write wrapper functions that fill in the (now optional) *canvas* and *toolbar* parameters.

5.9 Functions to compute a Path's size

Various functions were added to *BezierSegment* and *Path* to allow computation of the shape/size of a *Path* and its composite Bezier curves.

In addition to the fixes below, *BezierSegment* has gained more documentation and usability improvements, including properties that contain its dimension, degree, control_points, and more.

5.9.1 Better interface for Path segment iteration

iter_bezier iterates through the *BezierSegment*'s that make up the Path. This is much more useful typically than the existing *iter_segments* function, which returns the absolute minimum amount of information possible to reconstruct the Path.

5.9.2 Fixed bug that computed a Path's Bbox incorrectly

Historically, *get_extents* has always simply returned the Bbox of a curve's control points, instead of the Bbox of the curve itself. While this is a correct upper bound for the path's extents, it can differ dramatically from the Path's actual extents for non-linear Bezier curves.

5.10 Backend-specific improvements

5.10.1 `savefig()` gained a *backend* keyword argument

The *backend* keyword argument to `savefig` can now be used to pick the rendering backend without having to globally set the backend; e.g., one can save PDFs using the pgf backend with `savefig("file.pdf", backend="pgf")`.

5.10.2 The SVG backend can now render hatches with transparency

The SVG backend now respects the hatch stroke alpha. Useful applications are, among others, semi-transparent hatches as a subtle way to differentiate columns in bar plots.

5.10.3 SVG supports URLs on more artists

URLs on more artists (i.e., from *Artist.set_url*) will now be saved in SVG files, namely, `Ticks` and `Line2Ds` are now supported.

5.10.4 Images in SVG will no longer be blurred in some viewers

A style is now supplied to images without interpolation (`imshow(..., interpolation='none')`) so that SVG image viewers will no longer perform interpolation when rendering themselves.

5.10.5 Saving SVG now supports adding metadata

When saving SVG files, metadata can now be passed which will be saved in the file using Dublin Core and RDF. A list of valid metadata can be found in the documentation for *FigureCanvasSVG.print_svg*.

5.10.6 Saving PDF metadata via PGF now consistent with PDF backend

When saving PDF files using the PGF backend, passed metadata will be interpreted in the same way as with the PDF backend. Previously, this metadata was only accepted by the PGF backend when saving a multi-page PDF with *backend_pgf.PdfPages*, but is now allowed when saving a single figure, as well.

5.10.7 NbAgg and WebAgg no longer use jQuery & jQuery UI

Instead, they are implemented using vanilla JavaScript. Please report any issues with browsers.

CHAPTER

SIX

HISTORY

Note: The following introductory text was written in 2008 by John D. Hunter (1968-2012), the original author of Matplotlib.

Matplotlib is a library for making 2D plots of arrays in Python. Although it has its origins in emulating the MATLAB graphics commands, it is independent of MATLAB, and can be used in a Pythonic, object oriented way. Although Matplotlib is written primarily in pure Python, it makes heavy use of NumPy and other extension code to provide good performance even for large arrays.

Matplotlib is designed with the philosophy that you should be able to create simple plots with just a few commands, or just one! If you want to see a histogram of your data, you shouldn't need to instantiate objects, call methods, set properties, and so on; it should just work.

For years, I used to use MATLAB exclusively for data analysis and visualization. MATLAB excels at making nice looking plots easy. When I began working with EEG data, I found that I needed to write applications to interact with my data, and developed an EEG analysis application in MATLAB. As the application grew in complexity, interacting with databases, http servers, manipulating complex data structures, I began to strain against the limitations of MATLAB as a programming language, and decided to start over in Python. Python more than makes up for all of MATLAB's deficiencies as a programming language, but I was having difficulty finding a 2D plotting package (for 3D VTK more than exceeds all of my needs).

When I went searching for a Python plotting package, I had several requirements:

- Plots should look great - publication quality. One important requirement for me is that the text looks good (antialiased, etc.)
- Postscript output for inclusion with TeX documents
- Embeddable in a graphical user interface for application development
- Code should be easy enough that I can understand it and extend it
- Making plots should be easy

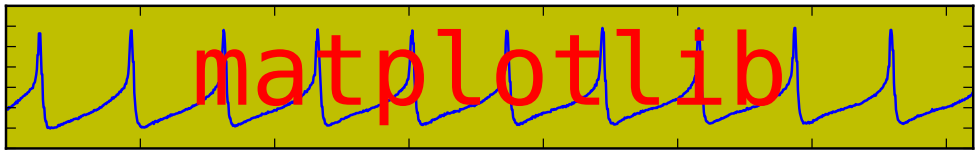
Finding no package that suited me just right, I did what any self-respecting Python programmer would do: rolled up my sleeves and dived in. Not having any real expe-

rience with computer graphics, I decided to emulate MATLAB's plotting capabilities because that is something MATLAB does very well. This had the added advantage that many people have a lot of MATLAB experience, and thus they can quickly get up to steam plotting in python. From a developer's perspective, having a fixed user interface (the pylab interface) has been very useful, because the guts of the code base can be redesigned without affecting user code.

The Matplotlib code is conceptually divided into three parts: the *pylab interface* is the set of functions provided by `pylab` which allow the user to create plots with code quite similar to MATLAB figure generating code (*Pyplot tutorial*). The *Matplotlib frontend* or *Matplotlib API* is the set of classes that do the heavy lifting, creating and managing figures, text, lines, plots and so on (*Artist tutorial*). This is an abstract interface that knows nothing about output. The *backends* are device-dependent drawing devices, aka renderers, that transform the frontend representation to hardcopy or a display device (*What is a backend?*). Example backends: PS creates PostScript® hardcopy, SVG creates Scalable Vector Graphics hardcopy, Agg creates PNG output using the high quality Anti-Grain Geometry library that ships with Matplotlib, GTK embeds Matplotlib in a Gtk+ application, GTKAgg uses the Anti-Grain renderer to create a figure and embed it in a Gtk+ application, and so on for PDF, WxWidgets, Tkinter, etc.

Matplotlib is used by many people in many different contexts. Some people want to automatically generate PostScript files to send to a printer or publishers. Others deploy Matplotlib on a web application server to generate PNG output for inclusion in dynamically-generated web pages. Some use Matplotlib interactively from the Python shell in Tkinter on Windows. My primary use is to embed Matplotlib in a Gtk+ EEG application that runs on Windows, Linux and Macintosh OS X.

Matplotlib's original logo (2003 -- 2008).



Matplotlib logo (2008 - 2015).

GITHUB STATS

GitHub stats for 2020/09/15 - 2020/11/11 (tag: v3.3.2)

These lists are automatically generated, and may be incomplete or contain duplicates.

We closed 14 issues and merged 46 pull requests. The full list can be seen on GitHub

The following 11 authors contributed 73 commits.

- Antony Lee
- David Stansby
- Elliott Sales de Andrade
- Eric Larson
- Jody Klymak
- Jouni K. Seppänen
- Ryan May
- shevawen
- Stephen Sinclair
- Thomas A Caswell
- Tim Hoffmann

GitHub issues and pull requests:

Pull Requests (46):

- PR #18936: Backport PR #18929 on branch v3.3.x
- PR #18929: FIX: make sure scalarmappable updates are handled correctly in 3D
- PR #18928: Backport PR #18842 on branch v3.3.x (Add CPython 3.9 wheels.)
- PR #18842: Add CPython 3.9 wheels.
- PR #18921: Backport PR #18732 on branch v3.3.x (Add a ponyfill for ResizeObserver on older browsers.)
- PR #18732: Add a ponyfill for ResizeObserver on older browsers.

- PR #18886: Backport #18860 on branch v3.3.x
- PR #18860: FIX: stop deprecation message colorbar
- PR #18845: Backport PR #18839 on branch v3.3.x
- PR #18843: Backport PR #18756 on branch v3.3.x (FIX: improve date performance regression)
- PR #18850: Backport CI fixes to v3.3.x
- PR #18839: MNT: make sure we do not mutate input in Text.update
- PR #18838: Fix ax.set_xticklabels(fontproperties=fp)
- PR #18756: FIX: improve date performance regression
- PR #18787: Backport PR #18769 on branch v3.3.x
- PR #18786: Backport PR #18754 on branch v3.3.x (FIX: make sure we have more than 1 tick with small log ranges)
- PR #18754: FIX: make sure we have more than 1 tick with small log ranges
- PR #18769: Support `ax.grid(visible=<bool>)`.
- PR #18778: Backport PR #18773 on branch v3.3.x (Update to latest cibuildwheel release.)
- PR #18773: Update to latest cibuildwheel release.
- PR #18755: Backport PR #18734 on branch v3.3.x (Fix deprecation warning in GitHub Actions.)
- PR #18734: Fix deprecation warning in GitHub Actions.
- PR #18725: Backport PR #18533 on branch v3.3.x
- PR #18723: Backport PR #18584 on branch v3.3.x (Fix setting 0-timeout timer with Tornado.)
- PR #18676: Backport PR #18670 on branch v3.3.x (MNT: make certifi actually optional)
- PR #18670: MNT: make certifi actually optional
- PR #18665: Backport PR #18639 on branch v3.3.x (nbagg: Don't close figures for bubbled events.)
- PR #18639: nbagg: Don't close figures for bubbled events.
- PR #18640: Backport PR #18636 on branch v3.3.x (BLD: certifi is not a run-time dependency)
- PR #18636: BLD: certifi is not a run-time dependency
- PR #18629: Backport PR #18621 on branch v3.3.x (Fix singleshot timers in wx.)
- PR #18621: Fix singleshot timers in wx.

- PR #18607: Backport PR #18604 on branch v3.3.x (Update test image to fix Ghostscript 9.53.)
- PR #18604: Update test image to fix Ghostscript 9.53.
- PR #18584: Fix setting 0-timeout timer with Tornado.
- PR #18550: backport pr 18549
- PR #18545: Backport PR #18540 on branch v3.3.x (Call to ExitStack.push should have been ExitStack.callback.)
- PR #18549: FIX: unit-convert pcolorargs before interpolating
- PR #18540: Call to ExitStack.push should have been ExitStack.callback.
- PR #18533: Correctly remove support for stackrel.
- PR #18509: Backport PR #18505 on branch v3.3.x (Fix depth shading when edge/facecolor is none.)
- PR #18505: Fix depth shading when edge/facecolor is none.
- PR #18504: Backport PR #18500 on branch v3.3.x (BUG: Fix all-masked imshow)
- PR #18500: BUG: Fix all-masked imshow
- PR #18476: CI: skip qt, cairo, pygobject related installs on OSX on travis
- PR #18134: Build on xcode9

Issues (14):

- #18885: 3D Scatter Plot with Colorbar is not saved correctly with savefig
- #18922: pyplot.xticks(): Font property specification is not effective except 1st tick label.
- #18481: "%matplotlib notebook" not working in firefox with matplotlib 3.3.1
- #18595: Getting internal "MatplotlibDeprecationWarning: shading='flat' ..."
- #18743: from mpl 3.2.2 to 3.3.0 enormous increase in creation time
- #18317: pcolormesh: shading='nearest' and non-monotonic coordinates
- #18758: Using Axis.grid(visible=True) results in TypeError for multiple values for keyword argument
- #18638: `matplotlib>=3.3.2` breaks `ipywidgets.interact`
- #18337: Error installing matplotlib-3.3.1 using pip due to old version of certifi on conda environment
- #18620: wx backend assertion error with fig.canvas.timer.start()
- #18551: test_transparent_markers[pdf] is broken on v3.3.x Travis macOS
- #18580: Animation freezes in Jupyter notebook

- #18547: pcolormesh x-axis with datetime broken for nearest shading
- #18539: Error in Axes.redraw_in_frame in use of ExitStack: push() takes 2 positional arguments but 3 were given

- PR #18459: Backport PR #18393 on branch v3.3.x (Fix Axis scale on twinned Axes.)
- PR #18393: Fix Axis scale on twinned Axes.
- PR #18441: Backport PR #18395: TkAgg bugfix: deselect buttons that are not the current _Mode
- PR #18395: TkAgg bugfix: deselect buttons that are not the current _Mode
- PR #18380: Backport PR #18374 on branch v3.3.x (FIX: make _reshape_2D accept pandas df with string indices)
- PR #18374: FIX: make _reshape_2D accept pandas df with string indices
- PR #18376: Backport PR #18298 on branch v3.3.x (Include license files in built distribution)
- PR #18375: Backport PR #18293 on branch v3.3.x (Fix scatter3d color/linewidth re-projection)
- PR #18298: Include license files in built distribution
- PR #18293: Fix scatter3d color/linewidth re-projection
- PR #18361: nbagg: Store DPI ratio on figure instead of window.
- PR #18354: Backport PR #18352 on branch v3.3.x (Avoid triggering backend resolution during qt initial import.)
- PR #18352: Avoid triggering backend resolution during qt initial import.
- PR #18335: Backport PR #18322 on branch v3.3.x (Disable FH4 so that we don't require VCRUNTIME140_1.dll.)
- PR #18322: Disable FH4 so that we don't require VCRUNTIME140_1.dll.
- PR #18333: Backport PR #18328 on branch v3.3.x (Add missing check for None in Qt toolmanager.)
- PR #18328: Add missing check for None in Qt toolmanager.

- PR #18309: Backport PR #18304 on branch v3.3.x (Fix canvas redraws during motion in figures with a Button or TextBox)
- PR #18304: Fix canvas redraws during motion in figures with a Button or TextBox
- PR #18297: Backport PR #18288 on branch v3.3.x (FIX: check if axes is off page before repositioning title)
- PR #18288: FIX: check if axes is off page before repositioning title
- PR #18269: Backport PR #18266 on branch v3.3.x (Fix Path.get_extents for empty paths.)
- PR #18266: Fix Path.get_extents for empty paths.
- PR #18263: Backport PR #18260 on branch v3.3.x (Add parent widget to IntVar)
- PR #18260: Add parent widget to IntVar
- PR #18253: Backport PR #18245 on branch v3.3.x
- PR #18245: MNT: do a better job guessing the GUI framework in use

Issues (15):

- #18415: imshow with LogNorm crashes with certain inputs
- #18447: nbagg: Closing a figure from the notebook does not close the python figure
- #18470: interactive plots slow with matplotlib 3.3.1
- #18457: Incorrect log y-scale for histogram with partitioned and barstacked data
- #18385: twinx not respecting log-scale
- #18371: Plotting a pandas DataFrame with string MultiIndex
- #18296: LICENSE file(s) not included in published PyPI package
- #18287: scatter3D assigns wrong color to points for some plot orientations
- #18292: ImportError: DLL load failed with Matplotlib 3.3.1 on Windows
- #18327: Tool Manager: adding buttons to toolbar fails with matplotlib version 3.3.1 using Qt backend
- #18324: Poor UI responsiveness of 3.3.1 compared with 3.2.2 for interactive mode UI using widgets
- #18303: Canvas redraws during any motion when Button is present
- #18283: Automatic title placement wrong if parent axes is off the page
- #18254: scatter(..., marker='') raises on drawing with mpl3.3.1
- #18259: New IntVar needs a parent widget

7.1.2 GitHub Stats for Matplotlib 3.3.1

GitHub stats for 2020/07/16 - 2020/08/13 (tag: v3.3.0)

These lists are automatically generated, and may be incomplete or contain duplicates.

We closed 25 issues and merged 73 pull requests. The full list can be seen on GitHub

The following 17 authors contributed 131 commits.

- Antony Lee
- Ben Root
- Bruno Beltran
- David Stansby
- Elliott Sales de Andrade
- Isuru Fernando
- jbhopkins
- Jody Klymak
- Jouni K. Seppänen
- Lee Johnston
- linchiwei123
- Neilzon Viloria

GitHub issues and pull requests:

Pull Requests (73):

- PR #18243: Fix reshape list of strings
- PR #18240: Backport PR #18235 on branch v3.3.x
- PR #18239: Backport PR #18233 on branch v3.3.x (Fix cibuildwheel trigger condition.)
- PR #18235: FIX: check we have a back button in tk toolbar before we touch it
- PR #18233: Fix cibuildwheel trigger condition.
- PR #18231: Backport PR #18224 on branch v3.3.x (Try out cibuildwheel.)
- PR #18224: Try out cibuildwheel.

- PR #18230: Backport PR #18225 on branch v3.3.x (Use certifi when downloading bundled build requirements.)
- PR #18225: Use certifi when downloading bundled build requirements.
- PR #18229: Backport PR #18219 on branch v3.3.x (Fixes an issue where WxAgg NavigationToolbar2 broke custom toolbars)
- PR #18219: Fixes an issue where WxAgg NavigationToolbar2 broke custom toolbars
- PR #18228: Backport PR #18227 on branch v3.3.x (Set pipefail when running flake8 linter.)
- PR #18227: Set pipefail when running flake8 linter.
- PR #18215: Backport PR #18185 on branch v3.3.x (FIX: fix reading from http/https urls via imread)
- PR #18214: Backport PR #18184 on branch v3.3.x (Go back to checking figures for their manager in destroy.)
- PR #18185: FIX: fix reading from http/https urls via imread
- PR #18184: Go back to checking figures for their manager in destroy.
- PR #18183: Backport PR #17995 on branch v3.3.x (Avoid using Bbox machinery in Path.get_extents; special case polylines.)
- PR #18182: Backport PR #17994 on branch v3.3.x (Special case degree-1 Bezier curves.)
- PR #18179: Backport PR #18175 on branch v3.3.x (Downgrade symbol substitution log to info level.)
- PR #18177: Backport PR #18092 on branch v3.3.x (Use same Make as FreeType's configure to build it.)
- PR #18174: Backport PR #18167 on branch v3.3.x (Catch Pandas AssertionError on deprecated multidimensional indexing. Closes #18158)
- PR #18176: Backport PR #18173 on branch v3.3.x (Fix the return value of Axes.get_navigate_mode.)
- PR #18175: Downgrade symbol substitution log to info level.
- PR #18092: Use same Make as FreeType's configure to build it.
- PR #18173: Fix the return value of Axes.get_navigate_mode.
- PR #18167: Catch Pandas AssertionError on deprecated multidimensional indexing. Closes #18158
- PR #18162: Backport PR #18156 on branch v3.3.x (Fix IndexError when using scatter3d and depthshade=False)
- PR #18156: Fix IndexError when using scatter3d and depthshade=False
- PR #18153: Backport PR #18142 on branch v3.3.x (Fix nbagg in Chrome 84)

- PR #18146: Backport PR #17989 on branch v3.3.x (gtk/tk: Ensure no flicker when hovering over images.)
- PR #18142: Fix nbagg in Chrome 84
- PR #18147: Backport PR #18136 on branch v3.3.x (Sort 3d sizes along with other properties)
- PR #18136: Sort 3d sizes along with other properties
- PR #17989: gtk/tk: Ensure no flicker when hovering over images.
- PR #18102: Fix linting on v3.3.x
- PR #18111: Backport PR #18089 on branch v3.3.x
- PR #18109: Backport PR #18093 on branch v3.3.x (Improve saving animated GIF with ffmpeg)
- PR #18089: Revert "Convert adjust_bbox to use ExitStack."
- PR #18093: Improve saving animated GIF with ffmpeg
- PR #18104: Backport PR #18101 on branch v3.3.x (FIX: catch all multi-dim warnings pandas)
- PR #18101: FIX: catch all multi-dim warnings pandas
- PR #18091: ci: Fix linting being ignored by reviewdog
- PR #18083: Backport PR #18079 on branch v3.3.x (Set shading='auto' if invalid value passed to pcolormesh)
- PR #18079: Set shading='auto' if invalid value passed to pcolormesh
- PR #18067: Backport PR #17956 on branch v3.3.x (ENH: Add version check for mac sdk version)
- PR #17956: ENH: Add version check for mac sdk version
- PR #18053: Backport PR #18021: FIX: update num2julian and julian2num
- PR #18021: FIX: update num2julian and julian2num
- PR #18041: Backport PR #18038 on branch v3.3.x (FIX: use internal _set_postion, not external)
- PR #18038: FIX: use internal _set_postion, not external
- PR #18036: Backport PR #18030 on branch v3.3.x (Fix PolyCollection.set_verts optimization.)
- PR #18030: Fix PolyCollection.set_verts optimization.
- PR #18032: Backport PR #18026 on branch v3.3.x (FIX: Be sure matplotlib.backends is imported before we use it)
- PR #18026: FIX: Be sure matplotlib.backends is imported before we use it

- PR #18027: Backport PR #17981 on branch v3.3.x (gtk: Fix `draw` on unmapped windows.)
- PR #17981: gtk: Fix `draw` on unmapped windows.
- PR #18024: Backport PR #17963 on branch v3.3.x (TST: Ignore deprecations when switching backends.)
- PR #18023: Backport PR #18014 on branch v3.3.x (Fix flipped paths in non-writable config dir warning.)
- PR #17963: TST: Ignore deprecations when switching backends.
- PR #18014: Fix flipped paths in non-writable config dir warning.
- PR #18008: Backport PR #17969 on branch v3.3.x (Honor `'Date': None` in metadata)
- PR #18009: Backport PR #17982 on branch v3.3.x (BF: for degenerate polygons, add CLOSEPOLY vertex)
- PR #17982: BF: for degenerate polygons, add CLOSEPOLY vertex
- PR #17969: Honor `'Date': None` in metadata
- PR #17995: Avoid using Bbox machinery in Path.get_extents; special case polylines.
- PR #17994: Special case degree-1 Bezier curves.
- PR #17990: Manual backport of pr 17983 on v3.3.x
- PR #17984: Backport PR #17972 on branch v3.3.x (Fix PyPy compatiblity issue)
- PR #17985: Backport PR #17976 on branch v3.3.x (Fixed #17970 - Docstrings should not accessed with -OO)
- PR #17983: FIX: undeprecate and update num2epoch/epoch2num
- PR #17976: Fixed #17970 - Docstrings should not accessed with -OO
- PR #17972: Fix PyPy compatiblity issue

Issues (25):

- #18234: _reshape_2D function behavior changed, breaks hist for some cases in 3.3.0
- #18232: different behaviour between 3.3.0 and 3.2.2 (and earlier) for ploting in a Tk canvas
- #18212: Updated WxAgg NavigationToolbar2 breaks custom toolbars
- #18129: Error reading png image from URL with imread in matplotlib 3.3
- #18163: Figure can not be closed if it has associated Agg canvas
- #17974: Major speed regression introduced in "plt.bar" definition clipping between 3.0.3 and 3.3.0.

- #17998: New warning: Substituting symbol perp from STIXGeneral
- #18057: Fails to install in FreeBSD
- #18150: Regression in get_navigate_mode() return value
- #18158: X-axis that is Pandas Series time zone aware timestamps raises AssertionError
- #18037: Scatter3D: depthshade=False causes IndexError for Tkinter when plotting more than one point.
- #18169: When running python with -OO option, an empty matplotlib docstring causes an exception.
- #18165: fig.colorbar() and using bbox='tight' in PDF export mess up figure dimensions
- #18132: A simple 3D scatter plot with %matplotlib notebook is not working
- #18135: Point size array in the Axes3D scatter() does not follow the same order as in the data points
- #18061: 3.3.0 regression in png backend with colorbar()
- #18076: pcolormesh + gourand shading + polar axes is broken
- #18010: 3.3.0: possible regression/bug with DateFormatter?
- #18033: v. 3.3.0: horizontal colorbar broken
- #18017: Optimisation in set_verts causes error if `verts` have irregular sizes
- #18022: AttributeError: module 'matplotlib' has no attribute 'backends'
- #18011: Confusing error message when home config directory not writable
- #17975: Computing the bounding box of a degenerate polygon throws an error
- #17968: Setting `Date` metadata to `None` does not remove the date metadata from the SVG file
- #17970: AttributeError when using PYTHONOPTIMIZE (due to stripped docstring)

7.1.3 GitHub Stats for Matplotlib 3.3.0

GitHub stats for 2020/03/03 - 2020/07/16 (tag: v3.2.0)

These lists are automatically generated, and may be incomplete or contain duplicates.

We closed 198 issues and merged 1066 pull requests. The full list can be seen on GitHub

Pull Requests (1066):

- PR #17943: Backport PR #17942 on branch v3.3.x (Increase heading level for 3.3 What's New)
- PR #17942: Increase heading level for 3.3 What's New
- PR #17941: Backport PR #17938 on branch v3.3.x (Don't allow 1D lists as subplot_moasic layout.)
- PR #17940: Backport PR #17885 on branch v3.3.x (BF: ignore CLOSEPOLY after NaN in PathNanRemover)
- PR #17937: Backport PR #17877 on branch v3.3.x (Fix drawing zoom rubberband on GTK backends.)
- PR #17938: Don't allow 1D lists as subplot_moasic layout.
- PR #17885: BF: ignore CLOSEPOLY after NaN in PathNanRemover
- PR #17877: Fix drawing zoom rubberband on GTK backends.
- PR #17933: Backport PR #17858 on branch v3.3.x (Refresh what's new page for 3.3.0)
- PR #17858: Refresh what's new page for 3.3.0
- PR #17919: Backport PR #17913 on branch v3.3.x (Revert using SVG inheritance diagrams)

- PR #17913: Revert using SVG inheritance diagrams
- PR #17911: Backport PR #17907 on branch v3.3.x (Fix release() method name in macosx backend)
- PR #17907: Fix release() method name in macosx backend
- PR #17903: Backport PR #17859 on branch v3.3.x (API: resolve unset vmin / vmax in all ScalarMapple based methods)
- PR #17859: API: resolve unset vmin / vmax in all ScalarMapple based methods
- PR #17898: Backport PR #17882 on branch v3.3.x (Fix FFMpegBase.isAvailable with detached terminals.)
- PR #17882: Fix FFMpegBase.isAvailable with detached terminals.
- PR #17881: Backport PR #17871 on branch v3.3.x (Mention single char colors shading in more places)
- PR #17871: Mention single char colors shading in more places
- PR #17872: Backport PR #17800 on branch v3.3.x (Increase tolerance for alternate architectures)
- PR #17800: Increase tolerance for alternate architectures
- PR #17861: Revert "Fix linewidths and colors for scatter() with unfilled markers"
- PR #17864: Backport PR #17862 on branch v3.3.x (CI: Install, or upgrade, Python 3 on homebrew.)
- PR #17846: Backport PR #17844 on branch v3.3.x (Explain why Qt4 backends are deprecated)
- PR #17844: Explain why Qt4 backends are deprecated
- PR #17833: Backport PR #17831 on branch v3.3.x (BLD: default to system freetype on AIX)
- PR #17831: BLD: default to system freetype on AIX
- PR #17823: Backport PR #17821 on branch v3.3.x (FIX: Keep lists of lists of one scalar each 2D in _reshape_2D)
- PR #17821: FIX: Keep lists of lists of one scalar each 2D in _reshape_2D
- PR #17811: Backport PR #17797 on branch v3.3.x (Fix running contour's test_internal_cpp_api directly.)
- PR #17812: Backport PR #17772 on branch v3.3.x (Partially fix rubberbanding in GTK3.)
- PR #17815: Backport PR #17814 on branch v3.3.x (Don't duplicate deprecated parameter addendum.)
- PR #17814: Don't duplicate deprecated parameter addendum.
- PR #17772: Partially fix rubberbanding in GTK3.

- PR #17797: Fix running contour's test_internal_cpp_api directly.
- PR #17809: Backport PR #17801 on branch v3.3.x (BUG: Fix implementation of _is_closed_polygon)
- PR #17801: BUG: Fix implementation of _is_closed_polygon
- PR #17796: Backport PR #17764 on branch v3.3.x (FIX: be more careful about not importing pyplot early)
- PR #17795: Backport PR #17781 on branch v3.3.x (Fix limit setting after plotting empty data)
- PR #17764: FIX: be more careful about not importing pyplot early
- PR #17781: Fix limit setting after plotting empty data
- PR #17787: Backport PR #17784 on branch v3.3.x (Allow passing emtpy list of ticks to FixedLocator)
- PR #17784: Allow passing empty list of ticks to FixedLocator
- PR #17766: Backport PR #17752 on branch v3.3.x (Numpydoc-ify various functions)
- PR #17752: Numpydoc-ify various functions
- PR #17762: Backport PR #17742 on branch v3.3.x (Update tricontour[f] docs)
- PR #17742: Update tricontour[f] docs
- PR #17760: Backport PR #17756 on branch v3.3.x (Fix tk tooltips for dark themes.)
- PR #17756: Fix tk tooltips for dark themes.
- PR #17747: Backport PR #17731 on branch v3.3.x ("Fix" tight_layout for template backend.)
- PR #17731: "Fix" tight_layout for template backend.
- PR #17739: Backport PR #17734 on branch v3.3.x (Oversample thumbnail x2)
- PR #17734: Oversample thumbnail x2
- PR #17738: Backport PR #17729 on branch v3.3.x (Fix type doc for scroll event "step" attribute.)
- PR #17729: Fix type doc for scroll event "step" attribute.
- PR #17724: Backport PR #17720 on branch v3.3.x (Fix check for manager = None.)
- PR #17720: Fix check for manager = None.
- PR #17719: Backport PR #17693 on branch v3.3.x (DOC: Add svg2pdf converter for generating PDF docs.)
- PR #17693: DOC: Add svg2pdf converter for generating PDF docs.

- PR #17718: Backport PR #17715 on branch v3.3.x (Clarify gridspec error message for non-integer inputs.)
- PR #17717: Backport PR #17705 on branch v3.3.x (Keep cachedRenderer as None when pickling Figure.)
- PR #17715: Clarify gridspec error message for non-integer inputs.
- PR #17705: Keep cachedRenderer as None when pickling Figure.
- PR #17701: Backport PR #17687 on branch v3.3.x (Mention keyboard modifiers in toolbar tooltip texts.)
- PR #17687: Mention keyboard modifiers in toolbar tooltip texts.
- PR #17698: Backport PR #17686 on branch v3.3.x (Fix tooltip for wx toolbar.)
- PR #17686: Fix tooltip for wx toolbar.
- PR #17692: Backport PR #17680 on branch v3.3.x (MNT: migrate away from deprecated c-api)
- PR #17680: MNT: migrate away from deprecated c-api
- PR #17688: Backport PR #17676 on branch v3.3.x (FIX: correctly process the tick label size)
- PR #17676: FIX: correctly process the tick label size
- PR #17677: Backport PR #17664 on branch v3.3.x (Clarify docs of AutoDateLocator.intervald)
- PR #17678: Backport PR #17665 on branch v3.3.x (Document that some single char colors are shaded)
- PR #17679: Backport PR #17675 on branch v3.3.x (DOC: specify that the LaTeX installation needs to include cm-super)
- PR #17675: DOC: specify that the LaTeX installation needs to include cm-super
- PR #17665: Document that some single char colors are shaded
- PR #17664: Clarify docs of AutoDateLocator.intervald
- PR #17672: Backport PR #17668 on branch v3.3.x (Don't pass "wrong" `indent=False` in SVG generation.)
- PR #17671: Backport PR #17667 on branch v3.3.x (Don't linewrap css in svg header.)
- PR #17668: Don't pass "wrong" `indent=False` in SVG generation.
- PR #17667: Don't linewrap css in svg header.
- PR #17666: Prepare for 3.3.0 rc1
- PR #17663: DOC: update the gh stats for v3.3.0
- PR #17656: Fix default colouring of Shadows

- PR #17657: V3.2.x mergeup
- PR #17623: Add a flag for disabling LTO.
- PR #17569: Delay usepackage{textcomp} until after the custom tex preamble.
- PR #17416: Reorder NavigationToolbar2 methods.
- PR #17604: DOC: Clarify offset notation and scientific notation
- PR #17617: Rewrite pdf test to use check_figures_equal.
- PR #17654: Small fixes to recent What's New
- PR #17649: MNT: make _setattr_cm more forgiving
- PR #17644: Doc 33 whats new consolidation
- PR #17647: Fix example in docstring of cbook._unfold.
- PR #10187: DOC: add a blitting tutorial
- PR #17471: Removed idiomatic constructs from interactive figures docs
- PR #17639: DOC: Update colormap deprecation warning to use Python's copy function.
- PR #17223: Warn on invalid savefig keyword arguments
- PR #17625: Give _DummyAxis instances a __name__
- PR #17636: Fix image vlim clipping again
- PR #17635: Fix autoscaling with tiny sticky values.
- PR #17620: MNT: make _setattr_cm more conservative
- PR #17621: FIX: restore ability to pass a tuple to axes_class in axes_grid
- PR #16603: axes collage
- PR #17622: Fix typo in description of savefig.bbox.
- PR #17619: Skip test_tmpconfigdir_warning when running as root.
- PR #17610: MNT: allow 0 sized figures
- PR #17163: Fix clipping of markers in PDF backend.
- PR #17556: DOC: Update contributor listing in credits
- PR #17221: Add metadata saving support to SVG.
- PR #17603: Replace image comparison in test_axes_grid1 by geometry checks.
- PR #17428: Doc start 33 merges
- PR #17607: Convert adjust_bbox to use ExitStack.
- PR #17575: DOCS: update collections.py docstrings to current doc conventions
- PR #15826: Fix bar3d bug with matching color string and array x lengths

- PR #14507: Simplify handling of Qt modifier keys.
- PR #17589: Fix doc build with Sphinx < 3.
- PR #17590: Clarify docs of set_powerlimits()
- PR #17597: MNT: cleanup minor style issues
- PR #17183: Update configuration of CircleCI builds
- PR #17592: Improve docstrings of ScalarFormatter
- PR #17456: Improve stackplot example
- PR #17545: Improve docs of markers
- PR #17233: Improve PDF metadata support in PGF
- PR #17086: Remove jQuery & jQuery UI
- PR #17580: Fix same_color() for 'none' color
- PR #17582: Fix link in doc
- PR #17491: DOC: Only link to overall Zenodo DOI.
- PR #17515: FIX: add set_box_aspect, improve tight bounding box for Axes3D + fix bbox_inches support with fixed box_aspect
- PR #17581: DOC: Remove duplicate Returns in subplot2grid.
- PR #17550: Update subplot2grid doc to use Figure.add_gridspec, not GridSpec.
- PR #17544: markerfacecolor should not override fillstyle='none' in plot()
- PR #15672: Remove mention that tkagg was derived from PIL.
- PR #17573: Examples: fix formatting issue in 'Errorbar limit selection'
- PR #17543: Fix linewidths and colors for scatter() with unfilled markers
- PR #17448: Add example for drawing an error band around a curve
- PR #17572: Examples: clarity for 'set and get' example page
- PR #17276: Allow numpy arrays in markevery
- PR #17536: Consolidate some tests and fix a couple typos
- PR #17558: Simplify plot_date()
- PR #17534: Fmaussion extended boundary norm
- PR #17540: Fix help window on GTK.
- PR #17535: Update docs on subplot2grid / SubplotBase
- PR #17510: Fix exception handling in FT2Font init.
- PR #16953: Changed 'colors' paramater in PyPlot vlines/hlines and Axes vlines/hlines to default to configured rcParams 'lines.color' option
- PR #17459: Use light icons on dark themes for wx and gtk, too.

- PR #17539: Use symbolic icons for buttons in GTK toolbar.
- PR #15435: Reuse png metadata handling of imsave() in FigureCanvasAgg.print_png().
- PR #5034: New "extend" keyword to colors.BoundaryNorm
- PR #17532: DOC: correct legend.title_fontsize docstring
- PR #17531: Remove unneeded check/comment re: multiprocessing in setup.py.
- PR #17522: Privatize ttconv module.
- PR #17517: Make sure _parent is in sync with Qt parent in NavigationToolbar2QT
- PR #17525: DOC/API: set __qualname__ when using class factory
- PR #17511: Fix offset legend tightbbox
- PR #16203: Port fontconfig's font weight detection to font_manager.
- PR #17485: Support marking a single artist as not-usetex.
- PR #17338: Support url on more Artists in svg
- PR #17519: Prefer demo'ing rcParams rather than rc in examples.
- PR #13457: Give `AnnotationBbox` an opinion about its extent
- PR #15037: Simplifications to errorbar().
- PR #17493: Update SVGs that use interpolation='none'.
- PR #15221: Don't fallback to agg in tight_layout.get_renderer.
- PR #17512: DOC: remove inkscape restriction in doc
- PR #17484: Deprecate ismath parameter to draw_tex and ismath="TeX!".
- PR #17492: Correctly set default linewidth for unfilled markers.
- PR #16908: Adding 2d support to quadmesh set_array
- PR #17506: Fix dicts unpacking for `.plot`
- PR #17496: Fix some incorrect image clipping
- PR #17340: convert some sample plots to use plt.subplots() instead of other methods
- PR #17504: Undocument parameter orientation of bar()
- PR #13884: Add some documentation for axisartist's ExtremeFinder, plus some cleanups.
- PR #17495: Fix Pillow import in testing.
- PR #17462: Inline FigureCanvasGtkFoo._render_figure.
- PR #17474: Numpydocify RectangleSelector docstring.

- PR #17003: Optimize extensions with LTO and hidden visibility
- PR #17489: BUG: Picking vertical line broken
- PR #17486: Simplify handling of fontproperties=None.
- PR #17478: Add support for blitting in qt5cairo.
- PR #15641: Make get_sample_data autoload npy/npz files.
- PR #17481: Fix LightSource.shade on fully unmasked array.
- PR #17289: Prepare for ragged array warnings in NumPy 1.19
- PR #17358: Fix masked CubicTriInterpolator
- PR #17477: DOC: Use Sphinx-gallery animation capture
- PR #17482: Shorten RectangleSelector._release.
- PR #17475: Cleanup RectangleSelector example.
- PR #17461: Deprecate the private FigureCanvasGTK3._renderer_init.
- PR #17464: Fold _make_nseq_validator into _listify_validator.
- PR #17469: Use qVersion, not QT_VERSION_STR -- the latter doesn't exist in PySide2.
- PR #4779: DOC: Start to document interactive figures
- PR #17458: Cleanup C++ code
- PR #17466: DOC: clarify that milestones are intentions not approvals
- PR #17062: Fix to "exported SVG files blurred in viewers"
- PR #17443: Fix rcParams validator for dashes.
- PR #17350: Move integerness checks to SubplotSpec._from_subplot_args.
- PR #17444: Support odd-length dash patterns in Agg.
- PR #17405: Show the failing line in bad-rcparams warnings.
- PR #17452: Make validate_date throw ValueError, not RuntimeError.
- PR #17439: Remove comment re: validation of datetime format strings.
- PR #17438: Discourage use of proprietary Matplotlib names for freetype hinting
- PR #16990: update testing helpers
- PR #16340: Make set_x/ymargin() update axes limits, just like margins().
- PR #15029: Get default params from matplotlibrc.template.
- PR #17363: Fix toolbar separators in wx+toolmanager.
- PR #17348: Avoid creating a Tick in Axis.get_tick_space.
- PR #15725: Changed line color of boxplot for dark_background

- PR #17362: Remove status bars in toolmanager mode as well.
- PR #16551: DOC: be more opinionated about flags passed to pip
- PR #17328: Fixes icon clipping issue with WxAgg NavigationToolbar2 for wxpython 4.1.0
- PR #17425: fix typo in stem doc
- PR #17415: Cygwin fixes
- PR #17401: FIX: Fix for FFmpeg + GIF
- PR #16569: MNT: improve the error message in Path init
- PR #17404: Don't forget to dlclose() main_program in tkagg init.
- PR #17414: Keep validate_date private.
- PR #17413: Revert "DOC: drop the experimental tag constrained_layout and tight_layout"
- PR #17394: Deprecate passing keys to update_keymap as single comma-separated string
- PR #17395: TexManager fixes.
- PR #17399: Remove qt4 backends from backend fallback candidates.
- PR #17392: Clarify deprecation message re: tex/pgf preambles as list-of-strings.
- PR #17400: Cleanup wx examples.
- PR #17378: Fix marker overlap
- PR #17351: Fix running the test suite with inkscape>=1.
- PR #17382: FIX: properly check figure on gridspec
- PR #17390: Small updates to troubleshooting guide.
- PR #15104: Simplify file handling in ft2font.
- PR #17380: Support standard names for freetype hinting flags.
- PR #15594: Fix marker overlap
- PR #17372: Auto-set artist.mouseover based on if get_cursor_data is overridden.
- PR #17377: Remove code for sphinx < 1.8
- PR #17266: Keep explicit ticklabels in sync with ticks from FixedLocator
- PR #17359: Fix running test_internal_cpp_api directly.
- PR #17355: Change subprocess for inkscape version detection
- PR #17369: CI: Add eslint for JS linting
- PR #17226: Replace backend_driver by new example runner.
- PR #17365: Also use light color tool buttons in qt+toolmanager+dark theme.

- PR #17366: Restrict Qt toolbars to top/bottom of canvas.
- PR #17361: Remove randomness from test_colorbar_get_ticks_2.
- PR #17151: Cleanup colors.py docstrings.
- PR #17287: Make API of get_tightbbox more consistent between Axes and Axis.
- PR #17092: Don't create a statusbar in Qt, wx backends.
- PR #17220: Simplify Annotation and Text bbox drawing.
- PR #17353: Make zooming work in qt-embedding example.
- PR #16727: Update xtick.alignment parameter in rcsetup to validate against correct values
- PR #17236: Add the "contour.linewidths" configuration option
- PR #16328: Make Artist.set() apply properties in the order in which they are given.
- PR #9696: FIX: set_url() without effect in the plot for instances of Tick
- PR #17002: Fix AnnotationBbox picking and a bit of cleanup
- PR #17256: Improve ps handling of individual usetex strings.
- PR #17267: Improve image comparison decorator
- PR #17332: Cleanup docstring of subplots().
- PR #16843: Deprecate is_pyqt5.
- PR #15898: New textcolor kwarg for legend
- PR #17333: Make sharex, etc. args of subplots() keyword-only.
- PR #17329: Improve docs of eventplot()
- PR #17330: Remove pnpoly license.
- PR #13656: For single datasets, don't wrap artist added by Axes.hist in silent_list
- PR #16247: DOC added kwargs and tight_layout description in plt.figure
- PR #16992: Implement FigureManager.resize for macosx backend
- PR #17324: DOC: add offset axes to secondary_axes
- PR #17311: Make pyplot signatures of rgrids() and thetagrids() explicit
- PR #17302: Fix alignment of offset text on top axis.
- PR #14421: Add GridSpec.subplots()
- PR #15111: By default, don't change the figure face/edgecolor on savefig().
- PR #17318: both x and y should multiply the radius
- PR #17309: Cleanup parameter types in docstrings
- PR #17308: Improve docs of bar() and barh()

- PR #17312: changed axis to axes in lifecycle tutorial
- PR #16715: Automatically create tick formatters for str and callable inputs.
- PR #16959: Simplify and robustify ConnectionPatch coordinates conversion.
- PR #17306: FIX: CL more stable
- PR #17301: Use deprecate_privatize_attribute more.
- PR #16985: Adds normalize kwarg to pie function
- PR #5243: Enhancement of tick label offset text positioning
- PR #17292: Deprecate various wx Toolbar attributes.
- PR #17297: Simplify pickling support.
- PR #17298: Fix rubberband in tk.
- PR #17299: Avoid "dash motion" in qt zoom box.
- PR #17200: Implement set_history_buttons for Tk toolbar.
- PR #16798: Make the Qt interactive zoom rectangle black & white.
- PR #17296: Fix doc wording
- PR #17282: Don't divide by zero in Line2D.segment_hits.
- PR #17293: Fix incorrect deprecation.
- PR #17285: V32 mergeup
- PR #15933: Warn if a temporary config/cache dir must be created.
- PR #15911: Use os.getpid() in configdir, to avoid multiprocess concurrency issues
- PR #17277: Move slow FontManager warning to FontManager constructor.
- PR #17222: FIX: long titles x/ylabel layout
- PR #14960: Don't generate individual doc entries for inherited Axes/Axis/Tick methods
- PR #17175: Further sync axes_grid colorbars with standard colorbars.
- PR #17030: Move widget functions into matplotlib.testing.widgets.
- PR #16975: Fix "out of bounds" undefined behavior
- PR #17111: Deprecate NavigationToolbar2._init_toolbar.
- PR #15275: adds turbo colormap
- PR #17174: Inline RGBAxes._config_axes to its only call site.
- PR #17156: Deprecate text.latex.preview rcParam.
- PR #17242: Make deprecations versions explicit
- PR #17165: Small optimizations to scale and translate of Affine2D

- PR #17181: Inline some private helper methods in ColorbarBase + small refactors.
- PR #17264: Don't trigger save when gtk save dialog is closed by escape.
- PR #17262: fix typo in set_clip_on doc
- PR #17234: Shorten and privatize qt's UiSubplotTool.
- PR #17137: Deprecate Toolbar.press/release; add helper to find overridden methods.
- PR #17245: Improve error handling in _parse_scatter_color_args
- PR #15008: ENH: add variable epoch
- PR #17260: Text Rotation Example: Correct roation_mode typo
- PR #17258: Improve info logged by tex subsystem.
- PR #17211: Deprecate support for running svg converter from path contaning newline.
- PR #17078: Improve nbAgg & WebAgg toolbars
- PR #17191: Inline unsampled-image path; remove renderer kwarg from _check_unsampled_image.
- PR #17213: Replace use of Bbox.bounds by appropriate properties.
- PR #17219: Add support for suptitle() in tight_layout().
- PR #17235: More axisartist cleanups
- PR #17239: Remove deprecations that expire in 3.3
- PR #13696: Deprecate offset_position="data".
- PR #16991: Begin warning on modifying global state of colormaps
- PR #17053: Replace most jQuery with vanilla JavaScript
- PR #17228: Make params to pyplot.tight_layout keyword-only.
- PR #17225: Remove Patch visibility tracking by Legend & OffsetBox.
- PR #17027: Fix saving nbAgg figure after a partial blit
- PR #16847: Ticks are not markers
- PR #17229: Autogenerate subplots_adjust with boilerplate.py.
- PR #17209: Simplify some axisartist code.
- PR #17204: Draw unfilled hist()s with the zorder of lines.
- PR #17205: Shorten tight_layout code.
- PR #17218: Document `Transform.__add__` and `.__sub__`.
- PR #17215: Small cleanups.

- PR #17212: Cleanup text.py.
- PR #17196: Move polar tests to their own module.
- PR #14747: Deprecate AxisArtist.dpi_transform.
- PR #13144: Deprecate NavigationToolbar2GTK3.ctx.
- PR #17202: DOC: Remove extra word
- PR #17194: Small cleanups/simplifications/fixes to pie().
- PR #17102: Switch tk pan/zoom to use togglable buttons.
- PR #16832: Correctly compute path extents
- PR #17193: Document docstring quote convention
- PR #17195: Fix polar tests.
- PR #17189: Make all parameters of ColorbarBase, except `ax`, keyword-only.
- PR #16717: Bugfix for issue 16501 raised ValueError polar subplot with (thetamax - thetamin) > 2pi
- PR #17180: Doc: spines arrows example
- PR #17184: Fix various small typos.
- PR #17143: Move linting to GitHub Actions with reviewdog.
- PR #17160: Correctly go through property setter when init'ing Timer interval.
- PR #17166: Deprecate ScalarMappable.check_update and associated machinery.
- PR #17177: Manually linewrap PS hexlines. Fixes #17176
- PR #17162: Update docs of rc_context()
- PR #17170: Convert SubplotZero example into centered-spines-with-arrows recipe.
- PR #17164: Fix Figure.add_axes(rect=...).
- PR #17154: DOC: Fix some warning and unreproducibility
- PR #17169: Clarify that draw_event occurs after the canvas draw.
- PR #17089: Cleanup some imports in tests
- PR #17040: Improve docs on automated tests
- PR #17145: CI: run pydocstyle with our custom options
- PR #16864: Check parameter type for legend(labels)
- PR #17146: FigureManager/NavigationToolbar2 cleanups.
- PR #16933: Add tests for toolmanager.
- PR #17127: ENH: allow title autopositioning to be turned off

- PR #17150: Many docstring cleanups.
- PR #17148: Fix most instances of D404 ("docstring should not start with 'this'").
- PR #17142: BUGFIX: conditional for add_axes arg deprecation
- PR #17032: Fold table.CustomCell into Cell.
- PR #17117: TextBox improvements.
- PR #17108: Make widgets.TextBox work also when embedding.
- PR #17135: Simplify pan/zoom toggling.
- PR #17134: Don't override update() in NavigationToolbar2Tk.
- PR #17129: In docs remove 'optional' if 'default' can be given
- PR #16963: Deprecate Locator.refresh and associated helpers.
- PR #17133: Fix Button widget motion callback.
- PR #17125: Make multiline docstrings start with a newline.
- PR #17124: Widgets cleanup.
- PR #17123: Cleanup/Simplify Cell._set_text_position.
- PR #16862: FIX: turn off title autopos if pad is set
- PR #15214: Inline wx icon loading.
- PR #16831: Simplify interactive zoom handling.
- PR #17094: DOC: drop the experimental tag constrained_layout and tight_layout
- PR #17101: Avoid "wrapped C/C++ object has been deleted" when closing wx window.
- PR #17028: Changed return type of get_{x,y}ticklabels to plain list
- PR #16058: Deprecate {ContourSet,Quiver}.ax in favor of .axes.
- PR #15349: Use checkboxes as bullet points for the PR review checklists
- PR #17112: Fix some link redirects in docs
- PR #17090: DOCS: add examples of how one "should" use Bbox
- PR #17110: Simplify connection of the default key_press and button_press handlers.
- PR #17070: Cleanups to Qt backend.
- PR #16776: Make cursor text precision actually correspond to pointing precision.
- PR #17026: Add eslint & prettier, and re-format JS
- PR #17091: Make sure slider uses "x" sign before multiplicative factor.

- PR #17082: Cleanup TextBox implementation.
- PR #17067: Simplify and generalize _set_view_from_bbox.
- PR #17081: Update animation_api.rst
- PR #17077: Improve default formatter for Slider values.
- PR #17079: Use True instead of 1 for boolean parameters.
- PR #17074: Fixed a typo in Lifecycle of a Plot
- PR #17072: Cleanup multi_image example.
- PR #15287: Allow sharex/y after axes creation.
- PR #16987: Deprecate case-insensitive properties.
- PR #17059: More missing refs fixes, and associated doc rewordings.
- PR #17057: Simplify subgridspec example/tutorial.
- PR #17058: Fix minor doc typos.
- PR #17024: Clarify docs of Rectangle
- PR #17043: Avoid spurious deprecation warning in TextBox.
- PR #17047: Highlighted .cbook.warn_deprecated() in contributing.rst
- PR #17054: Use slope in axline example
- PR #17048: More missing refs fixes.
- PR #17021: File name made more understandable
- PR #16903: Shorten implementation of Axes methods that just wrap Axis methods.
- PR #17039: Cleanups to contour docs.
- PR #17011: ci: Publish result images as Azure artifacts.
- PR #17038: Improve readability of documenting_mpl.rst
- PR #16996: Clean up get_proj() docstring (used view_init docstring as reference)
- PR #17019: Add return field to documentation of 'get_major_ticks'
- PR #16999: Add section on artifacts to imshow docs
- PR #17029: Fix table.Cell docstrings.
- PR #17025: Fix RecursionError when closing nbAgg figures.
- PR #16971: Don't change Figure DPI if value unchanged
- PR #16972: Fix resize bugs in GTK
- PR #17008: Change the description of Rectangle's xy parameter
- PR #16337: Create axline() using slope

- PR #16947: Fix missing parameter initialization in Axes.specgram()
- PR #17001: Cleanup imshow_extent tutorial.
- PR #17000: More stringent eventplot orientations.
- PR #16771: Deprecate non-string values as legend labels
- PR #15910: Simplify init of EventCollection.
- PR #16998: Made INSTALL.rst consistent
- PR #15393: Cleanup shape manipulations.
- PR #10924: Clear() methods to Radio and CheckButtons and other improvements
- PR #16988: Make plt.{r,theta}grids act as setters even when all args are kwargs.
- PR #16986: update tox.ini to match pythons supported and allow flags for pytest
- PR #16111: Move locking of fontlist.json *into* json_dump.
- PR #13110: Slightly tighten the Bbox/Transform API.
- PR #16973: TST: don't actually render 1k+ date ticks
- PR #16967: Simplify animation writer fallback.
- PR #16812: Bezier/Path API Cleanup: fix circular import issue
- PR #16968: Add link to 3.2 min-supported-requirements.
- PR #16957: Remove unused, private aliases Polygon._{get,set}_xy.
- PR #16960: Improve error for quoted values in matplotlibrc.
- PR #16530: Fix violinplot support list of pandas.Series
- PR #16939: Cleanup/tighten axes_grid.
- PR #16942: Cleanup and avoid refleaks OSX Timer__timer_start.
- PR #16944: TST: update default junit_family
- PR #16823: Dedupe implementation of axes grid switching in toolmanager.
- PR #16951: Cleanup dates docstrings.
- PR #16769: Fix some small style issues
- PR #16936: FIX: Plot is now rendered with correct inital value
- PR #16937: Making sure to keep over/under/bad in cmap resample/reverse.
- PR #16915: Tighten/cleanup wx backend.
- PR #16923: Test the macosx backend on Travis.
- PR #15369: Update style docs
- PR #16893: Robustify `AffineBase.__eq__` against comparing to other classes.

- PR #16904: Turn fontdict & minor into kwonly parameters for set_{x,y}ticklabels.
- PR #16917: Add test for close_event.
- PR #16920: Remove unused _read_ppm_image from macosx.m.
- PR #16877: Cleanup new_fixed_axis examples.
- PR #15049: Annotate argument in axes class match upstream
- PR #16774: Cleanup demo_axes_hbox_divider.
- PR #16873: More fixes to pydocstyle D403 (First word capitalization)
- PR #16896: set_tick_params(label1On=False) should also make offset text invisible.
- PR #16907: Fix typo in implementation of quit_all_keys.
- PR #16900: Document and test common_texification()
- PR #16902: Remove dot from suffix in testing.compare.
- PR #16828: Use more _setattr_cm, thus fix Text('').get_window_extent(dpi=...)
- PR #16901: Cleanup many docstrings.
- PR #16840: Deprecate support for Qt4.
- PR #16899: Remove optional returns from TriAnalyzer._get_compressed_triangulation.
- PR #16618: Use SubplotSpec row/colspans more, and deprecate get_rows_columns.
- PR #15392: Autoscale for ax.arrow()
- PR #14626: Add support for minor ticks in 3d axes.
- PR #16897: Add back missing import.
- PR #14725: Move the debug-mode TransformNode.write_graphviz out.
- PR #15437: Improve handling of alpha when saving to jpeg.
- PR #15606: Simplify OldAutoLocator and AutoDateLocator.
- PR #16863: Shortcut for closing all figures
- PR #16876: Small cleanups to dviread.
- PR #15680: Use more kwonly arguments, less manual kwargs-popping.
- PR #15318: Deprecate unused rcParams["animation.html_args"].
- PR #15303: Make it possible to use rc_context as a decorator.
- PR #16890: Enables hatch alpha on SVG
- PR #16887: Shorter event mocking in tests.

- PR #16881: Validate tickdir strings
- PR #16846: Disconnect manager when resizing figure for animation saving.
- PR #16871: Shorter Path import in setupext.
- PR #16892: Warn in the docs that MouseEvent.key can be wrong.
- PR #16209: Dedupe boilerplate for "adoption" of figure into pyplot.
- PR #16098: Deprecate parameter props of Shadow
- PR #15747: Move Text init to end of Annotation init.
- PR #15679: np.concatenate cleanups.
- PR #16778: Remove more API deprecated in 3.1(part 7)
- PR #16886: Finish removing mentions of idle_event.
- PR #16882: Fix trivial docstring typos.
- PR #16874: Fix pydocstyle D209 (Multi-line docstring closing separate line)
- PR #14044: Remove font preamble caching in TexManager.
- PR #16724: Fixed incorrect colour in ErrorBar when Nan value is presented
- PR #15254: Propagate signature-modifying decorators to pyplot wrappers.
- PR #16868: Update release guide
- PR #14442: In the build, declare all (compulsory) extension modules together.
- PR #16866: Cleanup/update deprecations.
- PR #16850: use validate_[cap/join]style
- PR #16858: Fix various numpydoc style issues
- PR #16848: Cleanup CI setup
- PR #16845: Fix checking of X11 builds with PySide2.
- PR #14199: Deprecate Path helpers in bezier.py
- PR #16838: Inline some more kwargs into setup.py's setup() call.
- PR #16841: Cleanup errorbar subsampling example
- PR #16839: spines doc cleanup
- PR #16844: fix example hist(density=...)
- PR #16827: Fix warnings in doc examples
- PR #16772: Remove more API deprecated in 3.1
- PR #16822: fix bug where make_compound_path kept all STOPs
- PR #16819: Destroy figures by manager instance, not by number.
- PR #16824: Deprecate NavigationToolbar2QT.parent.

- PR #16825: Don't use deprecated Gtk add_with_viewport.
- PR #16816: Merge v3.2.x into master
- PR #16786: Simple cleanups to formatters.
- PR #16807: Update barchart_demo.
- PR #16804: Deprecate some mathtext glue helper classes.
- PR #16808: One more instance of check_in_list.
- PR #16802: Fix incorrect super class of VCentered.
- PR #16789: Update markup for collections docstrings.
- PR #16781: Update image tutorial wrt. removal of native png handler.
- PR #16787: Avoid vstack() when possible.
- PR #16689: Add a fast path for NumPy arrays to Collection.set_verts
- PR #15373: Further shorten quiver3d computation...
- PR #16780: Don't import rcParams but rather use mpl.rcParams (part 3)
- PR #16775: Cleanup axes_divider examples.
- PR #15949: Simplify implementation of SubplotTool.
- PR #14869: Deduplicate code for text-to-path conversion in svg backend.
- PR #16527: Validate positional parameters of add_subplot()
- PR #15622: Cleanup mpl_toolkits locators.
- PR #16744: Reword axes_divider tutorial.
- PR #16746: Reword colorbar-with-axes-divider example.
- PR #15211: Various backend cleanups.
- PR #15890: Remove API deprecated in 3.1 (part 2)
- PR #16757: Simplify interactive zoom handling.
- PR #15515: Combine withEffect PathEffect definitions.
- PR #15977: pgf backend cleanups.
- PR #15981: Reuse colorbar outline and patch when updating the colorbar.
- PR #14852: Use Path.arc() to interpolate polar arcs.
- PR #16686: Deprecate Substitution.from_params.
- PR #16675: Vectorize patch extraction in Axes3D.plot_surface
- PR #15846: Standardize signature mismatch error messages.
- PR #16740: Fix type of `dpi` in docstrings.
- PR #16741: Dedupe RGBAxes examples.

- PR #16755: Reword docstring of panning callbacks, and pass them a MouseButton.
- PR #16749: Document behavior of savefig("extensionless-name").
- PR #16754: Cleanup image.py.
- PR #14606: Generic cleanup to hist().
- PR #16692: Allow MarkerStyle instances as input for lines
- PR #15479: Cleanup axes_rgb.
- PR #16617: Use Path(..., closed=True) more.
- PR #16710: Make format_coord messagebox resize with the window and the content in osx backend
- PR #16681: Simplify docstring interpolation for Box/Arrow/ConnectionStyles.
- PR #16576: Deprecate arg-less calls to subplot_class_factory (and similar factories)
- PR #16652: Deprecate {Locator,Axis}.{pan,zoom}.
- PR #16596: Deprecate dviread.Encoding.
- PR #16231: Deprecate JPEG-specific kwargs and rcParams to savefig.
- PR #16636: Deprecate autofmt_xdate(which=None) to mean which="major".
- PR #16644: Deprecate validate_webagg_address.
- PR #16619: Fix overindented lines.
- PR #15233: backend_ps cleanup.
- PR #16604: Deprecate more rc validators.
- PR #16601: Small unrelated cleanups.
- PR #16584: Rename font_bunch to psfont in textpath.
- PR #16023: Dedupe implementations of fill_between & fill_betweenx.
- PR #16485: Simplify validate_color_for_prop_cycle.
- PR #16285: Deprecate RendererCairo.font{weights,angles}
- PR #16410: Fix support for empty usetex strings.
- PR #11644: Add feature to fallback to stix font in mathtext
- PR #16537: Delay checking for existence of postscript distillers.
- PR #16351: Group all init of Legend.legendPatch together.
- PR #15988: Refactor Annotation properties.
- PR #16421: Shorten the type1-to-unicode name table.
- PR #16200: Deprecate Artist.{set,get}_contains.

- PR #15828: Deprecate support for dash-offset = None.
- PR #16338: Document SymmetricalLogLocator parameters.
- PR #16504: DOC: more pcolor fixes
- PR #15996: Cleanup axes_size.
- PR #16108: Deprecate DraggableBase.on_motion_blit.
- PR #16706: Fix exception causes all over the codebase
- PR #15855: Simplify 3d axes callback setup.
- PR #16219: Simplify CallbackRegistry pickling.
- PR #16002: relax two test tolerances on x86_64
- PR #16063: Make the signature of Axes.draw() consistent with Artist.draw().
- PR #16177: Further simplify setupext.
- PR #16191: Make Figure._axobservers a CallbackRegistry.
- PR #16698: Small edits to toolkits docs.
- PR #15430: Simplify setupext.download_or_cache.
- PR #16694: Lower Text's FontProperties priority when updating
- PR #16511: Add more detailed kwargs docstrings to Axes methods.
- PR #16653: Tutorials: make path/URL option clearer in matplotlibrc tutorial
- PR #16697: Update docstrings for plot_directive.
- PR #16684: Fix exception causes in 19 modules
- PR #16674: Docstring + import cleanups to legend.py.
- PR #16683: Turn mathtext.GlueSpec into a (private) namedtuple.
- PR #16660: Cleanup fancybox_demo.
- PR #16691: Clarify tiny comment re: AnnotationBbox constructor.
- PR #16676: Cleanup animation docstrings.
- PR #16673: DOC: correct title_fontsize docstring
- PR #16669: DOC: update doc release guide
- PR #16563: Parametrize imshow antialiased tests.
- PR #16658: In docs, add multi-axes connectionpatches to Figure, not Axes.
- PR #16647: Update annotation tutorial.
- PR #16638: Remove unused, outdated division operators on jpl_units.
- PR #16509: Add custom math fallback
- PR #16609: Fix exception causes in rcsetup.py

- PR #16637: Update docstrings in figure.py.
- PR #16534: DOC: MaxNLocator and contour/contourf doc update (replaces #16428)
- PR #16597: close #16593: setting ecolor turns off color cycling
- PR #16615: Update custom boxstyles example.
- PR #16610: Added graphviz_docs to conf.py
- PR #16608: Stricter validation of rcParams["axes.axisbelow"].
- PR #16614: Cleanup quiver3d examples.
- PR #16556: Make backend_ps test robust against timestamp changes in ghostscript.
- PR #16602: Cleanup testing.compare.
- PR #16575: Style fix for dynamic axes subclass generation in mpl_toolkits.
- PR #16587: Remove warnings control from tests.py.
- PR #16599: Cleanup dolphin example.
- PR #16586: Deprecate recursionlimit kwarg to matplotlib.test().
- PR #16595: Minor docstring/references update.
- PR #16579: Update usetex_fonteffects example.
- PR #16578: Use rc() less often in examples/tutorials.
- PR #16572: Remove some remnants of hist{,2d}(normed=...).
- PR #16491: Expire the _rename_parameters API changes.
- PR #14592: In SecondaryAxis.set_functions, reuse _set_scale's parent scale caching.
- PR #16279: STY: Fix underindented continuation lines.
- PR #16549: Improve documentation for examples/widgets/textbox.py
- PR #16560: Update URL to pyparsing.
- PR #16292: More edits to Normalize docstrings.
- PR #16536: API/TST: minimum versions
- PR #16559: 3D example avoid using statefull .gca()
- PR #16553: DOC: clarify the expected shapes of eventplot input
- PR #16535: Clarify docs of num parameter of plt.figure()
- PR #16547: Reformat/reword mathtext docstrings.
- PR #16545: Add a smoketest for ps.usedistiller="xpdf".
- PR #16529: Deprecate toggling axes navigatability using the keyboard.

- PR #16521: Remove more API deprecated in 3.1.
- PR #16481: Update set_thetalim documentation
- PR #16524: Cleanup docstrings
- PR #16540: Cleanup imports
- PR #16429: CI: update codecov
- PR #16533: Recommend to amend pull requests
- PR #16531: Also deprecate ignorecase ValidateInStrings.
- PR #16428: DOC: MaxNLocator and contour/contourf doc update
- PR #16525: Don't import rcParams but rather use mpl.rcParams (part 2)
- PR #16528: Improve test failure messages on warnings.
- PR #16393: Shorten PyFT2Font_get_charmap.
- PR #16483: Deprecate most ValidateInStrings validators.
- PR #16523: Reorder mathtext rcparams in matplotlibrc template.
- PR #16520: Update a comment re: minimum version of numpy working around bug.
- PR #16522: Fix deprecation warning
- PR #16515: Fix doc for set_{x,y}label, and then some more.
- PR #16516: Fixes to boxplot() docstring & error messages.
- PR #16508: Multi-dim transforms are non-separable by default.
- PR #16507: Factor out common parts of `__str__` for Transform subclasses.
- PR #16514: Various delayed PR reviews
- PR #16512: Fix a bunch of random typos.
- PR #16510: Doc markup cleanups.
- PR #16500: Dedupe timer attribute docs.
- PR #16503: DOC: suppress warning on pcolor demo
- PR #16495: Deemphasize basemap in user-facing docs.
- PR #16484: Don't forget to set stretch when exporting font as svg reference.
- PR #16486: Simplify validate_color, and make it slightly stricter.
- PR #16246: Avoid using FontProperties when not needed.
- PR #16432: Prefer geomspace() to logspace().
- PR #16099: Consistently name callback arguments event instead of evt
- PR #16477: Remove some APIs deprecated in mpl3.1.

- PR #16475: Use vlines() and plot(), not stem(), in timeline example.
- PR #16474: Switch default of stem(use_line_collection=...) to True.
- PR #16467: Convert named_colors example to use Rectangle
- PR #16047: Remove more API deprecated in 3.1
- PR #16373: Fix usetex_baseline_test.
- PR #16433: Simplify demo_curvelinear_grid2.
- PR #16472: Fix mplot3d projection
- PR #16092: Deprecate clear_temp param/attr of FileMovieWriter.
- PR #15504: Warn when trying to start a GUI event loop out of the main thread.
- PR #15023: Simplify formatting of matplotlibrc.template.
- PR #13535: Validate inputs to ScalarMappable constructor
- PR #16469: FIX: colorbar minorticks when rcParams['x/ytick.minor.visible'] = True
- PR #16401: BLD: Auto-detect PlatformToolset
- PR #16024: Keep parameter names in preprocess_data.
- PR #13390: Make sure that scatter3d copies its inputs.
- PR #16107: Deprecate DraggableBase.artist_picker.
- PR #16455: Update some docstrings in colors.py
- PR #16456: Enable more font_manager tests to be run locally.
- PR #16459: Update backend dependency docs.
- PR #16444: Dedupe spectral plotting tests.
- PR #16460: Remove some mentions of avconv, following its deprecation.
- PR #16443: Parametrize some spectral tests.
- PR #16204: Expire deprecation of mathcircled
- PR #16446: Replace matshow baseline test by check_figures_equal.
- PR #16418: Backend timer simplifications.
- PR #16454: Use pytest.raises(match=...)
- PR #14916: Make kwargs names in scale.py not include the axis direction.
- PR #16258: ENH: add shading='nearest' and 'auto' to `pcolormesh`
- PR #16228: Allow directly passing explicit font paths.
- PR #16445: Remove a bunch of imports-within-tests.
- PR #16440: Expire deprecation of stackrel.

- PR #16439: Rework pylab docstring.
- PR #16441: Rework pylab docstring.
- PR #16442: Expire deprecation of stackrel.
- PR #16365: TST: test_acorr (replaced image comparison with figure comparion)
- PR #16206: Expire deprecation of stackrel
- PR #16437: Rework pylab docstring.
- PR #8896: Fix mplot3d projection
- PR #16430: Remove unnecessary calls to np.array in examples.
- PR #16407: Remove outdated comment re: PYTHONHASHSEED and pytest.
- PR #16225: Cleanup animation examples.
- PR #16336: Include axline() in infinite lines example
- PR #16395: Add set/get for ellipse width/height
- PR #16431: CI: add py38 to azure matrix
- PR #16415: Expire some APIs deprecated in mpl3.1.
- PR #16425: MNT: rename internal variable
- PR #16427: Style-fix some examples and update .flake8 per-file-ignores.
- PR #16423: Slightly improve streamplot code legibility.
- PR #16414: DOC: Fix `axes:plot` method docstring verb tense
- PR #16408: Deprecate avconv animation writers.
- PR #16406: Don't import rcParams but rather use mpl.rcParams.
- PR #16326: Cleanup stack
- PR #16193: Catch shadowed imports in style checks.
- PR #16374: Log about font manager generation beforehand.
- PR #16372: Dedupe ImageGrid doc from tutorial and docstring.
- PR #16380: "gif" third-party package added to the extension page
- PR #16327: Cleanup list copying
- PR #16366: Special-case usetex minus to zero depth.
- PR #16350: TST: Improved test (getting rid of image comparison test for test_titletwiny)
- PR #16359: Make Text.update_from copy usetex state.
- PR #16355: typo in `ticker.ScalarFormatter` doc
- PR #15440: Use rcParams to control default "raise window" behavior (Qt,Gtk,Tk,Wx)

- PR #16302: Cleanup Legend._auto_legend_data.
- PR #16329: ENH: add zorder kwarg to contour clabel (and a better default value for zorder)
- PR #16341: Remove mention of now-removed --verbose-foo flags.
- PR #16265: Fix spy(..., marker=<not-None>, origin="lower")
- PR #16333: Document animation HTML writer.
- PR #16334: Fix doc regarding deprecation of properties.
- PR #16335: Fix some more missing references.
- PR #16304: Simplify Legend.get_children.
- PR #16309: Remove duplicated computations in Axes.get_tightbbox.
- PR #16314: Avoid repeatedly warning about too many figures open.
- PR #16319: Put doc for XAxis befor YAxis and likewise for XTick, YTick.
- PR #16313: Cleanup constrainedlayout_guide.
- PR #16312: Remove unnecessary Legend._approx_text_height.
- PR #16307: Cleanup axes_demo.
- PR #16303: Dedupe Legend.draw_frame which is the same as set_frame_on.
- PR #16261: TST: move the Qt-specific handling to conftest
- PR #16297: DOC: fix description of vmin/vmax in scatter
- PR #16288: Remove the private, unused _csv2rec.
- PR #16281: Update/cleanup pgf tutorial.
- PR #16283: Cleanup backend_agg docstrings.
- PR #16282: Replace "unicode" by "str" in docs, messages when referring to the type.
- PR #16289: axisartist tutorial markup fixes.
- PR #16293: Revert "Fix doc CI by pointing to dev version of scipy docs."
- PR #16287: Improve markup for rcParams in docs.
- PR #16271: Clean up and clarify Normalize docs
- PR #16290: Fix doc CI by pointing to dev version of scipy docs.
- PR #16276: Cleanup docstring of print_figure, savefig.
- PR #16277: Prefer using MouseButton to numeric values in docs and defaults.
- PR #16270: numpydoc-ify SymLogNorm
- PR #16274: Tiny cleanups to set_xlabel(..., loc=...).
- PR #16273: DOC: Changing the spelling of co-ordinates.

- PR #15974: Enable set_{x|y|}label(loc={'left'|'right'|'center'}...)
- PR #16248: Update matplotlib.__doc__.
- PR #16262: Dedupe update of rcParams["backend"] in use() and in switch_backend()
- PR #9629: Make pcolor(mesh) preserve all data
- PR #16254: DOC: pdf.preamble --> pgf.preamble
- PR #16245: Cleanup image docs
- PR #16117: CI: Unify required dependencies installation
- PR #16240: Cleanup custom_scale example.
- PR #16227: Make Animation.repeat_delay an int, not an int-or-None.
- PR #16242: CI: Remove PYTHONUNBUFFERED=1 on Appveyor
- PR #16183: Remove some baseline images for plot() tests.
- PR #16229: And more missing refs.
- PR #16215: Concise dates test
- PR #16233: Reword ScalarFormatter docstrings.
- PR #16218: Cleanup animation docs.
- PR #16172: And more missing references.
- PR #16205: Deprecate the empty matplotlib.compat.
- PR #16214: Fix overindented line in AnchoredOffsetbox doc.
- PR #15943: Deprecate the TTFPATH & AFMPATH environment variables.
- PR #16039: Deprecate unused features of normalize_kwargs.
- PR #16202: Remove outdated statement in tight_layout guide.
- PR #16201: UnCamelCase examples.
- PR #16194: Numpydoc ticklabel_format.
- PR #16195: Numpydoc ContourSet.find_nearest_contour.
- PR #16198: Remove em dash
- PR #16199: Do not use camel case for variables in examples
- PR #15644: Rewrite cursor example to include speedup possibilities
- PR #16196: Cleanup patches docstrings.
- PR #16184: Expire a mpl2.2-deprecated API
- PR #16188: Remove ref. to non-existent method in animation tests.
- PR #16170: Deprecate old and little used formatters.

- PR #16187: Fix overly long lines in examples & tutorials.
- PR #15982: Colorbar cleanup.
- PR #16154: Deprecate setting pickradius via set_picker
- PR #16174: Numpydocify artist.getp().
- PR #16165: Remove rcParams deprecated in mpl3.0/3.1.
- PR #16141: Update _base.py
- PR #16169: Add missing spaces after commas.
- PR #15847: Remove some dead branches from texmanager code.
- PR #16125: Fix more missing references again.
- PR #16150: Simplify transforms addition.
- PR #16152: Inline _init_axes_pad into Grid.__init__.
- PR #16129: Deprecate some Transform aliases in scale.py.
- PR #16162: (Mostly) avoid the term "command" in the docs.
- PR #16159: Simple cleanups for contour.py.
- PR #16164: Fix trivial typo in deprecation warning message.
- PR #16160: Cleanup hist() docstring.
- PR #16149: DOC: reword density desc in `ax.hist`
- PR #16151: Remove outdated comment re: blended transforms.
- PR #16102: Rework example "Scatter Star Poly" to "Marker examples"
- PR #16134: Validate Line2D pickradius when setting it, not when reading it.
- PR #15019: Add step option where='edges' to facilitate pre-binned hist plots
- PR #16142: Avoid using np.r_, np.c_.
- PR #16146: Remove LICENSE_CONDA.
- PR #16133: Reword docstring of Line2D.contains.
- PR #16120: Minor fontproperty fixes.
- PR #15670: Reuse Grid.__init__ in ImageGrid.__init__.
- PR #16025: Deprecate update_datalim_bounds.
- PR #16001: Remove parameters deprecated in 3.1
- PR #16049: Add __repr__ to SubplotSpec.
- PR #16100: Consistently name event callbacks on_[event]
- PR #16106: In DraggableLegend, inherit DraggableBase.artist_picker.
- PR #16109: Name Axes variables ax instead of a

- PR #16115: Fix more missing references.
- PR #16096: Deprecate unused parameters
- PR #16085: Improve docstrings in offsetbox.py
- PR #16097: Cleanup unused variables
- PR #16101: Fix incorrect doc regarding projections.
- PR #16095: Deprecate MovieWriter.{exec,args}_key, making them private.
- PR #16078: Refactor a bit animation start/save interaction.
- PR #16081: Delay resolution of animation extra_args.
- PR #16088: Use C++ true/false in ttconv.
- PR #16082: Defaut to writing animation frames to a temporary directory.
- PR #16070: Make animation blit cache robust against 3d viewpoint changes.
- PR #5056: MNT: more control of colorbar with CountourSet
- PR #16051: Deprecate parameters to colorbar which have no effect.
- PR #16045: Use triple-double-quotes for docstrings
- PR #16076: Cleanup path_editor example.
- PR #16059: Simplify colorbar test.
- PR #16072: Cleanup category.py docstrings.
- PR #15769: scatter() should not rescale if norm is given
- PR #16060: Cleanup pcolor_demo.
- PR #16057: Trivial docstring fix for cbook.deprecated.
- PR #16043: Simplify some comparisons
- PR #16044: Code style cleanup
- PR #15894: rcsetup cleanups.
- PR #16050: Unbreak CI.
- PR #16034: Update comments re: colors._vector_magnitude.
- PR #16035: Make eventplot use the standard alias resolution mechanism.
- PR #15798: Better default behavior for boxplots when rcParams['lines.marker'] is set
- PR #16004: Improve documentation of text module
- PR #15507: Use FixedFormatter only with FixedLocator
- PR #16008: Remove unused imports
- PR #16036: Rely on pytest to record warnings, rather than doing it manually.

- PR #15734: Fix home/forward/backward buttons for 3d plots.
- PR #16038: Cleanup contour_demo.
- PR #15998: Join marker reference and marker fiillstyle reference
- PR #15976: Cleanup span_where.
- PR #15990: Remove deprecated support for setting single property via multiple aliases
- PR #15940: Some unicode-support related cleanups.
- PR #15836: Compactify a bit the EventCollection tests.
- PR #16013: Relayout some conditions in axes_grid.
- PR #16010: Inherit the Artist.draw docstring in subclasses.
- PR #16017: Document support for no-args plt.subplot() call.
- PR #16014: Simplify calls to AxesGrid/ImageGrid.
- PR #16012: Normalize aspect="equal" to aspect=1 in the setter.
- PR #15997: Shorten wx _onMouseWheel.
- PR #15993: Style fixes for axes_divider.
- PR #15989: Simplify Artist.update.
- PR #16015: Some small extension cleanups
- PR #16011: Replace axes_size.Fraction by multiplication.
- PR #15719: Templatize spectral helpers.
- PR #15995: Remove toolkit functions deprecated in 3.1
- PR #16003: prevent needless float() conversion
- PR #16000: De-deprecate *min/*max parameters to set_x/y/zlim()
- PR #15684: Avoid RuntimeError at wx exit.
- PR #15992: Avoid using np.matrix.
- PR #15961: Be more opinionated for setting up a dev env.
- PR #15991: Avoid setting dtypes as strings...
- PR #15985: Remove unnecessary :func:, :meth: from examples markup.
- PR #15983: Fix some examples docstrings.
- PR #15979: Remove references to scipy cookbook.
- PR #15966: FIX: check subplot kwargs
- PR #15947: Merge the two usetex demos.
- PR #15939: Exceptions should start with a capital letter

- PR #15948: Use rc_context more.
- PR #15962: Add tests for IndexFormatter
- PR #15965: Test registering cmaps
- PR #15950: Remove deprecated TextWithDash
- PR #15942: Update docs of type1font
- PR #15927: Trying to set the labels without setting ticks through pyplot now raises TypeError*
- PR #15944: Minor doc cleanups
- PR #15945: Do not use "object" or "instance" when documenting types
- PR #15897: Cleanup TriAnalyzer docs
- PR #15777: Don't bother disconnecting idle_draw at gtk shutdown.
- PR #15929: Remove unused cbook._lockstr.
- PR #15935: Raise an ValueError when Axes.pie accepts negative values #15923
- PR #15895: Deprecate unused illegal_s attribute.
- PR #15900: Rewrite test_cycles to avoid image comparison tests.
- PR #15892: Update docs of backend_manager
- PR #15878: Remove API deprecated in 3.1
- PR #15928: DOC: use markers as slanted breaks in broken axis example
- PR #14659: Update some widget docstrings.
- PR #15919: Remove mod_python specific code.
- PR #15883: Improve error when passing 0d array to scatter().
- PR #15907: More docstrings cleanup.
- PR #15906: Cleanup legend docstrings.
- PR #15776: Improve doc for data kwarg.
- PR #15904: Deemphasize ACCEPTS blocks in documenting_mpl docs.
- PR #15891: Mark self.* expressions in docstrings as literal
- PR #15875: Deprecate implicit creation of colormaps in register_cmap()
- PR #15885: Cleanup text.py docstrings.
- PR #15888: Cleanup backend_bases docs.
- PR #15887: Fix AnnotationBbox docstring.
- PR #15858: Avoid some uses of len-1 tuples.
- PR #15873: Standardize parameter types in docs

- PR #15874: Cleanup backend_bases docs
- PR #15876: Deprecate case-insensitive capstyles and joinstyles.
- PR #15877: Suppress exception chaining on rc validator failure.
- PR #15880: Use True/False instead of 0/1 as booleans in backend_ps.
- PR #15827: Fix validation of linestyle in rcparams and cycler.
- PR #15850: Docstrings cleanup in matplotlib.axes
- PR #15853: np.abs -> (builtins).abs
- PR #15854: Simplify Axes3D init.
- PR #15822: More cleanup defaults in docstrings
- PR #15838: Remove some references to Py2.
- PR #15834: Optimize colors.to_rgba.
- PR #15830: Allow failure on nightly builds.
- PR #15788: Fixes pyplot xticks() and yticks() by allowing setting only the labels
- PR #15805: Improve docs on figure size
- PR #15783: Fix stepfilled histogram polygon bottom perimeter
- PR #15812: Cleanup defaults in docstrings
- PR #15804: Cleanup many docstrings.
- PR #15790: Update docs of PolyCollection
- PR #15792: Cleanup dviread docs.
- PR #15801: Cleanup some references to rcParams in docs.
- PR #15787: Cleanup `Colormap.__call__`.
- PR #15766: Shorten description on search page
- PR #15786: Slightly clarify the implementation of safe_masked_invalid.
- PR #15767: Update badges in README.rst
- PR #15778: Fix typos and comma splices in legend guide
- PR #15775: Some pathlibification.
- PR #15772: Directly dedent the spectral parameter docs.
- PR #15765: Reword some docstrings.
- PR #15686: Simplify and unify character tracking in pdf and ps backends (with linked fonts)
- PR #9321: Add Axes method for drawing infinite lines
- PR #15749: Fix travis links in README

- PR #15673: Rely on findfont autofallback-to-default in pdf/ps backends.
- PR #15740: Small animation cleanup.
- PR #15739: ImageMagick animators now can use extra_args
- PR #15591: Remove FAQ on 'Search' -- already referenced in search file
- PR #15629: Consistently use realpaths to build XObject names
- PR #15696: Improve mathtext.fontset docs and fix :mathmpl: cache bug.
- PR #15721: Render default values in :rc: directive as literal
- PR #15720: Suppress triage_tests warning on Py3.8.
- PR #15709: Make 3d plot accept scalars as arguments.
- PR #15711: Don't explicitly list scalez kwarg in Axes3D constructor and docs.
- PR #14948: Simplify Tick and Axis initialization.
- PR #15693: Also test PySide2 on CI.
- PR #15701: Tried to solve Issue #15650: Print URL when webbrowser.open Fails
- PR #15704: Fix more broken refs.
- PR #15687: Add tooltips to HTML animation controls
- PR #15592: Offset text position
- PR #15697: Fix some broken doc refs.
- PR #15700: Parametrize some spectral tests.
- PR #15699: Fix some incorrect ValueErrors.
- PR #15698: Bump numpy dependency to >=1.15.
- PR #15694: Handle upcoming deprecation of np.float.
- PR #15691: Correctly handle high dpi in Pillow animation writer.
- PR #15676: Doc adopt nep29
- PR #15692: Update FUNDING.yml
- PR #15645: Bump minimal numpy version to 1.12.
- PR #15646: Hide sphinx-gallery config comments
- PR #15642: Remove interpolation="nearest" from most examples.
- PR #15671: Don't mention tcl in tkagg commments anymore.
- PR #15607: Simplify tk loader.
- PR #15651: Simplify axes_pad handling in axes_grid.
- PR #15652: Remove mention of Enthought Canopy from the docs.

- PR #15655: Remove outdated license files.
- PR #15639: Simplify axes_grid.Grid/axes_grid.ImageGrid construction.
- PR #15640: Remove some commented-out code from axes_grid.
- PR #15643: Fix examples claiming matplotlib can't plot np.datetime64.
- PR #15375: Add note to hist docstring about speed
- PR #15461: Fix invalid checks for axes_class parameter in ImageGrid.
- PR #15635: Deprecate "U" mode passed to cbook.to_filehandle().
- PR #15563: In backend_pgf, directly open subprocess in utf8 mode.
- PR #15462: Simplify azure setup.
- PR #13075: Remove logic for optionally building Agg and TkAgg.
- PR #15262: Declare qt figureoptions tool in toolitems.
- PR #15292: Shorten RendererWx.get_wx_font.
- PR #15569: Allow linking against a system qhull as well.
- PR #15589: Make sure that figures are closed when check_figures_equal finishes
- PR #15465: Validate and simplify set_tick_params(which=...)
- PR #15090: Coerce MxNx1 images into MxN images for imshow
- PR #15578: BLD: set the max line length on the flake8 config
- PR #15564: Use True instead of 1 as filternorm default
- PR #15536: Add a backend kwarg to savefig.
- PR #15571: Cleanup following using Pillow as universal image reader
- PR #15476: Default to local_freetype builds.
- PR #15557: Skip failing pgf test when sfmath.sty is not present.
- PR #15555: Add pgf to list of builtin backends in docs.
- PR #15534: BLD: update pillow dependency
- PR #15427: Separate plots using #### in demo_fixed_size_axes.py
- PR #15505: Cleanup axisartist tutorial.
- PR #15506: Rename locator.den to the clearer locator.nbins in mpl_toolkits.
- PR #15502: Get rid of trivial compiler warning.
- PR #15451: Ci py38
- PR #15484: Cleanup docs regarding compilers.
- PR #15467: Validate locator_params(axis=...)

- PR #15330: Add axes method for drawing infinite lines.
- PR #15482: Trivial style fixes to constrained_layout.
- PR #15418: Use correct pip/pytest on azure
- PR #15466: Update tick_params() docs
- PR #15463: Remove staticbuild option from setup.cfg.template.
- PR #15378: Don't link ft2font to zlib by default.
- PR #15270: When no gui event loop is running, propagate callback exceptions.
- PR #15447: Move testing of Py3.8 to Travis.
- PR #15431: Fix range(len()) usages
- PR #15390: Simplify implementation of vectorized date operations.
- PR #15403: Fix DeprecationWarning in nightly testing
- PR #15394: Deprecate {NonUniformImage,PcolorImage}.is_grayscale.
- PR #15400: Updated INSTALL.rst to correct install commands
- PR #13788: Autoscale for ax.arrow()
- PR #15367: Update the readme on providing API changes
- PR #15193: Switch to using pillow for png as well.
- PR #15346: vectorized calc_arrow loop in quiver
- PR #15011: Adding example for drawstyle
- PR #15371: Deprecate Colorbar.config_axis()
- PR #15361: Update next API changes to new structure
- PR #15274: NavigationToolbar2Tk: make packing optional.
- PR #15158: Change the way API changes are documented
- PR #15356: Fix broken imports.
- PR #15200: Simplify SubplotParams.update().
- PR #15210: Explicitly list allowed "unused" imports, remove the rest.
- PR #15348: Some figure and related docs cleanup
- PR #13355: Simplify and generalize BezierSegment.
- PR #14917: ENH: box aspect for axes
- PR #14949: Use fix_minus in format_data_short.
- PR #15341: Move non-gui warning message to backend_bases.
- PR #15335: Add discourse link to readme
- PR #15293: Fixes for wx savefig dialog.

- PR #15324: Update PR guidelines
- PR #15301: Update colorbar docs
- PR #15340: Always attach a manager attribute (possibly None) on canvas.
- PR #15319: Make validate_movie_writer actually check registered writers.
- PR #10973: PGF: Replace pgfimage by includegraphics to fix import regression
- PR #15302: fix warning used by cbook.warn_deprecated()
- PR #15321: Sort missing_references.json.
- PR #15290: Unify fig.delaxes(ax) and ax.remove().
- PR #15309: Simplify sca().
- PR #15201: Autogenerate gca(), gci() from boilerplate.py.
- PR #15305: Autogenerate footer Copyright year
- PR #15294: Replace custom logging in wx by stdlib logging.
- PR #15288: More properties aliases.
- PR #15286: throw deprecation warning on empty call to fig.add_axes()
- PR #15282: Colorbar cleanup.
- PR #15250: Cleanup font_manager.
- PR #13581: Cleanup _pylab_helpers.
- PR #15273: DOC: don't use term units in transform tutorial
- PR #15263: Correctly setup comparisons in test_compare_images.
- PR #15226: Turn gtk3 pan/zoom button into togglable buttons.
- PR #14609: Simplify implementation of set_{x,y}bound.
- PR #15261: Change layout of test_triager to avoid cropping images.
- PR #15236: Dedupe SubplotSpec construction in mpl_toolkits.
- PR #14130: Add decorator to inherit keyword-only deprecations
- PR #15249: In findfont(fallback_to_default=False), throw if default font is missing
- PR #15175: Simplify pdf image output.
- PR #7506: [WIP] Add Axes method for drawing infinite lines.

Issues (198):

- #16501: Setting a thetalim > 2pi gives odd results
- #15035: security exposure in the packaged jquery library
- #10375: Coordinate text wrapping in navigation toolbar

- #10720: Option to set the text color in legend to be same as the line
- #17868: plt.bar with nan input fails rendering in notebook using 3.3.0rc1
- #17773: gtk3 rubberband is invisible
- #5726: Cursor displays x, y coordinates with too much or too little precision
- #5164: Sort out qt_compat
- #17905: macosx backend warns when using the zoom method
- #17703: QuadMesh.get_clim changed behavior in 3.3.0rc1
- #17875: animation.writers['ffmpeg']" is hung when run in background.
- #17591: Single-character colors do not match long names
- #16905: if pie normalizes depends on input values
- #17829: trunk fails to build in AIX
- #17820: Regression: _reshape_2D no longer preserves the shape of lists of lists of one scalar each
- #17807: "%matplotlib notebook" Download is Noise After Interacting with Plot
- #17763: matplotlib.use('agg', force=True) does not ignore unavailable configured backend
- #17586: Surprising datetime autoscaling after passing empty data
- #17792: when using plt.tight_layout(), figure title overlaps subplot titles
- #17736: ax.set_xticklabels([]) for categorical plots is broken in 3.3.0rc1
- #17757: Plotting Hist with histtype 'stepfilled' does not respect bottom correctly
- #17744: BUG: AttributeError: 'FigureCanvasBase' object has no attribute 'print_png' in 3.3rc0
- #17730: Using backend Template and plt.tight_layout raises UnboundLocalError
- #17716: Error using "set_window_title" for canvas via backend_qt5agg
- #17681: PDF cannot be built due to Zenodo SVGs
- #17627: AttributeError: 'Figure' object has no attribute '_cachedRenderer'
- #17658: Feature request: Add advanced zoom and inspect feature to GUI for more productivity
- #17629: Use of Python deprecated APIs.
- #17670: BUG: Setting ticksize xx-small broken by #17348
- #17673: RuntimeError: latex was not able to process the following string: b'$\\mathdefault{-2}$'
- #17412: Document the dependency on the type1ec LaTeX package

- #17643: AutoDateLocator docs has a typo
- #9118: make TeXManager more user-configurable
- #11131: Make pyplot.pause not give focus to the figure window
- #17646: more conservative setattr_cm broke mplcairo
- #17634: Cannot copy LinearSegmentedColormap
- #16496: Single path optimisation for Collection w/ offsets broken
- #192: Savefig does not issue a warning on a non-existent keyword n
- #17624: _DummyAxis needs a __name__ attribute for ScalarFormatter
- #16910: Axes.imshow draws invalid color at value is 0 when max of 'X' not equal to vmax
- #17637: streamplot and sticky edges interaction
- #17633: Stackplot fails for small numbers
- #17616: waitforbuttonpress in Linux
- #17615: small bug in documentation of backend.FigureCanvasBase.start_event_loop
- #17093: Zero size figure use case
- #17608: How avoid PyQt5 to crash when I move Qslitter to the edge with a matplotlib figure in it?
- #9829: Vertices clipped for certain markers when plotting more than two points and saving as pdf
- #15815: bar3d color length bug
- #15376: ScalarFormatter.set_powerlimits documentation seems inconsistent
- #17595: Master doc builds broken
- #16482: Pyplot hlines and vlines do not use the 'lines.color' property in rcParams by default
- #16388: rethink how we display DOI svg badges
- #17172: set_aspect for 3D plots
- #16463: Jupyter "inline" backend seems to misinterpret "figsize" with Axes3D
- #17527: The markers are not hollow when I use ax.scatter() and set markers.MarkerStyle()'s fillstyle to 'none'. My usage is wrong?
- #7491: sort out if the high-resolution ellipse code still works
- #17398: Plotting an error band along a curve
- #8550: Matplotlib chooses the wrong font for unrecognized weights

- #8788: Font issue: findfonts should differentiate between thin and regular ttf fonts
- #10194: legend is not present in the generated image if I use 'tight' for bbox_inches
- #17336: set_url without effect for instances of Line2D
- #9695: set_url() without effect in the plot for instances of Tick
- #17192: How to change the thickness of the marker "x" when using scatter?
- #17507: pyplot.savefig() throwing warning suggesting a bug (possibly in figManger)
- #17502: dict unpacking broken for `.plot` in 3.2
- #15546: plt.imshow: clip_on=False has no effect
- #17023: DOC: Tutorial/Sample plots should use same fig/axis creation method
- #7537: Conflict between different AGG static libraries in a same binary
- #16836: Dropping support for PyQt4; preparing support for PyQt6.
- #17455: LightSource.shade fails on a masked array
- #16353: BUG: VisibleDeprecationWarning in boxplot
- #11820: Compressed Triangulation Masking in CubicTriInterpolator
- #11823: Animation Examples
- #15410: Change in OSX Catalina makes matplotlib + multiprocessing crash
- #17467: Bug Report: saved Figure ignores figure.facecolor
- #17343: Regression in add_subplot..
- #7093: ordering issues between `set_xmargin` and `set_xscale`
- #13971: Unnecessary drawing with NbAgg
- #17432: Scatter accepts marker=MarkerStyle(), but plot does not
- #15675: Boxplot line color with style dark_background should be bright
- #5962: No output from pyplot on cygwin64 python3 virtualenv
- #17393: TexManager.get_rgba fails
- #5830: Incorrect overlap of markers in scatter3D
- #11937: Limiting ticks on colorbar axes falsify tick labels.
- #17354: Converter detection fails for inkscape if on headless system without DISPLAY
- #17352: Zoom In-Out not behaving as expected in QT backend example
- #15409: Datetime plot fails with 'Agg' backend in interactive mode

- #14155: Adding GridSpec.subplots?
- #16583: matplotlibrc validates some parameters wrongly
- #16946: Pick_event on AnnotationBbox fires at wrong position
- #15131: set_size_inches doesn't resize window on macosx backend
- #7619: Figure background colors
- #15899: Describe possible kwargs that may be input into a function
- #17304: constrained-layout gives wrong results when explicitly equal width ratios are set
- #17295: DOC: https://matplotlib.org/api/_as_gen/matplotlib.quiver.Quiver.html
- #17294: DOC: matplotlib.axes.Axes.annotate.html
- #17290: backend_svg fails with dashed line style
- #16677: tmp_config_or_cache_dir atexit cleanup fails after forks()
- #15091: Turbo color map
- #7372: Moving get_ax and do_event to testing
- #15225: Show offset text on subplots after sharing axis
- #7138: misplaced spines in dates plot
- #17243: Misleading error message in _parse_scatter_color_args
- #16461: Hexbin if singular and mincnt used
- #14596: forward port jquery removal from ipympl
- #17217: Transform operators are not publicly documented....
- #2253: matplotlib makes python lose focus
- #7184: margins does not handle bézier curves
- #16830: `_path.get_extents` does not correctly handle bezier curves
- #17176: Print figure using PS backend is needlessly slow
- #17141: flake8-docstrings does not check all of our requirements
- #16567: Let legend get the handles from the provided objects if not specified explicitly.
- #16805: Titles cannot be padded to negative numbers anymore.
- #17114: `add_axes` shows deprecation warning when called with only `kwargs`
- #16885: Change return type get_{x,y}ticklabels to plain list
- #17044: widgets.TextBox continuously creates new text objects and linecollection objects.
- #17066: documentation of animation contains non-working code example

- #16588: Rename next_api_changes to api_changes_3.x (whatever number makes sense)
- #17015: `get_major_ticks` docs missing return type
- #16976: Thin line color distortion on large scale
- #16934: gtk3 window immediately resizes down to zero-height upon showing up.
- #16941: test_determinism_check is failing (sometimes)
- #16982: pyplot.rgrids don't do anything
- #16952: How to solve an error of "ValueError: Key backend: Unrecognized backend string '"agg"'
- #15272: Axes.violinplot has small issue in using pandas.DataFrame without index 0.
- #16926: tk window immediately resizes down to zero-height upon showing up.
- #16919: wx backends don't send close_event if window is closed via "q" keypress
- #16854: small typo in the documentation
- #16895: offset text still visible with ImageGrid axis "L"
- #12712: Autoscale does not work for ax.arrow()
- #14208: shift + w does not close all figures (has no effect)
- #15745: Failed to add annotate to figure
- #11432: Pressing the "1" key kills the zoom/pan tool
- #13799: BUG: incorrect error bar colors when NaN values are present
- #16185: hist demo appears to incorrectly mention `normed` and something odd about `density` as well.
- #15203: Closing figures is done by number
- #16016: Better argument checking of subplot definition in `add_subplot()`
- #15980: Is the reset of the colorbar's edgecolor when updating the corresponding image clim wanted behaviour?
- #16718: Float figure DPI
- #16498: long string of format_coord in osx backend
- #8405: BUG: PDF export seems wrong with dash sequences that include a None offset
- #8619: Feature request: allow mathtext fallback font other than Computer Modern for custom mathtext setup
- #14996: format error saving eps figure using custom linestyle
- #16493: Example/tutorials warn due to new pcolormesh shading

- #16022: Cleanup Artist.draw() signatures
- #16389: “Size” ignored if placed before fontproperties
- #16687: Creating a figure of size (0, 0) raises an error
- #12729: Docs for contour levels argument is incorrect
- #16593: specifying ecolor in errobar turns off cycling
- #15621: secondary_xaxis doesn't seem to use formatters
- #16116: travis36minver.txt needs an update
- #16546: Problem with eventplot - error message claims events & lineoffsets are unequal sizes
- #16462: Allow wedges of polar plots to include theta = 0.
- #15142: pyplot.annotate() API deprecation
- #16479: font-stretch property missing in svg export
- #14304: 'NSWindow drag regions should only be invalidated on the Main Thread!' - macos/python
- #12085: Tcl_AsyncDelete: async handler deleted by the wrong thread
- #14669: cm.ScalarMappable should fail early when norm input is wrong
- #16468: incorrect cbar minor ticks for extend regions when x/ytick.minor.visible is True
- #16243: windows builds: devenv freetype /update appears not to have an effect
- #11525: Axes3D scatter plot for Numpy arrays in F-order does not give correct z-values
- #8894: mplot3d projection results in non-orthogonal axes
- #1104: Resizing a GUI window with Axes3D
- #16371: Incomplete documentation in axes_grid1
- #6323: Vertical alignment of tick labels with usetex=True
- #7957: clabel not respecting zorder parameter
- #16252: axes.spy plotting function doesn't respect origin='lower' kwarg when marker is not None
- #16299: The interactive polar plot animation's axis label won't scale.
- #15182: More tests `ConciseDateFormatter` needed
- #16140: Unclear Documentation for get_xticklabels
- #16147: pp.hist parmeter 'density' does not scale data appropriately
- #16069: matplotlib glitch when rotating interactively a 3d animation
- #14603: Scatterplot: should vmin/vmax be ignored when a norm is specified?

- #15730: Setting lines.marker = s in matplotlibrc also sets markers in boxplots
- #11178: home/back/forward buttons do nothing in 3d mode
- #14520: pylab with wx backend not exiting cleanly
- #15964: Guard `plt.subplot` kwargs a bit better?
- #15404: Add python 3.8 tests
- #15773: Warning:... GLib.source_remove(self._idle_draw_id) when using plt.savefig()
- #15923: pie takes negative values
- #10317: Setting plt.rc('text', usetex=True) after ticker.ScalarFormatter(useMathText=True) causes Error
- #15825: Customised dashed linstyle in matplotlib.cycler throws ValueError when using in Axes.set_prop_cycle
- #9792: Error with linestyles rcParams entries under the form (on, off, ...) and a style context manager
- #15782: Invalid polygon in stepfilled histogram when bottom is set
- #15628: Invalid unicode characters in PDF when font is a symlink
- #8577: mplot3D scalar arguments for plot function
- #15650: URL is not shown when webagg failed to open the browser.
- #5238: the offset of the scientific notation in xaxis stays at bottom when axis is set to top
- #15678: Error at save animation with pillow
- #15079: check_figures_equal decorator reuses figures if called multiple times inside a single test.
- #15089: Coerce MxNx1 images into MxN images for imshow
- #5253: abline() - for drawing arbitrary lines on a plot, given specifications.
- #15165: Switch to requiring Pillow rather than having our own png wrapper?
- #15280: Add pull request checklist to Reviewers Guidlines
- #15289: cbook.warn_deprecated() should warn with a MatplotlibDeprecation-Warning not a UserWarning
- #15285: DOC: make copy right year auto-update
- #15059: fig.add_axes() with no arguments silently does nothing
- #14546: Setting lines.markeredgecolor in rcParams affects the ticks' mark color too

7.1.4 GitHub Stats for Matplotlib 3.2.2

GitHub stats for 2020/03/18 - 2020/06/17 (tag: v3.2.1)

These lists are automatically generated, and may be incomplete or contain duplicates.

We closed 34 issues and merged 92 pull requests. The full list can be seen on GitHub

The following 19 authors contributed 183 commits.

- Antony Lee
- Ben Root
- Clemens Brunner
- David Stansby
- Elliott Sales de Andrade
- Eric Firing
- Eric Wieser
- hannah
- Jody Klymak
- Lawrence D'Anna
- Leo Singer
- Luke Davis
- Matt Newville
- Max
- Ryan May
- Sidharth Bansal
- Stefan Mitic
- Thomas A Caswell
- Tim Hoffmann

GitHub issues and pull requests:

Pull Requests (92):

- PR #17655: Auto backport of pr 17564 on v3.2.x
- PR #17564: FIX: correctly handle large arcs
- PR #17641: Qt backports
- PR #17640: More qt fractional DPI fixes
- PR #17638: V3.2.1 doc

- PR #15656: Support fractional HiDpi scaling with Qt backends
- PR #17600: FIX: work with PyQt 5.15
- PR #17598: DOC: remove banner
- PR #17618: Doc event loop
- PR #17614: DOC: Remove duplicated line.
- PR #17611: Backport #17606 to v3.2.x
- PR #17609: Backport PR #17602: FIX: propagate _is_saving state when changing can…
- PR #17606: Move codecov.yml to .github.
- PR #17602: FIX: propagate _is_saving state when changing canvases
- PR #17605: Backport PR #17560: FIX: do not let no-op monkey patches to renderer …
- PR #17601: Backport PR #16948 on branch v3.2.x (solution: All subclasses of LocationEvent could be used in cbook.callbacks before being fully initialized - issue 15139)
- PR #17560: FIX: do not let no-op monkey patches to renderer leak out
- PR #16948: solution: All subclasses of LocationEvent could be used in cbook.callbacks before being fully initialized - issue 15139
- PR #17588: Backport PR #17565: FIX: support Qt 5.15
- PR #17593: Backport PR #17587 on branch v3.2.x (Add a docstring to toolkit's BezierPath.__init__.)
- PR #17587: Add a docstring to toolkit's BezierPath.__init__.
- PR #17565: FIX: support Qt 5.15
- PR #17562: Backport PR #17470 on branch v3.2.x (FIX: add guardrails for too big tk figures)
- PR #17470: FIX: add guardrails for too big tk figures
- PR #17553: Backport PR #17552 on branch v3.2.x (ci: Add xcb libraries that were removed from PyQt5.)
- PR #17552: ci: Add xcb libraries that were removed from PyQt5.
- PR #17533: Backport PR #17408 on branch v3.2.x
- PR #17408: FIX: cancel pending autoscale on manually setting limits
- PR #17501: Backport PR #17499: Fix scatter singlecolor
- PR #17499: Fix scatter singlecolor
- PR #17468: v3.2.x: Fix leaks in C++ code
- PR #17457: Backport PR #17391 on branch v3.2.x

- PR #17391: tk/wx: Fix saving after the window is closed
- PR #17435: Backport PR #17422: Unstale viewlims before draw()ing polar axes.
- PR #17422: Unstale viewlims before draw()ing polar axes.
- PR #17407: FIX: don't try to use non-standard functions on standard status bars
- PR #17346: Backport #17084 and #17210 to v3.2.x
- PR #17084: Fix macosx segfault
- PR #17300: Backport PR #17263 on branch v3.2.x (you can't call CGDataProviderCreateWithData on a stack pointer)
- PR #17263: you can't call CGDataProviderCreateWithData on a stack pointer
- PR #17272: Backport PR #17271 on branch v3.2.x (MNT: do not try to import xml.etree.cElementTree)
- PR #17271: MNT: do not try to import xml.etree.cElementTree
- PR #17268: Backport PR #17261 on branch v3.2.x (avoid calling wx.Bitmap() if width or height is zero)
- PR #17261: avoid calling wx.Bitmap() if width or height is zero
- PR #17257: Backport eps work
- PR #17255: Fix eps + usetex combo.
- PR #17254: Backport PR #17252 on branch v3.2.x (Fix bug where matplotlib.style('default') resets the backend)
- PR #17252: Fix bug where matplotlib.style('default') resets the backend
- PR #17250: Merge pull request #17206 from jklymak/fix-bypass-inverse-collection
- PR #17206: FIX: bypass inverse in collection
- PR #17241: Backport PR #17240 on branch v3.2.x (CI: Download wx wheels for the correct Ubuntu version.)
- PR #17240: CI: Download wx wheels for the correct Ubuntu version.
- PR #17210: Fix missing attribute in _SVGConverter.
- PR #17186: Backport PR #17131 on branch v3.2.x
- PR #17188: Backport PR #16958: MAINT: Replace uses of tostring with tobytes
- PR #17187: Backport PR #17076: Fix SyntaxErrors when running setup in old Python
- PR #16913: Fix use of psfrags in ps backend + usetex.
- PR #16476: Fix baseline alignment when using usetex.
- PR #17131: BUG: Fix formatting error in GridSpec.__repr__

- PR #17132: Backport PR #17126 on branch v3.2.x (Remove Python2/3 info box)
- PR #17126: Remove Python2/3 info box
- PR #17076: Fix SyntaxErrors when running setup in old Python
- PR #17071: Backport PR #17065 on branch v3.2.x (Fix macOS CI test failure)
- PR #17065: Fix macOS CI test failure
- PR #17051: Backport PR #17045: Fix missing-references.json.
- PR #17045: Fix missing-references.json.
- PR #17020: Merge pull request #17017 from jklymak/fix-blended-transform
- PR #17017: FIX: force blended transforms with data to be in data space
- PR #16989: Backport PR #16980 on branch v3.2.x (Correctly disable more drawing methods in tight_bboxing renderer.)
- PR #16980: Correctly disable more drawing methods in tight_bboxing renderer.
- PR #16974: Backport PR #16940 on branch v3.2.x (DOC/FIX: clarify the docs for check_figures_equal)
- PR #16979: Backport PR #16970 on branch v3.2.x (tk: Don't resize toolbar during resize event.)
- PR #16970: tk: Don't resize toolbar during resize event.
- PR #16940: DOC/FIX: clarify the docs for check_figures_equal
- PR #16969: Backport PR #16966 on branch v3.2.x (Fix animation writer fallback.)
- PR #16966: Fix animation writer fallback.
- PR #16958: MAINT: Replace uses of tostring with tobytes
- PR #16950: Backport PR #16949 on branch v3.2.x (TST: Don't modify actual pyplot file for boilerplate test.)
- PR #16949: TST: Don't modify actual pyplot file for boilerplate test.
- PR #16932: Backport PR #16929 on branch v3.2.x (tk: Resize the canvas, not the figure.)
- PR #16929: tk: Resize the canvas, not the figure.
- PR #16880: Backport PR #16870: Unbreak CI by xfailing wxAgg test on macOS
- PR #16870: Unbreak CI by xfailing wxAgg test on macOS
- PR #16869: Backport PR #16867 on branch v3.2.x (BLD: Auto-trigger macOS/Linux wheels on tags.)
- PR #16867: BLD: Auto-trigger macOS/Linux wheels on tags.
- PR #16852: Backport PR #16851 on branch v3.2.x (DOC: Fix docstring of Axes.secondary_yaxis.)

- PR #16855: Fix typo in deprecation warning
- PR #16851: DOC: Fix docstring of Axes.secondary_yaxis.
- PR #16842: Backport PR #16835 on branch v3.2.x (Don't forget to export isdeleted on Qt4.)
- PR #16835: Don't forget to export isdeleted on Qt4.
- PR #15695: Define mathdefault as a noop in the usetex preamble.
- PR #14694: Vectorize Arc.draw.

Issues (34):

- #17547: Arcs with large radii in small
- #17440: Low quality window plots on hidpi display
- #17104: input() caused _tkinter.TclError: invalid command name XXX after plot.close()
- #17613: Matplotlib.pdf duplication
- #15139: All subclasses of LocationEvent could be used in cbook.callbacks before being fully initialized
- #17004: Output regression in 3.2 that affects SymPy's plotting
- #17599: Saving issue with pdf backend
- #17542: Matplotlib 3.2.1 savefig empty image when fig size matches data size exactly
- #17594: Cannot use Qt4Agg backend in mpl 3.2.1
- #17460: set_size_inches with a width over 14090 crashes Xorg
- #17331: Surprising/changed axis limit (autoscale) behavior
- #17423: Scatter produce multiple colors for a single RGB/RGBA input
- #17385: Matplotlib memory leaks when save figure in a file with qt5 backend
- #15474: Memory leak with log scale in pcolorfast, pcolormesh, imshow ...
- #17388: savefig error: tkinter.TclError: invalid command name "."
- #16909: plot save and plot show
- #17085: set_function not working properly in backend_wx
- #17418: Issue rendering polar plot (agg backend?) with rorigin set
- #17061: Segmentation fault with macosx backend
- #17253: EPS + usetex is broken
- #16700: Deprecation warnings from stylelib
- #17203: Subplots using bad axis limits in 3.2

- #16898: EPS and `usetex` give blank output
- #16409: Confusing error on fully commented-out usetex strings
- #17075: Installation error downloading jquery on python3 on Ubuntu
- #17037: Travis Failing in many PRs
- #17033: Using a `TextBox` in current master produces a seemingly unrelated warning.
- #17016: Issues with autoscaling and transforms with 3.2+
- #16978: savefig("myplot.svgz", bbox_inches="tight") fails
- #16965: FuncAnimation.save throws TypeError
- #16916: check_figures_equal regression from 3.2.0 to 3.2.1
- #10566: blocking UI functions cause figure size to change
- #10083: Wrong figure height after set_size_inches within event handler
- #16834: Error importing FigureCanvas

7.1.5 GitHub Stats for Matplotlib 3.2.1

GitHub stats for 2020/03/03 - 2020/03/17 (tag: v3.2.0)

These lists are automatically generated, and may be incomplete or contain duplicates.

We closed 11 issues and merged 52 pull requests. The full list can be seen on GitHub and on GitHub

The following 12 authors contributed 154 commits.

- Amy Roberts
- Antony Lee
- Elliott Sales de Andrade
- hannah
- Hugo van Kemenade
- Jody Klymak
- Kyle Sunden
- MarcoGorelli
- Maximilian Nöthe
- Sandro Tosi
- Thomas A Caswell
- Tim Hoffmann

GitHub issues and pull requests:

Pull Requests (52):

- PR #15199: MNT/TST: generalize check_figures_equal to work with pytest.marks
- PR #15685: Avoid a RuntimeError at animation shutdown with PySide2.
- PR #15969: Restart pgf's latex instance after bad latex inputs.
- PR #16640: ci: Fix Azure on v3.2.x
- PR #16648: Document filling of Poly3DCollection
- PR #16649: Fix typo in docs
- PR #16650: Backport PR #16649 on branch v3.2.x (Fix typo in docs)
- PR #16651: Docs: Change Python 2 note to past tense
- PR #16654: Backport PR #16651 on branch v3.2.0-doc (Docs: Change Python 2 note to past tense)
- PR #16656: Make test_imagegrid_cbar_mode_edge less flaky.
- PR #16661: added Framework :: Matplotlib to setup
- PR #16665: Backport PR #16661 on branch v3.2.x (added Framework :: Matplotlib to setup)
- PR #16671: Fix some readme bits
- PR #16672: Update CircleCI and add direct artifact link
- PR #16682: Avoid floating point rounding causing bezier.get_parallels to fail
- PR #16690: Backport PR #16682 on branch v3.2.x (Avoid floating point rounding causing bezier.get_parallels to fail)
- PR #16693: TST: use pytest name in naming files for check_figures_equal
- PR #16695: Restart pgf's latex instance after bad latex inputs.
- PR #16705: Backport PR #16656 on branch v3.2.x (Make test_imagegrid_cbar_mode_edge less flaky.)
- PR #16708: Backport PR #16671: Fix some readme bits
- PR #16709: Fix saving PNGs to file objects in some places
- PR #16722: Deprecate rcParams["datapath"] in favor of mpl.get_data_path().
- PR #16725: TST/CI: also try to run test_user_fonts_win32 on azure
- PR #16734: Disable draw_foo methods on renderer used to estimate tight extents.
- PR #16735: Make test_stem less flaky.
- PR #16736: xpdf: Set AutoRotatePages to None, not false.

- PR #16742: nbagg: Don't send events if manager is disconnected.
- PR #16745: Allow numbers to set uvc for all arrows in quiver.set_UVC, fixes #16743
- PR #16751: Backport PR #16742 on branch v3.2.x (nbagg: Don't send events if manager is disconnected.)
- PR #16752: ci: Disallow pytest 5.4.0, which is crashing.
- PR #16753: Backport #16752 to v3.2.x
- PR #16760: Backport PR #16735 on branch v3.2.x (Make test_stem less flaky.)
- PR #16761: Backport PR #16745 on branch v3.2.x (Allow numbers to set uvc for all arrows in quiver.set_UVC, fixes #16743)
- PR #16763: Backport PR #16648 on branch v3.2.x (Document filling of Poly3DCollection)
- PR #16764: Backport PR #16672 on branch v3.2.0-doc
- PR #16765: Backport PR #16736 on branch v3.2.x (xpdf: Set AutoRotatePages to None, not false.)
- PR #16766: Backport PR #16734 on branch v3.2.x (Disable draw_foo methods on renderer used to estimate tight extents.)
- PR #16767: Backport PR #15685 on branch v3.2.x (Avoid a RuntimeError at animation shutdown with PySide2.)
- PR #16768: Backport PR #16725 on branch v3.2.x (TST/CI: also try to run test_user_fonts_win32 on azure)
- PR #16770: Fix tuple markers
- PR #16779: Documentation: make instructions for documentation contributions easier to find, add to requirements for building docs
- PR #16784: Update CircleCI URL for downloading humor-sans.ttf.
- PR #16790: Backport PR #16784 on branch v3.2.x (Update CircleCI URL for downloading humor-sans.ttf.)
- PR #16791: Backport PR #16770 on branch v3.2.x (Fix tuple markers)
- PR #16794: DOC: Don't mention drawstyle in `set_linestyle` docs.
- PR #16795: Backport PR #15199 on branch v3.2.x (MNT/TST: generalize check_figures_equal to work with pytest.marks)
- PR #16797: Backport #15589 and #16693, fixes for check_figures_equal
- PR #16799: Backport PR #16794 on branch v3.2.0-doc (DOC: Don't mention drawstyle in `set_linestyle` docs.)
- PR #16800: Fix check_figures_equal for tests that use its fixtures.
- PR #16803: Fix some doc issues

- PR #16806: Backport PR #16803 on branch v3.2.0-doc (Fix some doc issues)
- PR #16809: Backport PR #16779 on branch v3.2.0-doc (Documentation: make instructions for documentation contributions easier to find, add to requirements for building docs)

Issues (11):

- #12820: [Annotations] ValueError: lines do not intersect when computing tight bounding box containing arrow with filled paths
- #16538: xpdf distiller seems broken
- #16624: Azure pipelines are broken on v3.2.x
- #16633: Wrong drawing Poly3DCollection
- #16645: Minor typo in API document of patches.ConnectionPatch
- #16670: BLD: ascii codec decode on 3.2.0 in non-UTF8 locales
- #16704: 3.2.0: `setup.py clean` fails with `NameError: name 'long_description' is not defined`
- #16721: nbAgg backend does not allow saving figures as png
- #16731: PGF backend + savefig.bbox results in I/O error in 3.2
- #16743: Breaking change in 3.2: quiver.set_UVC does not support single numbers any more
- #16801: Doc: figure for colormaps off

GitHub issues and pull requests:

Pull Requests (839):

- PR #16626: Updated Readme + Setup.py for PyPa
- PR #16627: ci: Restore nuget install step on Azure for v3.2.x.

- PR #16625: v3.2.x: Make Azure use local FreeType.
- PR #16622: Backport PR #16613 on branch v3.2.x (Fix edge-case in preprocess_data, if label_namer is optional and unset.)
- PR #16613: Fix edge-case in preprocess_data, if label_namer is optional and unset.
- PR #16612: Backport PR #16605: CI: tweak the vm images we use on azure
- PR #16611: Backport PR #16585 on branch v3.2.x (Fix _preprocess_data for Py3.9.)
- PR #16605: CI: tweak the vm images we use on azure
- PR #16585: Fix _preprocess_data for Py3.9.
- PR #16541: Merge pull request #16404 from jklymak/fix-add-base-symlognorm
- PR #16542: Backport PR #16006: Ignore pos in StrCategoryFormatter.__call__ to di…
- PR #16543: Backport PR #16532: Document default value of save_count parameter in…
- PR #16532: Document default value of save_count parameter in FuncAnimation
- PR #16526: Backport PR #16480 on v.3.2.x: Re-phrase doc for bottom kwarg to hist
- PR #16404: FIX: add base kwarg to symlognor
- PR #16518: Backport PR #16502 on branch v3.2.x (Document theta getters/setters)
- PR #16519: Backport PR #16513 on branch v3.2.x (Add more FreeType tarball hashes.)
- PR #16513: Add more FreeType tarball hashes.
- PR #16502: Document theta getters/setters
- PR #16506: Backport PR #16505 on branch v3.2.x (Add link to blog to front page)
- PR #16505: Add link to blog to front page
- PR #16480: Re-phrase doc for bottom kwarg to hist
- PR #16494: Backport PR #16490 on branch v3.2.x (Fix some typos on the front page)
- PR #16489: Backport PR #16272 on branch v3.2.x (Move mplot3d autoregistration api changes to 3.2.)
- PR #16490: Fix some typos on the front page
- PR #16465: Backport PR #16450 on branch v3.2.x (Fix interaction between sticky_edges and shared axes.)

- PR #16466: Backport PR #16392: FIX colorbars for Norms that do not have a scale.
- PR #16392: FIX colorbars for Norms that do not have a scale.
- PR #16450: Fix interaction between sticky_edges and shared axes.
- PR #16453: Backport PR #16452 on branch v3.2.x (Don't make InvertedLogTransform inherit from deprecated base class.)
- PR #16452: Don't make InvertedLogTransform inherit from deprecated base class.
- PR #16436: Backport PR #16435 on branch v3.2.x (Reword intro to colors api docs.)
- PR #16435: Reword intro to colors api docs.
- PR #16399: Backport PR #16396 on branch v3.2.x (font_manager docs cleanup.)
- PR #16396: font_manager docs cleanup.
- PR #16397: Backport PR #16394 on branch v3.2.x (Mark inkscape 1.0 as unsupported (at least for now).)
- PR #16394: Mark inkscape 1.0 as unsupported (at least for now).
- PR #16286: Fix cbars for different norms
- PR #16385: Backport PR #16226 on branch v3.2.x: Reorganize intro section on main page
- PR #16383: Backport PR #16379 on branch v3.2.x (FIX: catch on message content, not module)
- PR #16226: Reorganize intro section on main page
- PR #16364: Backport PR #16344 on branch v3.2.x (Cast vmin/vmax to floats before nonsingular-expanding them.)
- PR #16344: Cast vmin/vmax to floats before nonsingular-expanding them.
- PR #16360: Backport PR #16347 on branch v3.2.x (FIX: catch warnings from pandas in cbook._check_1d)
- PR #16357: Backport PR #16330 on branch v3.2.x (Clearer signal handling)
- PR #16349: Backport PR #16255 on branch v3.2.x (Move version info to sidebar)
- PR #16346: Backport PR #16298 on branch v3.2.x (Don't recursively call draw_idle when updating artists at draw time.)
- PR #16331: Backport PR #16308 on branch v3.2.x (CI: Use Ubuntu Bionic compatible package names)
- PR #16332: Backport PR #16308 on v3.2.x: CI: Use Ubuntu Bionic compatible package names

- PR #16324: Backport PR #16323 on branch v3.2.x (Add sphinx doc for Axis.axis_name.)
- PR #16325: Backport PR #15462 on v3.2.x: Simplify azure setup.
- PR #16323: Add sphinx doc for Axis.axis_name.
- PR #16321: Backport PR #16311 on branch v3.2.x (don't override non-Python signal handlers)
- PR #16308: CI: Use Ubuntu Bionic compatible package names
- PR #16306: Backport PR #16300 on branch v3.2.x (Don't default to negative radii in polar plot.)
- PR #16305: Backport PR #16250 on branch v3.2.x (Fix zerolen intersect)
- PR #16300: Don't default to negative radii in polar plot.
- PR #16278: Backport PR #16273 on branch v3.2.x (DOC: Changing the spelling of co-ordinates.)
- PR #16260: Backport PR #16259 on branch v3.2.x (TST: something changed in pytest 5.3.3 that breaks our qt fixtures)
- PR #16259: TST: something changed in pytest 5.3.3 that breaks our qt fixtures
- PR #16238: Backport PR #16235 on branch v3.2.x (FIX: AttributeError in TimerBase.start)
- PR #16211: DOC: ValidateInterval was deprecated in 3.2, not 3.1
- PR #16224: Backport PR #16223 on branch v3.2.x (Added DNA Features Viewer description + screenshot in docs/thirdparty/)
- PR #16223: Added DNA Features Viewer description + screenshot in docs/thirdparty/
- PR #16222: Backport PR #16212 on branch v3.2.x (Fix deprecation from #13544)
- PR #16212: Fix deprecation from #13544
- PR #16207: Backport PR #16189 on branch v3.2.x (MNT: set default canvas when un-pickling)
- PR #16189: MNT: set default canvas when un-pickling
- PR #16179: Backport PR #16175: FIX: ignore axes that aren't visible
- PR #16175: FIX: ignore axes that aren't visible
- PR #16168: Backport PR #16166 on branch v3.2.x (Add badge for citing 3.1.2)
- PR #16148: Backport PR #16128 on branch v3.2.x (CI: Do not use nbformat 5.0.0/5.0.1 for testing)
- PR #16145: Backport PR #16053 on branch v3.2.x (Fix v_interval setter)
- PR #16128: CI: Do not use nbformat 5.0.0/5.0.1 for testing

- PR #16135: Backport PR #16112 on branch v3.2.x (CI: Fail when failed to install dependencies)
- PR #16132: Backport PR #16126 on branch v3.2.x (TST: test_fork: Missing join)
- PR #16124: Backport PR #16105 on branch v3.2.x (Fix legend dragging.)
- PR #16122: Backport PR #16113 on branch v3.2.x (Renderer Graphviz inheritance diagrams as svg)
- PR #16105: Fix legend dragging.
- PR #16113: Renderer Graphviz inheritance diagrams as svg
- PR #16112: CI: Fail when failed to install dependencies
- PR #16119: Backport PR #16065 on branch v3.2.x (Nicer formatting of community aspects on front page)
- PR #16074: Backport PR #16061 on branch v3.2.x (Fix deprecation message for axes_grid1.colorbar.)
- PR #16093: Backport PR #16079 on branch v3.2.x (Fix restuctured text formatting)
- PR #16094: Backport PR #16080 on branch v3.2.x (Cleanup docstrings in backend_bases.py)
- PR #16086: FIX: use supported attribute to check pillow version
- PR #16084: Backport PR #16077 on branch v3.2.x (Fix some typos)
- PR #16077: Fix some typos
- PR #16079: Fix restuctured text formatting
- PR #16080: Cleanup docstrings in backend_bases.py
- PR #16061: Fix deprecation message for axes_grid1.colorbar.
- PR #16006: Ignore pos in StrCategoryFormatter.__call__ to display correct label in the preview window
- PR #16056: Backport PR #15864 on branch v3.2.x ([Add the info of 'sviewgui' in thirdparty package])
- PR #15864: Add 'sviewgui' to list of thirdparty packages
- PR #16055: Backport PR #16037 on branch v3.2.x (Doc: use empty ScalarMappable for colorbars with no associated image.)
- PR #16054: Backport PR #16048 on branch v3.2.x (Document that colorbar() takes a label kwarg.)
- PR #16037: Doc: use empty ScalarMappable for colorbars with no associated image.
- PR #16048: Document that colorbar() takes a label kwarg.
- PR #16042: Backport PR #16031 on branch v3.2.x (Fix docstring of hillshade().)

- PR #16033: Backport PR #16028 on branch v3.2.x (Prevent FigureCanvasQT_draw_idle recursively calling itself.)
- PR #16021: Backport PR #16007 on branch v3.2.x (Fix search on nested pages)
- PR #16019: Backport PR #15735 on branch v3.2.x (Cleanup some mplot3d docstrings.)
- PR #15987: Backport PR #15886 on branch v3.2.x (Fix Annotation using different units and different coords on x/y.)
- PR #15886: Fix Annotation using different units and different coords on x/y.
- PR #15984: Backport PR #15970 on branch v3.2.x (Process clip paths the same way as regular Paths.)
- PR #15970: Process clip paths the same way as regular Paths.
- PR #15963: Backport PR #15937 on branch v3.2.x (Don't hide exceptions in FontManager.addfont.)
- PR #15956: Backport PR #15901 on branch v3.2.x (Update backend_nbagg for removal of Gcf._activeQue.)
- PR #15937: Don't hide exceptions in FontManager.addfont.
- PR #15959: Backport PR #15953 on branch v3.2.x (Update donation link)
- PR #15901: Update backend_nbagg for removal of Gcf._activeQue.
- PR #15954: Backport PR #15914 on branch v3.2.x (Example for sigmoid function with horizontal lines)
- PR #15914: Example for sigmoid function with horizontal lines
- PR #15930: Backport PR #15925 on branch v3.2.x (Optimize setting units to None when they're already None.)
- PR #15925: Optimize setting units to None when they're already None.
- PR #15915: Backport PR #15903 on branch v3.2.x (Correctly handle non-affine transData in Collection.get_datalim.)
- PR #15903: Correctly handle non-affine transData in Collection.get_datalim.
- PR #15908: Backport PR #15857 on branch v3.2.x (LassoSelection shouldn't useblit on canvas not supporting blitting.)
- PR #15857: LassoSelection shouldn't useblit on canvas not supporting blitting.
- PR #15905: Backport PR #15763 on branch v3.2.x (Skip webagg test if tornado is not available.)
- PR #15882: Backport PR #15859 on branch v3.2.x (Doc: Move search field into nav bar)
- PR #15868: Backport PR #15848 on branch v3.2.x: Cleanup environment variables FAQ

- PR #15872: Backport PR #15869 on branch v3.2.x (Update markers docs.)
- PR #15869: Update markers docs.
- PR #15867: Backport PR #15789 on branch v3.2.x (Cleanup xticks/yticks docstrings.)
- PR #15870: Backport PR #15865 on branch v3.2.x (Fix a typo)
- PR #15871: Backport PR #15824 on branch v3.2.x (Document doc style for default values)
- PR #15824: Document doc style for default values
- PR #15865: Fix a typo
- PR #15789: Cleanup xticks/yticks docstrings.
- PR #15862: Backport PR #15851 on branch v3.2.x (ffmpeg is available on default ubuntu packages now)
- PR #15848: Cleanup environment variables FAQ.
- PR #15844: Backport PR #15841 on branch v3.2.x (DOC: specify the expected shape in the Collection.set_offset)
- PR #15841: DOC: specify the expected shape in the Collection.set_offset
- PR #15837: Backport PR #15799 on branch v3.2.x (Improve display of author names on PDF titlepage of matplotlib own docs)
- PR #15799: Improve display of author names on PDF titlepage of matplotlib own docs
- PR #15831: Backport PR #15829 on branch v3.2.x (In C extensions, use FutureWarning, not DeprecationWarning.)
- PR #15829: In C extensions, use FutureWarning, not DeprecationWarning.
- PR #15818: Backport PR #15619 on branch v3.2.x (Improve zorder demo)

- PR #15454: Rewrite Anscombe's quartet example
- PR #15480: Fix wording in [packages] section of setup.cfg
- PR #15477: Backport PR #15464 on branch v3.2.x (Remove unused code (remainder from #15453))
- PR #15471: Backport PR #15460 on branch v3.2.x (Fix incorrect value check in axes_grid.)
- PR #15456: Backport PR #15453 on branch v3.2.x (Improve example for tick locators)
- PR #15457: Backport PR #15450 on branch v3.2.x (API: rename DivergingNorm to TwoSlopeNorm)
- PR #15450: API: rename DivergingNorm to TwoSlopeNorm
- PR #15434: In imsave, let pnginfo have precedence over metadata.
- PR #15445: Backport PR #15439 on branch v3.2.x (DOC: mention discourse main page)
- PR #15425: Backport PR #15422 on branch v3.2.x (FIX: typo in attribute lookup)
- PR #15449: DOC: fix build
- PR #15429: Fix OSX build on azure
- PR #15420: Backport PR #15380 on branch v3.2.x (Update docs of BoxStyle)
- PR #15380: Update docs of BoxStyle
- PR #15300: CI: use python -m to make sure we are using the pip/pytest we want
- PR #15414: Backport PR #15413 on branch v3.2.x (catch OSError instead of FileNotFoundError in _get_executable_info to resolve #15399)
- PR #15413: catch OSError instead of FileNotFoundError in _get_executable_info to resolve #15399
- PR #15406: Backport PR #15347 on branch v3.2.x (Fix axes.hist bins units)

- PR #15405: Backport PR #15391 on branch v3.2.x (Increase fontsize in inheritance graphs)
- PR #15347: Fix axes.hist bins units
- PR #15391: Increase fontsize in inheritance graphs
- PR #15389: Backport PR #15379 on branch v3.2.x (Document formatting strings in the docs)
- PR #15379: Document formatting strings in the docs
- PR #15386: Backport PR #15385 on branch v3.2.x (Reword hist() doc.)
- PR #15385: Reword hist() doc.
- PR #15377: Backport PR #15357 on branch v3.2.x (Add 'step' and 'barstacked' to histogram_histtypes demo)
- PR #15357: Add 'step' and 'barstacked' to histogram_histtypes demo
- PR #15366: Backport PR #15364 on branch v3.2.x (DOC: fix typo in colormap docs)
- PR #15362: Backport PR #15350 on branch v3.2.x (Don't generate double-reversed cmaps ("viridis_r_r", ...).)
- PR #15360: Backport PR #15258 on branch v3.2.x (Don't fallback to view limits when autoscale()ing no data.)
- PR #15350: Don't generate double-reversed cmaps ("viridis_r_r", ...).
- PR #15258: Don't fallback to view limits when autoscale()ing no data.
- PR #15299: Backport PR #15296 on branch v3.2.x (Fix typo/bug from 18cecf7)
- PR #15327: Backport PR #15326 on branch v3.2.x (List of minimal versions of dependencies)
- PR #15326: List of minimal versions of dependencies
- PR #15317: Backport PR #15291 on branch v3.2.x (Remove error_msg_qt from backend_qt4.)
- PR #15316: Backport PR #15283 on branch v3.2.x (Don't default axes_grid colorbar locator to MaxNLocator.)
- PR #15291: Remove error_msg_qt from backend_qt4.
- PR #15283: Don't default axes_grid colorbar locator to MaxNLocator.
- PR #15315: Backport PR #15308 on branch v3.2.x (Doc: Add close event to list of events)
- PR #15308: Doc: Add close event to list of events
- PR #15312: Backport PR #15307 on branch v3.2.x (DOC: center footer)
- PR #15307: DOC: center footer

- PR #15276: Backport PR #15271 on branch v3.2.x (Fix font weight validation)
- PR #15279: Backport PR #15252 on branch v3.2.x (Mention labels and milestones in PR review guidelines)
- PR #15252: Mention labels and milestones in PR review guidelines
- PR #15268: Backport PR #15266 on branch v3.2.x (Embedding in Tk example: Fix toolbar being clipped.)
- PR #15269: Backport PR #15267 on branch v3.2.x (added multi-letter example to mathtext tutorial)
- PR #15267: added multi-letter example to mathtext tutorial
- PR #15266: Embedding in Tk example: Fix toolbar being clipped.
- PR #15243: Move some new API changes to the correct place
- PR #15245: Fix incorrect calls to warn_deprecated.
- PR #15239: Composite against white, not the savefig.facecolor rc, in print_jpeg.
- PR #15227: contains_point() docstring fixes
- PR #15242: Cleanup widgets docstrings.
- PR #14889: Support pixel-by-pixel alpha in imshow.
- PR #14928: Logit scale nonsingular
- PR #14998: Fix nonlinear spine positions & inline Spine._calc_offset_transform into get_spine_transform.
- PR #15231: Doc: Do not write default for non-existing rcParams
- PR #15222: Cleanup projections/__init__.py.
- PR #15228: Minor docstring style cleanup
- PR #15237: Cleanup widgets.py.
- PR #15229: Doc: Fix Bbox and BboxBase links
- PR #15235: Kill FigureManagerTk._num.
- PR #15234: Drop mention of msinttypes in Windows build.
- PR #15224: Avoid infinite loop when switching actions in qt backend.
- PR #15230: Doc: Remove hard-documented rcParams defaults
- PR #15149: pyplot.style.use() to accept pathlib.Path objects as arguments
- PR #15220: Correctly format floats passed to pgf backend.
- PR #15216: Update docstrings of contains_point(s) methods
- PR #15209: Exclude s-g generated files from flake8 check.
- PR #15204: PEP8ify some variable names.

- PR #15196: Force html4 writer for sphinx 2
- PR #13544: Improve handling of subplots spanning multiple gridspec cells.
- PR #15194: Trivial style fixes.
- PR #15202: Deprecate the renderer parameter to Figure.tight_layout.
- PR #15195: Fix integers being passed as length to quiver3d.
- PR #15180: Add some more internal links to 3.2.0 what's new
- PR #13510: Change Locator MAXTICKS checking to emitting a log at WARNING level.
- PR #15184: Mark missing_references extension as parallel read safe
- PR #15150: Autodetect whether pgf can use includegraphics[interpolate].
- PR #15163: 3.2.0 API changes page
- PR #15176: What's new for 3.2.0
- PR #11947: Ensure streamplot Euler step is always called when going out of bounds.
- PR #13702: Deduplicate methods shared between Container and Artist.
- PR #15169: TST: verify warnings fail the test suite
- PR #14888: Replace some polar baseline images by check_figures_equal.
- PR #15027: More readability improvements on axis3d.
- PR #15171: Add useful error message when trying to add Slider to 3DAxes
- PR #13775: Doc: Scatter Hist example update
- PR #15164: removed a typo
- PR #15152: Support for shorthand hex colors.
- PR #15159: Follow up on #14424 for docstring
- PR #14424: ENH: Add argument size validation to quiver.
- PR #15137: DOC: add example to power limit API change note
- PR #15144: Improve local page contents CSS
- PR #15143: Restore doc references.
- PR #15124: Replace parameter lists with square brackets
- PR #13077: fix FreeType build on Azure
- PR #15123: Improve categorical example
- PR #15134: Fix missing references in doc build.
- PR #13937: Use PYTHONFAULTHANDLER to switch on the Python fault handler.

- PR #13452: Replace axis_artist.AttributeCopier by normal inheritance.
- PR #15045: Resize canvas when changing figure size
- PR #15122: Fixed app creation in qt5 backend (see #15100)
- PR #15099: Add lightsource parameter to bar3d
- PR #14876: Inline some afm parsing code.
- PR #15119: Deprecate a validator for a deprecated rcParam value.
- PR #15121: Fix Stacked bar graph example
- PR #15113: Cleanup layout_from_subplotspec.
- PR #13543: Remove zip_safe=False flag from setup.py.
- PR #12860: ENH: LogLocator: check for correct dimension of subs added
- PR #14349: Replace ValidateInterval by simpler specialized validators.
- PR #14352: Remove redundant is_landscape kwarg from backend_ps helpers.
- PR #15087: Pass gid to renderer
- PR #14703: Don't bother with manually resizing the Qt main window.
- PR #14833: Reuse TexManager implementation in convert_psfrags.
- PR #14893: Update layout.html for sphinx themes
- PR #15098: Simplify symlog range determination logic
- PR #15112: Cleanup legend() docstring.
- PR #15108: Fix doc build and resync matplotlibrc.template with actual defaults.
- PR #14940: Fix text kerning calculations and some FT2Font cleanup
- PR #15082: Privatize font_manager.JSONEncoder.
- PR #15106: Update docs of GridSpec
- PR #14832: ENH:made default tick formatter to switch to scientific notation earlier
- PR #15086: Style fixes.
- PR #15073: Add entry for blume to thirdparty package index
- PR #15095: Simplify _png extension by handling file open/close in Python.
- PR #15092: MNT: Add test for aitoff-projection
- PR #15101: Doc: fix typo in contour doc
- PR #14624: Fix axis inversion with loglocator and logitlocator.
- PR #15088: Fix more doc references.
- PR #15063: Add Comic Neue as a fantasy font.

- PR #14867: Propose change to PR merging policy.
- PR #15068: Add FontManager.addfont to register fonts at specific paths.
- PR #13397: Deprecate axes_grid1.colorbar (in favor of matplotlib's own).
- PR #14521: Move required_interactive_framework to canvas class.
- PR #15083: Cleanup spines example.
- PR #14997: Correctly set formatters and locators on removed shared axis
- PR #15064: Fix eps hatching in MacOS Preview
- PR #15074: Write all ACCEPTS markers in docstrings as comments.
- PR #15078: Clarify docstring of FT2Font.get_glyph_name.
- PR #15080: Fix cross-references in API changes < 3.0.0.
- PR #15072: Cleanup patheffects.
- PR #15071: Cleanup offsetbox.py.
- PR #15070: Fix cross-references in API changes < 2.0.0.
- PR #10691: Fix for shared axes diverging after setting tick markers
- PR #15069: Style fixes for font_manager.py.
- PR #15067: Fix cross-references in API changes < 1.0
- PR #15061: Fix cross-references in tutorials and FAQ
- PR #15060: Fix cross-references in examples.
- PR #14957: Documentation for using ConnectionPatch across Axes with constrained...
- PR #15053: Make citation bit of README less wordy
- PR #15044: numpydoc set_size_inches docstring
- PR #15050: Clarify unnecessary special handling for colons in paths.
- PR #14797: DOC: create a Agg figure without pyplot in buffer example
- PR #14844: Add citation info to README
- PR #14884: Do not allow canvas size to become smaller than MinSize in wx backend...
- PR #14941: Improvements to make_icons.py.
- PR #15048: DOC: more nitpick follow up
- PR #15043: Fix Docs: Don’t warn for unused ignores
- PR #15025: Re-write text wrapping logic
- PR #14840: Don't assume transform is valid on access to matrix.
- PR #14862: Make optional in docstrings optional

- PR #15028: Python version conf.py
- PR #15033: FIX: un-break nightly wheels on py37
- PR #15046: v3.1.x merge up
- PR #15015: Fix bad missing-references.json due to PR merge race condition.
- PR #14581: Make logscale bar/hist autolimits more consistents.
- PR #15034: Doc fix nitpick
- PR #14614: Deprecate {x,y,z}axis_date.
- PR #14991: Handle inherited is_separable, has_inverse in transform props detection.
- PR #15032: Clarify effect of axis('equal') on explicit data limits
- PR #15031: Update docs of GridSpec
- PR #14106: Describe FigureManager
- PR #15024: Update docs of GridSpecBase
- PR #14906: Deprecate some FT2Image methods.
- PR #14963: More Axis3D cleanup.
- PR #15009: Provide signatures to some C-level classes and methods.
- PR #14968: DOC: colormap manipulation tutorial update
- PR #15006: Deprecate get/set_*ticks minor positional use
- PR #14989: DOC:Update axes documentation
- PR #14871: Parametrize determinism tests.
- PR #14768: DOC: Enable nitpicky
- PR #15013: Matplotlib requires Python 3.6, which in turn requires Mac OS X 10.6+
- PR #15012: Fix typesetting of "GitHub"
- PR #14954: Cleanup polar_legend example.
- PR #14519: Check parameters of ColorbarBase
- PR #14942: Make _classic_test style a tiny patch on top of classic.
- PR #14988: pathlibify/fstringify setup/setupext.
- PR #14511: Deprecate allowing scalars for fill_between where
- PR #14493: Remove deprecated fig parameter form GridSpecBase.get_subplot_params()
- PR #14995: Further improve backend tutorial.

- PR #15000: Use warnings.warn, not logging.warning, in microseconds locator warning.
- PR #14990: Fix nonsensical transform in mixed-mode axes aspect computation.
- PR #15002: No need to access filesystem in test_dates.py.
- PR #14549: Improve backends documentation
- PR #14774: Fix image bbox clip.
- PR #14978: Typo fixes in pyplot.py
- PR #14702: Don't enlarge toolbar for Qt high-dpi.
- PR #14922: Autodetect some transform properties.
- PR #14962: Replace inspect.getfullargspec by inspect.signature.
- PR #14958: Improve docs of toplevel module.
- PR #14926: Save a matrix unpacking/repacking in offsetbox.
- PR #14961: Cleanup demo_agg_filter.
- PR #14924: Kill the C-level (private) RendererAgg.buffer_rgba, which returns a copy.
- PR #14946: Delete virtualenv faq.
- PR #14944: Shorten style.py.
- PR #14931: Deprecate some obscure rcParam synonyms.
- PR #14947: Fix inaccuracy re: backends in intro tutorial.
- PR #14904: Fix typo in secondary_axis.py example.
- PR #14925: Support passing spine bounds as single tuple.
- PR #14921: DOC: Make abbreviation of versus consistent.
- PR #14739: Improve indentation of Line2D properties in docstrings.
- PR #14923: In examples, prefer buffer_rgba to print_to_buffer.
- PR #14908: Make matplotlib.style.available sorted alphabetically.
- PR #13567: Deprecate MovieWriterRegistry cache-dirtyness system.
- PR #14879: Error out when unsupported kwargs are passed to Scale.
- PR #14512: Logit scale, changes in LogitLocator and LogitFormatter
- PR #12415: ENH: fig.set_size to allow non-inches units
- PR #13783: Deprecate disable_internet.
- PR #14886: Further simplify the flow of pdf text output.
- PR #14894: Make slowness warning for legend(loc="best") more accurate.
- PR #14891: Fix nightly test errors

- PR #14895: Fix typos
- PR #14890: Remove unused private helper method in mplot3d.
- PR #14872: Unify text layout paths.
- PR #8183: Allow array alpha for imshow
- PR #13832: Vectorize handling of stacked/cumulative in hist().
- PR #13630: Simplify PolarAxes.can_pan.
- PR #14565: Rewrite an argument check to _check_getitem
- PR #14875: Cleanup afm module docstring.
- PR #14880: Fix animation blitting for plots with shared axes
- PR #14870: FT2Font.get_char_index never returns None.
- PR #13463: Deprecate Locator.autoscale.
- PR #13724: ENH: anti-alias down-sampled images
- PR #14848: Clearer error message for plt.axis()
- PR #14660: colorbar(label=None) should give an empty label
- PR #14654: Cleanup of docstrings of scales
- PR #14868: Update bar stacked example to directly manipulate axes.
- PR #14749: Fix get_canvas_width_height() for pgf backend.
- PR #14776: Make ExecutableUnavailableError
- PR #14843: Don't try to cleanup CallbackRegistry during interpreter shutdown.
- PR #14849: Improve tkagg icon resolution
- PR #14866: changed all readme headings to verbs
- PR #13364: Numpyfy tick handling code in Axis3D.
- PR #13642: FIX: get_datalim for collection
- PR #14860: Stopgap fix for pandas converters in tests.
- PR #6498: Check canvas identity in Artist.contains.
- PR #14707: Add titlecolor in rcParams
- PR #14853: Fix typo in set_adjustable check.
- PR #14845: More cleanups.
- PR #14809: Clearer calls to ConnectionPatch.
- PR #14716: Use str instead of string as type in docstrings
- PR #14338: Simplify/pathlibify image_comparison.
- PR #8930: timedelta formatter

- PR #14733: Deprecate FigureFrameWx.statusbar & NavigationToolbar2Wx.statbar.
- PR #14713: Unite masked and NaN plot examples
- PR #14576: Let Axes3D share have_units, _on_units_changed with 2d axes.
- PR #14575: Make ticklabel_format work both for 2D and 3D axes.
- PR #14834: DOC: Webpage not formatted correctly on gallery docs
- PR #14730: Factor out common parts of wx event handlers.
- PR #14727: Fix axes aspect for non-linear, non-log, possibly mixed-scale axes.
- PR #14835: Only allow set_adjustable("datalim") for axes with standard data ratios.
- PR #14746: Simplify Arrow constructor.
- PR #14752: Doc changes to git setup
- PR #14732: Deduplicate wx configure_subplots tool.
- PR #14715: Use array-like in docs
- PR #14728: More floating_axes cleanup.
- PR #14719: Make Qt navtoolbar more robust against removal of either pan or zoom.
- PR #14695: Various small simplifications
- PR #14745: Replace Affine2D().scale(x, x) by Affine2D().scale(x).
- PR #14687: Add missing spaces after commas in docs
- PR #14810: Lighten icons of NavigationToolbar2QT on dark-themes
- PR #14786: Deprecate axis_artist.BezierPath.
- PR #14750: Misc. simplifications.
- PR #14807: API change note on automatic blitting detection for backends
- PR #11004: Deprecate smart_bounds handling in Axis and Spine
- PR #14785: Kill some never-used attributes.
- PR #14723: Cleanup some parameter descriptions in matplotlibrc.template
- PR #14808: Small docstring updates
- PR #14686: Inset orientation
- PR #14805: Simplify text_layout example.
- PR #12052: Make AxesImage.contains account for transforms
- PR #11860: Let MovieFileWriter save temp files in a new dir
- PR #11423: FigureCanvas Designer

- PR #10688: Add legend handler and artist for FancyArrow
- PR #8321: Added ContourSet clip_path kwarg and set_clip_path() method (#2369)
- PR #14641: Simplify _process_plot_var_args.
- PR #14631: Refactor from_levels_and_colors.
- PR #14790: DOC:Add link to style examples in matplotlib.style documentation
- PR #14799: Deprecate dates.mx2num.
- PR #14793: Remove sudo tag in travis
- PR #14795: Autodetect whether a canvas class supports blitting.
- PR #14794: DOC: Update the documentation of homepage of website
- PR #14629: Delete HTML build sources to save on artefact upload time
- PR #14792: Fix spelling typos
- PR #14789: Prefer Affine2D.translate to offset_transform in examples.
- PR #14783: Cleanup mlab.detrend.
- PR #14791: Make 'extended' and 'expanded' synonymous in font_manager
- PR #14787: Remove axis_artist _update, which is always a noop.
- PR #14758: Compiling C-ext with incorrect FreeType libs makes future compiles break
- PR #14763: Deprecate math_symbol_table function directive
- PR #14762: Decrease uses of get_canvas_width_height.
- PR #14748: Cleanup demo_text_path.
- PR #14740: Remove sudo tag in travis
- PR #14737: Cleanup twin axes docstrings.
- PR #14729: Small simplifications.
- PR #14726: Trivial simplification to Axis3d._get_coord_info.
- PR #14718: Add explanations for single character color names.
- PR #14710: Pin pydocstyle<4.0
- PR #14709: Try to improve the readability and styling of matplotlibrc.template file
- PR #14278: Inset axes bug and docs fix
- PR #14478: MNT: protect from out-of-bounds data access at the c level
- PR #14569: More deduplication of backend_tools.
- PR #14652: Soft-deprecate transform_point.

- PR #14664: Improve error reporting for scatter c as invalid RGBA.
- PR #14625: Don't double-wrap in silent_list.
- PR #14689: Update embedding_in_wx4 example.
- PR #14679: Further simplify colormap reversal.
- PR #14667: Move most of pytest's conf to conftest.py.
- PR #14632: Remove reference to old Tk/Windows bug.
- PR #14673: More shortening of setup.py prints.
- PR #14678: Fix small typo
- PR #14680: Format parameters in descriptions with emph instead of backticks
- PR #14674: Simplify colormap reversal.
- PR #14672: Artist tutorial fixes
- PR #14653: Remove some unnecessary prints from setup.py.
- PR #14662: Add a _check_getitem helper to go with _check_in_list/_check_isinstance.
- PR #14666: Update IPython's doc link in Image tutorial
- PR #14671: Improve readability of matplotlibrc.template
- PR #14665: Fix a typo in pyplot tutorial
- PR #14616: Use builtin round instead of np.round for scalars.
- PR #12554: backend_template docs and fixes
- PR #14635: Fix bug when setting negative limits and using log scale
- PR #14604: Update hist() docstring following removal of normed kwarg.
- PR #14630: Remove the private Tick._name attribute.
- PR #14555: Coding guidelines concerning the API
- PR #14516: Document and test _get_packed_offsets()
- PR #14628: matplotlib > Matplotlib in devel docs
- PR #14627: gitignore pip-wheel-metadta/ directory
- PR #14612: Update some mplot3d docs.
- PR #14617: Remove a Py2.4(!) backcompat fix.
- PR #14605: Update hist2d() docstring.
- PR #13084: When linking against libpng/zlib on Windows, use upstream lib names.
- PR #13685: Remove What's new fancy example
- PR #14573: Cleanup jpl_units.

- PR #14583: Fix overly long lines in setupext.
- PR #14588: Remove [status] suppress from setup.cfg.
- PR #14591: Style fixes for secondary_axis.
- PR #14594: DOC: Make temperature scale example use a closure for easier reusability
- PR #14447: FIX: allow secondary axes minor locators to be set
- PR #14567: Fix unicode_minus + usetex.
- PR #14351: Remove some redundant check_in_list calls.
- PR #14550: Restore thumbnail of usage guide
- PR #10222: Use symlinks instead of copies for test result_images.
- PR #14267: cbook docs cleanup
- PR #14556: Improve @deprecated's docstring.
- PR #14557: Clarify how to work with threads.
- PR #14545: In contributing.rst, encourage kwonly args and minimizing public APIs.
- PR #14533: Misc. style fixes.
- PR #14542: Move plot_directive doc to main API index.
- PR #14499: Improve custom figure example
- PR #14543: Remove the "Developing a new backend" section from contributing guide.
- PR #14540: Simplify backend switching in plot_directive.
- PR #14539: Don't overindent enumerated list in plot_directive docstring.
- PR #14537: Slightly tighten the Bbox API.
- PR #14223: Rewrite intro to usage guide.
- PR #14495: Numpydocify axes_artist.py
- PR #14529: mpl_toolkits style fixes.
- PR #14528: mathtext style fixes.
- PR #13536: Make unit converters also handle instances of subclasses.
- PR #13730: Include FreeType error codes in FreeType exception messages.
- PR #14500: Fix pydocstyle D403 (First word of the first line should be properly capitalized) in examples
- PR #14506: Simplify Qt tests.
- PR #14513: More fixes to pydocstyle D403 (First word capitalization)

- PR #14496: Fix pydocstyle D208 (Docstring is over-indented)
- PR #14347: Deprecate rcsetup.validate_path_exists.
- PR #14383: Remove the ``package_data.dlls`` setup.cfg entry.
- PR #14346: Simplify various validators in rcsetup.
- PR #14366: Move test_rcparams test files inline into test_rcparams.py.
- PR #14401: Assume that mpl-data is in its standard location.
- PR #14454: Simplify implementation of svg.image_inline.
- PR #14470: Add _check_isinstance helper.
- PR #14479: fstringify backend_ps more.
- PR #14484: Support unicode minus with ps.useafm.
- PR #14494: Style fixes.
- PR #14465: Docstrings cleanups.
- PR #14466: Let SecondaryAxis inherit get_tightbbox from _AxesBase.
- PR #13940: Some more f-strings.
- PR #14379: Remove unnecessary uses of unittest.mock.
- PR #14483: Improve font weight guessing.
- PR #14419: Fix test_imshow_pil on Windows.
- PR #14460: canvas.blit() already defaults to blitting the full figure canvas.
- PR #14462: Register timeout pytest marker.
- PR #14414: FEATURE: Alpha channel in Gouraud triangles in the pdf backend
- PR #13659: Clarify behavior of the 'tight' kwarg to autoscale/autoscale_view.
- PR #13901: Only test png output for mplot3d.
- PR #13338: Replace list.extend by star-expansion or other constructs.
- PR #14448: Misc doc style cleanup
- PR #14310: Update to Bounding Box for Qt5 FigureCanvasATAgg.paintEvent()
- PR #14380: Inline $MPLLOCALFREETYPE/$PYTEST_ADDOPTS/$NPROC in .travis.yml.
- PR #14413: MAINT: small improvements to the pdf backend
- PR #14452: MAINT: Minor cleanup to make functions more self consisntent
- PR #14441: Misc. docstring cleanups.
- PR #14440: Interpolations example
- PR #14402: Prefer `mpl.get_data_path()`, and support Paths in FontProperties.

- PR #14420: MAINT: Upgrade pytest again
- PR #14423: Fix docstring of subplots().
- PR #14410: Use aspect=1, not aspect=True.
- PR #14412: MAINT: Don't install pytest 4.6.0 on Travis
- PR #14377: Rewrite assert np.* tests to use numpy.testing
- PR #14399: Improve warning for case where data kwarg entry is ambiguous.
- PR #14390: Cleanup docs of bezier
- PR #14400: Fix to_rgba_array() for empty input
- PR #14308: Small clean to SymmetricalLogLocator
- PR #14311: travis: add c code coverage measurements
- PR #14393: Remove remaining unicode-strings markers.
- PR #14391: Remove explicit inheritance from object
- PR #14343: acquiring and releaseing keypresslock when textbox is being activated
- PR #14353: Register flaky pytest marker.
- PR #14373: Properly hide __has_include to support C++<17 compilers.
- PR #14378: Remove setup_method
- PR #14368: Finish removing jquery from the repo.
- PR #14360: Deprecate `boxplot(..., whis="range")`.
- PR #14376: Simplify removal of figure patch from bbox calculations.
- PR #14363: Make is_natively_supported private.
- PR #14330: Remove remaining unittest.TestCase uses
- PR #13663: Kill the PkgConfig singleton in setupext.
- PR #13067: Simplify generation of error messages for missing libpng/freetype.
- PR #14358: DOC boxplot `whis` parameter
- PR #14014: Disallow figure argument for pyplot.subplot() and Figure.add_subplot()
- PR #14350: Use cbook._check_in_list more often.
- PR #14348: Cleanup markers.py.
- PR #14345: Use importorskip for tests depending on pytz.
- PR #14170: In setup.py, inline the packages that need to be installed into setup().
- PR #14332: Use raw docstrings instead of escaping backslashes

- PR #14336: Enforce pydocstyle D412
- PR #14144: Deprecate the 'warn' parameter to matplotlib.use().
- PR #14328: Remove explicit inheritance from object
- PR #14035: Improve properties formatting in interpolated docstrings.
- PR #14018: pep8ing.
- PR #13542: Move {setup,install}_requires from setupext.py to setup.py.
- PR #13670: Simplify the logic of axis().
- PR #14046: Deprecate checkdep_ps_distiller.
- PR #14236: Simplify StixFonts.get_sized_alternatives_for_symbol.
- PR #14101: Shorten _ImageBase._make_image.
- PR #14246: Deprecate public use of makeMappingArray
- PR #13740: Deprecate plotfile.
- PR #14216: Walk the artist tree when preparing for saving with tight bbox.
- PR #14305: Small grammatical error.
- PR #14104: Factor out retrieval of data relative to datapath
- PR #14016: pep8ify backends.
- PR #14299: Fix #13711 by importing cbook.
- PR #14244: Remove APIs deprecated in mpl3.0.
- PR #14068: Alternative fix for passing iterator as frames to FuncAnimation
- PR #13711: Deprecate NavigationToolbar2Tk.set_active.
- PR #14280: Simplify validate_markevery logic.
- PR #14273: pep8ify a couple of variable names.
- PR #14115: Reorganize scatter arguments parsing.
- PR #14271: Replace some uses of np.iterable
- PR #14257: Changing cmap(np.nan) to 'bad' value rather than 'under' value
- PR #14259: Deprecate string as color sequence
- PR #13506: Change colorbar for contour to have the proper axes limits...
- PR #13494: Add colorbar annotation example plot to gallery
- PR #14266: Make matplotlib.figure.AxesStack private
- PR #14166: Shorten usage of `@image_comparison`.
- PR #14240: Merge up 31x
- PR #14242: Avoid a buffer copy in PillowWriter.

- PR #9672: Only set the wait cursor if the last draw was >1s ago.
- PR #14224: Update plt.show() doc
- PR #14218: Use stdlib mimetypes instead of hardcoding them.
- PR #14082: In tk backend, don't try to update mouse position after resize.
- PR #14084: Check number of positional arguments passed to quiver()
- PR #14214: Fix some docstring style issues.
- PR #14201: Fix E124 flake8 violations (closing bracket indentation).
- PR #14096: Consistently use axs to refer to a set of Axes
- PR #14204: Fix various flake8 indent problems.
- PR #14205: Obey flake8 "don't assign a lambda, use a def".
- PR #14198: Remove unused imports
- PR #14173: Prepare to change the default pad for AxesDivider.append_axes.
- PR #13738: Fix TypeError when plotting stacked bar chart with decimal
- PR #14151: Clarify error with usetex when cm-super is not installed.
- PR #14107: Feature: draw percentiles in violinplot
- PR #14172: Remove check_requirements from setupext.
- PR #14158: Fix test_lazy_imports in presence of $MPLBACKEND or matplotlibrc.
- PR #14157: Isolate nbagg test from user ipython profile.
- PR #14147: Dedent overindented list in example docstring.
- PR #14134: Deprecate the dryrun parameter to print_foo().
- PR #14145: Remove warnings handling for fixed bugs.
- PR #13977: Always import pyplot when calling matplotlib.use().
- PR #14131: Make test suite fail on warnings.
- PR #13593: Only autoscale_view() when needed, not after every plotting call.
- PR #13902: Add support for metadata= and pil_kwargs= in imsave().
- PR #14140: Avoid backslash-quote by changing surrounding quotes.
- PR #14132: Move some toplevel strings into the only functions that use them.
- PR #13708: Annotation.contains shouldn't consider the text+arrow's joint bbox.
- PR #13980: Don't let margins expand polar plots to negative radii by default.
- PR #14075: Remove uninformative entries from glossary.
- PR #14002: Allow pandas DataFrames through norms

- PR #14114: Allow SVG Text-as-Text to Use Data Coordinates
- PR #14120: Remove mention of $QT_API in matplotlibrc example.
- PR #13878: Style fixes for floating_axes.
- PR #14108: Deprecate FigureCanvasMac.invalidate in favor of draw_idle.
- PR #13879: Clarify handling of "extreme" values in FloatingAxisArtistHelper.
- PR #5602: Automatic downsampling of images.
- PR #14112: Remove old code path in layout.html
- PR #13959: Scatter: make "c" and "s" argument handling more consistent.
- PR #14110: Simplify scatter_piecharts example.
- PR #14111: Trivial cleanups.
- PR #14085: Simplify get_current_fig_manager().
- PR #14083: Deprecate FigureCanvasBase.draw_cursor.
- PR #14089: Cleanup bar_stacked, bar_unit_demo examples.
- PR #14063: Add pydocstyle checks to flake8
- PR #14077: Fix tick label wobbling in animated Qt example
- PR #14070: Cleanup some pyplot docstrings.
- PR #6280: Added ability to offset errorbars when using errorevery.
- PR #13679: Fix passing iterator as frames to FuncAnimation
- PR #14023: Improve Unicode minus example
- PR #14041: Pretty-format subprocess logs.
- PR #14038: Cleanup path.py docstrings.
- PR #13701: Small cleanups.
- PR #14020: Better error message when trying to use Gtk3Agg backend without cairo
- PR #14021: Fix ax.legend Returns markup
- PR #13986: Support RGBA for quadmesh mode of pcolorfast.
- PR #14009: Deprecate compare_versions.
- PR #14010: Deprecate get_home()
- PR #13932: Remove many unused variables.
- PR #13854: Cleanup contour.py.
- PR #13866: Switch PyArg_ParseTupleAndKeywords from "es" to "s".
- PR #13945: Make unicode_minus example more focused.

- PR #13876: Deprecate factor=None in axisartist.
- PR #13929: Better handle deprecated rcParams.
- PR #13851: Deprecate setting Axis.major.locator to non-Locator; idem for Formatters
- PR #13938: numpydocify quiverkey.
- PR #13936: Pathlibify animation.
- PR #13984: Allow setting tick colour on 3D axes
- PR #13987: Deprecate mlab.{apply_window,stride_repeat}.
- PR #13983: Fix locator/formatter setting when removing shared Axes
- PR #13957: Remove many unused variables in tests.
- PR #13981: Test cleanups.
- PR #13970: Check vmin/vmax are valid when doing inverse in LogNorm
- PR #13978: Make normalize_kwargs more convenient for third-party use.
- PR #13972: Remove _process_plot_var_args.set{line,patch}_props.
- PR #13795: Make _warn_external correctly report warnings arising from tests.
- PR #13885: Deprecate axisartist.grid_finder.GridFinderBase.
- PR #13913: Fix string numbers in to_rgba() and is_color_like()
- PR #13935: Deprecate the useless switch_backend_warn parameter to matplotlib.test.
- PR #13952: Cleanup animation tests.
- PR #13942: Make Cursors an (Int)Enum.
- PR #13953: Unxfail a now fixed test in test_category.
- PR #13925: Fix passing Path to ps backend when text.usetex rc is True.
- PR #13943: Don't crash on str(figimage(...)).
- PR #13944: Document how to support unicode minus in pgf backend.
- PR #13802: New rcparam to set default axes title location
- PR #13855: `a and b or c -> b if a else c`
- PR #13923: Correctly handle invalid PNG metadata.
- PR #13926: Suppress warnings in tests.
- PR #13920: Style fixes for category.py.
- PR #13889: Shorten docstrings by removing unneeded :class:/:func: + rewordings.
- PR #13911: Fix joinstyles example

- PR #13917: Faster categorical tick formatter.
- PR #13918: Make matplotlib.testing assume pytest by default, not nose.
- PR #13894: Check for positive number of rows and cols
- PR #13895: Remove unused setupext.is_min_version.
- PR #13886: Shorten Figure.set_size_inches.
- PR #13859: Ensure figsize is positive finite
- PR #13877: `zeros_like(x) + y` -> `full_like(x, y)`
- PR #13875: Style fixes for grid_helper_curvelinear.
- PR #13873: Style fixes to grid_finder.
- PR #13782: Don't access internet during tests.
- PR #13833: Some more usage of _check_in_list.
- PR #13834: Cleanup FancyArrowPatch docstring
- PR #13811: Generate Figure method wrappers via boilerplate.py
- PR #13797: Move sphinxext test to matplotlib.tests like everyone else.
- PR #13770: broken_barh docstring
- PR #13757: Remove mention of "enabling fontconfig support".
- PR #13454: Add "c" as alias for "color" for Collections
- PR #13756: Reorder the logic of _update_title_position.
- PR #13744: Restructure boilerplate.py
- PR #13369: Use default colours for examples
- PR #13697: Delete pyplot_scales example.
- PR #13726: Clarify a bit the implementation of blend_hsv.
- PR #13731: Check for already running QApplication in Qt embedding example.
- PR #13736: Deduplicate docstrings and validation for set_alpha.
- PR #13737: Remove duplicated methods in FixedAxisArtistHelper.
- PR #13721: Kill pyplot docstrings that get overwritten by @docstring.copy.
- PR #13690: Cleanup hexbin.
- PR #13683: Remove axes border for examples that list styles
- PR #13280: Add SubplotSpec.add_subplot.
- PR #11387: Deprecate Axes3D.w_{x,y,z}axis in favor of .{x,y,z}axis.
- PR #13671: Suppress some warnings in tests.
- PR #13657: DOC: fail the doc build on errors, but keep going to end

- PR #13647: Fix FancyArrowPatch joinstyle
- PR #13637: BLD: parameterize python_requires
- PR #13633: plot_directive: Avoid warning if plot_formats doesn't contain 'png'
- PR #13629: Small example simplification.
- PR #13620: Improve watermark example
- PR #13589: Kill Axes._connected.
- PR #13428: free cart pendulum animation example
- PR #10487: fixed transparency bug
- PR #13551: Fix IndexError for pyplot.legend() when plotting empty bar chart with label
- PR #13524: Cleanup docs for GraphicsContextBase.{get,set}_dashes.
- PR #13556: Cleanup warnings handling in tests.
- PR #8100: Deprecate MAXTICKS, Locator.raise_if_exceeds.
- PR #13534: More followup to autoregistering 3d axes.
- PR #13327: pcolorfast simplifications.
- PR #13532: More use of cbook._check_in_list.
- PR #13520: Register 3d projection by default.
- PR #13394: Deduplicate some code between floating_axes and grid_helper_curvelinear.
- PR #13527: Make SubplotSpec.num2 never None.
- PR #12249: Replaced noqa-comments by using Axes3D.name instead of '3d' for proje…

Issues (125):

- #16487: Add link to blog to front page
- #16478: The bottom parameter of plt.hist() shifts the data as well, not just the baseline
- #16280: SymLogNorm colorbar incorrect on master
- #16448: Bad interaction between shared axes and pcolormesh sticky edges
- #16451: InvertedLogTransform inherits from deprecated base
- #16420: Error when adding colorbar to pcolormesh of a boolean array
- #16114: Prose error on website (first paragraph)
- #8291: Unable to pickle.load(fig) with mpl in jupyter notebook
- #16173: Constrained_layout creates extra axes when used with subgridspec

- #16127: nbformat 5.0.0 missing schema files
- #15849: Using pandas.Timestamp in blended coordinate system of ax.annotate.
- #6015: scatterplot axis autoscale fails for small data values
- #15806: 3.2.0 may break some Cartopy tests
- #15852: Lasso selector does not show in Jupyter notebook
- #15820: Show incomplete tick labels when using mixed chinese and english characters
- #15770: DOCS 2D Line label option `_nolegend_` is not documented
- #15332: Type promotion error with datetime bins in hist
- #15611: BUG: Qt5Agg window size regression
- #7130: Incorrect autoscaling of polar plot limits after scatter
- #15576: Multi-line ticks cause cut-offs
- #8609: Clipped tick labels
- #15517: antialiased image check seems wrong when used on zoomed image
- #13400: Qt Embedding w/ Spyder
- #14724: drawstyle parameter of line needs example
- #13619: Importing matplotlib.animation prevents python script from executing in the background
- #14270: Secondary axis called with [0, 1] might produce exceptions in case these are invalid data
- #15417: Why is smart_bounds() being deprecated?
- #9778: Blanks in colorbar just inside of 'extend' arrowpoints when using AxesGrid
- #15336: DivergingNorm is a misleading name
- #15399: OSError: [Errno 86] Bad CPU type in executable: 'convert' on import matplotlib.animation
- #15109: matplotlib.collections inheritance diagram small/blurry
- #15331: Log Scale: FloatingPointError: underflow encountered in power
- #15251: Large memory growth with log scaling and linear ticking
- #15247: Colorbar tick placement issues with ImageGrid and LogNorm
- #15306: Footer off centre
- #13485: Matplotlib NavigationToolbar2Tk disappears when reducing window size

- #15232: DOC: Automatic default rcParam expansion creates misleading sentences
- #14141: setting spine position on a log plot fails
- #15138: Make plt.style.use accept path-like objects in addition to string
- #14207: Check if point is in path or not by contains_point
- #13591: Style issues when building the docs with (future) Sphinx 2.0
- #8089: Using Minute Locator to set x-axis ticks exceeds Locator.MAXTICKS
- #15075: sphinxext.missing_references does not specify if it supports parallel file read.
- #10963: Replace pgfimage by includegraphics in PGF backend
- #15156: ax.text fails with positional argument error
- #14439: hist() fails when all data points are np.nan
- #15042: How to handle sphinx nitpicky mode
- #14060: quiver(C=...) argument is not reasonably validated
- #11335: TST: testing not catching bad escape sequences in doc strings
- #15040: Wrong figure window size after calling fig.set_size_inches() repeatedly
- #15100: Issue with creating QApplication in QT backend
- #14887: kerning seems generally wrong
- #14800: default tick formatter could switch to scientific notation earlier
- #14503: Add a test for #14451
- #14907: ConnectionPatch across axes needs to be excluded from layout management
- #14911: Removing a shared axes via `ax.remove()` leads to an error.
- #12462: cbar.add_lines should allow manually adding lines, not just contour sets
- #14796: Show user how to use Agg buffer in example
- #14883: MinSize not respected using wx backend causes wxAssertionError. Bug fix included.
- #15014: Wrapping of text adds leading newline character if first word is long
- #14918: constrained_layout fails with hidden axis...
- #14981: Barplot call crashes when called with yscale="log" and bins with h=0
- #4621: Default bottom of Stepfilled histograms should be set according to ymin
- #15030: Doc build broken
- #8093: set_ylim not working with plt.axis('equal')

- #6055: Serious problems on the axes documentation
- #9979: Axis limits are set badly with small values in scatter().
- #10842: Text bbox empty dict should be ignored
- #13698: The default logit minor locator should not display tick labels
- #14878: plt.yscale doesn't throw warning with invalid kwarg
- #5619: Symlog linear region
- #14564: Broken string interpolation
- #13668: Add better error message to plt.axis()
- #14563: colorbar label prints "None" when label=None
- #13660: Closing a matplotlib figure with event handling occasionally causes “TypeError: isinstance()”
- #13033: 'NoneType' has no attribute '_alive' when using plt in a context manager
- #13891: Blurry app icon on macOS
- #14656: Axes title default color
- #14831: DOC: Webpage not formatted correctly on gallery docs
- #13819: Aspect ratio for not so common scales
- #8878: Setting aspect ratio for semi-log plots
- #4900: UnboundLocalError: local variable 'aspect_scale_mode' referenced before assignment
- #14608: Issue with using plt.axis('equal') with plt.polar(theta,r) plot
- #12893: [PyQt] NavigationToolbar2QT : Error when removing tools
- #14670: indicate_inset rectangles is sensitive to axis-flipping
- #14362: Add link to style examples in matplotlib.style documentation
- #6295: restore_region is not documented as a method of FigureCanvas
- #14754: Better pointer to dev docs on website
- #14744: Savefig svg fails with "Cannot cast array data from dtype('<U7') to dtype('float64') according to the rule 'safe'"
- #11919: Wrong Error Message
- #6824: Image comparison decorator: symlinks to baseline images
- #12180: Deprecate and remove pyplot.plotfile?
- #14180: ImageComparisonFailure: Image sizes do not match expected size
- #14443: Secondary axis does not show minor ticks.

- #8423: UnicodeDecodeError when making a plot using the 'classic' style and text.usetex=True
- #11275: A "TypeError" is raised if subclass inherited from "datetime" is used
- #9127: ps.useafm and axes.unicode_minus are incompatible
- #7571: matplotlib.widget.TextBox not correctly stopping keyboard shortcuts
- #14370: gcc error when building matplotlib dev from source
- #14011: TypeError on plt.subplot(figure=plt.figure())
- #13676: FuncAnimation with generator causes crash on StopIteration
- #9892: colormaps (cm) do not properly handle NaN values.
- #14122: Unexpected behavior in matplotlib.colors.to_rgba_array when passing unknown color name string
- #9546: The busy cursor is annoying in some instances
- #10788: TypeError when plotting stacked bar chart with decimal
- #14146: Saving polar plots with MiKTeX on Windows fails for some file formats
- #8532: Feature Request: draw percentiles in violinplot
- #13883: In headless mode, matplotlib.use('tkagg') only errors after importing pyplot
- #13967: Creating colorbar without artist fails with LogNorm
- #12542: The plot function of the matplotlib 2 and 3 versions is much slower than 1.5.3
- #13292: Non-sensical negative radial scale minimum autoset in polar plot
- #10909: Calling a Normalize instance with a DataFrame
- #14076: Tick label positions wobble in animated Qt example
- #14007: GTK3Agg backend raises ImportError for missing cairo dependency
- #12911: Tick mark color cannot be set on Axes3D
- #12853: Remove()ing a shared axes prevents the remaining axes from using unit-provided formatters
- #13912: `is_color_like` returning erroneous value on strings of integers
- #13921: − with save fig in .pgf
- #13872: ValueError message requests impossible condition
- #13857: Zero-width figure crashes libpng
- #13768: broken_barh docstring incorrect information
- #13641: `joinstyle` is not respected for `FancyArrowPatch` (either the path or the arrow heads)

- #11923: ColorbarBase fails to show if the first two values map to the same result
- #11527: Inconsistent path intersection
- #13003: IndexError thrown by pyplot.legend() when plotting empty bar chart with label

7.1.7 GitHub Stats for Matplotlib 3.1.2

GitHub stats for 2019/05/18 - 2019/06/30 (tag: v3.1.0)

These lists are automatically generated, and may be incomplete or contain duplicates.

We closed 30 issues and merged 120 pulnl requests. The full list can be seen on GitHub

The following 30 authors contributed 323 commits.

- Adam Gomaa
- Antony Lee
- Ben Root
- Christer Jensen
- chuanzhu xu

Pull Requests (120):

- PR #14636: Don't capture stderr in _check_and_log_subprocess.
- PR #14655: Backport PR #14649 on branch v3.1.x (Fix appveyor conda py37)
- PR #14649: Fix appveyor conda py37
- PR #14646: Backport PR #14640 on branch v3.1.x (FIX: allow secondary axes to be non-linear)
- PR #14640: FIX: allow secondary axes to be non-linear
- PR #14643: Second attempt at fixing axis inversion (for mpl3.1).
- PR #14623: Fix axis inversion with loglocator and logitlocator.
- PR #14619: Backport PR #14598 on branch v3.1.x (Fix inversion of shared axes.)
- PR #14621: Backport PR #14613 on branch v3.1.x (Cleanup DateFormatter docstring.)
- PR #14622: Backport PR #14611 on branch v3.1.x (Update some axis docstrings.)
- PR #14611: Update some axis docstrings.
- PR #14613: Cleanup DateFormatter docstring.
- PR #14598: Fix inversion of shared axes.
- PR #14610: Backport PR #14579 on branch v3.1.x (Fix inversion of 3d axis.)
- PR #14579: Fix inversion of 3d axis.
- PR #14600: Backport PR #14599 on branch v3.1.x (DOC: Add numpngw to third party packages.)
- PR #14574: Backport PR #14568 on branch v3.1.x (Don't assume tk canvas have a manager attached.)

- PR #14568: Don't assume tk canvas have a manager attached.
- PR #14571: Backport PR #14566 on branch v3.1.x (Move setting of AA_EnableHighDpiScaling before creating QApplication.)
- PR #14566: Move setting of AA_EnableHighDpiScaling before creating QApplication.
- PR #14541: Backport PR #14535 on branch v3.1.x (Invalidate FT2Font cache when fork()ing.)
- PR #14535: Invalidate FT2Font cache when fork()ing.
- PR #14522: Backport PR #14040 on branch v3.1.x (Gracefully handle non-finite z in tricontour (issue #10167))
- PR #14434: Backport PR #14296 on branch v3.1.x (Fix barbs to accept array of bool for `flip_barb`)
- PR #14518: Backport PR #14509 on branch v3.1.x (Fix too large icon spacing in Qt5 on non-HiDPI screens)
- PR #14509: Fix too large icon spacing in Qt5 on non-HiDPI screens
- PR #14514: Backport PR #14256 on branch v3.1.x (Improve docstring of Axes.barbs)
- PR #14256: Improve docstring of Axes.barbs
- PR #14505: Backport PR #14395 on branch v3.1.x (MAINT: work around non-zero exit status of "pdftops -v" command.)
- PR #14504: Backport PR #14445 on branch v3.1.x (FIX: fastpath clipped artists)
- PR #14502: Backport PR #14451 on branch v3.1.x (FIX: return points rather than path to fix regression)
- PR #14445: FIX: fastpath clipped artists
- PR #14497: Backport PR #14491 on branch v3.1.x (Fix uses of PyObject_IsTrue.)
- PR #14491: Fix uses of PyObject_IsTrue.
- PR #14492: Backport PR #14490 on branch v3.1.x (Fix links of parameter types)
- PR #14490: Fix links of parameter types
- PR #14489: Backport PR #14459 on branch v3.1.x (Cleanup docstring of DraggableBase.)
- PR #14459: Cleanup docstring of DraggableBase.
- PR #14485: Backport #14429 on v3.1.x
- PR #14486: Backport #14403 on v3.1.
- PR #14429: FIX: if the first elements of an array are masked keep checking

- PR #14481: Backport PR #14475 on branch v3.1.x (change ginoput docstring to match behavior)
- PR #14482: Backport PR #14464 on branch v3.1.x (Mention origin and extent tutorial in API docs for origin kwarg)
- PR #14464: Mention origin and extent tutorial in API docs for origin kwarg
- PR #14468: Backport PR #14449: Improve docs on gridspec
- PR #14475: change ginoput docstring to match behavior
- PR #14477: Backport PR #14461 on branch v3.1.x (Fix out of bounds read in backend_tk.)
- PR #14476: Backport PR #14474 on branch v3.1.x (Fix default value in docstring of errorbar func)
- PR #14461: Fix out of bounds read in backend_tk.
- PR #14474: Fix default value in docstring of errorbar func
- PR #14473: Backport PR #14472 on branch v3.1.x (Fix NameError in example code for setting label via method)
- PR #14472: Fix NameError in example code for setting label via method
- PR #14449: Improve docs on gridspec
- PR #14450: Backport PR #14422 on branch v3.1.x (Fix ReST note in span selector example)
- PR #14446: Backport PR #14438 on branch v3.1.x (Issue #14372 - Add degrees to documentation)
- PR #14438: Issue #14372 - Add degrees to documentation
- PR #14437: Backport PR #14387 on branch v3.1.x (Fix clearing rubberband on nbagg)
- PR #14387: Fix clearing rubberband on nbagg
- PR #14435: Backport PR #14425 on branch v3.1.x (Lic restore license paint)
- PR #14296: Fix barbs to accept array of bool for `flip_barb`
- PR #14430: Backport PR #14397 on branch v3.1.x (Correctly set clip_path on pcolorfast return artist.)
- PR #14397: Correctly set clip_path on pcolorfast return artist.
- PR #14409: Backport PR #14335 on branch v3.1.x (Add explanation of animation.embed_limit to matplotlibrc.template)
- PR #14335: Add explanation of animation.embed_limit to matplotlibrc.template
- PR #14403: Revert "Preserve whitespace in svg output."
- PR #14407: Backport PR #14406 on branch v3.1.x (Remove extra iint in math_symbol_table for document)

- PR #14398: Backport PR #14394 on branch v3.1.x (Update link to "MathML torture test".)
- PR #14394: Update link to "MathML torture test".
- PR #14389: Backport PR #14388 on branch v3.1.x (Fixed one little spelling error)
- PR #14385: Backport PR #14316 on branch v3.1.x (Improve error message for kiwisolver import error (DLL load failed))
- PR #14388: Fixed one little spelling error
- PR #14384: Backport PR #14369 on branch v3.1.x (Don't use deprecated mathcircled in docs.)
- PR #14316: Improve error message for kiwisolver import error (DLL load failed)
- PR #14369: Don't use deprecated mathcircled in docs.
- PR #14375: Backport PR #14374 on branch v3.1.x (Check that the figure patch is in bbox_artists before trying to remove.)
- PR #14374: Check that the figure patch is in bbox_artists before trying to remove.
- PR #14040: Gracefully handle non-finite z in tricontour (issue #10167)
- PR #14342: Backport PR #14326 on branch v3.1.x (Correctly apply PNG palette when building ImageBase through Pillow.)
- PR #14326: Correctly apply PNG palette when building ImageBase through Pillow.
- PR #14341: Backport PR #14337 on branch v3.1.x (Docstring cleanup)
- PR #14337: Docstring cleanup
- PR #14325: Backport PR #14126 on branch v3.1.x (Simplify grouped bar chart example)
- PR #14324: Backport PR #14139 on branch v3.1.x (TST: be more explicit about identifying qt4/qt5 imports)
- PR #14126: Simplify grouped bar chart example
- PR #14323: Backport PR #14290 on branch v3.1.x (Convert SymmetricalLogScale to numpydoc)
- PR #14139: TST: be more explicit about identifying qt4/qt5 imports
- PR #14290: Convert SymmetricalLogScale to numpydoc
- PR #14321: Backport PR #14313 on branch v3.1.x
- PR #14313: Support masked array inputs for to_rgba and to_rgba_array.
- PR #14320: Backport PR #14319 on branch v3.1.x (Don't set missing history buttons.)

- PR #14319: Don't set missing history buttons.
- PR #14317: Backport PR #14295: Fix bug in SymmetricalLogTransform.
- PR #14302: Backport PR #14255 on branch v3.1.x (Improve docsstring of Axes.streamplot)
- PR #14255: Improve docsstring of Axes.streamplot
- PR #14295: Fix bug in SymmetricalLogTransform.
- PR #14294: Backport PR #14282 on branch v3.1.x (Fix toolmanager's destroy subplots in tk)
- PR #14282: Fix toolmanager's destroy subplots in tk
- PR #14292: Backport PR #14289 on branch v3.1.x (BUG: Fix performance regression when plotting values from Numpy array sub-classes)
- PR #14289: BUG: Fix performance regression when plotting values from Numpy array sub-classes
- PR #14287: Backport PR #14286 on branch v3.1.x (fix minor typo)
- PR #14284: Backport PR #14279 on branch v3.1.x (In case fallback to Agg fails, let the exception propagate out.)
- PR #14254: Merge up 30x
- PR #14279: In case fallback to Agg fails, let the exception propagate out.
- PR #14268: Backport PR #14261 on branch v3.1.x (Updated polar documentation)
- PR #14261: Updated polar documentation
- PR #14264: Backport PR #14260 on branch v3.1.x (Remove old OSX FAQ page)
- PR #14260: Remove old OSX FAQ page
- PR #14249: Backport PR #14243 on branch v3.1.x (Update docstring of makeMappingArray)
- PR #14250: Backport PR #14149 on branch v3.1.x
- PR #14252: Backport PR #14248 on branch v3.1.x (Fix TextBox not respecting eventson)
- PR #14253: Backport PR #13596 on branch v3.1.x (Normalize properties passed to bxp().)
- PR #14251: Backport PR #14241 on branch v3.1.x (Fix linear segmented colormap with one element)
- PR #13596: Normalize properties passed to bxp().
- PR #14248: Fix TextBox not respecting eventson
- PR #14241: Fix linear segmented colormap with one element

- PR #14243: Update docstring of makeMappingArray
- PR #14238: Backport PR #14164 on branch v3.1.x (Fix regexp for dvipng version detection)
- PR #14149: Avoid using `axis([xlo, xhi, ylo, yhi])` in examples.
- PR #14164: Fix regexp for dvipng version detection
- PR #13739: Fix pressing tab breaks keymap in CanvasTk

Issues (30):

- #14620: Plotting on a log/logit scale overwrites axis inverting
- #14615: Inverting an axis using its limits does not work for log scale
- #14577: Calling invert_yaxis() on a 3D plot has either no effect or removes ticks
- #14602: NavigationToolbar2Tk save_figure function bug
- #1219: Show fails on figures created with the object-oriented system
- #10167: Segmentation fault with tricontour
- #13723: RuntimeError when saving PDFs via parallel processes (not threads!)
- #14315: Improvement: Better error message if kiwisolver fails to import
- #14356: matplotlib.units.ConversionError on scatter of dates with a NaN in the first position
- #14467: Docs for plt.ginput() have the wrong default value for show_clicks keyword argument.
- #14225: Matplotlib crashes on windows while maximizing plot window when using Multicursor
- #14458: DOC: small inconsistency in errobar docstring
- #14372: Document that view_init() arguments should be in degrees
- #12201: issues clearing rubberband on nbagg at non-default browser zoom
- #13576: pcolorfast misbehaves when changing axis limits
- #14303: Unable to import matplotlib on Windows 10 v1903
- #14283: RendererSVG CSS 'white-space' property conflicts with default HTML CSS
- #14293: imshow() producing "inverted" colors since 3.0.3
- #14322: Cannot import matplotlib with Python 3.7.x on Win10Pro
- #14137: Qt5 test auto-skip is not working correctly
- #14301: scatter() fails on nan-containing input when providing edgecolor
- #14318: Don't try to set missing history buttons.
- #14265: symlog looses some points since 3.1.0 (example given)

- #14274: BUG: plotting with Numpy array subclasses is slow with Matplotlib 3.1.0 (regression)
- #14263: import pyplot issue -
- #14227: Update "working with Mpl on OSX" docs
- #13448: boxplot doesn't normalize properties before applying them
- #14226: Modify matplotlib TextBox value without triggering callback
- #14232: LinearSegmentedColormap with N=1 gives confusing error message
- #10365: Scatter plot with non-sequence ´c´ color should give a better Error message.

7.1.8 GitHub Stats for Matplotlib 3.1.1

GitHub stats for 2019/05/18 - 2019/06/30 (tag: v3.1.0)

These lists are automatically generated, and may be incomplete or contain duplicates.

We closed 30 issues and merged 120 pull requests. The full list can be seen on GitHub

The following 30 authors contributed 323 commits.

- Adam Gomaa
- Antony Lee
- Ben Root
- Christer Jensen
- chuanzhu xu
- David Stansby
- Deng Tian
- djdt
- Dora Fraeman Caswell

GitHub issues and pull requests:

Pull Requests (120):

- PR #14636: Don't capture stderr in _check_and_log_subprocess.
- PR #14655: Backport PR #14649 on branch v3.1.x (Fix appveyor conda py37)
- PR #14649: Fix appveyor conda py37
- PR #14646: Backport PR #14640 on branch v3.1.x (FIX: allow secondary axes to be non-linear)
- PR #14640: FIX: allow secondary axes to be non-linear
- PR #14643: Second attempt at fixing axis inversion (for mpl3.1).
- PR #14623: Fix axis inversion with loglocator and logitlocator.
- PR #14619: Backport PR #14598 on branch v3.1.x (Fix inversion of shared axes.)
- PR #14621: Backport PR #14613 on branch v3.1.x (Cleanup DateFormatter docstring.)
- PR #14622: Backport PR #14611 on branch v3.1.x (Update some axis docstrings.)
- PR #14611: Update some axis docstrings.
- PR #14613: Cleanup DateFormatter docstring.
- PR #14598: Fix inversion of shared axes.
- PR #14610: Backport PR #14579 on branch v3.1.x (Fix inversion of 3d axis.)

- PR #14579: Fix inversion of 3d axis.
- PR #14600: Backport PR #14599 on branch v3.1.x (DOC: Add numpngw to third party packages.)
- PR #14574: Backport PR #14568 on branch v3.1.x (Don't assume tk canvas have a manager attached.)
- PR #14568: Don't assume tk canvas have a manager attached.
- PR #14571: Backport PR #14566 on branch v3.1.x (Move setting of AA_EnableHighDpiScaling before creating QApplication.)
- PR #14566: Move setting of AA_EnableHighDpiScaling before creating QApplication.
- PR #14541: Backport PR #14535 on branch v3.1.x (Invalidate FT2Font cache when fork()ing.)
- PR #14535: Invalidate FT2Font cache when fork()ing.
- PR #14522: Backport PR #14040 on branch v3.1.x (Gracefully handle non-finite z in tricontour (issue #10167))
- PR #14434: Backport PR #14296 on branch v3.1.x (Fix barbs to accept array of bool for `flip_barb`)
- PR #14518: Backport PR #14509 on branch v3.1.x (Fix too large icon spacing in Qt5 on non-HiDPI screens)
- PR #14509: Fix too large icon spacing in Qt5 on non-HiDPI screens
- PR #14514: Backport PR #14256 on branch v3.1.x (Improve docstring of Axes.barbs)
- PR #14256: Improve docstring of Axes.barbs
- PR #14505: Backport PR #14395 on branch v3.1.x (MAINT: work around non-zero exit status of "pdftops -v" command.)
- PR #14504: Backport PR #14445 on branch v3.1.x (FIX: fastpath clipped artists)
- PR #14502: Backport PR #14451 on branch v3.1.x (FIX: return points rather than path to fix regression)
- PR #14445: FIX: fastpath clipped artists
- PR #14497: Backport PR #14491 on branch v3.1.x (Fix uses of PyObject_IsTrue.)
- PR #14491: Fix uses of PyObject_IsTrue.
- PR #14492: Backport PR #14490 on branch v3.1.x (Fix links of parameter types)
- PR #14490: Fix links of parameter types
- PR #14489: Backport PR #14459 on branch v3.1.x (Cleanup docstring of DraggableBase.)

- PR #14459: Cleanup docstring of DraggableBase.
- PR #14485: Backport #14429 on v3.1.x
- PR #14486: Backport #14403 on v3.1.
- PR #14429: FIX: if the first elements of an array are masked keep checking
- PR #14481: Backport PR #14475 on branch v3.1.x (change ginoput docstring to match behavior)
- PR #14482: Backport PR #14464 on branch v3.1.x (Mention origin and extent tutorial in API docs for origin kwarg)
- PR #14464: Mention origin and extent tutorial in API docs for origin kwarg
- PR #14468: Backport PR #14449: Improve docs on gridspec
- PR #14475: change ginoput docstring to match behavior
- PR #14477: Backport PR #14461 on branch v3.1.x (Fix out of bounds read in backend_tk.)
- PR #14476: Backport PR #14474 on branch v3.1.x (Fix default value in docstring of errorbar func)
- PR #14461: Fix out of bounds read in backend_tk.
- PR #14474: Fix default value in docstring of errorbar func
- PR #14473: Backport PR #14472 on branch v3.1.x (Fix NameError in example code for setting label via method)
- PR #14472: Fix NameError in example code for setting label via method
- PR #14449: Improve docs on gridspec
- PR #14450: Backport PR #14422 on branch v3.1.x (Fix ReST note in span selector example)
- PR #14446: Backport PR #14438 on branch v3.1.x (Issue #14372 - Add degrees to documentation)
- PR #14438: Issue #14372 - Add degrees to documentation
- PR #14437: Backport PR #14387 on branch v3.1.x (Fix clearing rubberband on nbagg)
- PR #14387: Fix clearing rubberband on nbagg
- PR #14435: Backport PR #14425 on branch v3.1.x (Lic restore license paint)
- PR #14296: Fix barbs to accept array of bool for `flip_barb`
- PR #14430: Backport PR #14397 on branch v3.1.x (Correctly set clip_path on pcolorfast return artist.)
- PR #14397: Correctly set clip_path on pcolorfast return artist.

- PR #14409: Backport PR #14335 on branch v3.1.x (Add explanation of animation.embed_limit to matplotlibrc.template)
- PR #14335: Add explanation of animation.embed_limit to matplotlibrc.template
- PR #14403: Revert "Preserve whitespace in svg output."
- PR #14407: Backport PR #14406 on branch v3.1.x (Remove extra iint in math_symbol_table for document)
- PR #14398: Backport PR #14394 on branch v3.1.x (Update link to "MathML torture test".)
- PR #14394: Update link to "MathML torture test".
- PR #14389: Backport PR #14388 on branch v3.1.x (Fixed one little spelling error)
- PR #14385: Backport PR #14316 on branch v3.1.x (Improve error message for kiwisolver import error (DLL load failed))
- PR #14388: Fixed one little spelling error
- PR #14384: Backport PR #14369 on branch v3.1.x (Don't use deprecated mathcircled in docs.)
- PR #14316: Improve error message for kiwisolver import error (DLL load failed)
- PR #14369: Don't use deprecated mathcircled in docs.
- PR #14375: Backport PR #14374 on branch v3.1.x (Check that the figure patch is in bbox_artists before trying to remove.)
- PR #14374: Check that the figure patch is in bbox_artists before trying to remove.
- PR #14040: Gracefully handle non-finite z in tricontour (issue #10167)
- PR #14342: Backport PR #14326 on branch v3.1.x (Correctly apply PNG palette when building ImageBase through Pillow.)
- PR #14326: Correctly apply PNG palette when building ImageBase through Pillow.
- PR #14341: Backport PR #14337 on branch v3.1.x (Docstring cleanup)
- PR #14337: Docstring cleanup
- PR #14325: Backport PR #14126 on branch v3.1.x (Simplify grouped bar chart example)
- PR #14324: Backport PR #14139 on branch v3.1.x (TST: be more explicit about identifying qt4/qt5 imports)
- PR #14126: Simplify grouped bar chart example
- PR #14323: Backport PR #14290 on branch v3.1.x (Convert SymmetricalLogScale to numpydoc)

- PR #14139: TST: be more explicit about identifying qt4/qt5 imports
- PR #14290: Convert SymmetricalLogScale to numpydoc
- PR #14321: Backport PR #14313 on branch v3.1.x
- PR #14313: Support masked array inputs for to_rgba and to_rgba_array.
- PR #14320: Backport PR #14319 on branch v3.1.x (Don't set missing history buttons.)
- PR #14319: Don't set missing history buttons.
- PR #14317: Backport PR #14295: Fix bug in SymmetricalLogTransform.
- PR #14302: Backport PR #14255 on branch v3.1.x (Improve docsstring of Axes.streamplot)
- PR #14255: Improve docsstring of Axes.streamplot
- PR #14295: Fix bug in SymmetricalLogTransform.
- PR #14294: Backport PR #14282 on branch v3.1.x (Fix toolmanager's destroy subplots in tk)
- PR #14282: Fix toolmanager's destroy subplots in tk
- PR #14292: Backport PR #14289 on branch v3.1.x (BUG: Fix performance regression when plotting values from Numpy array sub-classes)
- PR #14289: BUG: Fix performance regression when plotting values from Numpy array sub-classes
- PR #14287: Backport PR #14286 on branch v3.1.x (fix minor typo)
- PR #14284: Backport PR #14279 on branch v3.1.x (In case fallback to Agg fails, let the exception propagate out.)
- PR #14254: Merge up 30x
- PR #14279: In case fallback to Agg fails, let the exception propagate out.
- PR #14268: Backport PR #14261 on branch v3.1.x (Updated polar documentation)
- PR #14261: Updated polar documentation
- PR #14264: Backport PR #14260 on branch v3.1.x (Remove old OSX FAQ page)
- PR #14260: Remove old OSX FAQ page
- PR #14249: Backport PR #14243 on branch v3.1.x (Update docstring of makeMappingArray)
- PR #14250: Backport PR #14149 on branch v3.1.x
- PR #14252: Backport PR #14248 on branch v3.1.x (Fix TextBox not respecting eventson)

- PR #14253: Backport PR #13596 on branch v3.1.x (Normalize properties passed to bxp().)
- PR #14251: Backport PR #14241 on branch v3.1.x (Fix linear segmented colormap with one element)
- PR #13596: Normalize properties passed to bxp().
- PR #14248: Fix TextBox not respecting eventson
- PR #14241: Fix linear segmented colormap with one element
- PR #14243: Update docstring of makeMappingArray
- PR #14238: Backport PR #14164 on branch v3.1.x (Fix regexp for dvipng version detection)
- PR #14149: Avoid using `axis([xlo, xhi, ylo, yhi])` in examples.
- PR #14164: Fix regexp for dvipng version detection
- PR #13739: Fix pressing tab breaks keymap in CanvasTk

Issues (30):

- #14620: Plotting on a log/logit scale overwrites axis inverting
- #14615: Inverting an axis using its limits does not work for log scale
- #14577: Calling invert_yaxis() on a 3D plot has either no effect or removes ticks
- #14602: NavigationToolbar2Tk save_figure function bug
- #1219: Show fails on figures created with the object-oriented system
- #10167: Segmentation fault with tricontour
- #13723: RuntimeError when saving PDFs via parallel processes (not threads!)
- #14315: Improvement: Better error message if kiwisolver fails to import
- #14356: matplotlib.units.ConversionError on scatter of dates with a NaN in the first position
- #14467: Docs for plt.ginput() have the wrong default value for show_clicks keyword argument.
- #14225: Matplotlib crashes on windows while maximizing plot window when using Multicursor
- #14458: DOC: small inconsistency in errobar docstring
- #14372: Document that view_init() arguments should be in degrees
- #12201: issues clearing rubberband on nbagg at non-default browser zoom
- #13576: pcolorfast misbehaves when changing axis limits
- #14303: Unable to import matplotlib on Windows 10 v1903

- #14283: RendererSVG CSS 'white-space' property conflicts with default HTML CSS
- #14293: imshow() producing "inverted" colors since 3.0.3
- #14322: Cannot import matplotlib with Python 3.7.x on Win10Pro
- #14137: Qt5 test auto-skip is not working correctly
- #14301: scatter() fails on nan-containing input when providing edgecolor
- #14318: Don't try to set missing history buttons.
- #14265: symlog looses some points since 3.1.0 (example given)
- #14274: BUG: plotting with Numpy array subclasses is slow with Matplotlib 3.1.0 (regression)
- #14263: import pyplot issue -
- #14227: Update "working with Mpl on OSX" docs
- #13448: boxplot doesn't normalize properties before applying them
- #14226: Modify matplotlib TextBox value without triggering callback
- #14232: LinearSegmentedColormap with N=1 gives confusing error message
- #10365: Scatter plot with non-sequence ´c´ color should give a better Error message.

7.1.9 GitHub Stats for Matplotlib 3.1.0

GitHub stats for 2018/09/18 - 2019/05/13 (tag: v3.0.0)

These lists are automatically generated, and may be incomplete or contain duplicates.

We closed 161 issues and merged 918 pull requests. The full list can be seen on GitHub

The following 150 authors contributed 3426 commits.

Pull Requests (918):

- PR #14209: Backport PR #14197 on branch v3.1.x (Minor cleanup of acorr/xcoor docs)
- PR #14210: Make intro tutorial less jargony.
- PR #14197: Minor cleanup of acorr/xcoor docs
- PR #14203: Backport PR #14202 on branch v3.1.x (Fix docstring of Line2D.set_data.)
- PR #14202: Fix docstring of Line2D.set_data.
- PR #14196: Backport PR #14188 on branch v3.1.x (Clarify scope of MouseEvent attributes)
- PR #14188: Clarify scope of MouseEvent attributes
- PR #14194: Backport PR #14167 on branch v3.1.x (Fix backend_pgf header.)
- PR #14193: Backport PR #14153 on branch v3.1.x (Update qt_compat.py test for already imported binding.)
- PR #14167: Fix backend_pgf header.
- PR #14153: Update qt_compat.py test for already imported binding.
- PR #14190: Backport PR #14176 on branch v3.1.x (Merge doc/api/api_overview and doc/api/index.)
- PR #14192: Unbreak testsuite for pytest 4.5.

- PR #14189: Backport PR #14186 on branch v3.1.x (Update FancyBboxPatch docs to numpydoc style)
- PR #14176: Merge doc/api/api_overview and doc/api/index.
- PR #14186: Update FancyBboxPatch docs to numpydoc style
- PR #14187: Backport PR #13169 on branch v3.1.x (Add example code for current logo)
- PR #14165: Backport PR #14156 on branch v3.1.x (Fix glyph loading in textpath.)
- PR #14156: Fix glyph loading in textpath.
- PR #14162: Backport PR #14150 on branch v3.1.x (Fix deprecation of withdash for figtext().)
- PR #14150: Fix deprecation of withdash for figtext().
- PR #14136: Backport PR #14109 on branch v3.1.x
- PR #14109: Some simple pyplot doc improvements
- PR #14129: Backport PR #14117 on branch v3.1.x (Simplify ribbon_box example.)
- PR #14128: Backport PR #14057 on branch v3.1.x (Improve Gradient bar example)
- PR #14127: Backport PR #14125 on branch v3.1.x (Remove extra keyword from pytest.skip call.)
- PR #14117: Simplify ribbon_box example.
- PR #14057: Improve Gradient bar example
- PR #14125: Remove extra keyword from pytest.skip call.
- PR #14123: Backport PR #14119 on branch v3.1.x (Add ridge_map to third party packages documentation)
- PR #14119: Add ridge_map to third party packages documentation
- PR #14103: Backport PR #14088 on branch v3.1.x (Cleanup major_minor_demo.)
- PR #14102: Backport PR #14100 on branch v3.1.x (Improve docstring of axes_zoom_effect example.)
- PR #14099: Backport PR #14090 on branch v3.1.x (Pep8ify some variable names in examples.)
- PR #14100: Improve docstring of axes_zoom_effect example.
- PR #14088: Cleanup major_minor_demo.
- PR #14090: Pep8ify some variable names in examples.

- PR #14097: Backport PR #14079 on branch v3.1.x (Consistently use axs.flat instead of axs.flatten())
- PR #14095: Backport PR #14087 on branch v3.1.x (Cleanup date example.)
- PR #14094: Backport PR #14029 on branch v3.1.x (Fix doc building with numpydoc 0.9)
- PR #14093: Backport PR #14052 on branch v3.1.x (Check axes identity in image.contains.)
- PR #14092: Backport PR #14056 on branch v3.1.x (FIX: do not try to manage the visibility of un-drawn ticks)
- PR #14091: Backport PR #14078 on branch v3.1.x (Minor fix in multiple subplots example)
- PR #14079: Consistently use axs.flat instead of axs.flatten()
- PR #14087: Cleanup date example.
- PR #14029: Fix doc building with numpydoc 0.9
- PR #14052: Check axes identity in image.contains.
- PR #14056: FIX: do not try to manage the visibility of un-drawn ticks
- PR #14078: Minor fix in multiple subplots example
- PR #14080: Backport PR #14069 on branch v3.1.x (Don't try to use the colorbar formatter to format RGBA data.)
- PR #14069: Don't try to use the colorbar formatter to format RGBA data.
- PR #14074: Backport PR #14019 on branch v3.1.x (Update docstring of locator_params())
- PR #14019: Update docstring of locator_params()
- PR #14066: Backport PR #14053 on branch v3.1.x (Improve fill() example)
- PR #14065: Backport PR #14059 on branch v3.1.x (Improve Scatter hist example)
- PR #14067: Backport PR #14062 on branch v3.1.x (Improve advanced quiver example)
- PR #14062: Improve advanced quiver example
- PR #14053: Improve fill() example
- PR #14059: Improve Scatter hist example
- PR #14064: Backport PR #14043 on branch v3.1.x (Ensure errorbars are always drawn on top of bars in ax.bar)
- PR #14043: Ensure errorbars are always drawn on top of bars in ax.bar
- PR #14061: Backport PR #14051 on branch v3.1.x (Add Yellowbrick to third party packages)

- PR #14051: Add Yellowbrick to third party packages
- PR #14050: Backport PR #14048 on branch v3.1.x (Fix Animation.save)
- PR #14049: Backport PR #14047 on branch v3.1.x (Remove references to "Draws" in matplotlib.patches)
- PR #14048: Fix Animation.save
- PR #14047: Remove references to "Draws" in matplotlib.patches
- PR #14037: Backport PR #14033 on branch v3.1.x (Reword add_subplot docstring.)
- PR #14036: Backport PR #14001 on branch v3.1.x ([BUG] DOC: Remove broken references to vischeck)
- PR #14033: Reword add_subplot docstring.
- PR #14032: Backport PR #14030 on branch v3.1.x (Update colorcet link)
- PR #14030: Update colorcet link
- PR #14027: Backport PR #14026 on branch v3.1.x (Fix bug in plot_directive that caused links to plots in different formats to be missing)
- PR #14026: Fix bug in plot_directive that caused links to plots in different formats to be missing
- PR #14012: Backport PR #14008 on branch v3.1.x (Don't install tests by default.)
- PR #14017: Backport PR #14015 on branch v3.1.x (Fix docstring of pyplot.clim())
- PR #14015: Fix docstring of pyplot.clim()
- PR #14008: Don't install tests by default.
- PR #14006: Backport PR #13998 on branch v3.1.x (Fix patch contains logic for patches that don't have any codes)
- PR #14005: Backport PR #14004 on branch v3.1.x (DOC: pin numpydoc to less than 0.9)
- PR #13998: Fix patch contains logic for patches that don't have any codes
- PR #13999: Backport PR #13992 on branch v3.1.x (FIX: undeprecate MaxNLocator default_params)
- PR #13997: Backport PR #13995 on branch v3.1.x (DOC: explain zorder for gridlines in grid docstring)
- PR #13992: FIX: undeprecate MaxNLocator default_params
- PR #13995: DOC: explain zorder for gridlines in grid docstring
- PR #13990: Backport PR #13989 on branch v3.1.x (FIX: update not replace hist_kwargs when density is passed)

- PR #13989: FIX: update not replace hist_kwargs when density is passed
- PR #13975: Backport PR #13966 on branch v3.1.x (Fix colorbar setting without artist)
- PR #13976: Backport PR #13973 on branch v3.1.x (BUG: Ensure docstrings are not accessed with -OO)
- PR #13856: What's new page for 3.1
- PR #13966: Fix colorbar setting without artist
- PR #13973: BUG: Ensure docstrings are not accessed with -OO
- PR #13969: Backport PR #13950 on branch v3.1.x (confidence_ellipse_markup)
- PR #13950: confidence_ellipse_markup
- PR #13965: Backport PR #13962 on branch v3.1.x (Fix typo in code example in docstring.)
- PR #13964: Backport PR #13870 on branch v3.1.x (3.1.0 API changes page)
- PR #13962: Fix typo in code example in docstring.
- PR #13870: 3.1.0 API changes page
- PR #13961: Backport PR #13914 on branch v3.1.x (Improve Rainbow text example)
- PR #13960: Backport PR #13958 on branch v3.1.x (Remove transparent fancy legend example)
- PR #13914: Improve Rainbow text example
- PR #13958: Remove transparent fancy legend example
- PR #13956: Backport PR #13908 on branch v3.1.x (Enh control tick deconflict2)
- PR #13955: Backport PR #13941 on branch v3.1.x (Add project_urls to setup)
- PR #13908: Enh control tick deconflict2
- PR #13954: Backport PR #13949 on branch v3.1.x (DOC: Add documentation to Text.set_fontfamily)
- PR #13941: Add project_urls to setup
- PR #13949: DOC: Add documentation to Text.set_fontfamily
- PR #13951: Backport PR #13939 on branch v3.1.x (Bunch of docstring cleanups.)
- PR #13939: Bunch of docstring cleanups.
- PR #13947: Backport PR #13897 on branch v3.1.x (numpydocification.)
- PR #13897: numpydocification.
- PR #13946: Backport PR #13924 on branch v3.1.x (Followup to deprecation of usetex parameter in get_text_path.)

- PR #13924: Followup to deprecation of usetex parameter in get_text_path.
- PR #13916: Backport PR #13850 on branch v3.1.x (Cleanup STIX Font Demo)
- PR #13915: Backport PR #13835 on branch v3.1.x (Improve Conectionstyle Demo)
- PR #13850: Cleanup STIX Font Demo
- PR #13835: Improve Conectionstyle Demo
- PR #13846: Backport PR #13836 on branch v3.1.x (MNT: account for cpython deprecations)
- PR #13898: Backport PR #13896 on branch v3.1.x (Fix cbook.boxplot_stats docstring)
- PR #13896: Fix cbook.boxplot_stats docstring
- PR #13893: Backport PR #13890 on branch v3.1.x (rst seealso -> numpydoc "See Also".)
- PR #13890: rst seealso -> numpydoc "See Also".
- PR #13888: Backport PR #13862 on branch v3.1.x (Move 3.x API changes to prev_api_changes)
- PR #13862: Move 3.x API changes to prev_api_changes
- PR #13882: Backport PR #13867 on branch v3.1.x (Rename "docs" to "contents" in navigation bar)
- PR #13867: Rename "docs" to "contents" in navigation bar
- PR #13881: Backport PR #13874 on branch v3.1.x (Remove redundant call to Formatter.set_locs() before .format_ticks().)
- PR #13874: Remove redundant call to Formatter.set_locs() before .format_ticks().
- PR #13871: Backport PR #13868 on branch v3.1.x (Correctly handle fallout of defining PY_SSIZE_T_CLEAN on Windows.)
- PR #13869: Backport PR #13861 on branch v3.1.x (Fix remaining links in docs)
- PR #13868: Correctly handle fallout of defining PY_SSIZE_T_CLEAN on Windows.
- PR #13861: Fix remaining links in docs
- PR #13849: Backport PR #13845 on branch v3.1.x (Fix some broken documentation links)
- PR #13845: Fix some broken documentation links
- PR #13836: MNT: account for cpython deprecations
- PR #13841: Backport PR #12928 on branch v3.1.x (textpath encoding)

- PR #13842: Backport PR #13827 on branch v3.1.x (Better MovieWriter init error message)
- PR #13838: Backport PR #13570 on branch v3.1.x (Add new example for plotting a confidence_ellipse)
- PR #13827: Better MovieWriter init error message
- PR #13839: Backport PR #13815 on branch v3.1.x (Numpydocify FontManager.findfont())
- PR #13837: Backport PR #8638 on branch v3.1.x (FIX: if bins input to hist is str, treat like no bins)
- PR #12928: textpath encoding
- PR #13815: Numpydocify FontManager.findfont()
- PR #13570: Add new example for plotting a confidence_ellipse
- PR #8638: FIX: if bins input to hist is str, treat like no bins
- PR #13831: Backport PR #13780 on branch v3.1.x (numpydoc ListedColormap parameters)
- PR #13780: numpydoc ListedColormap parameters
- PR #13830: Backport PR #13829 on branch v3.1.x (numpydoc IndexFormatter)
- PR #13829: numpydoc IndexFormatter
- PR #13828: Backport PR #13821 on branch v3.1.x (Remove mathcircled from mathtext docs following its deprecation.)
- PR #13821: Remove mathcircled from mathtext docs following its deprecation.
- PR #13822: Backport PR #13817 on branch v3.1.x (Remove borders from barcode example)
- PR #13820: Backport PR #13816 on branch v3.1.x (Correct windows env variable format)
- PR #13816: Correct windows env variable format
- PR #13817: Remove borders from barcode example
- PR #13814: Merge pull request #13805 from timhoffm/pin-sphinx-1.x
- PR #13813: Backport PR #13764 on branch v3.1.x (Deprecate mathcircled.)
- PR #13764: Deprecate mathcircled.
- PR #13805: Pin Sphinx to 1.x
- PR #13807: Backport PR #13800 on branch v3.1.x (Doc typos.)
- PR #13800: Doc typos.
- PR #13806: Backport PR #13771 on branch v3.1.x (patches.Arc docstring update #13759)

- PR #13804: Backport PR #13766 on branch v3.1.x (Search for fonts in XDG directory as well.)
- PR #13771: patches.Arc docstring update #13759
- PR #13766: Search for fonts in XDG directory as well.
- PR #13794: Backport PR #13695 on branch v3.1.x (numpydocify transform_angles.)
- PR #13793: Backport PR #13762 on branch v3.1.x (Cleanup marker_reference example.)
- PR #13792: Backport PR #13789 on branch v3.1.x (BUG: Fix function signature mismatch for set_clim)
- PR #13791: Backport PR #13787 on branch v3.1.x (Fix failure to import matplotlib.animation on Windows.)
- PR #13695: numpydocify transform_angles.
- PR #13762: Cleanup marker_reference example.
- PR #13789: BUG: Fix function signature mismatch for set_clim
- PR #13787: Fix failure to import matplotlib.animation on Windows.
- PR #13781: Backport PR #13777 on branch v3.1.x (Use class-based directive for mathmpl sphinxext.)
- PR #13790: Backport PR #13564 on branch v3.1.x (Add an option to log progress while saving animations)
- PR #13564: Add an option to log progress while saving animations
- PR #13777: Use class-based directive for mathmpl sphinxext.
- PR #13765: Backport PR #13761 on branch v3.1.x (Deprecate verbose-related rcParams.)
- PR #13761: Deprecate verbose-related rcParams.
- PR #13760: Backport PR #13719 on branch v3.1.x (Doc: Update timeline example)
- PR #13704: Backport PR #13021 on branch v3.1.x (Undesirable behaviour of MixedModeRenderer)
- PR #13758: Backport PR #13674 on branch v3.1.x (Preserve whitespace in svg output.)
- PR #13719: Doc: Update timeline example
- PR #13674: Preserve whitespace in svg output.
- PR #13755: Backport PR #13741 on branch v3.1.x (FIX: make title move above ticklabels)

- PR #13754: Backport PR #13712 on branch v3.1.x (Deprecate NavigationToolbar2QT.adj_window (unused and always None).)
- PR #13741: FIX: make title move above ticklabels
- PR #13712: Deprecate NavigationToolbar2QT.adj_window (unused and always None).
- PR #13752: Backport PR #13732 on branch v3.1.x (Fix doc markup.)
- PR #13753: Backport PR #13751 on branch v3.1.x (DOC/FIX: try merging comments)
- PR #13751: DOC/FIX: try merging comments
- PR #13732: Fix doc markup.
- PR #13750: Backport PR #13743 on branch v3.1.x (Fix doc warning)
- PR #13743: Fix doc warning
- PR #13747: Backport PR #13745 on branch v3.1.x (Fix stem(use_line_collection))
- PR #13748: Backport PR #13716 on branch v3.1.x (Kill attributes that are never used/updated.)
- PR #13716: Kill attributes that are never used/updated.
- PR #13745: Fix stem(use_line_collection)
- PR #13710: TST: only test agg_filter extensions with baseline images
- PR #13709: Backport PR #8690 on branch v3.1.x
- PR #13707: Backport PR #12760 on branch v3.1.x (Deduplicate implementation of per-backend Tools.)
- PR #13706: Backport PR #13689 on branch v3.1.x (BUG: fix scaling of quiverkey when quiver scale_units='xy')
- PR #13705: Backport PR #12419 on branch v3.1.x (Add DivergingNorm (again, again, again))
- PR #13703: Backport PR #12170 on branch v3.1.x (Deprecate considering *args, **kwargs in Timer.remove_callback.)
- PR #12760: Deduplicate implementation of per-backend Tools.
- PR #13689: BUG: fix scaling of quiverkey when quiver scale_units='xy'
- PR #12419: Add DivergingNorm (again, again, again)
- PR #8690: Adds support for rgba and rgb images to pcolorfast
- PR #13021: Undesirable behaviour of MixedModeRenderer
- PR #12170: Deprecate considering *args, **kwargs in Timer.remove_callback.

- PR #13700: Backport PR #13588 on branch v3.1.x (FIX: fallback to viewlims if no data)
- PR #13694: Backport PR #13677 on branch v3.1.x (Log all failures to extract font properties.)
- PR #13588: FIX: fallback to viewlims if no data
- PR #13692: Backport PR #13677 on branch v3.0.x (Log all failures to extract font properties.)
- PR #13677: Log all failures to extract font properties.
- PR #13691: Backport PR #13687 on branch v3.1.x (Update stem example)
- PR #13687: Update stem example
- PR #13688: Backport PR #13684 on branch v3.1.x (Use format_data_short to format image cursor data.)
- PR #13684: Use format_data_short to format image cursor data.
- PR #13686: Backport PR #13363 on branch v3.1.x (Inline iter_ticks into _update_ticks, and use that in mplot3d.)
- PR #13363: Inline iter_ticks into _update_ticks, and use that in mplot3d.
- PR #13681: Backport PR #13678 on branch v3.1.x (Fix font deduplication logic in createFontList.)
- PR #13678: Fix font deduplication logic in createFontList.
- PR #13669: Backport PR #13667 on branch v3.1.x (Fix incorrect signature in axis() doc.)
- PR #13667: Fix incorrect signature in axis() doc.
- PR #13664: Backport PR #12637 on branch v3.1.x (Tell IPython the correct GUI event loop to use for all backends.)
- PR #13665: Backport PR #13601 on branch v3.1.x (Add a make-parameter-keyword-only-with-deprecation decorator.)
- PR #13601: Add a make-parameter-keyword-only-with-deprecation decorator.
- PR #12637: Tell IPython the correct GUI event loop to use for all backends.
- PR #13662: Backport PR #13064 on branch v3.1.x (Don't explicitly add default include paths to Extensions)
- PR #13064: Don't explicitly add default include paths to Extensions
- PR #13658: Backport PR #13652 on branch v3.1.x (Fix empty FancyArrow crash)
- PR #13652: Fix empty FancyArrow crash
- PR #13655: Backport PR #11692 on branch v3.1.x (Deprecate frameon kwarg and rcParam to savefig.)

- PR #13654: Backport PR #13614 on branch v3.1.x (Fix polar get window extent)
- PR #11692: Deprecate frameon kwarg and rcParam to savefig.
- PR #13614: Fix polar get window extent
- PR #13646: Backport PR #13645 on branch v3.1.x (widgets.py fix examples connect -> mpl_connect)
- PR #13645: widgets.py fix examples connect -> mpl_connect
- PR #13644: Backport PR #13612 on branch v3.1.x (Improve Demo Text Rotation Mode)
- PR #13612: Improve Demo Text Rotation Mode
- PR #13636: Backport PR #13621 on branch v3.1.x (Remove `asfileobj=False` from a bunch of examples loading sample_data.)
- PR #13635: Backport PR #13632 on branch v3.1.x (Clarify tick collision API change doc.)
- PR #13634: Backport PR #13631 on branch v3.1.x (Switch deprecation of Tick.label to pending.)
- PR #13621: Remove `asfileobj=False` from a bunch of examples loading sample_data.
- PR #13632: Clarify tick collision API change doc.
- PR #13631: Switch deprecation of Tick.label to pending.
- PR #13628: Backport PR #13603 on branch v3.1.x
- PR #13603: FIX: continue to bail tight layout if rect supplied
- PR #13627: Backport PR #13622 on branch v3.1.x (Change title of named colors example)
- PR #13626: Backport PR #13549 on branch v3.1.x (Simplify some annotation() calls in examples.)
- PR #13624: Backport PR #13610 on branch v3.1.x (Update centered ticklabels example)
- PR #13625: Backport PR #13611 on branch v3.1.x (Fix text position in Fancytextbox demo)
- PR #13622: Change title of named colors example
- PR #13610: Update centered ticklabels example
- PR #13611: Fix text position in Fancytextbox demo
- PR #13607: Backport PR #13605 on branch v3.1.x (Warn on attempts at semi-transparent outputs in ps backend.)
- PR #13608: Backport PR #13602 on branch v3.1.x (Deprecate cbook.is_hashable.)

- PR #13602: Deprecate cbook.is_hashable.
- PR #13605: Warn on attempts at semi-transparent outputs in ps backend.
- PR #13599: Backport PR #13590 on branch v3.1.x (Doc event loop requirements for Figure.show)
- PR #13590: Doc event loop requirements for Figure.show
- PR #13597: Backport PR #12359 on branch v3.1.x (ENH: Add boolean support for axis())
- PR #13594: Backport PR #13592 on branch v3.1.x (DOC: Make canonical URLs point to versioned path.)
- PR #13592: DOC: Make canonical URLs point to versioned path.
- PR #12359: ENH: Add boolean support for axis()
- PR #13587: Backport PR #13573 on branch v3.1.x (Fix mplot3d transparency)
- PR #13573: Fix mplot3d transparency
- PR #13585: Backport PR #13578 on branch v3.1.x (Revert invalid change in Centered Ticklabels example)
- PR #13584: Backport PR #13582 on branch v3.1.x (Cleanup two font-related examples.)
- PR #13578: Revert invalid change in Centered Ticklabels example
- PR #13582: Cleanup two font-related examples.
- PR #13579: Backport PR #13477 on branch v3.1.x (FIX: make EngFormatter respect axes.unicode_minus rcParam)
- PR #13577: Backport PR #12832 on branch v3.1.x (Deprecate redundant log-scale transform classes.)
- PR #13477: FIX: make EngFormatter respect axes.unicode_minus rcParam
- PR #12832: Deprecate redundant log-scale transform classes.
- PR #13574: Backport PR #12856 on branch v3.1.x (added property usemathtext to EngFormatter)
- PR #12856: added property usemathtext to EngFormatter
- PR #13572: Backport PR #12899 on branch v3.1.x (Small cleanups.)
- PR #13571: Backport PR #11553 on branch v3.1.x (Improved Code for Segments Intersect)
- PR #12899: Small cleanups.
- PR #11553: Improved Code for Segments Intersect
- PR #13568: Backport PR #13563 on branch v3.1.x (FIX: inverted colorbar ticks)
- PR #13563: FIX: inverted colorbar ticks

- PR #13530: BUG: keep the ticks when the colorbar axis is inverted
- PR #13565: Backport PR #13550 on branch v3.1.x (Strip out Py2-compat in setupext.)
- PR #13550: Strip out Py2-compat in setupext.
- PR #13562: Backport PR #13560 on branch v3.1.x (Improve GridSpec doc)
- PR #13560: Improve GridSpec doc
- PR #13558: Backport PR #13546 on branch v3.1.x (Modified docstring of the set_ylabel and set_xlabel)
- PR #13559: Backport PR #12062 on branch v3.1.x (Separate alpha and rbg interpolation then recombine to fix issue11316)
- PR #13557: Backport PR #13548 on branch v3.1.x (Deprecate TextWithDash.)
- PR #12062: Separate alpha and rbg interpolation then recombine to fix issue11316
- PR #13546: Modified docstring of the set_ylabel and set_xlabel
- PR #13548: Deprecate TextWithDash.
- PR #13549: Simplify some annotation() calls in examples.
- PR #13552: Backport PR #11241 on branch v3.1.x (Deprecate the MATPLOTLIBDATA environment variable.)
- PR #11241: Deprecate the MATPLOTLIBDATA environment variable.
- PR #13547: Backport PR #9314 on branch v3.1.x (Simplify units.Registry.get_converter.)
- PR #13545: Backport PR #13541 on branch v3.1.x (DOC: Remove mention of 'complex' mode in specgram docstring)
- PR #9314: Simplify units.Registry.get_converter.
- PR #13541: DOC: Remove mention of 'complex' mode in specgram docstring
- PR #13539: Backport PR #12950 on branch v3.1.x (Inline or simplify FooFormatter.pprint_val.)
- PR #13538: Backport PR #12748 on branch v3.1.x (Use the builtin GTK3 FileChooser rather than our custom subclass.)
- PR #13537: Backport PR #12781 on branch v3.1.x (Lazy import of private modules)
- PR #12950: Inline or simplify FooFormatter.pprint_val.
- PR #12748: Use the builtin GTK3 FileChooser rather than our custom subclass.
- PR #12781: Lazy import of private modules
- PR #11218: fix pkg-config handling to make cross-compiling work

- PR #13531: Backport PR #11964 on branch v3.1.x (Simplify extension setup.)
- PR #11964: Simplify extension setup.
- PR #13529: Backport PR #13525 on branch v3.1.x (Move some links in rst out of running text.)
- PR #13528: Backport PR #13526 on branch v3.1.x (DOC: fix Subplot calls)
- PR #13525: Move some links in rst out of running text.
- PR #13526: DOC: fix Subplot calls
- PR #13523: Backport PR #13521 on branch v3.1.x (Small cleanup to headings of 3d examples.)
- PR #13521: Small cleanup to headings of 3d examples.
- PR #13519: Backport PR #12716 on branch v3.1.x (FIX: return the actual ax.get_window_extent)
- PR #13518: Backport PR #12839 on branch v3.1.x (BUG: Prevent Tick params calls from overwriting visibility without being told to)
- PR #12716: FIX: return the actual ax.get_window_extent
- PR #12839: BUG: Prevent Tick params calls from overwriting visibility without being told to
- PR #13517: Fix heading hierarchy in annotation tutorial.
- PR #13516: Backport PR #13514 on branch v3.1.x (Add missing show() at end of example.)
- PR #13514: Add missing show() at end of example.
- PR #13512: Backport PR #13511 on branch v3.1.x (Add missing plt.show() at end of example.)
- PR #13511: Add missing plt.show() at end of example.
- PR #13508: Backport PR #13413 on branch v3.1.x (Simplify decade up- and down-rounding, and symmetrize expansion of degenerate log scales.)
- PR #13509: Backport PR #13492 on branch v3.1.x (Doc more release updates)
- PR #13492: Doc more release updates
- PR #13413: Simplify decade up- and down-rounding, and symmetrize expansion of degenerate log scales.
- PR #13507: Backport PR #13488 on branch v3.1.x (Animation: interactive zoom/pan with blitting does not work)
- PR #13488: Animation: interactive zoom/pan with blitting does not work
- PR #13505: Backport PR #13459 on branch v3.1.x (Document histogramming pre-binned data.)

- PR #13503: Backport PR #10776 on branch v3.1.x (fix FancyArrowPatch picker fails depending on arrowstyle)
- PR #13504: Backport PR #13123 on branch v3.1.x (Add shading to Axes3D.voxels, and enable it by default)
- PR #13502: Backport PR #13180 on branch v3.1.x (Various TextPath cleanups.)
- PR #13459: Document histogramming pre-binned data.
- PR #13501: Backport PR #13209 on branch v3.1.x (Deprecate support for (n, 1)-shaped error arrays in errorbar().)
- PR #13500: Backport PR #12763 on branch v3.1.x (Remove deprecated rcParams.)
- PR #13123: Add shading to Axes3D.voxels, and enable it by default
- PR #13499: Backport PR #13303 on branch v3.1.x (Unify checking of executable info.)
- PR #10776: fix FancyArrowPatch picker fails depending on arrowstyle
- PR #13180: Various TextPath cleanups.
- PR #13498: Backport PR #13314 on branch v3.1.x (Move major/minor tick overstrike logic to Axis.)
- PR #13209: Deprecate support for (n, 1)-shaped error arrays in errorbar().
- PR #12763: Remove deprecated rcParams.
- PR #13303: Unify checking of executable info.
- PR #13497: Backport PR #13057 on branch v3.1.x (Simplify callable(self._contains) checks)
- PR #13314: Move major/minor tick overstrike logic to Axis.
- PR #13057: Simplify callable(self._contains) checks
- PR #13496: Backport PR #13465 on branch v3.1.x (FIX: polar set_rlim allow bottom-only call)
- PR #13465: FIX: polar set_rlim allow bottom-only call
- PR #13495: Backport PR #12232 on branch v3.1.x (Add helper function to check that an argument is in a list of strings.)
- PR #12232: Add helper function to check that an argument is in a list of strings.
- PR #11708: Revert "Skip wx interactive tests on OSX."
- PR #13062: Update FAQ re: batch/webserver use.
- PR #12904: Support forward/backward mouse buttons
- PR #12150: Deprecate stackrel.
- PR #13449: Let boxplot() defer rcParams application to bxp()

- PR #13425: API: un-deprecate keyword only args to set_xlim, set_ylim
- PR #13447: Update axes_grid docs
- PR #13473: Deprecate backend_wx.IDLE_DELAY.
- PR #13476: Add font to pyplot.xkcd()
- PR #13475: Cleanup titles of embedding examples.
- PR #13468: Suppress chaining of cache lookup failure in color conversion.
- PR #13467: Add "c" shorthand for "color" for the Text class.
- PR #13398: FIX: let pandas IndexInt64 work for boxplot
- PR #13375: Improve Axes selection in Qt figure options.
- PR #13421: DOC: update release guide
- PR #13275: Simple logging interface.
- PR #13427: Simplify check for tight-bbox finiteness.
- PR #13444: Allow constructing boxplots over multiple calls.
- PR #13385: Remove/rework uses of np.where where possible.
- PR #13441: Make AFM parser both more compliant and less strict.
- PR #13384: Replace np.compress by boolean indexing.
- PR #13422: Clarify IndexError for out-of-bounds indexing of gridspec.
- PR #13443: Remove some outdated comments from rcsetup.py.
- PR #13357: Inherit some docstrings in backend code.
- PR #12380: Stem speedup2
- PR #13368: FIX: Fix shape of hist output when input is multidimensional empty list
- PR #5590: [mpl_toolkits] Fix picking for things drawn on parasite axes
- PR #13323: Move the call to Formatter.set_locs into Formatter.format_ticks.
- PR #13424: Deprecate Quiver.color in favor of Quiver.get_facecolor().
- PR #13434: More smoketesting of pcolorfast.
- PR #13395: Cleanup demo_curvelinear_grid.
- PR #13411: Deemphasize numeric locations for legend() in docs.
- PR #13419: FIX: secondary_axis resize
- PR #13020: Deprecate proj3d.mod.
- PR #13030: Deprecate internal functions exposed in the public API of mplot3d
- PR #13408: test_figure style fixes.

- PR #11127: Legend for Scatter
- PR #11855: Adding the possible to add full command line in animation
- PR #13409: Add nonsingular to the locator base class, and use it in set_*lim too.
- PR #11859: ENH: add secondary x/y axis
- PR #13235: Vectorize mplot3d.art3d.zalpha.
- PR #10411: New "accepts units" decorator
- PR #13403: FIX: remove idle_event
- PR #13069: 5 minor divisions when major ticks are 2.5 units apart
- PR #13402: Fix empty reshape2d
- PR #11683: Reuse axes_grid1's AxisDict in axisartist, instead of duplicating it.
- PR #12141: Let digits toggle axes nav only if they correspond to an existing axes.
- PR #9845: Add inaxes method to FigureCanvas to check whether point is in an axes.
- PR #13396: mpl_toolkits style fixes.
- PR #11497: Make CI fail if interactive toolkits can't be tested
- PR #11595: test doc rendering
- PR #13393: Deprecate Spine.is_frame_like.
- PR #13391: Remove colour specification from some examples
- PR #13386: Replace use of np.<ufunc> by operators (</&/|).
- PR #13389: Inherit more docstrings.
- PR #13387: Fix regression in docstring.dedent_interpd.
- PR #13383: Replace np.take by normal indexing.
- PR #13381: Avoid unneeded copies from flatten().
- PR #13354: Properly deprecate non-1D inputs to pie().
- PR #13379: Remove citation entry from FAQ.
- PR #13380: Minor simplifications to scatter3d.
- PR #13173: Decorator for deleting a parameter with a deprecation period.
- PR #8205: [MRG+1] plot_date() after axhline() doesn't rescale axes
- PR #11027: Specify custom tick space heuristic in MaxNLocator
- PR #13262: Shorten setupext and remove uninformative build log entries.
- PR #13377: Add private helper to internally suppress deprecations.
- PR #13376: Undeprecate case-insensitive "long" colornames.

- PR #13373: Deprecate axis3d.Axis.get_tick_positions.
- PR #13362: Kill the unused, private _get_pixel_distance_along_axis.
- PR #12772: Improve plot() docstring.
- PR #13359: DOC: change language a bit
- PR #13351: Fix: Log Colorbar minorticks_off reverted if ticks set
- PR #13356: More spelling fixes.
- PR #13125: Simplify and tighten the docstring handling API.
- PR #13346: Simplify parsing of tuple in C extension code.
- PR #13282: MAINT install of pinned vers for travis
- PR #13234: FIX: allow colorbar mappable norm to change and do right thing
- PR #13269: Rework a bit axes addition.
- PR #13330: Add Axis.get_inverted and Axis.set_inverted.
- PR #13117: Cleanup matplotlib.use
- PR #13335: Update and factor out Axis.get_tick_positions.
- PR #13324: Cleanup ScalarFormatter; preparatory to moving it to format_ticks.
- PR #13322: Update Axis docs
- PR #13342: Update some (mostly internal) docstrings in image.py.
- PR #11848: Country specific characters in Windows user folder name when locating .tfm-file
- PR #13309: bezier cleanups.
- PR #13334: Inherit some docstrings.
- PR #13332: Rewrite convert_to_string using std::string
- PR #13336: Update imshow docs.
- PR #13331: Try forcing font cache rebuild in flaky ttc test.
- PR #12105: API: make MaxNLocator trim out-of-view ticks before returning
- PR #13329: Pin flake8<3.7 to mitigate issues with flake8-per-file-ignores
- PR #13319: Deprecate dates.{str,bytes}pdate2num.
- PR #13320: Kill some private, unused functions in dates.py.
- PR #12909: Let Formatters format all ticks at once.
- PR #13313: Better explanation of ticks
- PR #13310: Replace *kw by *args.
- PR #13285: Defer checking of tex install to when it is actually used.

- PR #13128: Parameter-renaming decorator
- PR #13307: Spelling fixes.
- PR #13304: TST: deregister pandas
- PR #13300: Trivial bezier cleanups.
- PR #11664: FIX: clean up unit conversion unpacking of data, particularly for dates and pandas series
- PR #9639: Unify querying of executable versions
- PR #13224: numpydocify (some of) mpl_toolkits.
- PR #13301: Replace np.empty + ndarray.fill by np.full.
- PR #13229: Prevent exception when running animation on Agg backend.
- PR #13263: In imsave()'s Pillow-handled case, don't create a temporary figure.
- PR #13294: Simplify some calculations in polar.py.
- PR #13295: Kill some commented-out code.
- PR #13298: Add note about thread safety to FAQ.
- PR #13299: Don't emit a non-GUI warning when building the docs on Linux.
- PR #13297: Minor cleanup to OSX FAQ.
- PR #13283: Fix doc style in add_gridspec()
- PR #13129: ENH: add a user-friendly verbose interface
- PR #13279: Remove a useless catch_warnings() from example.
- PR #13268: Select RadioButtons by closest in position.
- PR #13271: Fix animation speed in double_pendulum example
- PR #13265: Allow turning off minor ticks on Colorbar with LogNorm
- PR #13260: Improve docs for format determination in savefig()/imsave().
- PR #12379: MAINT Use np.full when possible
- PR #12905: Add optional parameter use_default_template to rc_file()
- PR #13218: Fix checking of 'labels' argument to Sankey.add.
- PR #13256: DOC: reject MEP25 due to being stalled
- PR #13255: TST pandas support bar
- PR #13251: DEBUG-log font-matching results, and print failing logs on CI.
- PR #12818: Enh arbitrary scale
- PR #13187: FIX: bar mixed units, allow ValueError as well
- PR #13232: Fix incorrect kwarg being passed to TextPath.

- PR #13250: Replace safezip() by more informative error message in errorbar().
- PR #13239: Improve sankey logging.
- PR #13247: Simplify and optimize png writing in backend_pdf.
- PR #12455: Warn when "best" loc of legend is used with lots of data
- PR #13233: Remove warning in image_annotated_heatmap, and numpydocify it.
- PR #13248: Remove an unused local variable in backend_gtk3.
- PR #13249: Deprecate an unused "internal" API.
- PR #13243: Rewrite subplots_demo
- PR #13240: FIX: spelling error of local variable in category
- PR #13026: MNT: add a logging call if a categorical string array is all convertible
- PR #13225: Fix a warning in the doc build.
- PR #13227: Make color lowercase in example to avoid warning.
- PR #13217: numpydocify Sankey.add.
- PR #10209: Various backend cleanups.
- PR #13113: Globally cache single TexManager instances.
- PR #13213: Broadcast 'orientations' arg to Sankey.add.
- PR #13219: Fix some backend_bases docstrings.
- PR #13214: Reformat Sankey exceptions.
- PR #13211: Deprecate case-insensitive colors.
- PR #13210: Suppress a warning in the test suite.
- PR #13189: Remove cairo-based backends from backend fallback.
- PR #13207: Allow saving PNGs through Pillow instead of the builtin _png module.
- PR #13124: Simplify parsing of errorbar input.
- PR #13162: DOC: better argcheck bar
- PR #8531: Added compression option to save TIFF images
- PR #13094: Allow passing arguments to PIL.Image.save().
- PR #13202: Avoid private API in some examples.
- PR #13197: Cleanup the text of two mpl_toolkits examples.
- PR #13198: Cleanup SkewT example.
- PR #11914: Remove the system_monitor example.

- PR #13196: Deemphasize comment about extremely old Matplotlib versions in example.
- PR #13190: Show returncode when subprocess test fails
- PR #13163: Add explanatory comment to annotation box example
- PR #13104: Remove some more 1-tuples.
- PR #13105: Make GridSpec.update docstring match behavior.
- PR #13127: Deprecate add_subplot(<no positional args>) silently doing nothing.
- PR #13166: Simplify Text.get_usetex.
- PR #13188: Remove an outdated doc point regarding backend selection.
- PR #13107: Cleanup BboxBase docstrings.
- PR #13108: Capitalize some docstrings.
- PR #13115: Check for sphinx_copybutton when building the docs
- PR #13151: Update RadioButtons docs numpydoc style
- PR #13178: Remove :func: markup from mlab docstrings.
- PR #7461: [WIP] add matrix checking function for quiver input
- PR #13089: Ensure that arguments to quiver() are not matrices.
- PR #13179: Avoid calling a deprecated API in axis_artist.
- PR #13170: Don't try to find TeX-only fonts when layouting TeX text.
- PR #12957: Search also for user fonts on Windows (#12954)
- PR #12951: Make Text._get_layout simpler to follow.
- PR #11385: Add a get_zaxis method for 3d axes.
- PR #13172: Hyperlink DOIs to preferred resolver
- PR #13171: Document how to make colorbars "without" a ScalarMappable.
- PR #12903: FIX: (broken)bar(h) math before units
- PR #13167: Typos on subplot comments and example
- PR #13005: Improve error messages for unit conversion
- PR #13147: Extend joinstyle example
- PR #13165: Change doc string for Axes.arrow()
- PR #13155: Let ffmpeg report errors.
- PR #13149: Update errorbar limits example
- PR #13074: Move _windowing extension into _tkagg.
- PR #13146: Remove an outdated comment in backend_wx.

- PR #13126: FIX: minor log ticks overwrite
- PR #13148: Update example Step Demo
- PR #13138: API: Use class-based directive in sphinxext
- PR #11894: add `cache_frame_data` kwarg into `FuncAnimation`. fixes #8528.
- PR #13136: Small cleanups.
- PR #13140: Remove an "cannot show figure in agg" warning in test suite.
- PR #13134: Simplify color conversion backcompat shim.
- PR #13141: Unpin pytest (pytest-cov's latest release is compatible with it).
- PR #13133: Simplify the polys3d example.
- PR #12158: MNT: simplify valid tick logic
- PR #9867: Factor out common code between pdf and ps backends.
- PR #10111: Add set_data_3d and get_data_3d to Line3d
- PR #12245: Remove (some) features deprecated in mpl2.2
- PR #13119: Deprecate TextToPath.glyph_to_path.
- PR #13122: Pin pytest<4.1 to unbreak CI tests
- PR #13100: Restore the font cache on Travis.
- PR #12792: BUG: Ensure that distinct polygon collections are shaded identically
- PR #13070: cairo backend: default to pycairo
- PR #13114: BUG: calculate colorbar boundaries correctly from values
- PR #13111: Delete an unused private method.
- PR #10841: ENH: new date formatter
- PR #13093: Remove unused fontconfig conf file.
- PR #13063: Use default colour cycle in more examples
- PR #13103: Remove tight_bbox_test example.
- PR #13097: Replace 1-tuples by scalars where possible.
- PR #13027: Qt5 reset signals after non-interactive plotting
- PR #9787: Support (first font of) TTC files.
- PR #11780: ENH: Allow arbitrary coordinates for ConnectionPatch
- PR #12943: Update the font_table example.
- PR #13091: Improve MouseEvent str().
- PR #13095: Remove a duplicate attribute setting.
- PR #13090: Cleanup unused non-public imports.

- PR #13060: Move doc-requirements from root folder
- PR #13078: Convert streamplot to numpydoc
- PR #13088: Don't use deprecated np.random.random_integers.
- PR #13073: Drop pytest version check in setupext.py.
- PR #12933: Deprecate backend_pgf.LatexManagerFactory.
- PR #12969: Clarify the implementation of _process_plot_var_args.
- PR #12472: Make FontManager.defaultFont a property, to avoid hardcoding the prefix.
- PR #11806: Allow to not draw the labels on pie chart
- PR #11983: Simplify version checks for freetype and libpng.
- PR #13050: FIX: always eraseRect in Qt widget
- PR #13065: FIX: print out the correct ip address when starting webagg
- PR #13061: Make examples that load msft.csv robust against locale changes.
- PR #13042: cairo: remove the append_path() fast path
- PR #13058: pathlibify/cleanup triage_tests.py.
- PR #12995: Don't split creation of deprecation message and choice of warning class.
- PR #12998: Init MaxNLocator params only once
- PR #11691: Make Figure.frameon a thin wrapper for the patch visibility.
- PR #11735: Change {FigureCanvasAgg,RendererAgg}.buffer_rgba to return a memoryview.
- PR #12831: Reuse scale from sharing axis when calling cla().
- PR #12962: Deprecate setting the same property under two different aliases.
- PR #12973: Fix item check for pandas Series
- PR #13049: Add boxplot.flierprops.markeredgewidth rcParam
- PR #13048: Fix section names for numpydoc
- PR #10928: Simplify (quite a bit...) _preprocess_data
- PR #13039: Speed up Path.iter_segments()
- PR #12992: Adding rcParams['scatter.edgecolors'] defaulting to 'face'
- PR #13014: Drop pgi support for the GTK3 backend
- PR #12215: Cleanup initialization in text()
- PR #13029: Fix vertical alignment of text
- PR #12968: Simpler and stricter process_plot_format.

- PR #12989: Avoid spamming tests with warnings re: deprecation of pprint_val.
- PR #13032: fix typo in docstring in `axis_artist.py`
- PR #13025: MNT: add one more alias for tacaswell to mailmap
- PR #13010: Fix a format error in documenting_mpl.rst
- PR #12997: Add sphinx-copybutton to docs
- PR #12422: Scatter color: moving #10809 forward
- PR #12999: Format MaxNLocator with numpydoc
- PR #12991: Canonicalize weights extracted for AFM fonts.
- PR #12955: Cleanup cursor_demo.
- PR #12984: Cleanup GTK examples.
- PR #12986: Minor cleanup to double_pendulum example.
- PR #12959: Update the documentation of Cursor
- PR #12945: Correctly get weight & style hints from certain newer Microsoft fonts
- PR #12976: ENH: replace deprecated numpy header
- PR #12975: Fail-fast when trying to run tests with too-old pytest.
- PR #12970: Minor simplifications.
- PR #12974: Remove some checks for Py<3.6 in the test suite.
- PR #12779: Include scatter plots in Qt figure options editor.
- PR #12459: Improve formatting of imshow() cursor data when a colorbar exists.
- PR #12927: MAINT: Correctly handle empty lists in zip unpacking in mplot3d.art3d
- PR #12919: Suppress deprecation warning when testing drawstyle conflict
- PR #12956: Misc. cleanups.
- PR #12924: Deprecate public use of Formatter.pprint_val.
- PR #12947: Support ~ as nonbreaking space in mathtext.
- PR #12944: Fix the title of testing_api
- PR #12136: MAINT: Unify calculation of normal vectors from polygons
- PR #12880: More table documentation
- PR #12940: Avoid pyplot in showcase examples.
- PR #12935: os.PathLike exists on all supported Pythons now.
- PR #12936: Minor updates following bump to Py3.6+.
- PR #12932: Simplify argument checking in Table.__getitem__.

- PR #12930: Shorten an argument check.
- PR #12538: MNT: drop 3.5 testing for 3.1 branch
- PR #12868: Simplify use of Path._fast_from_codes_and_verts.
- PR #12300: API: Polar: allow flipped y/rlims....
- PR #12861: Don't use deprecated wx.NewId().
- PR #12908: Allow all valid hist.bins strings to be set in the rcparams
- PR #12902: Kill dead code in textpath.
- PR #12885: Improve margins in formlayout
- PR #12877: fooImage -> foo_image in testing/compare.py
- PR #12845: Deprecate silent dropping of unknown arguments to TextPath().
- PR #12852: Cleanup collections docs.
- PR #12888: Properly enable forward/backward buttons on GTK3
- PR #12865: Avoid 1-tick or 0-tick log-scaled axis.
- PR #12844: Remove unused, private _process_text_args.
- PR #12881: Fix string comparison
- PR #12863: FIX: translate timedeltas in _to_ordinalf
- PR #12640: Introduce MouseButton enum for MouseEvent.
- PR #12897: Reword a bit the contour docs.
- PR #12898: Validate rcParams["image.origin"].
- PR #12882: Write error messages to logger instead of stderr
- PR #12889: Deprecate public access to the vendored formlayout module.
- PR #12891: Add Azure Pipelines build badge
- PR #12883: MAINT Use list comprehension
- PR #12886: Properly enable forward/backward buttons on Qt
- PR #12858: Bump oldest supported numpy to 1.11.
- PR #12876: Fix a typo
- PR #12739: make Axes._parse_scatter_color_args static
- PR #12846: Deprecate Path.has_nonfinite.
- PR #12829: Remove unused variables
- PR #12872: Inline references to RendererPS in backend_ps.
- PR #12800: documenting dtype of hist counts
- PR #12842: Fix message in nbagg connection_info()

- PR #12855: Cleanup axes/_base.py.
- PR #12826: Minor code cleanup
- PR #12866: Simplify stride calculations in loglocator.
- PR #12867: Drop compat code for outdated MSVC.
- PR #12218: Improve table docs
- PR #12847: correctly format ticklabels when EngFormatter is used with usetex = True
- PR #12851: Keep Collections and Patches property aliases in sync.
- PR #12849: Update docstrings in path.py, and small cleanups.
- PR #12805: Don't insert spurious newlines by joining tex.preamble.
- PR #12827: Remove unused imports
- PR #12560: Add matplotlib.testing to the documentation
- PR #12821: MNT: remove debug from update_title_pos
- PR #12764: Cleanup Renderer/GraphicsContext docs.
- PR #12759: Warn on FreeType missing glyphs.
- PR #12799: Reword some colorbar docs.
- PR #12633: Added support for MacOSX backend for PyPy
- PR #12798: Replace assignments to array.shape by calls to reshape().
- PR #11851: Simpler check for whether a Framework Python build is being used.
- PR #12259: BUG: Fix face orientations of bar3d
- PR #12565: Make FontManager.score_weight less lenient.
- PR #12674: Allow "real" LaTeX code for pgf.preamble in matplotlibrc
- PR #12770: Simplify implementation of FontProperties.copy().
- PR #12753: MNT: remove _hold shims to support basemap + cartopy
- PR #12450: Attach a FigureCanvasBase by default to Figures.
- PR #12643: Allow unit input to FancyArrowPatch
- PR #12767: Make colorbars constructible with dataless ScalarMappables.
- PR #12526: Rename jquery files
- PR #12552: Update docs for writing image comparison tests.
- PR #12746: Use skipif, not xfail, for uncomparable image formats.
- PR #12747: Prefer log.warning("%s", ...) to log.warning("%s" % ...).
- PR #11753: FIX: Apply aspect before drawing starts

- PR #12749: Move toolmanager warning from logging to warning.
- PR #12598: Support Cn colors with n>=10.
- PR #12727: Reorder API docs: separate file per module
- PR #12738: Add unobtrusive depreaction note to the first line of the docstring.
- PR #11663: Refactor color parsing of Axes.scatter
- PR #12736: Move deprecation note to end of docstring
- PR #12704: Rename tkinter import from Tk to tk.
- PR #12715: Cleanup dviread.
- PR #12717: Delete some `if __name__ == "__main__"` clauses.
- PR #10575: FIX patch.update_from to also copy _original_edge/facecolor
- PR #12537: Improve error message on failing test_pyplot_up_to_date
- PR #12721: Make get_scale_docs() internal
- PR #12706: Extend sphinx Makefile to cleanup completely
- PR #12481: Warn if plot_surface Z values contain NaN
- PR #12685: Make ticks in demo_axes_rgb.py visible
- PR #12523: Run flake8 before pytest on travis
- PR #12691: DOC: Link to "How to make a PR" tutorials as badge and in contributing
- PR #11974: Make code match comment in sankey.
- PR #12440: Make arguments to @deprecated/warn_deprecated keyword-only.
- PR #12470: Update AutoDateFormatter with locator
- PR #12586: Improve linestyles example
- PR #12006: Replace warnings.warn with cbook._warn_external or logging.warning
- PR #12659: Add note that developer discussions are private
- PR #12543: Make rcsetup.py flak8 compliant
- PR #12642: Don't silence TypeErrors in fmt_{x,y}data.
- PR #12442: Deprecate passing drawstyle with linestyle as single string.
- PR #12625: Shorten some docstrings.
- PR #12627: Be a bit more stringent on invalid inputs.
- PR #12629: Fix issue with PyPy on macOS
- PR #10933: Remove "experimental" fontconfig font_manager backend.
- PR #12600: Minor style fixes.

- PR #12570: Fix mathtext tutorial for build with Sphinx 1.8.
- PR #12487: Update docs/tests for the deprecation of aname and label1On/label2On/etc.
- PR #12521: Improve docstring of draw_idle()
- PR #12574: Remove some unused imports
- PR #12568: Add note regarding builds of old Matplotlibs.
- PR #12547: Disable sticky edge accumulation if no autoscaling.
- PR #12546: Avoid quadratic behavior when accumulating stickies.
- PR #11789: endless looping GIFs with PillowWriter
- PR #12525: Fix some flake8 issues
- PR #12516: Don't handle impossible values for `align` in hist()
- PR #12500: Adjust the widths of the messages during the build.
- PR #12492: Simplify radar_chart example.
- PR #11984: Strip out pkg-config machinery for agg and libqhull.
- PR #12463: Document Artist.cursor_data() parameter
- PR #12482: Test slider orientation
- PR #12317: Always install mpl_toolkits.
- PR #12246: Be less tolerant of broken installs.
- PR #12477: Use N{MICRO SIGN} instead of N{GREEK SMALL LETTER MU} in EngFormatter.
- PR #12483: Kill FontManager.update_fonts.
- PR #12474: Throw ValueError when irregularly gridded data is passed to streamplot.
- PR #12466: np.fromstring -> np.frombuffer.
- PR #12369: Improved exception handling on animation failure
- PR #12460: Deprecate RendererBase.strip_math.
- PR #12453: Rollback erroneous commit to whats_new.rst from #10746
- PR #12452: Minor updates to the FAQ.
- PR #10746: Adjusted matplotlib.widgets.Slider to have optional vertical orientatation
- PR #12441: Get rid of a signed-compare warning.
- PR #12430: Deprecate Axes3D.plot_surface(shade=None)
- PR #12435: Fix numpydoc parameter formatting

- PR #12434: Clarify documentation for textprops keyword parameter of TextArea
- PR #12427: Document Artist.get_cursor_data
- PR #10322: Use np.hypot wherever possible.
- PR #10809: Fix for scatter not showing points with valid x/y but invalid color
- PR #12423: Minor simplifications to backend_svg.
- PR #10356: fix detecting which artist(s) the mouse is over
- PR #10268: Dvi caching
- PR #10238: Call kpsewhich with more arguments at one time
- PR #10236: Cache kpsewhich results persistently
- PR #4675: Deprecate color keyword argument in scatter
- PR #5054: Diverging norm
- PR #12416: Move font cache rebuild out of exception handler
- PR #4762: Traitlets
- PR #5414: WIP: New FreeType wrappers
- PR #3875: ENH: passing colors (and other optional keyword arguments) to violinplot()
- PR #1959: PS backend optionally jpeg-compresses the embedded images
- PR #11891: Group some print()s in backend_ps.
- PR #12165: Remove deprecated mlab code
- PR #12387: Update HTML animation as slider is dragged
- PR #12333: ENH: add colorbar method to axes
- PR #10088: Deprecate Tick.{gridOn,tick1On,label1On,...} in favor of set_visible.
- PR #12393: Deprecate to-days converters in matplotlib dates
- PR #11232: FIX: fix figure.set_dpi when pixel ratio not 1
- PR #12247: Machinery for deprecating properties.
- PR #12371: Move check for ImageMagick Windows path to bin_path().
- PR #12384: Cleanup axislines style.
- PR #9565: Stem performance boost
- PR #12368: Don't use stdlib private API in animation.py.
- PR #12351: dviread: find_tex_file: Ensure the encoding on windows
- PR #12372: Remove two examples.
- PR #12356: Fix stripping of CRLF on Windows.

- PR #12283: FIX: errorbar xywhere should return ndarray
- PR #12304: TST: Merge Qt tests into one file.
- PR #12340: Catch test deprecation warnings for mlab.demean
- PR #12296: Make FooConverter inherit from ConversionInterface in examples
- PR #12309: Deduplicate implementations of FooNorm.autoscale{,_None}
- PR #7716: [NF] Add 'truncate' and 'join' methods to colormaps.
- PR #12314: Deprecate `axis('normal')` in favor of `axis('auto')`.
- PR #12307: Clarify missing-property error message.
- PR #12260: Fix docs : change from issue #12191, remove "if 1:" blocks in examples
- PR #12253: Handle utf-8 output by kpathsea on Windows.
- PR #12292: TST: Modify the bar3d test to show three more angles
- PR #12284: Don't try to autoscale if no data present to autoscale to
- PR #12255: Deduplicate inherited docstrings.
- PR #12222: Remove extraneous if 1 statements in demo_axisline_style.py
- PR #12137: MAINT: Vectorize bar3d
- PR #12219: Merge OSXInstalledFonts into findSystemFonts.
- PR #12229: Less ACCEPTS, more numpydoc.
- PR #11621: TST: make E402 a universal flake8 ignore
- PR #12231: CI: Speed up Appveyor repository cloning
- PR #11661: Update blocking_input.py
- PR #12199: Allow disabling specific mouse actions in blocking_input
- PR #12210: Axes.tick_params() argument checking
- PR #12211: Fix typo
- PR #12200: Slightly clarify some invalid shape exceptions for image data.
- PR #12151: Don't pretend @deprecated applies to classmethods.
- PR #12190: Remove some unused variables and imports
- PR #12192: Exclude examples from lgtm analysis
- PR #12196: Give Carreau the ability to mention the backport bot.
- PR #12171: Remove internal warning due to zsort deprecation
- PR #12030: Speed up canvas redraw for GTK3Agg backend.
- PR #12156: Cleanup the GridSpec demos.

- PR #12144: Add explicit getters and setters for Annotation.anncoords.
- PR #12152: Use _warn_external for deprecations warnings.
- PR #12147: DOC: update the gh_stats code
- PR #12139: Unbreak build re: mplot3d style.
- PR #11367: Raise TypeError on unsupported kwargs of spy()
- PR #9990: Fix and document lightsource argument in mplot3d
- PR #12124: Correctly infer units from empty arrays
- PR #11994: Cleanup unused variables and imports
- PR #12122: MNT: re-add cbook import art3d
- PR #12086: FIX: make MaxNLocator only follow visible ticks for order of magnitude
- PR #12032: Remove unused imports
- PR #12093: Correct the removal of -Wstrict-prototypes from compiler flags.
- PR #12069: Style fixes for mplot3d.
- PR #11997: Cleanup some axes_grid1 examples
- PR #12098: Improve layout of HTML animation
- PR #12094: Fine-tune logging notes in contributing.rst.
- PR #12079: Clarifications to **im_show()** doc regarding *interpolation*='*none*'.
- PR #12068: More style fixes.
- PR #11499: FIX: layout for mixed descent multiline text objects
- PR #11921: FIX: allow reshape 2-D to return a bare 1-d list
- PR #12070: Avoid some uses of np.isscalar.
- PR #12067: DOC: make Line2D docstring definition easier to find
- PR #12054: More style fixes.
- PR #12066: fix indentation in docstring interpolation for spy.
- PR #11931: Remove separate autosummary_inher template.
- PR #12049: Make Poly3DCollection.set_zsort less lenient.
- PR #12050: Various cleanups.
- PR #12038: Modernize ArtistInspector a bit...
- PR #12033: DOC: formatting fixes to mplot3d
- PR #12051: Is bool
- PR #12045: Fix 999.9... edge case in ticker.EngFormatter for negative numbers

- PR #12044: Update doc on the *progressive* and *optimize* keywords in savefig
- PR #12061: Small refactor/simplification.
- PR #12060: INSTALL.rst fixes
- PR #12055: Fix invalid escape in docstring.
- PR #12026: whitespace(-mostly) style cleanup.
- PR #12043: Deprecate get_py2exe_datafiles.
- PR #12046: Make HTMLWriter constructor a bit more strict.
- PR #12034: Doc markup fixes.
- PR #11972: FIX: close mem leak for repeated draw
- PR #12024: Fix typos
- PR #11996: Minor javascript cleanup
- PR #11989: Remove support for ghostscript 8.60.
- PR #12004: Update acorr and xcorr docs to match numpy docs
- PR #11998: No clf() needed after creating a figure
- PR #12001: Do not use an explicit figum in plt.figure(1, ...) in simple cases
- PR #11999: Do not use an explicit fignum plt.figure(1) in simple cases
- PR #11995: Don't use bare except statements
- PR #11993: DOC: fixed typos
- PR #11992: Use pytest.warns instead of home-baked warnings capture.
- PR #11975: Derive plt.figlegend.__doc__ from Figure.legend.__doc__.
- PR #11980: Remove __version__numpy__; simplify dependencies check.
- PR #11982: Remove and old keyword documentation.
- PR #11981: Some extra typos
- PR #11979: Fix a couple of typos.
- PR #11959: cbook.iterable -> np.iterable.
- PR #11965: Move the removal of the -Wstrict-prototypes flag to setup.py.
- PR #11958: Remove unused code
- PR #11960: Make jpl_units a bit less painful to read.
- PR #11951: Improve Artist docstrings
- PR #11954: No need to define _log twice in matplotlib.dates.
- PR #11948: Minor fixes to docs and gitignore.
- PR #11777: Avoid incorrect warning in savefig

- PR #11942: Deprecate Artist.aname and Axes.aname
- PR #11935: Remove ginput demo example
- PR #11939: Improve alias signatures
- PR #11940: Do not use aliases of properties in internal code
- PR #11941: Fix test_large_subscript_title()
- PR #11938: More docstring cleanup of Line2D.
- PR #11920: Add LGTM.com code quality badge
- PR #11922: Improve docstrings of Line2D
- PR #11924: Minor formatting update on alias docstrings
- PR #11926: Minor fix to ginput_demo.
- PR #11912: BLD: update PR template for flake8
- PR #11909: Simplify linestyle and fillstyle reference docs.
- PR #11502: FIX: move title(s) up if subscripts hang too low.
- PR #11906: fix format of bar_of_pie example
- PR #11741: Factor out common code between Patch.draw and FancyArrowPatch.draw.
- PR #11784: Argument checking for grid()
- PR #11888: Factor out a subprocess log-and-check helper.
- PR #11740: Deprecate support for 3rd-party backends without set_hatch_color.
- PR #11884: Deprecate the tk_window_focus function.
- PR #11689: Don't cache the renderer on the Axes instance.
- PR #11698: For property, use decorator or lambdas.
- PR #11872: Make all builtin cmaps picklable.
- PR #11870: More style fixes.
- PR #11873: Remove mention of deprecated/removed methods from mlab's docstring.
- PR #11869: Style fixes.
- PR #11874: Remove some remnants of Py2-handling in test_rcparams.
- PR #11865: example file for making a bar of pie chart
- PR #11868: mathtext.py style fixes.
- PR #11854: Accept anything that's not a directory for $MATPLOTLIBRC.
- PR #11589: WIP ENH secondary axes:
- PR #8449: Including Additional Metadata using the SVG Backend

- PR #11465: ENH: optimize Collection non-affine transform to call transform once

Issues (161):

- #4001: Qt5 Backend: dblclick is always False on 'mouse_release_event'
- #14152: qt_compat.py performing wrong test for PyQt5
- #10875: Annotation.contains and FancyArrow.contains return incorrect values
- #458: JPG quality keyword in savefig
- #4354: scatter not showing valid x/y points with invalid color
- #14113: scatter could not raise when colors are provided but position data are empty
- #14003: numpydoc 0.9 breaks doc build
- #14054: ticks sometimes disappear when zooming interactively
- #10189: The data decorator does not integrate well with numpydoc
- #14034: pyplot plot raises ValueError when plotting NaN against datetime dates
- #14039: bar plot yerr lines/caps should respect zorder
- #14042: dynamic_image.py + saving animation broken
- #14013: osx backend not usable with ipython/jupyter from conda?
- #13993: Tests files installed by default?
- #13991: MaxNLocator.default_params deprecation may break Cartopy
- #5045: Axes.grid() not honoring specified "zorder" kwarg
- #4371: LaTeX and PGF preambles do not allow commas
- #13982: hist() no longer respects range=... when density=True
- #13963: Dataless colorbars break when updated
- #10381: Issue when setting scatter color in separate method call
- #13618: Minor ticklabels are missing at positions of major ticks.
- #13880: Adding documentation for Text.fontfamily default, set_fontfamily(None)?
- #13865: Appveyor broken
- #8636: plt.hist chooses improper range when using string-based bin options
- #7300: weird mathtext doc markup
- #8862: Replace mathcircled by textcircled
- #13759: DOC: matplotlib.patches.Arc
- #13785: Imshow gives values out of the extent

- #13786: Cannot import matplotlib.animation
- #13561: Progress of animation.save (for long animations)
- #13735: title doesn't move for ticklables....
- #12175: Example link near markevery in the "What's new in 3.0" page is malformed/broken
- #13713: Boxplot xlim not correctly calculated
- #11070: Add a "density" kwarg to hist2d
- #11337: Cannot plot fully masked array against datetimes
- #10165: Adapt stem plot
- #10976: ENH: secondary axis for a x or y scale.
- #10763: Cairo in 2.2.0 not working for new backends
- #9737: setupext should not explicitly add /usr/{,local/}include to the include path
- #11217: Crash on zero-length FancyArrow
- #13623: do not cause warning in seaborn
- #13480: Segfault on help('modules') command when matplotlib is installed
- #13604: legend's framealpha kwarg does not apply when writing to an eps file
- #12311: 'off' vs. False bug
- #10237: Setting an alpha value to a Poly3DCollection
- #11781: fill_between interpolation & nan issue
- #1077: 3d plots with aspect='equal'
- #11761: Still naming inconsistency in API on axes limits
- #11623: Regression: "TypeError: Period('2000-12-31', 'D') is not a string" when a Series with date index was plotted
- #12655: auto-ticks do not handle values near bounds gracefully
- #13487: labelpad is not the spacing between the axis and the label
- #13540: Docs for matplotlib.pyplot.specgram() reference an unsupported mode setting
- #8997: Proposal: Grid arrangement by number of plots
- #6928: Cannot run `setup.py build` with numpy master
- #12697: Axes are drawn at wrong positions
- #13478: FuncAnimation: interactive zoom/pan with blitting does not work
- #11575: Setting axis ticks in log scale produces duplicate tick labels.

- #13464: set_rlim(bottom=...) no longer works
- #12628: Write canonical example of how to use Matplotlib inside a webserver
- #10022: boxplot: positions used to take Int64Index
- #11647: Disable buttons in ginput
- #12987: issues parsing AFM fonts
- #12667: Colorbar ticks....
- #13137: Travis for Python 3.7 sometimes fails due to missing font
- #7969: Stem is slow and will crash if I try to close the window
- #13002: Hist color kwarg broken for multiple empty datasets
- #5581: [mpl_toolkits] Things drawn on parasite axes don't fire pick events
- #13417: Secondary axis doesn't resize properly
- #8120: Inconsistent inset_axes position between show(), savefig(format='png') and savefig(format='pdf')
- #8947: Different result, slower runtime of heatmap between 2.0.0 and 2.0.1
- #13264: Use of logging in matplotlib
- #11602: animation error
- #12925: Python pandas datetime plot xticks in unexpected location
- #11025: AxesGrid ticks missing on x-axis
- #10974: Examples not shown in API docs for many methods.
- #13392: boxplot broken for empty inputs
- #12345: Need more tests for units and errorbar
- #10361: FigureCanvas.draw() with tight_layout () needs to be called twice with Matplotlib 2.1.0
- #11376: Temporary styling ignores color cycle
- #11546: import time
- #13286: AttributeError: 'float' object has no attribute 'deg2rad'
- #11508: bi-directional perceptually flat colormaps in matplotlib?
- #12918: Mac shows an icon in the dock when using matplotlib.pyplot.
- #13339: Log Colorbar minorticks_off reverted if ticks set...
- #13228: MPL 3 + Colorbar + PowerNorm bug
- #13096: Matplotlib.get_backend()/matplotlib.use() cause NSException with Anaconda
- #7712: Number of ticks for dates still gives overlapping labels

- #9978: General poor default formatting of datetimes on plot x-axis
- #13253: imsave outputs JPEG with wrong dimension
- #11391: Use data argument for scatter plotting timestamps from pandas
- #13145: widgets.RadioButtons: select by closest in position
- #13267: "double-pendulum" example's speed not correct / varying
- #13257: Allow turning off minorticks for Colorbar with LogNorm?
- #13237: Sankey basic gallery example is not rendered properly.
- #12836: matplotlib.rc_file resets to default template before updating rcparams
- #13186: ax.bar throws when x axis is pandas datetime
- #5397: Expose compression and filter PNG options through savefig
- #13142: Cannot plot bar graph with dates: "TypeError: ufunc subtract cannot use operands with types dtype('<M8[ns]') and dtype('float64')"
- #8530: Feature request: TIFF LZW compression support in savefig()
- #13139: font family ['serif'] not found. Falling back to DejaVu Sans
- #1558: Graceful handling of a numpy matrix
- #12954: Fonts installed in the user directory are not detected (Windows 1809)
- #3644: Feature Request: manually set colorbar without mappable
- #12862: broken_barh appears not to work with datetime/timedelta objects
- #11290: ax.bar doesn't work correctly when width is a timedelta64 object
- #13156: DOC: matplotlib.pyplot.arrow
- #12990: Unclear error message for `plt.xticks(names)`
- #12769: Failing to save an animated graph with matplotlib.animation
- #13112: LogNorm colorbar prints double tick labels after set_ticks()
- #13132: BUG: matplotlib.sphinxext.plot_directive uses old function-based API
- #8528: Funcanimation memory leak?
- #8914: line3D set_data only takes in x and y data
- #8768: One one tick in a log-scale axis
- #13121: Tests fail with pytest 4.1
- #13098: Likely incorrect code(?) in colorbar.py
- #12562: Clean up unused imports
- #12106: plt.plot does not plot anything with named arguments
- #5145: Python [Error 17]No usable Temporary file name found

- #13012: qt5agg image quality changes when window is out of focus
- #13055: 127.0.0.1 hardcoded in webagg backend server
- #12971: Pandas Series not supported as data kwarg
- #13022: boxplot not showing symbols with seaborn style sheet
- #13028: Bad rotation_mode/center_baseline combination even if rotation=0
- #12745: Sphinx copy button for code block
- #12801: scatter() should not drop data points at nonfinite coordinates
- #12358: Dropping support for Py3.5 and numpy 1.10
- #12994: Axes range with set_xticks with categoricals
- #12993: Semantics of set_xticks for categoricals
- #12946: ~ in mathrm leads to Unknown symbol: mathrm
- #10704: Add documentation for set_rlim
- #11202: Using of ax.set_ylim() for polar plot leads to "posx and posy should be finite values" error
- #12859: DeprecationWarning: NewId() is deprecated in wxPython.
- #12817: Multiple places where Type Errors on cbook.warn_deprecated will happen
- #12308: #12253 FIX: Handle utf-8 output by kpathsea on Windows -- possibly causing issues
- #12804: Usetex produces preamble with one character per line
- #12808: Issue with minor tick spacing in colorbar with custom Normalize class
- #12138: Faces of Axes3d.bar3d are not oriented correctly
- #12591: Adding FancyArrowPatch with datetime coordinates fails
- #11139: "make clean" doesn't remove all the build doc files
- #11908: Improve linestyle documentation
- #10643: Most warnings calls do not set the stacklevel
- #12532: Incorrect rendering of math symbols
- #11787: Looping gifs with PillowWriter
- #9205: after the animation encoder (e.g. ffmpeg) fails, the animation framework itself fails internally in various ways while trying to report the error
- #11154: Unexpected behavior for Axes3D.plot_surface(shade=None)
- #12121: Documentation of TextArea's fontprops keyword argument is misleading
- #12191: "if 1:" blocks in examples

- #12107: warnings re: deprecated pytest API with pytest 3.8
- #12010: Popover over plot is very slow
- #12118: Scatter: empty np.arrays with non-numeric dtypes cause TypeError
- #12072: `MaxNLocator` changes the scientific notation exponent with different number of tick labels
- #11795: Un-align animations created with to_jshtml()?
- #10201: Available fonts are ignored by font_manager
- #12065: Keyword *interpolation* behaving improperly while saving to SVG with **savefig()**
- #11498: Test layout with big descenders and multiple lines inconsistent.
- #11468: Layout managers have problems with titles containing MathText
- #11899: Histogram of list of datetimes
- #11956: apparent memory leak with live plotting
- #11587: Missing filled contours when using contourf
- #11716: errorbar pickling fails when specifying y error bars
- #11557: Hoping add a drawing function 'patch' in matplotlib

7.1.10 GitHub Stats for Matplotlib 3.0.2

GitHub stats for 2018/09/18 - 2018/11/09 (tag: v3.0.0)

These lists are automatically generated, and may be incomplete or contain duplicates.

We closed 170 issues and merged 224 pull requests.

The following 49 authors contributed 460 commits.

- Abhinuv Nitin Pitale
- Alon Hershenhorn
- Andras Deak

GitHub issues and pull requests:

Pull Requests (224):

- PR #12785: Use level kwargs in irregular contour example
- PR #12767: Make colorbars constructible with dataless ScalarMappables.
- PR #12775: Add note to errorbar function about sign of errors
- PR #12776: Fix typo in example (on-borad -> on-board).
- PR #12771: Do not rely on external stack frame to exist
- PR #12526: Rename jquery files
- PR #12552: Update docs for writing image comparison tests.
- PR #12746: Use skipif, not xfail, for uncomparable image formats.
- PR #12747: Prefer log.warning("%s", ...) to log.warning("%s" % ...).
- PR #11753: FIX: Apply aspect before drawing starts
- PR #12749: Move toolmanager warning from logging to warning.
- PR #12708: Run flake8 in a separate travis environment
- PR #12737: Improve docstring of Arc
- PR #12598: Support Cn colors with n>=10.
- PR #12670: FIX: add setter for hold to un-break basemap
- PR #12693: Workaround Text3D breaking tight_layout()
- PR #12727: Reorder API docs: separate file per module
- PR #12738: Add unobtrusive depreaction note to the first line of the docstring.
- PR #12740: DOC: constrained layout guide (fix: Spacing with colorbars)
- PR #11663: Refactor color parsing of Axes.scatter
- PR #12736: Move deprecation note to end of docstring
- PR #12704: Rename tkinter import from Tk to tk.
- PR #12730: MNT: merge ignore lines in .flake8

- PR #12707: Fix tk error when closing first pyplot figure
- PR #12715: Cleanup dviread.
- PR #12717: Delete some `if __name__ == "__main__"` clauses.
- PR #12726: Fix test_non_gui_warning for Azure (and mplcairo).
- PR #12720: Improve docs on Axes scales
- PR #12537: Improve error message on failing test_pyplot_up_to_date
- PR #12721: Make get_scale_docs() internal
- PR #12617: Set up CI with Azure Pipelines
- PR #12673: Fix for _axes.scatter() array index out of bound error
- PR #12676: Doc: document textpath module
- PR #12705: Improve docs on Axes limits and direction
- PR #12706: Extend sphinx Makefile to cleanup completely
- PR #12481: Warn if plot_surface Z values contain NaN
- PR #12709: Correctly remove nans when drawing paths with pycairo.
- PR #12685: Make ticks in demo_axes_rgb.py visible
- PR #12691: DOC: Link to "How to make a PR" tutorials as badge and in contributing
- PR #12684: Change ipython block to code-block
- PR #11974: Make code match comment in sankey.
- PR #12440: Make arguments to @deprecated/warn_deprecated keyword-only.
- PR #12683: TST: mark test_constrainedlayout.py::test_colorbar_location as flaky
- PR #12686: Remove deprecation warnings in tests
- PR #12470: Update AutoDateFormatter with locator
- PR #12656: FIX: fix error in colorbar.get_ticks not having valid data
- PR #12586: Improve linestyles example
- PR #12006: Added stacklevel=2 to all warnings.warn calls (issue 10643)
- PR #12651: FIX: ignore non-finite bbox
- PR #12653: Don't warn when accessing deprecated properties from the class.
- PR #12608: ENH: allow matplotlib.use after getbackend
- PR #12658: Do not warn-depreacted when iterating over rcParams
- PR #12635: FIX: allow non bbox_extra_artists calls
- PR #12659: Add note that developer discussions are private

- PR #12543: Make rcsetup.py flak8 compliant
- PR #12642: Don't silence TypeErrors in fmt_{x,y}data.
- PR #11667: DOC: update doc requirement
- PR #12442: Deprecate passing drawstyle with linestyle as single string.
- PR #12625: Shorten some docstrings.
- PR #12627: Be a bit more stringent on invalid inputs.
- PR #12561: Properly css-style exceptions in the documentation
- PR #12629: Fix issue with PyPy on macOS
- PR #10933: Remove "experimental" fontconfig font_manager backend.
- PR #12630: Fix RcParams.__len__
- PR #12285: FIX: Don't apply tight_layout if axes collapse
- PR #12548: undef _XOPEN_SOURCE breaks the build in AIX
- PR #12615: Fix travis OSX build
- PR #12600: Minor style fixes.
- PR #12607: STY: fix whitespace and escaping
- PR #12603: FIX: don't import macosx to check if eventloop running
- PR #12599: Fix formatting of docstring
- PR #12569: Don't confuse uintptr_t and Py_ssize_t.
- PR #12572: Fix singleton hist labels
- PR #12581: Fix hist() error message
- PR #12570: Fix mathtext tutorial for build with Sphinx 1.8.
- PR #12487: Update docs/tests for the deprecation of aname and label1On/label2On/etc.
- PR #12521: Improve docstring of draw_idle()
- PR #12573: BUG: mplot3d: Don't crash if azim or elev are non-integral
- PR #12574: Remove some unused imports
- PR #12568: Add note regarding builds of old Matplotlibs.
- PR #12555: Clarify horizontalalignment and verticalalignment in suptitle
- PR #12547: Disable sticky edge accumulation if no autoscaling.
- PR #12546: Avoid quadratic behavior when accumulating stickies.
- PR #12159: FIX: colorbar re-check norm before draw for autolabels
- PR #12501: Rectified plot error

- PR #11789: endless looping GIFs with PillowWriter
- PR #12525: Fix some flake8 issues
- PR #12431: FIX: allow single-string color for scatter
- PR #12216: Doc: Fix search for sphinx >=1.8
- PR #12461: FIX: make add_lines work with new colorbar
- PR #12241: FIX: make unused spines invisible
- PR #12516: Don't handle impossible values for `align` in hist()
- PR #12504: DOC: clarify min supported version wording
- PR #12507: FIX: make minor ticks formatted with science formatter as well
- PR #12500: Adjust the widths of the messages during the build.
- PR #12492: Simplify radar_chart example.
- PR #12478: MAINT: NumPy deprecates asscalar in 1.16
- PR #12363: FIX: errors in get_position changes
- PR #12495: Fix duplicate condition in pathpatch3d example
- PR #11984: Strip out pkg-config machinery for agg and libqhull.
- PR #12463: Document Artist.cursor_data() parameter
- PR #12489: Fix typo in documentation of ylim
- PR #12482: Test slider orientation
- PR #12317: Always install mpl_toolkits.
- PR #12246: Be less tolerant of broken installs.
- PR #12477: Use N{MICRO SIGN} instead of N{GREEK SMALL LETTER MU} in EngFormatter.
- PR #12483: Kill FontManager.update_fonts.
- PR #12448: Don't error if some font directories are not readable.
- PR #12474: Throw ValueError when irregularly gridded data is passed to streamplot.
- PR #12469: Clarify documentation of offsetbox.AnchoredText's prop kw argument
- PR #12468: Fix `set_ylim` unit handling
- PR #12466: np.fromstring -> np.frombuffer.
- PR #12369: Improved exception handling on animation failure
- PR #12460: Deprecate RendererBase.strip_math.
- PR #12457: Fix tutorial typos.

- PR #12453: Rollback erroneous commit to whats_new.rst from #10746
- PR #12452: Minor updates to the FAQ.
- PR #10746: Adjusted matplotlib.widgets.Slider to have optional vertical orientation
- PR #12441: Get rid of a signed-compare warning.
- PR #12430: Deprecate Axes3D.plot_surface(shade=None)
- PR #12435: Fix numpydoc parameter formatting
- PR #12434: Clarify documentation for textprops keyword parameter of TextArea
- PR #12427: Document Artist.get_cursor_data
- PR #12277: FIX: datetime64 now recognized if in a list
- PR #10322: Use np.hypot wherever possible.
- PR #12423: Minor simplifications to backend_svg.
- PR #12293: Make pyplot more tolerant wrt. 3rd-party subclasses.
- PR #12360: Replace axes_grid by axes_grid1 in test
- PR #10356: fix detecting which artist(s) the mouse is over
- PR #12416: Move font cache rebuild out of exception handler
- PR #11891: Group some print()s in backend_ps.
- PR #12165: Remove deprecated mlab code
- PR #12394: DOC: fix CL tutorial to give same output from saved file and example
- PR #12387: Update HTML animation as slider is dragged
- PR #12408: Don't crash on invalid registry font entries on Windows.
- PR #10088: Deprecate Tick.{gridOn,tick1On,label1On,...} in favor of set_visible.
- PR #12149: Mathtext tutorial fixes
- PR #12393: Deprecate to-days converters in matplotlib dates
- PR #12257: Document standard backends in matplotlib.use()
- PR #12383: Revert change of parameter name in annotate()
- PR #12385: CI: Added Appveyor Python 3.7 build
- PR #12247: Machinery for deprecating properties.
- PR #12371: Move check for ImageMagick Windows path to bin_path().
- PR #12384: Cleanup axislines style.
- PR #12353: Doc: clarify default parameters in scatter docs
- PR #12366: TST: Update test images for new Ghostscript.

- PR #11648: FIX: colorbar placement in constrained layout
- PR #12368: Don't use stdlib private API in animation.py.
- PR #12351: dviread: find_tex_file: Ensure the encoding on windows
- PR #12244: Merge barchart examples.
- PR #12372: Remove two examples.
- PR #12214: Improve docstring of Annotation
- PR #12347: DOC: add_child_axes to axes_api.rst
- PR #12304: TST: Merge Qt tests into one file.
- PR #12321: maint: setupext.py for freetype had a Catch case for missing ft2build.h
- PR #12340: Catch test deprecation warnings for mlab.demean
- PR #12334: Improve selection of inset indicator connectors.
- PR #12316: Fix some warnings from Travis
- PR #12268: FIX: remove unnecessary `self` in `super_`-calls, fixes #12265
- PR #12212: font_manager: Fixed problems with Path(...).suffix
- PR #12326: fixed minor spelling error in docstring
- PR #12296: Make FooConverter inherit from ConversionInterface in examples
- PR #12322: Fix the docs build.
- PR #12319: Fix Travis 3.6 builds
- PR #12309: Deduplicate implementations of FooNorm.autoscale{,_None}
- PR #12314: Deprecate `axis('normal')` in favor of `axis('auto')`.
- PR #12313: BUG: Fix typo in view_limits() for MultipleLocator
- PR #12307: Clarify missing-property error message.
- PR #12274: MNT: put back `_hold` as read-only attribute on AxesBase
- PR #12260: Fix docs : change from issue #12191, remove "if 1:" blocks in examples
- PR #12163: TST: Defer loading Qt framework until test is run.
- PR #12253: Handle utf-8 output by kpathsea on Windows.
- PR #12301: Ghostscript 9.0 requirement revisited
- PR #12294: Fix expand_dims warnings in triinterpolate
- PR #12292: TST: Modify the bar3d test to show three more angles
- PR #12297: Remove some pytest parameterising warnings
- PR #12261: FIX: parasite axis2 demo

- PR #12278: Document inheriting docstrings
- PR #12262: Simplify empty-rasterized pdf test.
- PR #12269: Add some param docs to BlockingInput methods
- PR #12272: Fix `contrained` to `constrained`
- PR #12255: Deduplicate inherited docstrings.
- PR #12254: Improve docstrings of Animations
- PR #12258: Fix CSS for module-level data
- PR #12222: Remove extraneous if 1 statements in demo_axisline_style.py
- PR #12137: MAINT: Vectorize bar3d
- PR #12219: Merge OSXInstalledFonts into findSystemFonts.
- PR #12229: Less ACCEPTS, more numpydoc.
- PR #12209: Doc: Sort named colors example by palette
- PR #12237: Use (float, float) as parameter type for 2D positions in docstrings
- PR #12238: Typo in docs
- PR #12236: Make boilerplate-generated pyplot.py flake8 compliant
- PR #12231: CI: Speed up Appveyor repository cloning
- PR #12228: Fix trivial typo in docs.
- PR #12227: Use (float, float) as parameter type for 2D positions
- PR #12199: Allow disabling specific mouse actions in blocking_input
- PR #12213: Change win32InstalledFonts return value
- PR #12207: FIX: dont' check for interactive framework if none required
- PR #11688: Don't draw axis (spines, ticks, labels) twice when using parasite axes.
- PR #12210: Axes.tick_params() argument checking
- PR #12211: Fix typo
- PR #12200: Slightly clarify some invalid shape exceptions for image data.
- PR #12151: Don't pretend @deprecated applies to classmethods.
- PR #12190: Remove some unused variables and imports
- PR #12186: DOC: fix API note about get_tightbbox
- PR #12203: Document legend's slowness when "best" location is used
- PR #12192: Exclude examples from lgtm analysis
- PR #12196: Give Carreau the ability to mention the backport bot.

- PR #12187: DOC: Update INSTALL.rst
- PR #12164: Fix Annotation.contains.
- PR #12177: FIX: remove cwd from mac font path search
- PR #12182: Fix Flash of Unstyled Content by removing remaining Flipcause integration
- PR #12184: DOC: update "Previous What's New" for 2.2 with reference to cividis paper
- PR #12183: Doc: Don't use Sphinx 1.8
- PR #12171: Remove internal warning due to zsort deprecation
- PR #12166: Document preference order for backend auto selection
- PR #12154: Avoid triggering deprecation warnings with pytest 3.8.
- PR #12030: Speed up canvas redraw for GTK3Agg backend.
- PR #12157: Properly declare the interactive framework for the qt4foo backends.
- PR #12156: Cleanup the GridSpec demos.
- PR #12144: Add explicit getters and setters for Annotation.anncoords.
- PR #12152: Use _warn_external for deprecations warnings.
- PR #12148: BLD: pragmatic fix for building basic_unit example on py37
- PR #12147: DOC: update the gh_stats code

Issues (170):

- #12699: Annotations get cropped out of figures saved with bbox_inches='tight'
- #9217: Weirdness with inline figure DPI settings in Jupyter Notebook
- #4853: %matplotlib notebook creates much bigger figures than %matplotlib inline
- #12780: Vague/misleading exception message in scatter()
- #10239: Weird interaction with Tkinter
- #10045: subplots_adjust() breaks layout of tick labels
- #12765: Matplotlib draws incorrect color
- #11800: Gridspec tutorial
- #12757: up the figure
- #12724: Importing pyplot steals focus on macOS
- #12669: fixing _hold on cartopy broke basemap
- #12687: Plotting text on 3d axes before tight_layout() breaks tight_layout()
- #12734: Wishlist: functionally linked twin axes

- #12576: RcParams is fundamentally broken
- #12641: `_axes.py.scatter()` array index out of bound / calling from `seaborn`
- #12703: Error when closing first of several pyplot figures in TkAgg
- #12728: Deprecation Warnings
- #4124: Provide canonical examples of mpl in web frameworks
- #10574: Default color after setting alptha to Patch in legened
- #12702: couldn't find or load Qt platform plugin "windows" in "".
- #11139: "make clean" doesn't remove all the build doc files
- #12701: semilogy with NaN prevents display of Title (cairo backend)
- #12696: Process finished with exit code -1 due to matplotlib configuration
- #12692: matplotlib.plot.show always blocks the execution of python script
- #12433: Travis error is MacOS image tolerance of 0.005 for `test_constrained_layout.py::test_colorbar_location`
- #10017: unicode_literals considered harmful
- #12682: using AxesImage.set_clim() shrinks the colorbar
- #12620: Overlapping 3D objects
- #12680: matplotlib ui in thread still blocked
- #11908: Improve linestyle documentation
- #12650: Deprecation warnings when calling help(matplotlib)
- #10643: Most warnings calls do not set the stacklevel
- #12671: make_axes_locatable breaks with matplotlib 3.0
- #12664: plt.scatter crashes because overwrites the colors to an empty list
- #12188: matplotlib 3 pyplot on MacOS bounces rocket icon in dock
- #12648: Regression when calling annotate with nan values for the position
- #12362: In 3.0.0 backend cannot be set if 'get_backend()' is run first
- #12649: Over-verbose deprecation warning about examples.directory
- #12661: In version 3.0.0 make_axes_locatable + colorbar does not produce expected result
- #12634: axes_grid1 axes have no keyword argument 'bbox_extra_artists'
- #12654: Broken 'Developer Discussions' link
- #12657: With v3.0.0 mpl_toolkits.axes_grid1.make_axes_locatable().append_axes breaks in Jupyter

- #12645: Markers are offset when 'facecolor' or 'edgecolor' are set to 'none' when plotting data
- #12644: Memory leak with plt.plot in Jupyter Notebooks?
- #12632: Do we need input hooks macosx?
- #12535: AIX Support - Do not undef _XOPEN_SOURCE
- #12626: AttributeError: module 'matplotlib' has no attribute 'artist'
- #11034: Doc Typo: matplotlib.axes.Axes.get_yticklabels / Axis.get_ticklabels
- #12624: make_axes_locatable : Colorbar in the middle instead of bottom while saving a pdf, png.
- #11094: can not use GUI backends inside django request handlers
- #12613: transiently linked interactivity of unshared pair of axes generated with make_axes_locatable
- #12578: macOS builds are broken
- #12612: gui backends do not work inside of flask request handlers
- #12611: Matplotlib 3.0.0 Likely bug TypeError: stackplot() got multiple values for argument 'x'
- #12610: matplotlibrc causes import to fail 3.0.0 (didn't crash 2.y.z series)
- #12601: Can't import matplotlib
- #12597: Please soon add Chinese language support!! It's to difficult for new people handle character
- #12590: Matplotlib pypi distribution lacks packages for Python 2.7
- #3869: Numeric labels do not work with plt.hist
- #12580: Incorrect hist error message with bad color size
- #12100: document where to get nightly wheels
- #7205: Converting docstrings to numpydoc
- #12564: Saving plot as PNG file prunes tick labels
- #12161: Problems of using sharex options with lines plots and colormesh with colorbar
- #12256: tight_layout for plot with non-clipped screen-unit items causes issues on zoom
- #12545: Program quit unormally without reporting error
- #12532: Incorrect rendering of math symbols
- #12567: Calling pyplot.show() with TkAgg backend on x86 machine raises OverflowError.

- #12571: cannot install because Fatal Python error: initfsencoding: Unable to get the locale encoding
- #12566: Problem installing Version 1.3.1 -> missing pkg-config freetype and libagg
- #12556: Matplotlib 3.0.0 import hangs in clean environment
- #12197: Weird behaviour of suptitle() when horizontalalignment is not 'center'
- #12550: colorbar resizes in animation
- #12155: Incorrect placement of Colorbar ticks using LogNorm
- #11787: Looping gifs with PillowWriter
- #12533: Plotting with alpha=0 with rasterized=True causes ValueError on saving to pdf
- #12438: Scatter doesn't accept a list of strings as color spec.
- #12429: scatter() does not accept gray strings anymore
- #12499: run my code failed after i Import pylab failed, python version is 3.6.6
- #12458: add_lines misses lines for matplotlib.colorbar.ColorbarBase
- #12239: 3d axes are collapsed by tight_layout
- #12414: Function to draw angle between two lines
- #12488: inconsistent colorbar tick labels for LogNorm
- #12515: pyplot.step broken in 3.0.0?
- #12355: Error for bbox_inches='tight' in savefig with make_axes_locatable
- #12505: ImageGrid in 3.0
- #12502: How can I put the ticks of logarithmic coordinate in the axes?
- #12496: Maplotlib Can't Plot a Dataset
- #12486: rotate label of legend ?
- #12291: Importing pyplot crashes on macOS due to missing fontlist-v300.json and then Permission denied: '/opt/local/share/fonts'
- #12480: "close_event" for nbagg/notebook backend
- #12467: Documentation of AnchoredText's prop keyword argument is misleading
- #12288: New function signatures in pyplot break Cartopy
- #12445: Error on colorbar
- #8760: Traceback from animation.MovieWriter.saving method is confusing because it provides no useful information

- #9205: after the animation encoder (e.g. ffmpeg) fails, the animation framework itself fails internally in various ways while trying to report the error
- #12357: Unclear error when saving Animation using FFMpeg
- #12454: Formatting numerical legend
- #9636: matplotlib crashes upon window resize
- #11473: Continuous plotting cause memory leak 20-50kb/sec
- #12018: No image pop-up or display for plt.imshow() and plt.show()
- #11583: How to draw parallelepiped with real size scaling?
- #12446: Polar Contour - float() argument must be a string or a number, not 'AxesParasiteParasiteAuxTrans'
- #12444: Issues with gridspec/tight_layout in matplotlib version 2.2.3
- #11154: Unexpected behavior for Axes3D.plot_surface(shade=None)
- #12409: Calling savefig() multiple times causes crash of Spyder IDE / IPython Kernel dying.
- #9799: FigureCanvasTkAgg - "buffer is of wrong type" error during blit
- #12439: FileNotFoundError for font_manager
- #12437: matplotlib-mac
- #12121: Documentation of TextArea's fontprops keyword argument is misleading
- #12279: Axes.format_cursor_data lacks documentation and seems unused
- #12428: Simple plot spacing bug: ylabel gets wrongfully removed from plot
- #11190: Images in the docs are too large.
- #12271: error with errorbar with datetime64
- #12405: plt.stackplot() does not work with 3.0.0
- #12282: `Axes.imshow` tooltip does not get updated when another call to `Axes.imshow` is made
- #12420: How to remove Rectangle Selector from figure?
- #12391: Constrained Layout tutorial needs some cleanup....
- #12406: Bug with font finding, and here is my fix as well.
- #9051: ParasiteAxes over plotting
- #12325: Annotation change from "s" to "text" in 3.0- documentation
- #12397: plt.show( ) not working (can't get figures to display in external window) when using jupyter QTconsole
- #12396: Defining arrowprops in draggable annotation disables the pick_event

- #12389: Setting row edge color of matplotlib table
- #12376: The output figure file is strange: there is a lot of blank area on the output figure.
- #11641: constrained_layout and colorbar for a subset of axes
- #12373: Unexpected outcome with matplotlib.pyplot.pcolor()
- #12370: ImageGrid bug when using inline backend
- #12364: pdf image generated by matplotlib with semi transparent lines missing in Word on Windows.
- #12352: TeX rendering broken on master with windows
- #12354: Too many levels of symbolic links
- #12323: indicate_inset_zoom sometimes draws incorrect connector lines
- #12341: Figures not rendering in docker
- #12335: Matplotlib plt.Rectangle Incoherent Results
- #12265: ParasiteAxesAuxTrans pcolor/pcolormesh and contour/contourf broken
- #12337: AttributeError: module 'matplotlib.pyplot' has no attribute 'hold'
- #11673: Inconsistent font settings when changing style context
- #11693: The rcParams setting for figure.figsize does not change when run from another notebook
- #11725: New mode between non-interactive and interactive?
- #12134: tight_layout flips images when making plots without displaying them
- #12310: plot fails with datetime64[ns] timezone aware objects (for example datetime64[ns, UTC+00:00])
- #12191: "if 1:" blocks in examples
- #11288: FR: Figure.subplots add optional SubplotSpec parameter
- #12298: c and cmap for plot
- #12286: Sample code given in Matplotlib's site does not work.
- #11955: UnicodeDecodeError on importing pyplot in python2
- #12208: parasite axis2 demo now crashes with log x-axis
- #8871: Error when using quantities when plotting errorbars
- #6658: literature reference for 'viridis' colormap
- #6789: Tutorial pyplot_scales.py crashes when used with plt.tight_layout()
- #6922: imshow does not immediately update shared axes
- #11879: Unable to change filename when saving from figure window

- #12225: In histogram, bars whose count is larger than 2**31 sometimes become negative
- #1461: DOC: keyword arguments to plt.axes, plt.subpot, and fig.add_subplot
- #12173: Cannot import pyplot
- #12217: Python will suddenly not plot anymore
- #12120: Default legend behavior (loc='best') very slow for large amounts of data.
- #12176: import pyplot on MacOS without font cache will search entire subtree of current dir
- #12146: fix pdf docs
- #12160: MacOS: Cannot import name 'format_exc'
- #12169: Cannot install 3.0.0 "python setup.py egg_info" failed (freetype & png)
- #12168: pip install v3.0.0 'failed with exit status 1181'
- #12107: warnings re: deprecated pytest API with pytest 3.8
- #12162: https://matplotlib.org/users/beginner.html is outdated
- #12010: Popover over plot is very slow
- #6739: Make matplotlib fail more gracefully in headless environments
- #3679: Runtime detection for default backend
- #11340: matplotlib fails to install from source with intel compiler
- #11838: docs do not build on py3.7 due to small change in python handling of -m
- #12115: Plot in JS Animation has larger margin than "normal" PNG plot

CHAPTER

EIGHT

PREVIOUS WHAT'S NEW

8.1 What's new in Matplotlib 3.2

For a list of all of the issues and pull requests since the last revision, see the *GitHub Stats*.

Table of Contents

8.1.1 Unit converters recognize subclasses

Unit converters now also handle instances of subclasses of the class they have been registered for.

8.1.2 `imsave` accepts metadata and PIL options

imsave has gained support for the `metadata` and `pil_kwargs` parameters. These parameters behave similarly as for the *Figure.savefig()* method.

8.1.3 `cbook.normalize_kwargs`

cbook.normalize_kwargs now presents a convenient interface to normalize artist properties (e.g., from "lw" to "linewidth"):

```
>>> cbook.normalize_kwargs({"lw": 1}, Line2D)
{"linewidth": 1}
```

The first argument is the mapping to be normalized, and the second argument can be an artist class or an artist instance (it can also be a mapping in a specific format; see the function's docstring for details).

8.1.4 `FontProperties` accepts `os.PathLike`

The *fname* argument to *FontProperties* can now be an `os.PathLike`, e.g.

```
>>> FontProperties(fname=pathlib.Path("/path/to/font.ttf"))
```

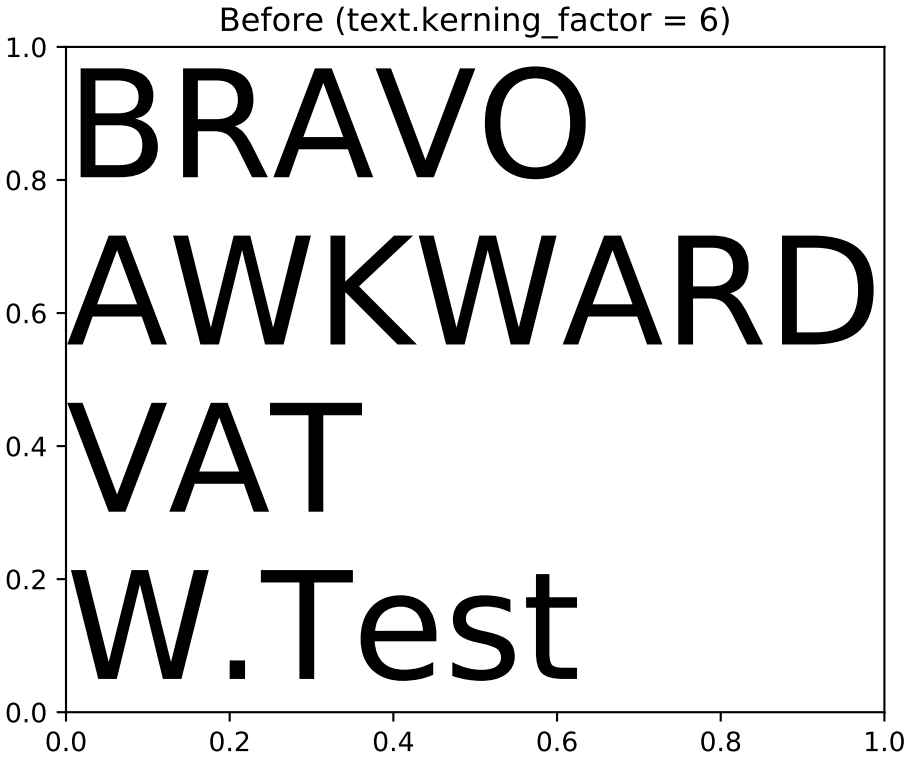
8.1.5 Gouraud-shading alpha channel in PDF backend

The pdf backend now supports an alpha channel in Gouraud-shaded triangle meshes.

8.1.6 Kerning adjustments now use correct values

Due to an error in how kerning adjustments were applied, previous versions of Matplotlib would under-correct kerning. This version will now correctly apply kerning (for fonts supported by FreeType). To restore the old behavior (e.g., for test images), you may set `rcParams["text.kerning_factor"]` (default: `0`) to 6 (instead of 0). Other values have undefined behavior.

Note how the spacing between characters is uniform between their bounding boxes (above). With corrected kerning (below), slanted characters (e.g., AV or VA) will be spaced closer together, as well as various other character pairs, depending on font support (e.g., T and e, or the period after the W).



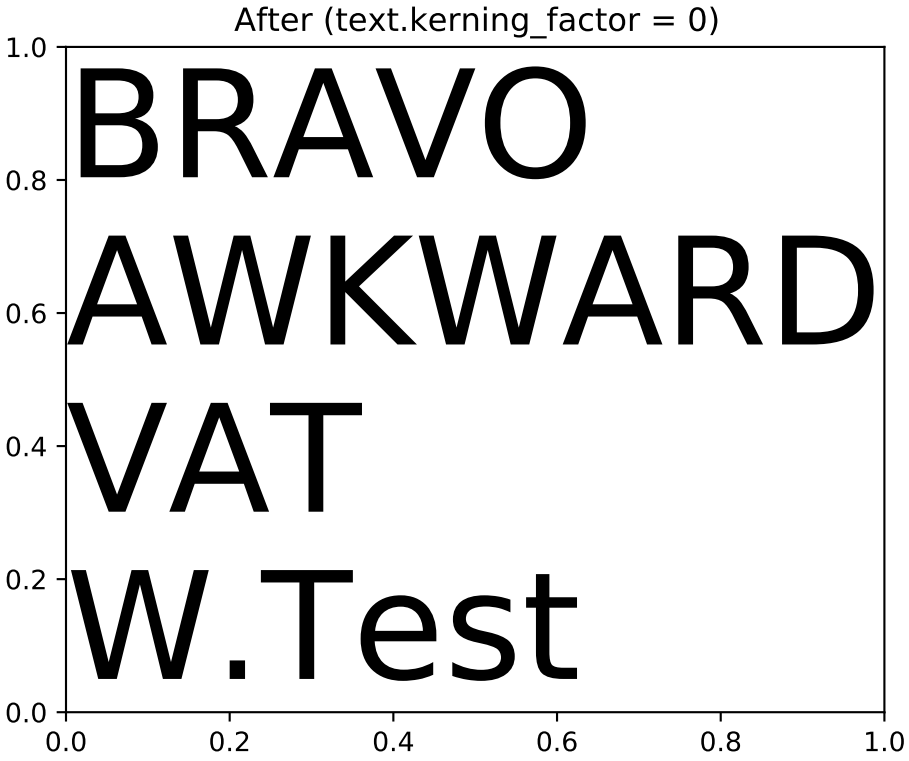
8.1.7 bar3d lightsource shading

bar3d() now supports lighting from different angles when the *shade* parameter is `True`, which can be configured using the `lightsource` parameter.

8.1.8 Shifting errorbars

Previously, *errorbar()* accepted a keyword argument *errorevery* such that the command `plt.errorbar(x, y, yerr, errorevery=6)` would add error bars to datapoints `x[::6], y[::6]`.

errorbar() now also accepts a tuple for *errorevery* such that `plt.errorbar(x, y, yerr, errorevery=(start, N))` adds error bars to points `x[start::N], y[start::N]`.



8.1.9 Improvements in Logit scale ticker and formatter

Introduced in version 1.5, the logit scale didn't have an appropriate ticker and formatter. Previously, the location of ticks was not zoom dependent, too many labels were displayed causing overlapping which broke readability, and label formatting did not adapt to precision.

Starting from this version, the logit locator has nearly the same behavior as the locator for the log scale or the linear scale, depending on used zoom. The number of ticks is controlled. Some minor labels are displayed adaptively as sublabels in log scale. Formatting is adapted for probabilities and the precision adapts to the scale.

8.1.10 rcParams for axes title location and color

Two new rcParams have been added: `rcParams["axes.titlelocation"]` (default: `'center'`) denotes the default axes title alignment, and `rcParams["axes.titlecolor"]` (default: `'auto'`) the default axes title color.

Valid values for `axes.titlelocation` are: left, center, and right. Valid values for `axes.titlecolor` are: auto or a color. Setting it to auto will fall back to previous behaviour, which is using the color in `text.color`.

8.1.11 3-digit and 4-digit hex colors

Colors can now be specified using 3-digit or 4-digit hex colors, shorthand for the colors obtained by duplicating each character, e.g. `#123` is equivalent to `#112233` and `#123a` is equivalent to `#112233aa`.

8.1.12 Added support for RGB(A) images in pcolorfast

`Axes.pcolorfast` now accepts 3D images (RGB or RGBA) arrays.

8.2 What's new in Matplotlib 3.1

For a list of all of the issues and pull requests since the last revision, see the *GitHub Stats*.

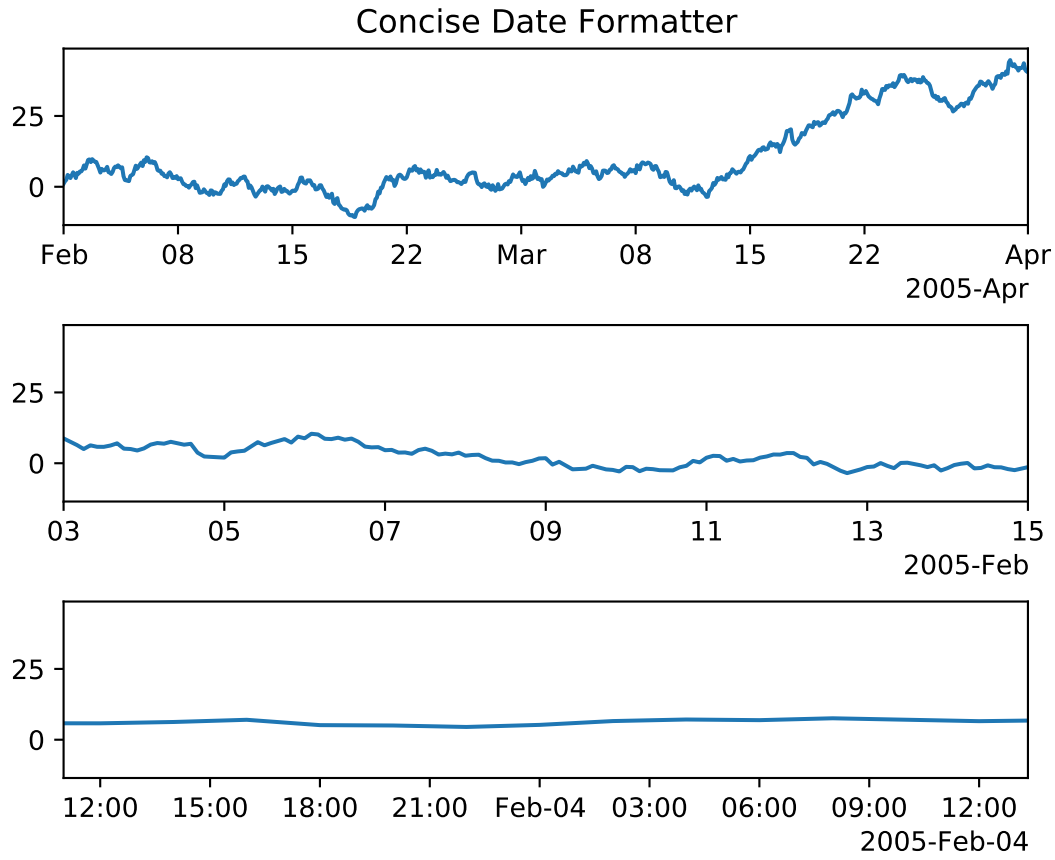
Table of Contents

    * *mplot3d Line3D now allows {set,get}_data_3d*
    * *`Axes3D.voxels` now shades the resulting voxels*
  - *Axis and Ticks*
    * *Added `Axis.get_inverted` and `Axis.set_inverted`*
    * *Adjust default minor tick spacing*
    * `EngFormatter` *now accepts* usetex, useMathText *as keyword only arguments*
  - *Animation and Interactivity*
    * *Support for forward/backward mouse buttons*
    * progress_callback *argument to* `save()`
    * *Add `cache_frame_data` keyword-only argument into* `animation.FuncAnimation`
    * *Endless Looping GIFs with PillowWriter*
    * *Adjusted* `matplotlib.widgets.Slider` *to have vertical orientation*
    * *Improved formatting of image values under cursor when a colorbar is present*
    * *MouseEvent button attribute is now an IntEnum*
  - *Configuration, Install, and Development*
    * *The MATPLOTLIBRC environment variable can now point to any "file" path*
    * *Allow LaTeX code `pgf.preamble` and `text.latex.preamble` in MATPLOTLIBRC file*
    * *New logging API*

8.2.1 New Features

`ConciseDateFormatter`

The automatic date formatter used by default can be quite verbose. A new formatter can be accessed that tries to make the tick labels appropriately concise.



Secondary x/y Axis support

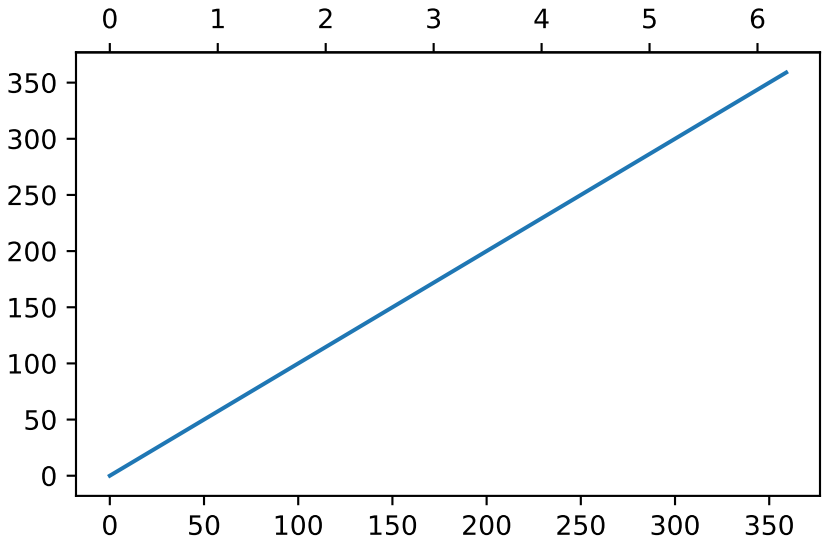
A new method provides the ability to add a second axis to an existing axes via *Axes.secondary_xaxis* and *Axes.secondary_yaxis*. See /gallery/subplots_axes_and_figures/secondary_axis for examples.

`FuncScale` for arbitrary axes scales

A new *FuncScale* class was added (and *FuncTransform*) to allow the user to have arbitrary scale transformations without having to write a new subclass of *ScaleBase*. This can be accessed by:

```
ax.set_yscale('function', functions=(forward, inverse))
```

where `forward` and `inverse` are callables that return the scale transform and its inverse. See the last example in /gallery/scales/scales.



Legend for scatter

A new method for creating legends for scatter plots has been introduced. Previously, in order to obtain a legend for a *scatter()* plot, one could either plot several scatters, each with an individual label, or create proxy artists to show in the legend manually. Now, *PathCollection* provides a method *legend_elements()* to obtain the handles and labels for a scatter plot in an automated way. This makes creating a legend for a scatter plot as easy as

An example can be found in automatedlegendcreation.

Matplotlib no longer requires framework app build on MacOSX backend

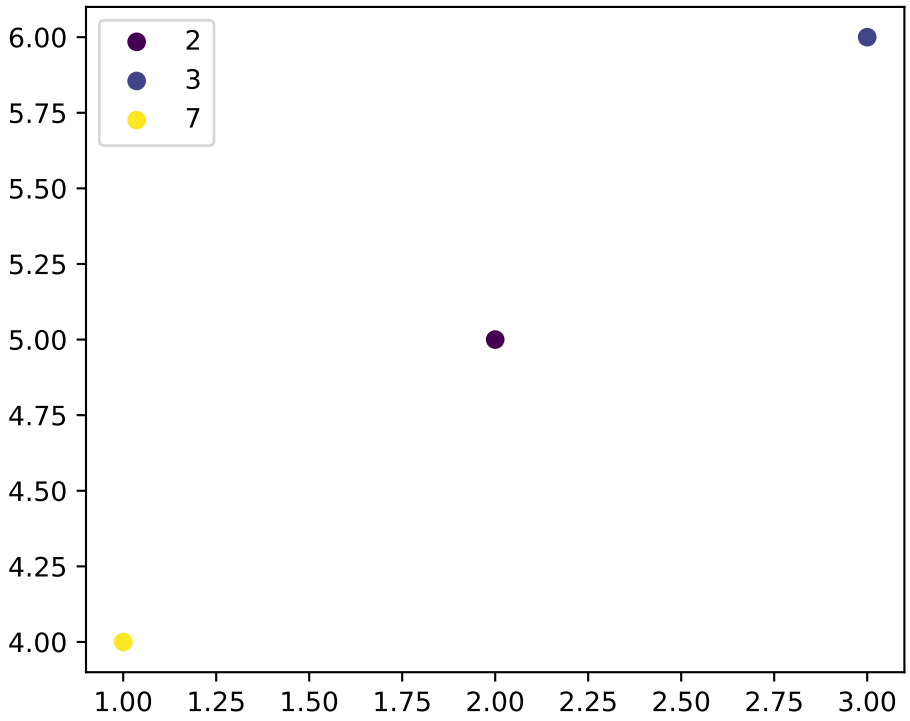
Previous versions of matplotlib required a Framework build of python to work. The app type was updated to no longer require this, so the MacOSX backend should work with non-framework python.

This also adds support for the MacOSX backend for PyPy3.

8.2.2 Figure, FigureCanvas, and Backends

Figure.frameon is now a direct proxy for the Figure patch visibility state

Accessing `Figure.frameon` (including via `get_frameon` and `set_frameon` now directly forwards to the visibility of the underlying Rectangle artist (`Figure.patch.get_frameon`, `Figure.patch.set_frameon`).



pil_kwargs argument added to savefig

Matplotlib uses Pillow to handle saving to the JPEG and TIFF formats. The *savefig()* function gained a *pil_kwargs* keyword argument, which can be used to forward arguments to Pillow's `pillow.Image.save()`.

The *pil_kwargs* argument can also be used when saving to PNG. In that case, Matplotlib also uses Pillow's `pillow.Image.save()` instead of going through its own builtin PNG support.

Add `inaxes` method to `FigureCanvasBase`

The *FigureCanvasBase* class has now an *inaxes* method to check whether a point is in an axes and returns the topmost axes, else None.

cairo backend defaults to pycairo instead of cairocffi

This leads to faster import/runtime performance in some cases. The backend will fall back to cairocffi in case pycairo isn't available.

8.2.3 Axes and Artists

axes_grid1 and axisartist Axes no longer draw spines twice

Previously, spines of *axes_grid1* and *axisartist* Axes would be drawn twice, leading to a "bold" appearance. This is no longer the case.

Return type of ArtistInspector.get_aliases changed

ArtistInspector.get_aliases previously returned the set of aliases as `{fullname: {alias1: None, alias2: None, ...}}`. The dict-to-None mapping was used to simulate a set in earlier versions of Python. It has now been replaced by a set, i.e. `{fullname: {alias1, alias2, ...}}`.

This value is also stored in `ArtistInspector.aliasd`, which has likewise changed.

`ConnectionPatch` accepts arbitrary transforms

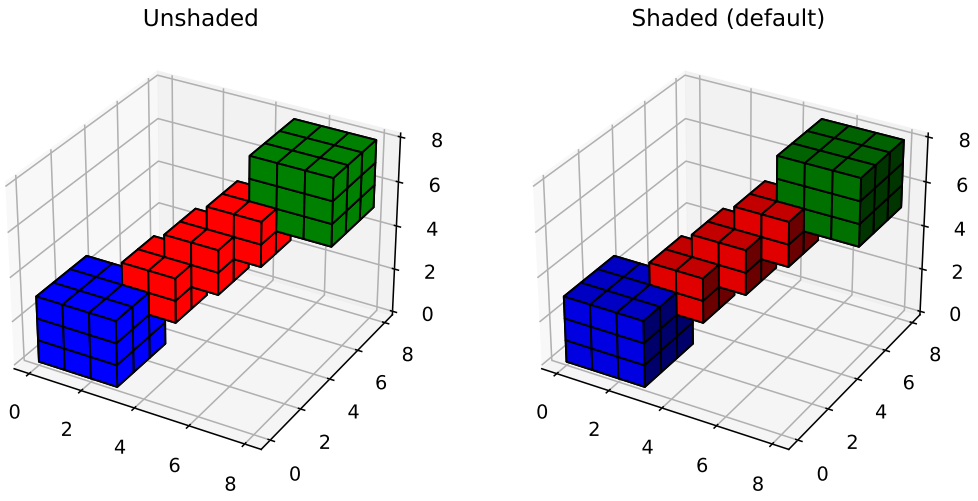
Alternatively to strings like `"data"` or `"axes fraction"`, `ConnectionPatch` now accepts any *Transform* as input for the *coordsA* and *coordsB* arguments. This allows to draw lines between points defined in different user defined coordinate systems. Also see the Connect Simple01 example.

mplot3d Line3D now allows {set,get}_data_3d

Lines created with the 3d projection in mplot3d can now access the data using *get_data_3d()* which returns a tuple of array_likes containing the (x, y, z) data. The equivalent *set_data_3d* can be used to modify the data of an existing Line3D.

`Axes3D.voxels` now shades the resulting voxels

The *Axes3D.voxels* method now takes a *shade* parameter that defaults to `True`. This shades faces based on their orientation, behaving just like the matching parameters to *plot_trisurf()* and *bar3d()*. The plot below shows how this affects the output.



8.2.4 Axis and Ticks

Added `Axis.get_inverted` and `Axis.set_inverted`

The `Axis.get_inverted` and `Axis.set_inverted` methods query and set whether the axis uses "inverted" orientation (i.e. increasing to the left for the x-axis and to the bottom for the y-axis).

They perform tasks similar to *Axes.xaxis_inverted*, *Axes.yaxis_inverted*, *Axes.invert_xaxis*, and *Axes.invert_yaxis*, with the specific difference that `Axis.set_inverted` makes it easier to set the inversion of an axis regardless of whether it had previously been inverted before.

Adjust default minor tick spacing

Default minor tick spacing was changed from 0.625 to 0.5 for major ticks spaced 2.5 units apart.

`EngFormatter` now accepts *usetex*, *useMathText* as keyword only arguments

A public API has been added to *EngFormatter* to control how the numbers in the ticklabels will be rendered. By default, *useMathText* evaluates to `rcParams["axes.formatter.use_mathtext'"]` and *usetex* evaluates to `rcParams["'text.usetex'"]`.

If either is `True` then the numbers will be encapsulated by `$` signs. When using `TeX` this implies that the numbers will be shown in TeX's math font. When using mathtext, the `$` signs around numbers will ensure Unicode rendering (as implied by mathtext). This will make sure that the minus signs in the ticks are rendered as the Unicode minus (U+2212) when using mathtext (without relying on the *fix_minus* method).

8.2.5 Animation and Interactivity

Support for forward/backward mouse buttons

Figure managers now support a `button_press` event for mouse buttons, similar to the `key_press` events. This allows binding actions to mouse buttons (see *MouseButton*) The first application of this mechanism is support of forward/backward mouse buttons in figures created with the Qt5 backend.

progress_callback argument to `save()`

The method *Animation.save* gained an optional *progress_callback* argument to notify the saving progress.

Add `cache_frame_data` keyword-only argument into `animation.FuncAnimation`

matplotlib.animation.FuncAnimation has been caching frame data by default; however, this caching is not ideal in certain cases e.g. When *FuncAnimation* needs to be only drawn(not saved) interactively and memory required by frame data is quite large. By adding *cache_frame_data* keyword-only argument, users can now disable this caching; thereby, this new argument provides a fix for issue #8528.

Endless Looping GIFs with PillowWriter

We acknowledge that most people want to watch a GIF more than once. Saving an animation as a GIF with PillowWriter now produces an endless looping GIF.

Adjusted `matplotlib.widgets.Slider` to have vertical orientation

The *matplotlib.widgets.Slider* widget now takes an optional argument *orientation* which indicates the direction (`'horizontal'` or `'vertical'`) that the slider should take.

Improved formatting of image values under cursor when a colorbar is present

When a colorbar is present, its formatter is now used to format the image values under the mouse cursor in the status bar. For example, for an image displaying the values 10,000 and 10,001, the statusbar will now (using default settings) display the values as `10000` and `10001`), whereas both values were previously displayed as `1e+04`.

MouseEvent button attribute is now an IntEnum

The `button` attribute of *MouseEvent* instances can take the values None, 1 (left button), 2 (middle button), 3 (right button), "up" (scroll), and "down" (scroll). For better legibility, the 1, 2, and 3 values are now represented using the `enum.IntEnum` class *matplotlib.backend_bases.MouseButton*, with the values *MouseButton.LEFT* (`== 1`), *MouseButton.MIDDLE* (`== 2`), and *MouseButton.RIGHT* (`== 3`).

8.2.6 Configuration, Install, and Development

The MATPLOTLIBRC environment variable can now point to any "file" path

This includes device files; in particular, on Unix systems, one can set `MATPLOTLIBRC` to `/dev/null` to ignore the user's matplotlibrc file and fall back to Matplotlib's defaults.

As a reminder, if `MATPLOTLIBRC` points to a directory, Matplotlib will try to load the matplotlibrc file from `$MATPLOTLIBRC/matplotlibrc`.

Allow LaTeX code `pgf.preamble` and `text.latex.preamble` in MATPLOTLIBRC file

Previously, the rc file keys `rcParams["pgf.preamble"]` (default: `''`) and `rcParams["text.latex.preamble"]` (default: `''`) were parsed using commas as separators. This would break valid LaTeX code, such as:

```
\usepackage[protrusion=true, expansion=false]{microtype}
```

The parsing has been modified to pass the complete line to the LaTeX system, keeping all commas. Passing a list of strings from within a Python script still works as it used to.

New logging API

`matplotlib.set_loglevel` / `pyplot.set_loglevel` can be called to display more (or less) detailed logging output.

8.3 New in Matplotlib 3.0

8.3.1 Improved default backend selection

The default backend no longer must be set as part of the build process. Instead, at run time, the builtin backends are tried in sequence until one of them imports.

Headless Linux servers (identified by the DISPLAY environment variable not being defined) will not select a GUI backend.

8.3.2 Cyclic colormaps

Two new colormaps named 'twilight' and 'twilight_shifted' have been added. These colormaps start and end on the same color, and have two symmetric halves with equal lightness, but diverging color. Since they wrap around, they are a good choice for cyclic data such as phase angles, compass directions, or time of day. Like *viridis* and *cividis*, *twilight* is perceptually uniform and colorblind friendly.

8.3.3 Ability to scale axis by a fixed order of magnitude

To scale an axis by a fixed order of magnitude, set the *scilimits* argument of *Axes.ticklabel_format* to the same (non-zero) lower and upper limits. Say to scale the y axis by a million (1e6), use

```
ax.ticklabel_format(style='sci', scilimits=(6, 6), axis='y')
```

The behavior of `scilimits=(0, 0)` is unchanged. With this setting, Matplotlib will adjust the order of magnitude depending on the axis values, rather than keeping it fixed. Previously, setting `scilimits=(m, m)` was equivalent to setting `scilimits=(0, 0)`.

8.3.4 Add `AnchoredDirectionArrows` feature to mpl_toolkits

A new mpl_toolkits class *AnchoredDirectionArrows* draws a pair of orthogonal arrows to indicate directions on a 2D plot. A minimal working example takes in the transformation object for the coordinate system (typically ax.transAxes), and arrow labels. There are several optional parameters that can be used to alter layout. For example, the arrow pairs can be rotated and the color can be changed. By default the labels and arrows have the same color, but the class may also pass arguments for customizing arrow and text layout, these are passed to *matplotlib.textpath.TextPath* and *matplotlib.patches.FancyArrowPatch*. Location, length and width for both arrow tail and head can be adjusted, the direction arrows and labels can have a frame. Padding and separation parameters can be adjusted.

8.3.5 Add `minorticks_on()/off()` methods for colorbar

A new method `colorbar.Colobar.minorticks_on()` has been added to correctly display minor ticks on a colorbar. This method doesn't allow the minor ticks to extend into the regions beyond vmin and vmax when the *extend* keyword argument (used while creating the colorbar) is set to 'both', 'max' or 'min'. A complementary method `colorbar.Colobar.minorticks_off()` has also been added to remove the minor ticks on the colorbar.

8.3.6 Colorbar ticks can now be automatic

The number of ticks placed on colorbars was previously appropriate for a large colorbar, but looked bad if the colorbar was made smaller (i.e. via the *shrink* keyword argument). This has been changed so that the number of ticks is now responsive to how large the colorbar is.

8.3.7 Don't automatically rename duplicate file names

Previously, when saving a figure to a file using the GUI's save dialog box, if the default filename (based on the figure window title) already existed on disk, Matplotlib would append a suffix (e.g. `Figure_1-1.png`), preventing the dialog from prompting to overwrite the file. This behaviour has been removed. Now if the file name exists on disk, the user is prompted whether or not to overwrite it. This eliminates guesswork, and allows intentional overwriting, especially when the figure name has been manually set using `figure.Figure.canvas.set_window_title()`.

8.3.8 Legend now has a *title_fontsize* keyword argument (and rcParam)

The title for a *Figure.legend* and *Axes.legend* can now have its font size set via the *title_fontsize* keyword argument. There is also a new `rcParams["legend.title_fontsize"]` (default: `None`). Both default to `None`, which means the legend title will have the same font size as the axes default font size (*not* the legend font size, set by the *fontsize* keyword argument or `rcParams["legend.fontsize"]` (default: `'medium'`)).

8.3.9 Support for axes.prop_cycle property *markevery* in rcParams

The Matplotlib `rcParams` settings object now supports configuration of the attribute `axes.prop_cycle` with cyclers using the `markevery` Line2D object property. An example of this feature is provided at /gallery/lines_bars_and_markers/markevery_prop_cycle.

8.3.10 Multi-page PDF support for pgf backend

The pgf backend now also supports multi-page PDF files.

```
from matplotlib.backends.backend_pgf import PdfPages
import matplotlib.pyplot as plt

with PdfPages('multipage.pdf') as pdf:
    # page 1
    plt.plot([2, 1, 3])
    pdf.savefig()

    # page 2
```

(continues on next page)

(continued from previous page)

```
    plt.cla()
    plt.plot([3, 1, 2])
    pdf.savefig()
```

8.3.11 Pie charts are now circular by default

We acknowledge that the majority of people do not like egg-shaped pies. Therefore, an axes to which a pie chart is plotted will be set to have equal aspect ratio by default. This ensures that the pie appears circular independent on the axes size or units. To revert to the previous behaviour set the axes' aspect ratio to automatic by using `ax.set_aspect("auto")` or `plt.axis("auto")`.

8.3.12 Add `ax.get_gridspec` to `SubplotBase`

New method *`SubplotBase.get_gridspec`* is added so that users can easily get the gridspec that went into making an axes:

```
import matplotlib.pyplot as plt

fig, axs = plt.subplots(3, 2)
gs = axs[0, -1].get_gridspec()

# remove the last column
for ax in axs[:,-1].flatten():
  ax.remove()

# make a subplot in last column that spans rows.
ax = fig.add_subplot(gs[:, -1])
plt.show()
```

8.3.13 Axes titles will no longer overlap xaxis

Previously an axes title had to be moved manually if an xaxis overlapped (usually when the xaxis was put on the top of the axes). Now, the title will be automatically moved above the xaxis and its decorators (including the xlabel) if they are at the top.

If desired, the title can still be placed manually. There is a slight kludge; the algorithm checks if the y-position of the title is 1.0 (the default), and moves if it is. If the user places the title in the default location (i.e. `ax.title.set_position(0.5, 1.0)`), the title will still be moved above the xaxis. If the user wants to avoid this, they can specify a number that is close (i.e. `ax.title.set_position(0.5, 1.01)`) and the title will not be moved via this algorithm.

8.3.14 New convenience methods for GridSpec

There are new convenience methods for *gridspec.GridSpec* and *gridspec.GridSpecFromSubplotSpec*. Instead of the former we can now call *Figure.add_gridspec* and for the latter *SubplotSpec.subgridspec*.

```
import matplotlib.pyplot as plt

fig = plt.figure()
gs0 = fig.add_gridspec(3, 1)
ax1 = fig.add_subplot(gs0[0])
ax2 = fig.add_subplot(gs0[1])
gssub = gs0[2].subgridspec(1, 3)
for i in range(3):
    fig.add_subplot(gssub[0, i])
```

8.3.15 Figure has an `add_artist` method

A method *add_artist* has been added to the *Figure* class, which allows artists to be added directly to a figure. E.g.

```
circ = plt.Circle((.7, .5), .05)
fig.add_artist(circ)
```

In case the added artist has no transform set previously, it will be set to the figure transform (`fig.transFigure`). This new method may be useful for adding artists to figures without axes or to easily position static elements in figure coordinates.

8.3.16 `:math:` directive renamed to `:mathmpl:`

The `:math:` rst role provided by `matplotlib.sphinxext.mathmpl` has been renamed to `:mathmpl:` to avoid conflicting with the `:math:` role that Sphinx 1.8 provides by default. (`:mathmpl:` uses Matplotlib to render math expressions to images embedded in html, whereas Sphinx uses MathJax.)

When using Sphinx<1.8, both names (`:math:` and `:mathmpl:`) remain available for backwards-compatibility.

8.4 New in Matplotlib 2.2

8.4.1 Constrained Layout Manager

Warning: Constrained Layout is **experimental**. The behaviour and API are subject to change, or the whole functionality may be removed without a deprecation period.

A new method to automatically decide spacing between subplots and their organizing `GridSpec` instances has been added. It is meant to replace the venerable `tight_layout` method. It is invoked via a new `constrained_layout=True` kwarg to *Figure* or *subplots*.

There are new *rcParams* for this package, and spacing can be more finely tuned with the new *set_constrained_layout_pads*.

Features include:

- Automatic spacing for subplots with a fixed-size padding in inches around subplots and all their decorators, and space between as a fraction of subplot size between subplots.
- Spacing for *suptitle*, and colorbars that are attached to more than one axes.
- Nested *GridSpec* layouts using *GridSpecFromSubplotSpec*.

For more details and capabilities please see the new tutorial: *Constrained Layout Guide*

Note the new API to access this:

New `plt.figure` and `plt.subplots` kwarg: `constrained_layout`

figure() and *subplots()* can now be called with `constrained_layout=True` kwarg to enable constrained_layout.

New `ax.set_position` behaviour

Axes.set_position now makes the specified axis no longer responsive to `constrained_layout`, consistent with the idea that the user wants to place an axis manually.

Internally, this means that old `ax.set_position` calls *inside* the library are changed to private `ax._set_position` calls so that `constrained_layout` will still work with these axes.

New `figure` kwarg for `GridSpec`

In order to facilitate `constrained_layout`, `GridSpec` now accepts a `figure` keyword. This is backwards compatible, in that not supplying this will simply cause `constrained_layout` to not operate on the subplots orgainzed by this `GridSpec` instance. Routines that use `GridSpec` (e.g. `fig.subplots`) have been modified to pass the figure to `GridSpec`.

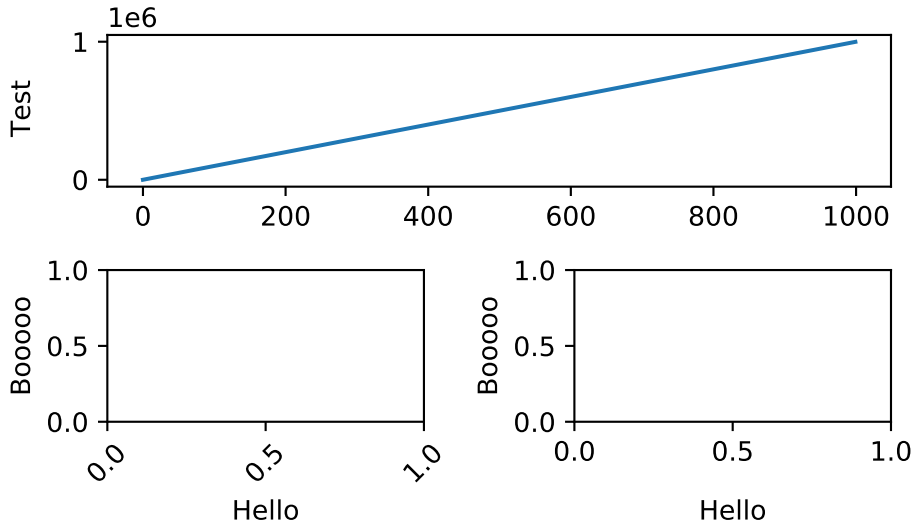
8.4.2 xlabels and ylabels can now be automatically aligned

Subplot axes `ylabels` can be misaligned horizontally if the tick labels are very different widths. The same can happen to `xlabels` if the ticklabels are rotated on one subplot (for instance). The new methods on the *Figure* class: *Figure.align_xlabels* and *Figure.align_ylabels* will now align these labels horizontally or vertically. If the user only wants to align some axes, a list of axes can be passed. If no list is passed, the algorithm looks at all the labels on the figure.

Only labels that have the same subplot locations are aligned. i.e. the ylabels are aligned only if the subplots are in the same column of the subplot layout.

Alignment is persistent and automatic after these are called.

A convenience wrapper *Figure.align_labels* calls both functions at once.

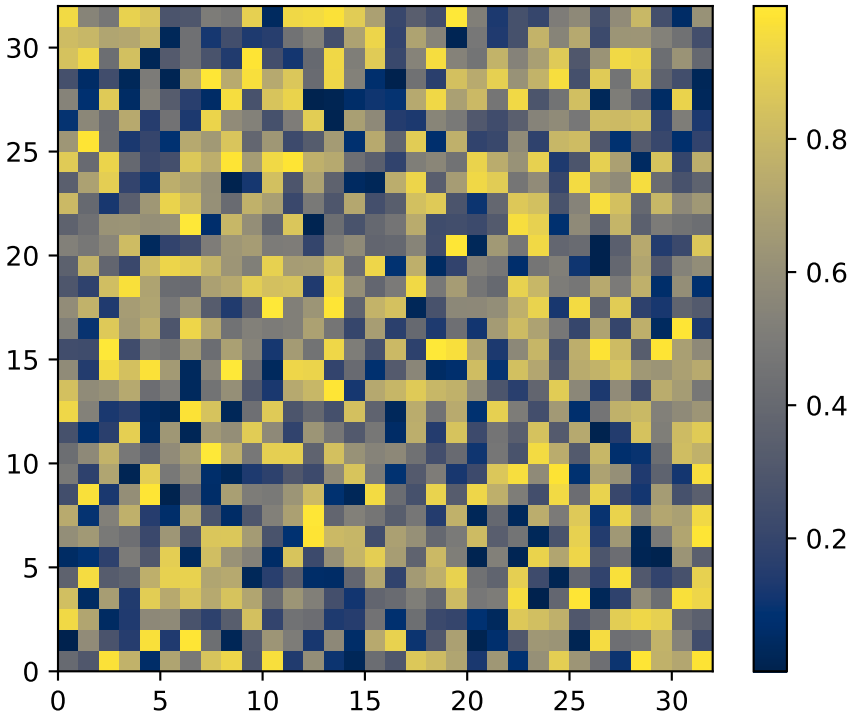


8.4.3 Axes legends now included in tight_bbox

Legends created via `ax.legend` can sometimes overspill the limits of the axis. Tools like `fig.tight_layout()` and `fig.savefig(bbox_inches='tight')` would clip these legends. A change was made to include them in the `tight` calculations.

8.4.4 Cividis colormap

A new dark blue/yellow colormap named 'cividis' was added. Like viridis, cividis is perceptually uniform and colorblind friendly. However, cividis also goes a step further: not only is it usable by colorblind users, it should actually look effectively identical to colorblind and non-colorblind users. For more details see Nuñez J, Anderton C, and Renslow R: "Optimizing colormaps with consideration for color vision deficiency to enable accurate interpretation of scientific data".



8.4.5 New style colorblind-friendly color cycle

A new style defining a color cycle has been added, tableau-colorblind10, to provide another option for colorblind-friendly plots. A demonstration of this new style can be found in the reference of style sheets. To load this color cycle in place of the default one:

```
import matplotlib.pyplot as plt
plt.style.use('tableau-colorblind10')
```

8.4.6 Support for numpy.datetime64

Matplotlib has supported `datetime.datetime` dates for a long time in *matplotlib.dates*. We now support `numpy.datetime64` dates as well. Anywhere that `datetime.datetime` could be used, `numpy.datetime64` can be used. eg:

```
time = np.arange('2005-02-01', '2005-02-02', dtype='datetime64[h]')
plt.plot(time)
```

8.4.7 Writing animations with Pillow

It is now possible to use Pillow as an animation writer. Supported output formats are currently gif (Pillow>=3.4) and webp (Pillow>=5.0). Use e.g. as

```
from __future__ import division

from matplotlib import pyplot as plt
from matplotlib.animation import FuncAnimation, PillowWriter

fig, ax = plt.subplots()
line, = plt.plot([0, 1])

def animate(i):
   line.set_ydata([0, i / 20])
   return [line]

anim = FuncAnimation(fig, animate, 20, blit=True)
anim.save("movie.gif", writer=PillowWriter(fps=24))
plt.show()
```

8.4.8 Slider UI widget can snap to discrete values

The slider UI widget can take the optional argument *valstep*. Doing so forces the slider to take on only discrete values, starting from *valmin* and counting up to *valmax* with steps of size *valstep*.

If *closedmax==True*, then the slider will snap to *valmax* as well.

8.4.9 `capstyle` and `joinstyle` attributes added to `Collection`

The *`Collection`* class now has customizable `capstyle` and `joinstyle` attributes. This allows the user for example to set the `capstyle` of errorbars.

8.4.10 *pad* kwarg added to ax.set_title

The method *`Axes.set_title`* now has a *pad* kwarg, that specifies the distance from the top of an axes to where the title is drawn. The units of *pad* is points, and the default is the value of the (already-existing) `rcParams["axes.titlepad"]` (default: `6.0`).

8.4.11 Comparison of 2 colors in Matplotlib

As the colors in Matplotlib can be specified with a wide variety of ways, the *`matplotlib.colors.same_color`* method has been added which checks if two *`colors`* are the same.

8.4.12 Autoscaling a polar plot snaps to the origin

Setting the limits automatically in a polar plot now snaps the radial limit to zero if the automatic limit is nearby. This means plotting from zero doesn't automatically scale to include small negative values on the radial axis.

The limits can still be set manually in the usual way using *`set_ylim`*.

8.4.13 PathLike support

On Python 3.6+, *`savefig`*, *`imsave`*, *`imread`*, and animation writers now accept `os.PathLike`s as input.

8.4.14 `Axes.tick_params` can set gridline properties

`Tick` objects hold gridlines as well as the tick mark and its label. *`Axis.set_tick_params`*, *`Axes.tick_params`* and *`pyplot.tick_params`* now have keyword arguments 'grid_color', 'grid_alpha', 'grid_linewidth', and 'grid_linestyle' for overriding the defaults in *`rcParams`*: 'grid.color', etc.

8.4.15 `Axes.imshow` clips RGB values to the valid range

When *`Axes.imshow`* is passed an RGB or RGBA value with out-of-range values, it now logs a warning and clips them to the valid range. The old behaviour, wrapping back in to the range, often hid outliers and made interpreting RGB images unreliable.

8.4.16 Properties in `matplotlibrc` to place xaxis and yaxis tick labels

Introducing four new boolean properties in `matplotlibrc` for default positions of xaxis and yaxis tick labels, namely, `rcParams["xtick.labeltop"]` (default: `False`), `rcParams["xtick.labelbottom"]` (default: `True`), `rcParams["ytick.labelright"]` (default: `False`) and `rcParams["ytick.labelleft"]` (default: `True`). These can also be changed in rcParams.

8.4.17 PGI bindings for gtk3

The GTK3 backends can now use PGI instead of PyGObject. PGI is a fairly incomplete binding for GObject, thus its use is not recommended; its main benefit is its availability on Travis (thus allowing CI testing for the gtk3agg and gtk3cairo backends).

The binding selection rules are as follows: - if `gi` has already been imported, use it; else - if `pgi` has already been imported, use it; else - if `gi` can be imported, use it; else - if `pgi` can be imported, use it; else - error out.

Thus, to force usage of PGI when both bindings are installed, import it first.

8.4.18 Cairo rendering for Qt, WX, and Tk canvases

The new `Qt4Cairo`, `Qt5Cairo`, `WXCairo`, and `TkCairo` backends allow Qt, Wx, and Tk canvases to use Cairo rendering instead of Agg.

8.4.19 Added support for QT in new ToolManager

Now it is possible to use the ToolManager with Qt5 For example

import matplotlib

matplotlib.use('QT5AGG') matplotlib.rcParams['toolbar'] = 'toolmanager' import matplotlib.pyplot as plt

plt.plot([1,2,3]) plt.show()

Treat the new Tool classes experimental for now, the API will likely change and perhaps the rcParam as well

The main example /gallery/user_interfaces/toolmanager_sgskip shows more details, just adjust the header to use QT instead of GTK3

8.4.20 TkAgg backend reworked to support PyPy

PyPy can now plot using the TkAgg backend, supported on PyPy 5.9 and greater (both PyPy for python 2.7 and PyPy for python 3.5).

8.4.21 Python logging library used for debug output

Matplotlib has in the past (sporadically) used an internal verbose-output reporter. This version converts those calls to using the standard python `logging` library.

Support for the old *rcParams* `verbose.level` and `verbose.fileo` is dropped.

The command-line options `--verbose-helpful` and `--verbose-debug` are still accepted, but deprecated. They are now equivalent to setting `logging.INFO` and `logging.DEBUG`.

The logger's root name is `matplotlib` and can be accessed from programs as:

```
import logging
mlog = logging.getLogger('matplotlib')
```

Instructions for basic usage are in *Troubleshooting* and for developers in *Contributing*.

8.4.22 Improved `repr` for `Transforms`

*Transform*s now indent their `repr`s in a more legible manner:

```
In [1]: l, = plt.plot([]); l.get_transform()
Out[1]:
CompositeGenericTransform(
   TransformWrapper(
      BlendedAffine2D(
```

(continues on next page)

(continued from previous page)

```
           IdentityTransform(),
           IdentityTransform())),
   CompositeGenericTransform(
      BboxTransformFrom(
           TransformedBbox(
              Bbox(x0=-0.05500000000000001, y0=-0.05500000000000001, x1=0.
↪05500000000000001, y1=0.05500000000000001),
              TransformWrapper(
                 BlendedAffine2D(
                       IdentityTransform(),
                       IdentityTransform()))),
      BboxTransformTo(
           TransformedBbox(
              Bbox(x0=0.125, y0=0.10999999999999999, x1=0.9, y1=0.88),
              BboxTransformTo(
                 TransformedBbox(
                       Bbox(x0=0.0, y0=0.0, x1=6.4, y1=4.8),
                       Affine2D(
                          [[ 100.    0.    0.]
                          [   0.  100.    0.]
                          [   0.    0.    1.]]))))))))
```

8.5 New in Matplotlib 2.1.0

8.5.1 Documentation

The examples have been migrated to use sphinx gallery. This allows better mixing of prose and code in the examples, provides links to download the examples as both a Python script and a Jupyter notebook, and improves the thumbnail galleries. The examples have been re-organized into *Tutorials* and a gallery.

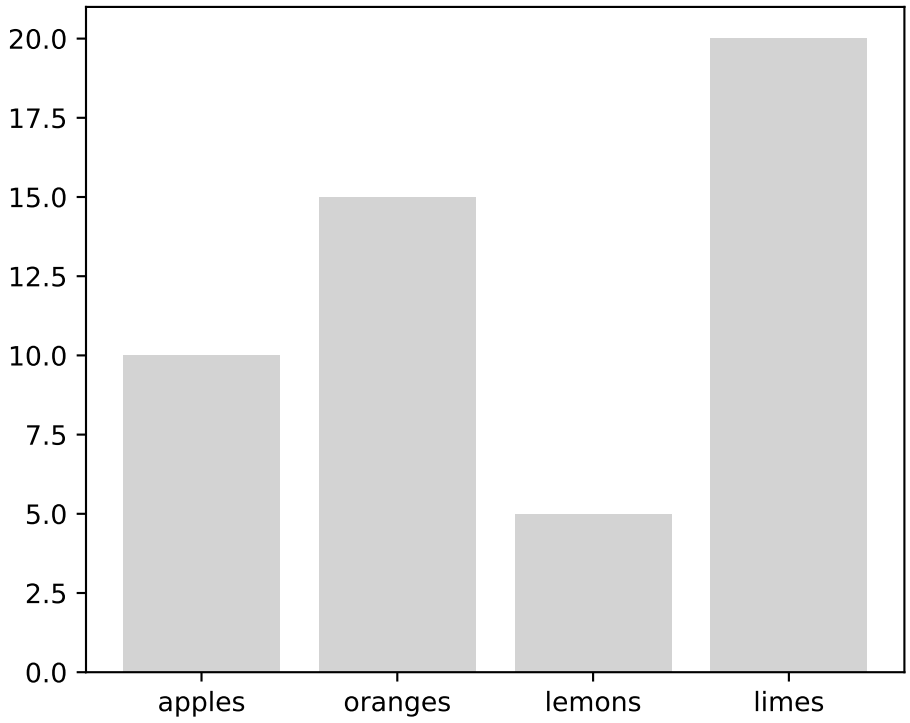
Many docstrings and examples have been clarified and improved.

8.5.2 New features

String categorical values

All plotting functions now support string categorical values as input. For example:

```
data = {'apples': 10, 'oranges': 15, 'lemons': 5, 'limes': 20}
fig, ax = plt.subplots()
ax.bar(data.keys(), data.values(), color='lightgray')
```



Interactive JS widgets for animation

Jake Vanderplas' JSAnimation package has been merged into Matplotlib. This adds to Matplotlib the *HTMLWriter* class for generating a JavaScript HTML animation, suitable for the IPython notebook. This can be activated by default by setting the `animation.html` rc parameter to `jshtml`. One can also call the *to_jshtml* method to manually convert an animation. This can be displayed using IPython's `HTML` display class:

```
from IPython.display import HTML
HTML(animation.to_jshtml())
```

The *HTMLWriter* class can also be used to generate an HTML file by asking for the `html` writer.

Enhancements to polar plot

The polar axes transforms have been greatly re-factored to allow for more customization of view limits and tick labelling. Additional options for view limits allow for creating an annulus, a sector, or some combination of the two.

The *set_rorigin()* method may be used to provide an offset to the minimum plotting radius, producing an annulus.

The *set_theta_zero_location()* method now has an optional `offset` argument. This argument may be used to further specify the zero location based on the given anchor point.

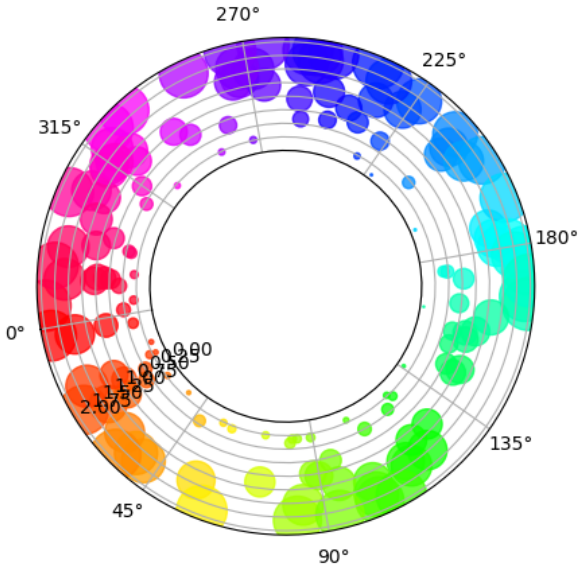


Fig. 1: Polar Offset Demo

The *set_thetamin()* and *set_thetamax()* methods may be used to limit the range of angles plotted, producing sectors of a circle.

Previous releases allowed plots containing negative radii for which the negative values are simply used as labels, and the real radius is shifted by the configured minimum. This release also allows negative radii to be used for grids and ticks, which were previously silently ignored.

Radial ticks have been modified to be parallel to the circular grid line, and angular ticks have been modified to be parallel to the grid line. It may also be useful to rotate tick *labels* to match the boundary. Calling `ax.tick_params(rotation='auto')` will enable the new behavior: radial tick labels will be parallel to the circular grid line, and angular tick labels will be perpendicular to the grid line (i.e., parallel to the outer boundary). Additionally, tick labels now obey the padding settings that previously only worked on Cartesian plots. Consequently, the `frac` argument to *PolarAxes.set_thetagrids* is no longer applied. Tick padding can be modified with the `pad` argu-

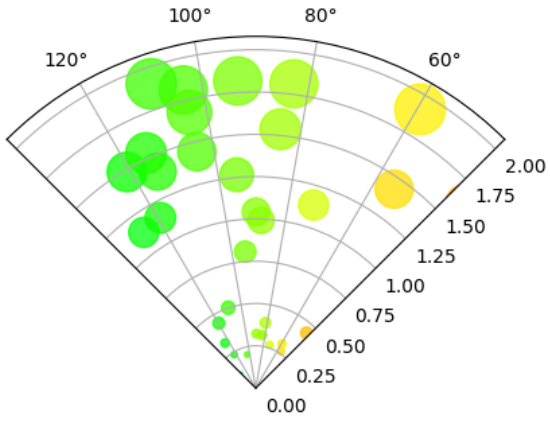

Fig. 2: Polar Sector Demo

ment to *Axes.tick_params* or *Axis.set_tick_params*.

`Figure` class now has `subplots` method

The *Figure* class now has a *subplots()* method which behaves the same as *pyplot.subplots()* but on an existing figure.

Metadata savefig keyword argument

savefig() now accepts `metadata` as a keyword argument. It can be used to store key/value pairs in the image metadata.

- 'png' with Agg backend
- 'pdf' with PDF backend (see *writeInfoDict()* for a list of supported keywords)
- 'eps' and 'ps' with PS backend (only 'Creator' key is accepted)

```
plt.savefig('test.png', metadata={'Software': 'My awesome software'})
```

Busy Cursor

The interactive GUI backends will now change the cursor to busy when Matplotlib is rendering the canvas.

PolygonSelector

A *PolygonSelector* class has been added to *matplotlib.widgets*. See /gallery/widgets/polygon_selector_demo for details.

Added `matplotlib.ticker.PercentFormatter`

The new *PercentFormatter* formatter has some nice features like being able to convert from arbitrary data scales to percents, a customizable percent symbol and either automatic or manual control over the decimal points.

Reproducible PS, PDF and SVG output

The `SOURCE_DATE_EPOCH` environment variable can now be used to set the timestamp value in the PS and PDF outputs. See source date epoch.

Alternatively, calling `savefig` with `metadata={'CreationDate': None}` will omit the timestamp altogether for the PDF backend.

The reproducibility of the output from the PS and PDF backends has so far been tested using various plot elements but only default values of options such as `{ps, pdf}.fonttype` that can affect the output at a low level, and not with the mathtext or usetex features. When Matplotlib calls external tools (such as PS distillers or LaTeX) their versions need to be kept constant for reproducibility, and they may add sources of nondeterminism outside the control of Matplotlib.

For SVG output, the `svg.hashsalt` rc parameter has been added in an earlier release. This parameter changes some random identifiers in the SVG file to be deterministic. The downside of this setting is that if more than one file is generated using deterministic identifiers and they end up as parts of one larger document, the identifiers can collide and cause the different parts to affect each other.

These features are now enabled in the tests for the PDF and SVG backends, so most test output files (but not all of them) are now deterministic.

Orthographic projection for mplot3d

Axes3D now accepts `proj_type` keyword argument and has a method *set_proj_type()*. The default option is `'persp'` as before, and supplying `'ortho'` enables orthographic view.

Compare the z-axis which is vertical in orthographic view, but slightly skewed in the perspective view.

```
import numpy as np
import matplotlib.pyplot as plt
from mpl_toolkits.mplot3d import Axes3D

fig = plt.figure(figsize=(4, 6))
ax1 = fig.add_subplot(2, 1, 1, projection='3d')
ax1.set_proj_type('persp')
ax1.set_title('Perspective (default)')

ax2 = fig.add_subplot(2, 1, 2, projection='3d')
ax2.set_proj_type('ortho')
ax2.set_title('Orthographic')

plt.show()
```

`voxels` function for mplot3d

Axes3D now has a *voxels* method, for visualizing boolean 3D data. Uses could include plotting a sparse 3D heat map, or visualizing a volumetric model.

8.5.3 Improvements

CheckButtons widget `get_status` function

A *get_status()* method has been added to the *matplotlib.widgets.CheckButtons* class. This `get_status` method allows user to query the status (True/False) of all of the buttons in the `CheckButtons` object.

Add `fill_bar` argument to `AnchoredSizeBar`

The `mpl_toolkits` class *AnchoredSizeBar* now has an additional `fill_bar` argument, which makes the size bar a solid rectangle instead of just drawing the border of the rectangle. The default is `None`, and whether or not the bar will be filled by default depends on the value of `size_vertical`. If `size_vertical` is nonzero, `fill_bar` will be set to `True`. If `size_vertical` is zero then `fill_bar` will be set to `False`. If you wish to override this default behavior, set `fill_bar` to `True` or `False` to unconditionally always or never use a filled patch rectangle for the size bar.

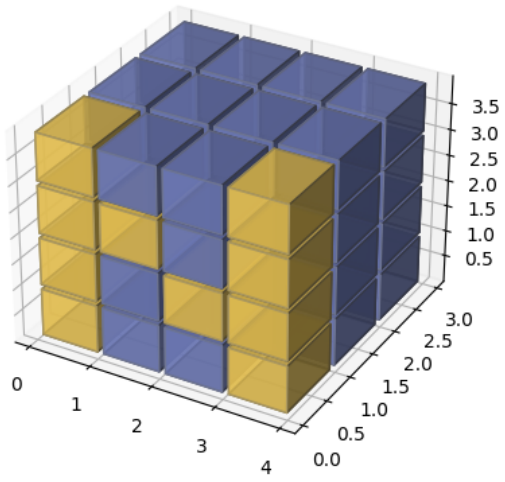

Fig. 3: Voxel Demo

```
import matplotlib.pyplot as plt
from mpl_toolkits.axes_grid1.anchored_artists import AnchoredSizeBar

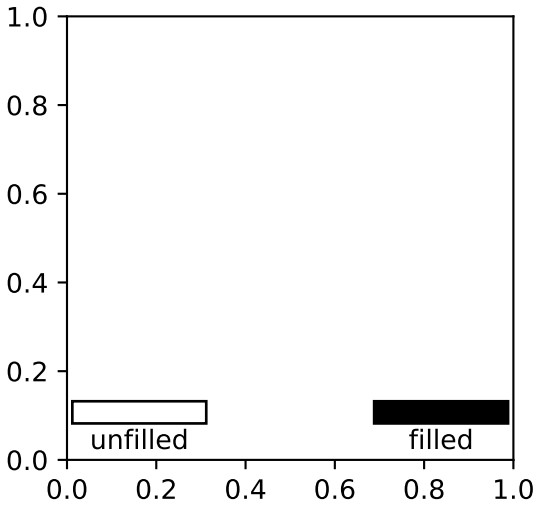
fig, ax = plt.subplots(figsize=(3, 3))

bar0 = AnchoredSizeBar(ax.transData, 0.3, 'unfilled', loc='lower left',
                       frameon=False, size_vertical=0.05, fill_bar=False)
ax.add_artist(bar0)
bar1 = AnchoredSizeBar(ax.transData, 0.3, 'filled', loc='lower right',
                       frameon=False, size_vertical=0.05, fill_bar=True)
ax.add_artist(bar1)

plt.show()
```

Annotation can use a default arrow style

Annotations now use the default arrow style when setting `arrowprops={}`, rather than no arrow (the new behavior actually matches the documentation).



Barbs and Quiver Support Dates

When using the *quiver()* and *barbs()* plotting methods, it is now possible to pass dates, just like for other methods like *plot()*. This also allows these functions to handle values that need unit-conversion applied.

Hexbin default line color

The default `linecolor` keyword argument for *hexbin()* is now `'face'`, and supplying `'none'` now prevents lines from being drawn around the hexagons.

Figure.legend() can be called without arguments

Calling *Figure.legend()* can now be done with no arguments. In this case a legend will be created that contains all the artists on all the axes contained within the figure.

Multiple legend keys for legend entries

A legend entry can now contain more than one legend key. The extended *HandlerTuple* class now accepts two parameters: `ndivide` divides the legend area in the specified number of sections; `pad` changes the padding between the legend keys.

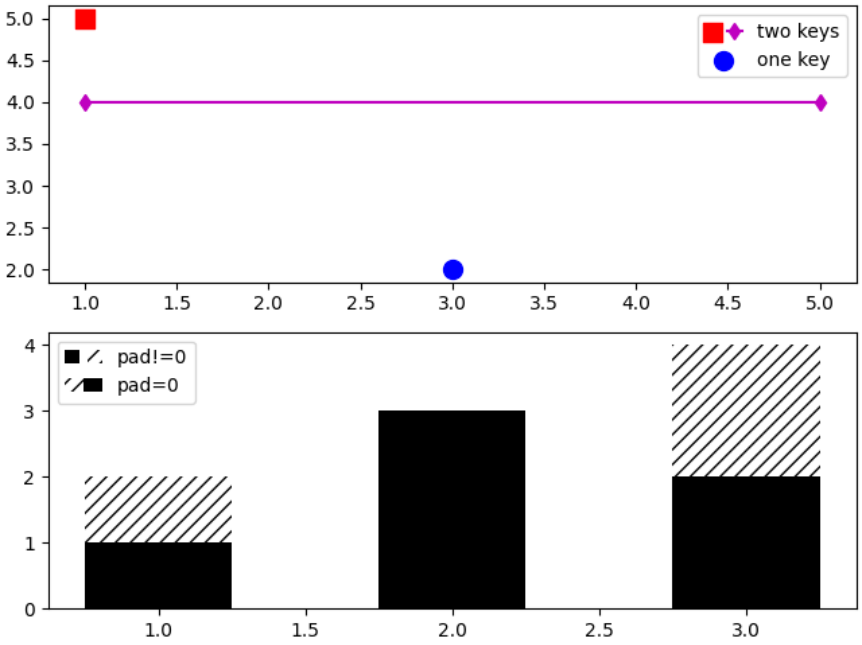


Fig. 4: Multiple Legend Keys

New parameter *clear* for `figure()`

When the pyplot's function *figure()* is called with a `num` parameter, a new window is only created if no existing window with the same value exists. A new bool parameter *clear* was added for explicitly clearing its existing contents. This is particularly useful when utilized in interactive sessions. Since *subplots()* also accepts keyword arguments from *figure()*, it can also be used there:

```
import matplotlib.pyplot as plt

fig0 = plt.figure(num=1)
fig0.suptitle("A fancy plot")
print("fig0.texts: ", [t.get_text() for t in fig0.texts])

fig1 = plt.figure(num=1, clear=False)  # do not clear contents of window
fig1.text(0.5, 0.5, "Really fancy!")
print("fig0 is fig1: ",  fig0 is fig1)
print("fig1.texts: ", [t.get_text() for t in fig1.texts])

fig2, ax2 = plt.subplots(2, 1, num=1, clear=True)  # clear contents
print("fig0 is fig2: ",  fig0 is fig2)
print("fig2.texts: ", [t.get_text() for t in fig2.texts])

# The output:
# fig0.texts:  ['A fancy plot']
# fig0 is fig1:  True
# fig1.texts:  ['A fancy plot', 'Really fancy!']
# fig0 is fig2:  True
```

(continues on next page)

(continued from previous page)

```
# fig2.texts:  []
```

Specify minimum value to format as scalar for `LogFormatterMathtext`

`LogFormatterMathtext` now includes the option to specify a minimum value exponent to format as a scalar (i.e., 0.001 instead of 10^{-3}).

New quiverkey angle keyword argument

Plotting a *`quiverkey()`* now admits the `angle` keyword argument, which sets the angle at which to draw the key arrow.

Colormap reversed method

The methods *`matplotlib.colors.LinearSegmentedColormap.reversed()`* and *`matplotlib.colors.ListedColormap.reversed()`* return a reversed instance of the Colormap. This implements a way for any Colormap to be reversed.

`artist.setp` (and `pyplot.setp`) accept a *file* argument

The argument is keyword-only. It allows an output file other than `sys.stdout` to be specified. It works exactly like the *file* argument to `print`.

`streamplot` streamline generation more configurable

The starting point, direction, and length of the stream lines can now be configured. This allows to follow the vector field for a longer time and can enhance the visibility of the flow pattern in some use cases.

`Axis.set_tick_params` now responds to `rotation`

Bulk setting of tick label rotation is now possible via *`tick_params()`* using the `rotation` keyword.

```
ax.tick_params(which='both', rotation=90)
```

Ticklabels are turned off instead of being invisible

Internally, the *Tick*'s `label1On()` attribute is now used to hide tick labels instead of setting the visibility on the tick label objects. This improves overall performance and fixes some issues. As a consequence, in case those labels ought to be shown, *tick_params()* needs to be used, e.g.

```
ax.tick_params(labelbottom=True)
```

Shading in 3D bar plots

A new `shade` parameter has been added the 3D *bar* plotting method. The default behavior remains to shade the bars, but now users have the option of setting `shade` to `False`.

```
import numpy as np
import matplotlib.pyplot as plt
from mpl_toolkits.mplot3d import Axes3D

x = np.arange(2)
y = np.arange(3)
x2d, y2d = np.meshgrid(x, y)
x, y = x2d.ravel(), y2d.ravel()
z = np.zeros_like(x)
dz = x + y

fig = plt.figure(figsize=(4, 6))
ax1 = fig.add_subplot(2, 1, 1, projection='3d')
ax1.bar3d(x, y, z, 1, 1, dz, shade=True)
ax1.set_title('Shading On')

ax2 = fig.add_subplot(2, 1, 2, projection='3d')
ax2.bar3d(x, y, z, 1, 1, dz, shade=False)
ax2.set_title('Shading Off')

plt.show()
```

New `which` Parameter for `autofmt_xdate`

A `which` parameter now exists for the method *autofmt_xdate()*. This allows a user to format `major`, `minor` or `both` tick labels selectively. The default behavior will rotate and align the `major` tick labels.

```
fig.autofmt_xdate(bottom=0.2, rotation=30, ha='right', which='minor')
```

New Figure Parameter for `subplot2grid`

A `fig` parameter now exists for the function *subplot2grid()*. This allows a user to specify the figure where the subplots will be created. If `fig` is `None` (default) then the method will use the current figure retrieved by *gcf()*.

```
subplot2grid(shape, loc, rowspan=1, colspan=1, fig=myfig)
```

Interpolation in `fill_betweenx`

The `interpolate` parameter now exists for the method *fill_betweenx()*. This allows a user to interpolate the data and fill the areas in the crossover points, similarly to *fill_between()*.

New keyword argument `sep` for EngFormatter

A new `sep` keyword argument has been added to *EngFormatter* and provides a means to define the string that will be used between the value and its unit. The default string is `" "`, which preserves the former behavior. Additionally, the separator is now present between the value and its unit even in the absence of SI prefix. There was formerly a bug that was causing strings like `"3.14V"` to be returned instead of the expected `"3.14 V"` (with the default behavior).

Extend `MATPLOTLIBRC` behavior

The environmental variable can now specify the full file path or the path to a directory containing a `matplotlibrc` file.

`density` kwarg to hist

The *hist()* method now prefers `density` to `normed` to control if the histogram should be normalized, following a change upstream to NumPy. This will reduce confusion as the behavior has always been that the integral of the histogram is 1 (rather than sum or maximum value).

8.5.4 Internals

New TransformedPatchPath caching object

A newly added *TransformedPatchPath* provides a means to transform a *Patch* into a *Path* via a *Transform* while caching the resulting path. If neither the patch nor the transform have changed, a cached copy of the path is returned.

This class differs from the older *TransformedPath* in that it is able to refresh itself based on the underlying patch while the older class uses an immutable path.

Abstract base class for movie writers

The new *AbstractMovieWriter* class defines the API required by a class that is to be used as the `writer` in the *matplotlib.animation.Animation.save()* method. The existing *MovieWriter* class now derives from the new abstract base class.

Stricter validation of line style rcParams

The validation of rcParams that are related to line styles (`lines.linestyle`, `boxplot.*.linestyle`, `grid.linestyle` and `contour.negative_linestyle`) now effectively checks that the values are valid line styles. Strings like `'dashed'` or `'--'` are accepted, as well as even-length sequences of on-off ink like `[1, 1.65]`. In this latter case, the offset value is handled internally and should *not* be provided by the user.

The new validation scheme replaces the former one used for the `contour.negative_linestyle` rcParams, that was limited to `'solid'` and `'dashed'` line styles.

The validation is case-insensitive. The following are now valid:

```
grid.linestyle             : (1, 3)   # loosely dotted grid lines
contour.negative_linestyle : dashdot  # previously only solid or dashed
```

pytest

The automated tests have been switched from nose to pytest.

8.5.5 Performance

Path simplification updates

Line simplification controlled by the `path.simplify` and `path.simplify_threshold` parameters has been improved. You should notice better rendering performance when plotting large amounts of data (as long as the above parameters are set accordingly). Only the line segment portion of paths will be simplified -- if you are also drawing markers and experiencing problems with rendering speed, you should consider using the `markevery` option to *plot*. See the *Performance* section in the usage tutorial for more information.

The simplification works by iteratively merging line segments into a single vector until the next line segment's perpendicular distance to the vector (measured in display-coordinate space) is greater than the `path.simplify_threshold` parameter. Thus, higher values of `path.simplify_threshold` result in quicker rendering times. If you are plotting just to explore data and not for publication quality, pixel perfect plots, then a value of `1.0` can be safely used. If you want to make sure your plot reflects your data *exactly*, then you should set `path.simplify` to false and/or `path.simplify_threshold` to `0`. Matplotlib currently defaults to a conservative value of `1/9`, smaller values are unlikely to cause any visible differences in your plots.

Implement intersects_bbox in c++

intersects_bbox() has been implemented in c++ which improves the performance of automatically placing the legend.

8.6 New in matplotlib 2.0

Note: matplotlib 2.0 supports Python 2.7, and 3.4+

8.6.1 Default style changes

The major changes in v2.0 are related to overhauling the default styles.

Changes to the default style

The most important changes in matplotlib 2.0 are the changes to the default style.

While it is impossible to select the best default for all cases, these are designed to work well in the most common cases.

A 'classic' style sheet is provided so reverting to the 1.x default values is a single line of python

```
import matplotlib.style
import matplotlib as mpl
mpl.style.use('classic')
```

See *The matplotlibrc file* for details about how to persistently and selectively revert many of these changes.

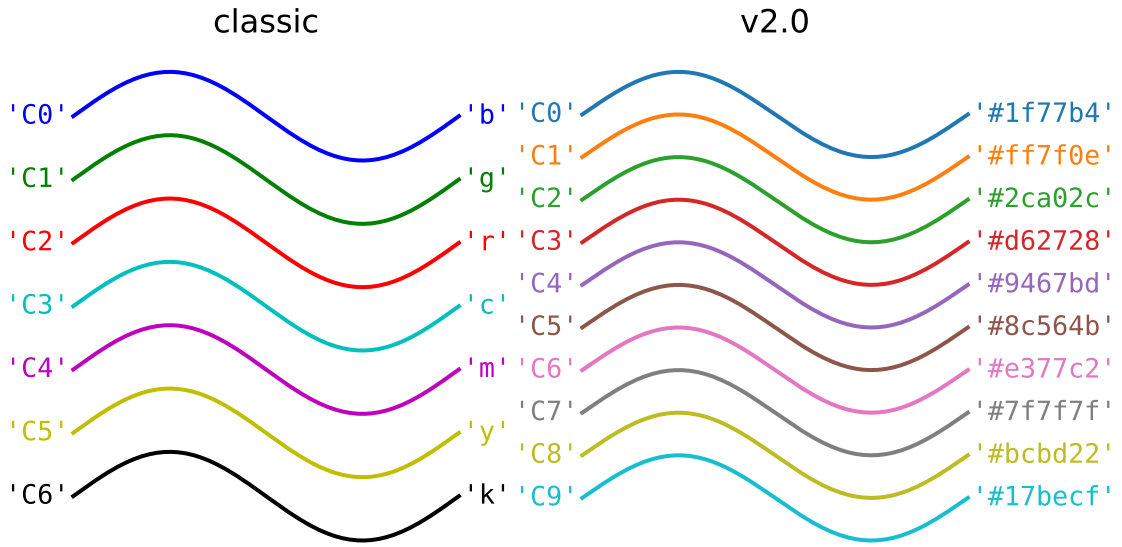
Colors, color cycles, and color maps

Colors in default property cycle

The colors in the default property cycle have been changed from `['b', 'g', 'r', 'c', 'm', 'y', 'k']` to the category10 color palette used by Vega and d3 originally developed at Tableau.



In addition to changing the colors, an additional method to specify colors was added. Previously, the default colors were the single character short-hand notations for red, green, blue, cyan, magenta, yellow, and black. This made them easy to type and usable in the abbreviated style string in `plot`, however the

new default colors are only specified via hex values. To access these colors outside of the property cycling the notation for colors `'CN'`, where `N` takes values 0-9, was added to denote the first 10 colors in `rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`). See *Specifying Colors* for more details.

To restore the old color cycle use

```
from cycler import cycler
mpl.rcParams['axes.prop_cycle'] = cycler(color='bgrcmyk')
```

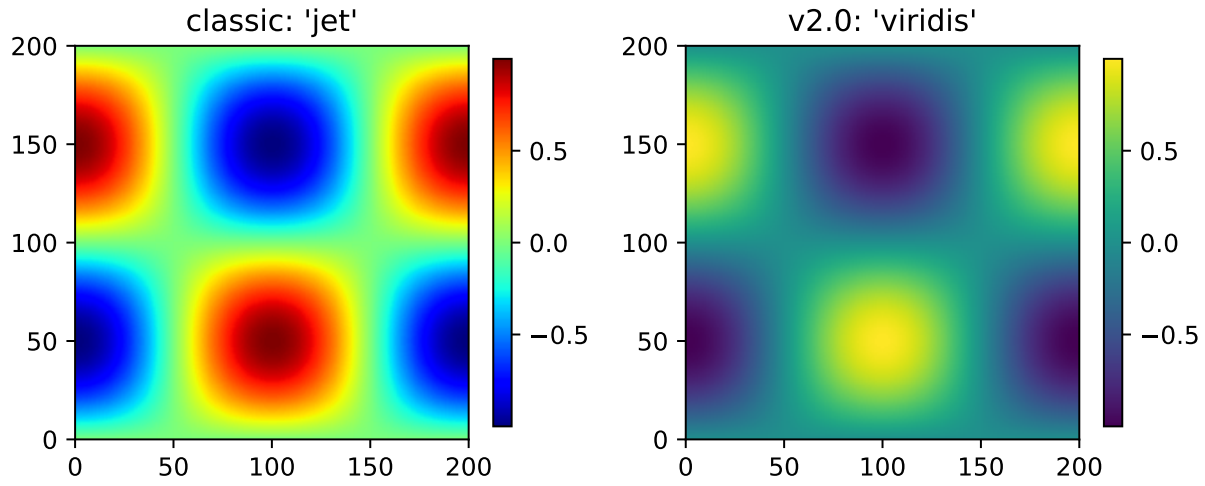
or set

```
axes.prop_cycle    : cycler('color', 'bgrcmyk')
```

in your `matplotlibrc` file.

Colormap

The new default color map used by *matplotlib.cm.ScalarMappable* instances is 'viridis' (aka option D).



For an introduction to color theory and how 'viridis' was generated watch Nathaniel Smith and Stéfan van der Walt's talk from SciPy2015. See here for many more details about the other alternatives and the tools used to create the color map. For details on all of the color maps available in matplotlib see *Choosing Colormaps in Matplotlib*.

The previous default can be restored using

```
mpl.rcParams['image.cmap'] = 'jet'
```

or setting

```
image.cmap    : 'jet'
```

in your `matplotlibrc` file; however this is strongly discouraged.

Interactive figures

The default interactive figure background color has changed from grey to white, which matches the default background color used when saving.

The previous defaults can be restored by

```
mpl.rcParams['figure.facecolor'] = '0.75'
```

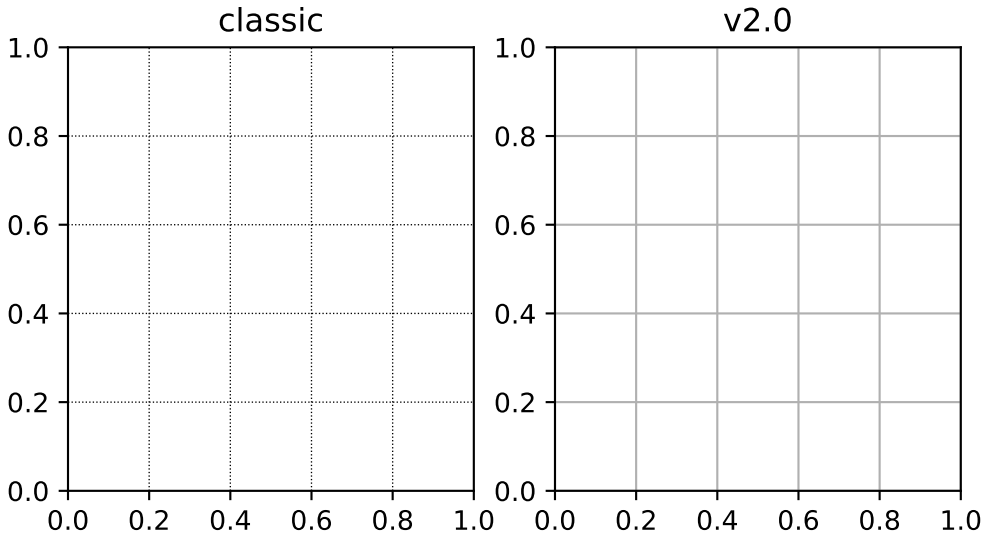
or by setting

```
figure.facecolor : '0.75'
```

in your `matplotlibrc` file.

Grid lines

The default style of grid lines was changed from black dashed lines to thicker solid light grey lines.



The previous default can be restored by using:

```
mpl.rcParams['grid.color'] = 'k'
mpl.rcParams['grid.linestyle'] = ':'
mpl.rcParams['grid.linewidth'] = 0.5
```

or by setting:

```
grid.color       :   k       # grid color
grid.linestyle   :   :       # dotted
grid.linewidth   :   0.5     # in points
```

in your `matplotlibrc` file.

Figure size, font size, and screen dpi

The default dpi used for on-screen display was changed from 80 dpi to 100 dpi, the same as the default dpi for saving files. Due to this change, the on-screen display is now more what-you-see-is-what-you-get for saved files. To keep the figure the same size in terms of pixels, in order to maintain approximately the same size on the screen, the default figure size was reduced from 8x6 inches to 6.4x4.8 inches. As a consequence of this the default font sizes used for the title, tick labels, and axes labels were reduced to maintain their size relative to the overall size of the figure. By default the dpi of the saved image is now the dpi of the *Figure* instance being saved.

This will have consequences if you are trying to match text in a figure directly with external text.

The previous defaults can be restored by

```
mpl.rcParams['figure.figsize'] = [8.0, 6.0]
mpl.rcParams['figure.dpi'] = 80
mpl.rcParams['savefig.dpi'] = 100

mpl.rcParams['font.size'] = 12
mpl.rcParams['legend.fontsize'] = 'large'
mpl.rcParams['figure.titlesize'] = 'medium'
```

or by setting:

```
figure.figsize   : [8.0, 6.0]
figure.dpi       : 80
savefig.dpi      : 100

font.size        : 12.0
legend.fontsize  : 'large'
figure.titlesize : 'medium'
```

In your `matplotlibrc` file.

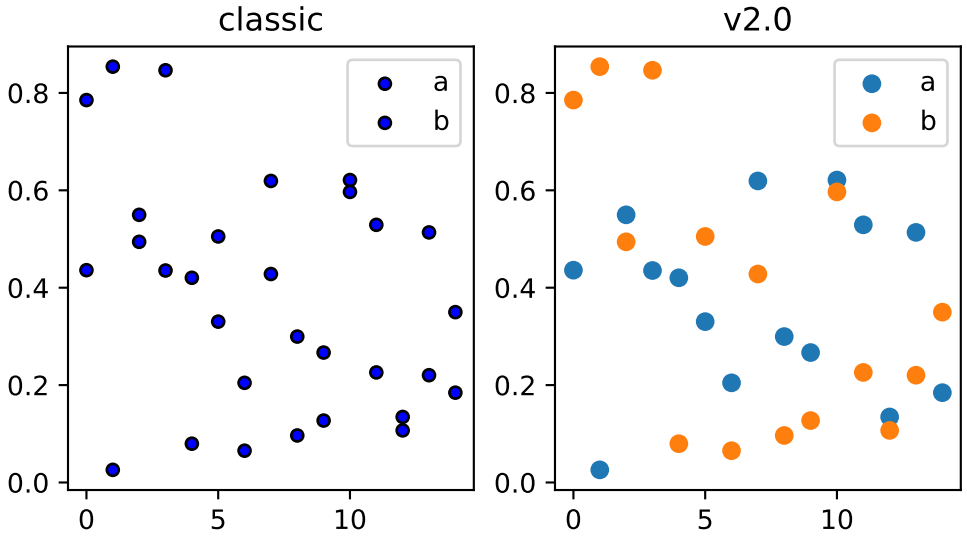
In addition, the `forward` kwarg to `set_size_inches` now defaults to `True` to improve the interactive experience. Backend canvases that adjust the size of their bound *matplotlib.figure.Figure* must pass `forward=False` to avoid circular behavior. This default is not configurable.

Plotting functions

scatter

The following changes were made to the default behavior of *scatter*

- The default size of the elements in a scatter plot is now based on `rcParams["lines.markersize"]` (default: `6.0`) so it is consistent with `plot(X, Y, 'o')`. The old value was 20, and the new value is 36 (6^2).
- Scatter markers no longer have a black edge.
- If the color of the markers is not specified it will follow the property cycle, pulling from the 'patches' cycle on the `Axes`.



The classic default behavior of *scatter* can only be recovered through `mpl.style.use('classic')`. The marker size can be recovered via

```
mpl.rcParam['lines.markersize'] = np.sqrt(20)
```

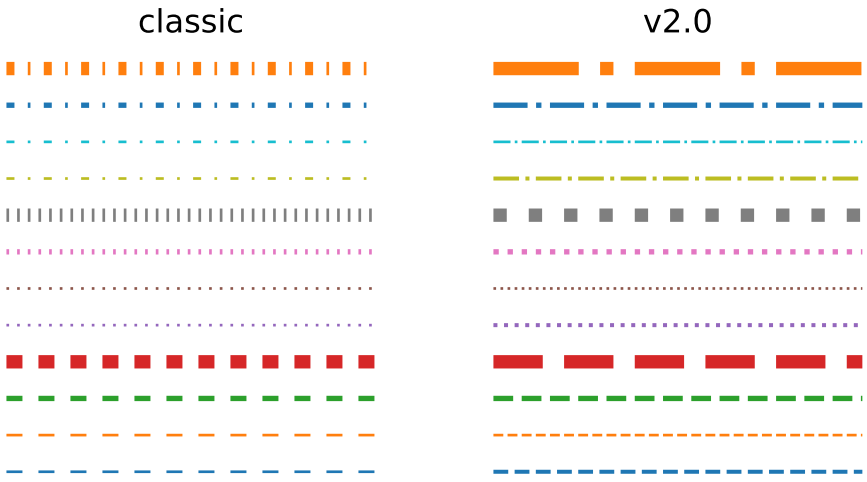
however, this will also affect the default marker size of *plot*. To recover the classic behavior on a per-call basis pass the following kwargs:

```
classic_kwargs = {'s': 20, 'edgecolors': 'k', 'c': 'b'}
```

`plot`

The following changes were made to the default behavior of *plot*

- the default linewidth increased from 1 to 1.5
- the dash patterns associated with `'--'`, `':'`, and `'-.'` have changed
- the dash patterns now scale with line width



The previous defaults can be restored by setting:

```
mpl.rcParams['lines.linewidth'] = 1.0
mpl.rcParams['lines.dashed_pattern'] = [6, 6]
mpl.rcParams['lines.dashdot_pattern'] = [3, 5, 1, 5]
mpl.rcParams['lines.dotted_pattern'] = [1, 3]
mpl.rcParams['lines.scale_dashes'] = False
```

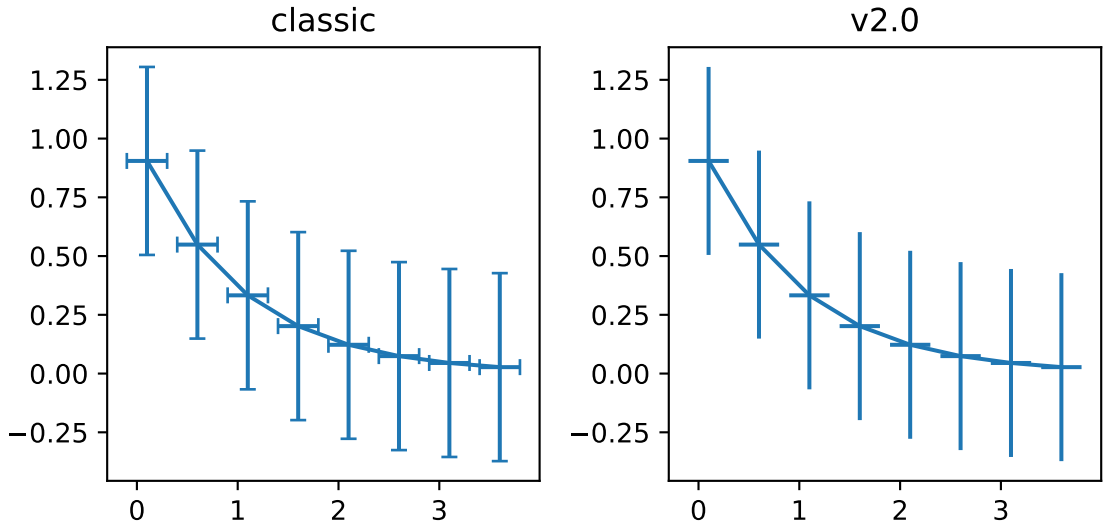
or by setting:

```
lines.linewidth   : 1.0
lines.dashed_pattern : 6, 6
lines.dashdot_pattern : 3, 5, 1, 5
lines.dotted_pattern : 1, 3
lines.scale_dashes: False
```

in your `matplotlibrc` file.

errorbar

By default, caps on the ends of errorbars are not present.



This also changes the return value of *errorbar()* as the list of 'caplines' will be empty by default.

The previous defaults can be restored by setting:

```
mpl.rcParams['errorbar.capsize'] = 3
```

or by setting

```
errorbar.capsize : 3
```

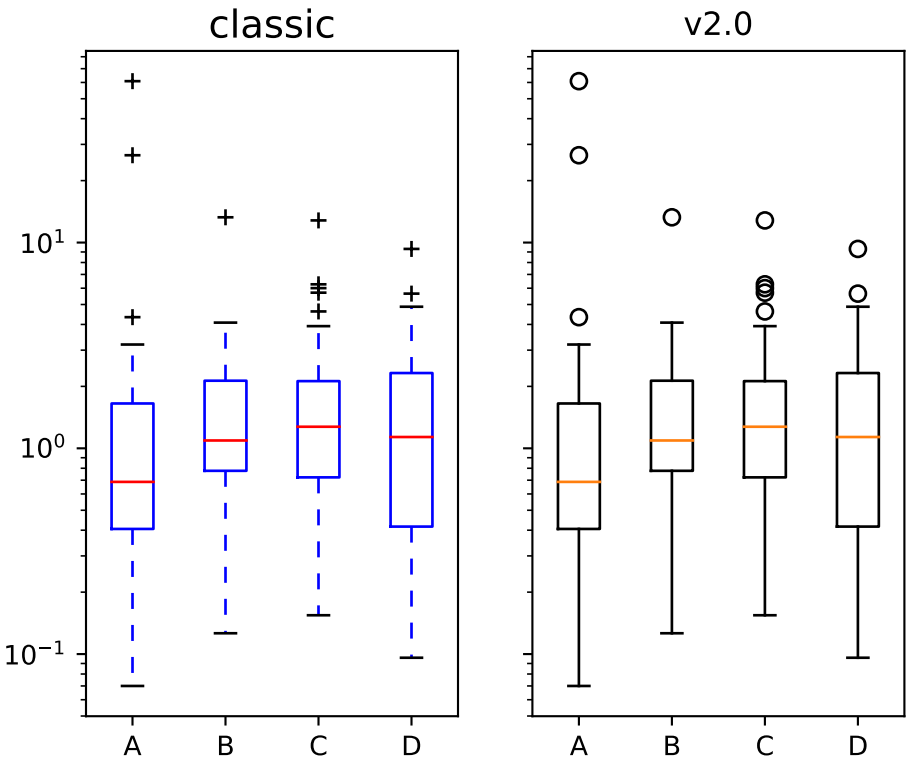
in your `matplotlibrc` file.

boxplot

Previously, boxplots were composed of a mish-mash of styles that were, for better for worse, inherited from Matlab. Most of the elements were blue, but the medians were red. The fliers (outliers) were black plus-symbols ('+') and the whiskers were dashed lines, which created ambiguity if the (solid and black) caps were not drawn.

For the new defaults, everything is black except for the median and mean lines (if drawn), which are set to the first two elements of the current color cycle. Also, the default flier markers are now hollow circles, which maintain the ability of the plus-symbols to overlap without obscuring data too much.

The previous defaults can be restored by setting:



```
mpl.rcParams['boxplot.flierprops.color'] = 'k'
mpl.rcParams['boxplot.flierprops.marker'] = '+'
mpl.rcParams['boxplot.flierprops.markerfacecolor'] = 'none'
mpl.rcParams['boxplot.flierprops.markeredgecolor'] = 'k'
mpl.rcParams['boxplot.boxprops.color'] = 'b'
mpl.rcParams['boxplot.whiskerprops.color'] = 'b'
mpl.rcParams['boxplot.whiskerprops.linestyle'] = '--'
mpl.rcParams['boxplot.medianprops.color'] = 'r'
mpl.rcParams['boxplot.meanprops.color'] = 'r'
mpl.rcParams['boxplot.meanprops.marker'] = '^'
mpl.rcParams['boxplot.meanprops.markerfacecolor'] = 'r'
mpl.rcParams['boxplot.meanprops.markeredgecolor'] = 'k'
mpl.rcParams['boxplot.meanprops.markersize'] = 6
mpl.rcParams['boxplot.meanprops.linestyle'] = '--'
mpl.rcParams['boxplot.meanprops.linewidth'] = 1.0
```

or by setting:

```
boxplot.flierprops.color:           'k'
boxplot.flierprops.marker:          '+'
boxplot.flierprops.markerfacecolor: 'none'
boxplot.flierprops.markeredgecolor: 'k'
boxplot.boxprops.color:             'b'
```

(continues on next page)

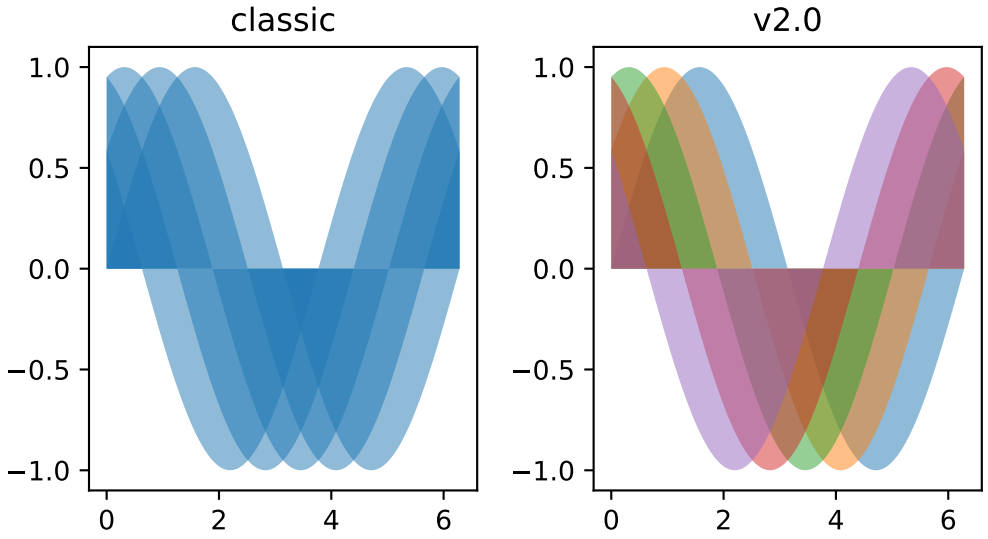
(continued from previous page)

```
boxplot.whiskerprops.color:          'b'
boxplot.whiskerprops.linestyle:      '--'
boxplot.medianprops.color:           'r'
boxplot.meanprops.color:             'r'
boxplot.meanprops.marker:            '^'
boxplot.meanprops.markerfacecolor:   'r'
boxplot.meanprops.markeredgecolor:   'k'
boxplot.meanprops.markersize:         6
boxplot.meanprops.linestyle:          '--'
boxplot.meanprops.linewidth:          1.0
```

in your `matplotlibrc` file.

`fill_between` and `fill_betweenx`

`fill_between` and *`fill_betweenx`* both follow the patch color cycle.

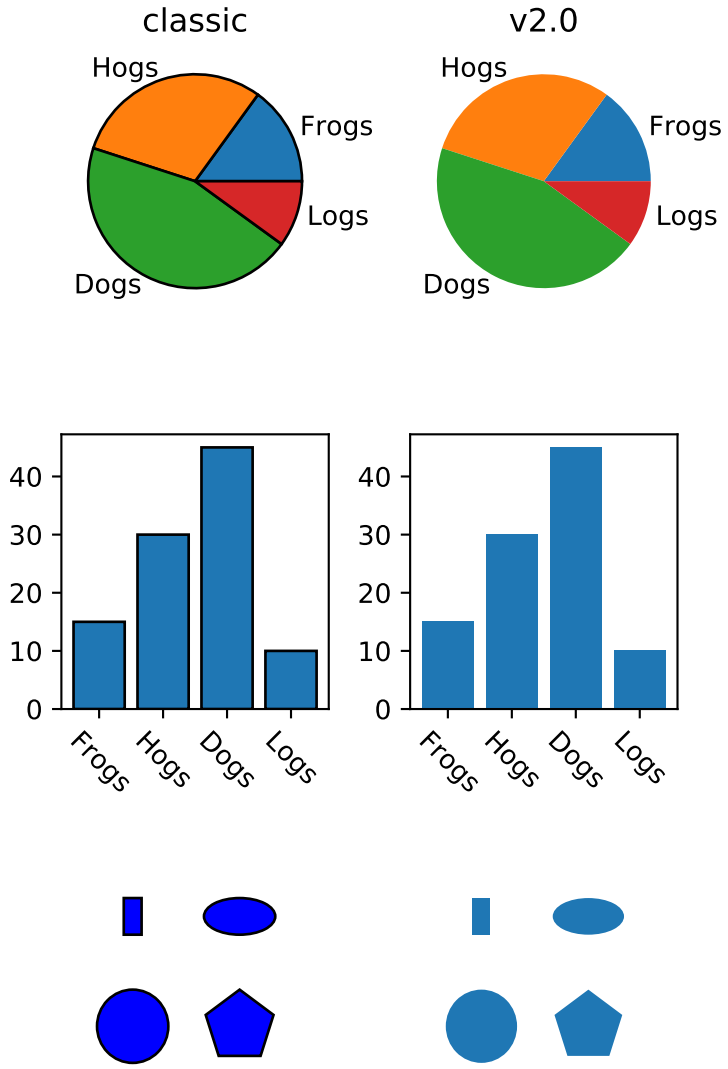


If the facecolor is set via the `facecolors` or `color` keyword argument, then the color is not cycled.

To restore the previous behavior, explicitly pass the keyword argument `facecolors='C0'` to the method call.

Patch edges and color

Most artists drawn with a patch (`~matplotlib.axes.Axes.bar`, `~matplotlib.axes.Axes.pie`, etc) no longer have a black edge by default. The default face color is now `'C0'` instead of `'b'`.



The previous defaults can be restored by setting:

```
mpl.rcParams['patch.force_edgecolor'] = True
mpl.rcParams['patch.facecolor'] = 'b'
```

or by setting:

```
patch.facecolor        : b
patch.force_edgecolor  : True
```

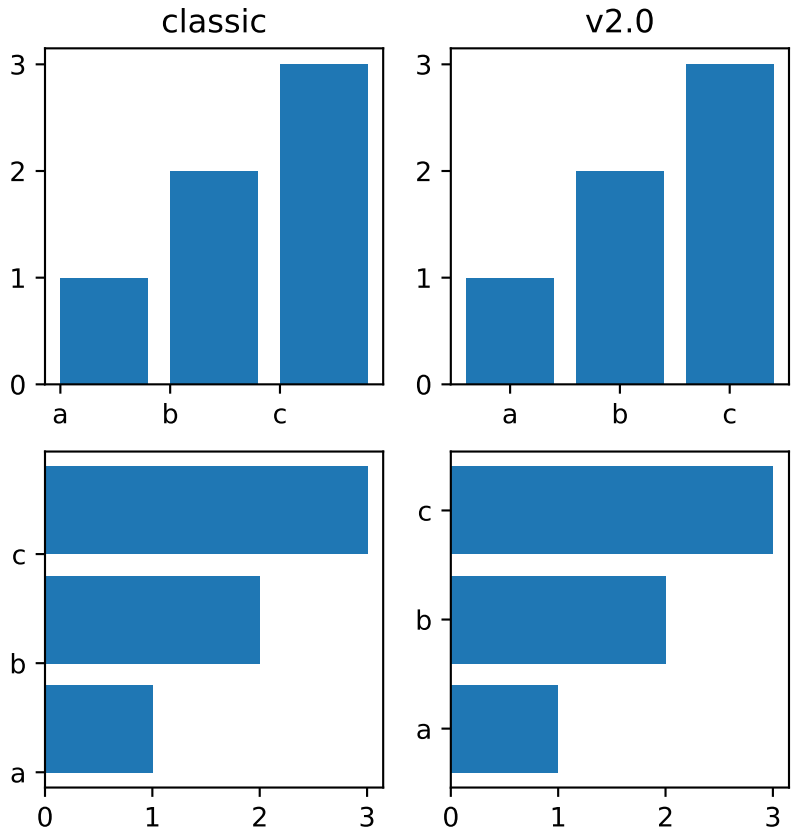
in your `matplotlibrc` file.

`hexbin`

The default value of the `linecolor` kwarg for `hexbin` has changed from `'none'` to `'face'`. If 'none' is now supplied, no line edges are drawn around the hexagons.

`bar` and `barh`

The default value of the `align` kwarg for both `bar` and `barh` is changed from `'edge'` to `'center'`.



To restore the previous behavior explicitly pass the keyword argument `align='edge'` to the method call.

Hatching

The color of the lines in the hatch is now determined by

- If an edge color is explicitly set, use that for the hatch color
- If the edge color is not explicitly set, use `rcParams["hatch.color"]` (default: `'black'`) which is looked up at artist creation time.

The width of the lines in a hatch pattern is now configurable by the rcParams `rcParams["hatch.linewidth"]` (default: `1.0`), which defaults to 1 point. The old behavior for the line width was different depending on backend:

- PDF: 0.1 pt
- SVG: 1.0 pt
- PS: 1 px
- Agg: 1 px

The old line width behavior can not be restored across all backends simultaneously, but can be restored for a single backend by setting:

```
mpl.rcParams['hatch.linewidth'] = 0.1  # previous pdf hatch linewidth
mpl.rcParams['hatch.linewidth'] = 1.0  # previous svg hatch linewidth
```

The behavior of the PS and Agg backends was DPI dependent, thus:

```
mpl.rcParams['figure.dpi'] = dpi
mpl.rcParams['savefig.dpi'] = dpi  # or leave as default 'figure'
mpl.rcParams['hatch.linewidth'] = 1.0 / dpi  # previous ps and Agg hatch linewidth
```

There is no direct API level control of the hatch color or linewidth.

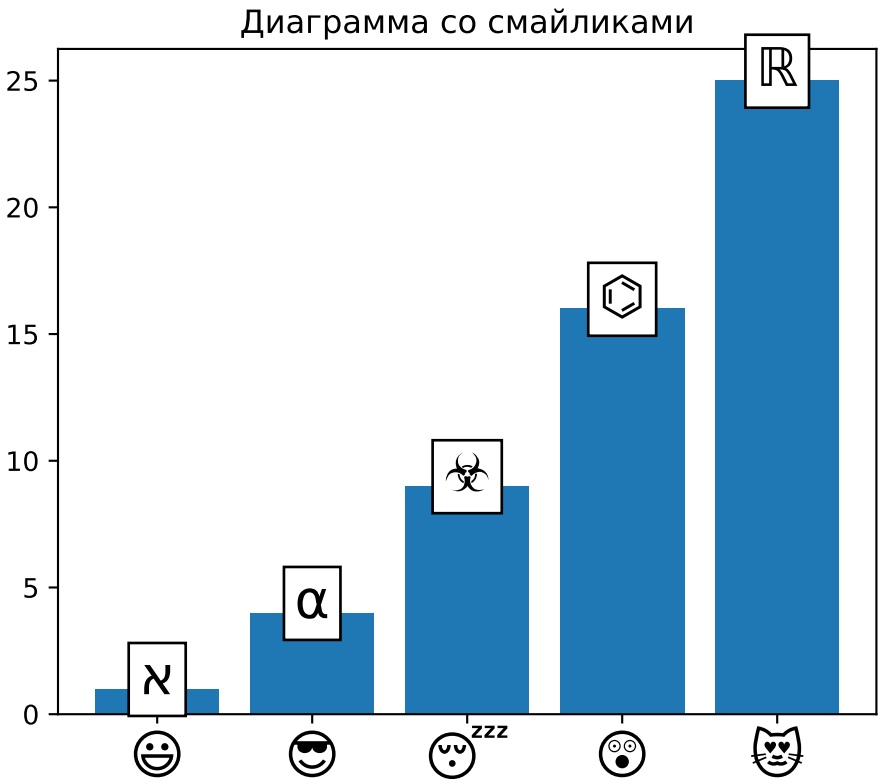
Hatching patterns are now rendered at a consistent density, regardless of DPI. Formerly, high DPI figures would be more dense than the default, and low DPI figures would be less dense. This old behavior cannot be directly restored, but the density may be increased by repeating the hatch specifier.

Fonts

Normal text

The default font has changed from "Bitstream Vera Sans" to "DejaVu Sans". DejaVu Sans has additional international and math characters, but otherwise has the same appearance as Bitstream Vera Sans. Latin, Greek, Cyrillic, Armenian, Georgian, Hebrew, and Arabic are all supported (but right-to-left rendering is still not handled by matplotlib). In addition, DejaVu contains a sub-set of emoji symbols.

See the DejaVu Sans PDF sample for full coverage.



Math text

The default math font when using the built-in math rendering engine (mathtext) has changed from "Computer Modern" (i.e. LaTeX-like) to "DejaVu Sans". This change has no effect if the TeX backend is used (i.e. `text.usetex` is `True`).

To revert to the old behavior set the:

```
mpl.rcParams['mathtext.fontset'] = 'cm'
mpl.rcParams['mathtext.rm'] = 'serif'
```

or set:

```
mathtext.fontset: cm
mathtext.rm : serif
```

in your `matplotlibrc` file.

This `rcParam` is consulted when the text is drawn, not when the artist is created. Thus all mathtext on a given `canvas` will use the same fontset.

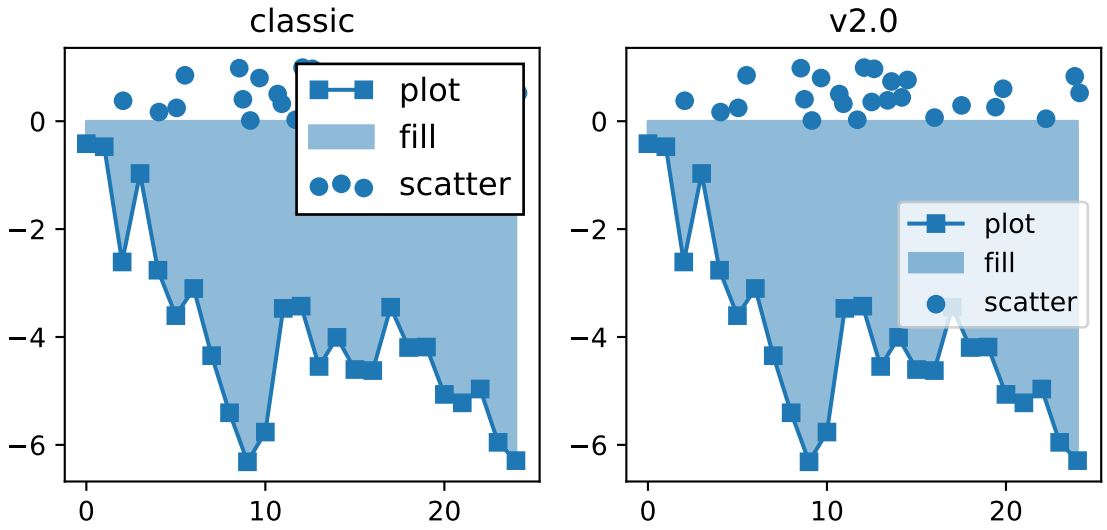
Legends

- By default, the number of points displayed in a legend is now 1.
- The default legend location is `'best'`, so the legend will be automatically placed in a location to minimize overlap with data.
- The legend defaults now include rounded corners, a lighter boundary, and partially transparent boundary and background.



The previous defaults can be restored by setting:

```
mpl.rcParams['legend.fancybox'] = False
mpl.rcParams['legend.loc'] = 'upper right'
mpl.rcParams['legend.numpoints'] = 2
mpl.rcParams['legend.fontsize'] = 'large'
mpl.rcParams['legend.framealpha'] = None
mpl.rcParams['legend.scatterpoints'] = 3
mpl.rcParams['legend.edgecolor'] = 'inherit'
```

or by setting:

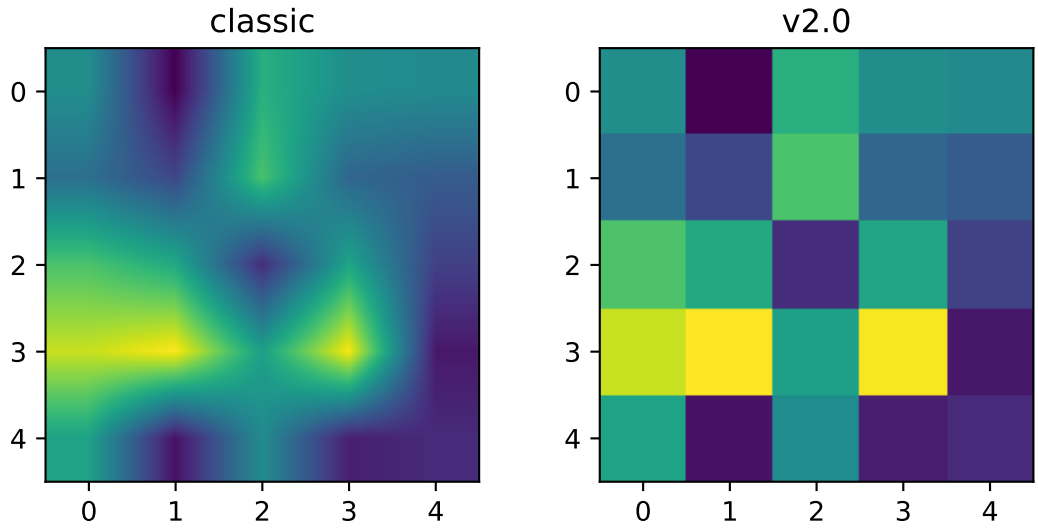
```
legend.fancybox      : False
legend.loc           : upper right
legend.numpoints     : 2      # the number of points in the legend line
legend.fontsize      : large
legend.framealpha    : None    # opacity of legend frame
legend.scatterpoints : 3 # number of scatter points
legend.edgecolor     : inherit   # legend edge color ('inherit'
                                 # means it uses axes.edgecolor)
```

in your `matplotlibrc` file.

Image

Interpolation

The default interpolation method for *imshow* is now `'nearest'` and by default it resamples the data (both up and down sampling) before color mapping.



To restore the previous behavior set:

```
mpl.rcParams['image.interpolation'] = 'bilinear'
mpl.rcParams['image.resample'] = False
```

or set:

```
image.interpolation  : bilinear  # see help(imshow) for options
image.resample  : False
```

in your `matplotlibrc` file.

Colormapping pipeline

Previously, the input data was normalized, then color mapped, and then resampled to the resolution required for the screen. This meant that the final resampling was being done in color space. Because the color maps are not generally linear in RGB space, colors not in the color map may appear in the final image. This bug was addressed by an almost complete overhaul of the image handling code.

The input data is now normalized, then resampled to the correct resolution (in normalized dataspace), and then color mapped to RGB space. This ensures that only colors from the color map appear in the final image. (If your viewer subsequently resamples the image, the artifact may reappear.)

The previous behavior cannot be restored.

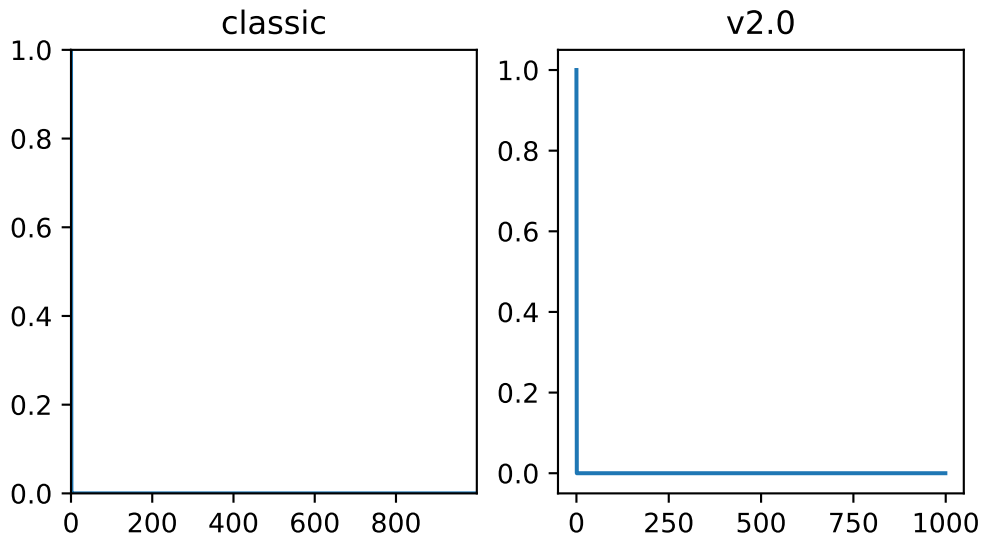
Shading

- The default shading mode for light source shading, in `matplotlib.colors.LightSource.shade`, is now `overlay`. Formerly, it was `hsv`.

Plot layout

Auto limits

The previous auto-scaling behavior was to find 'nice' round numbers as view limits that enclosed the data limits, but this could produce bad plots if the data happened to fall on a vertical or horizontal line near the chosen 'round number' limit. The new default sets the view limits to 5% wider than the data range.



The size of the padding in the x and y directions is controlled by the `'axes.xmargin'` and `'axes.ymargin'` rcParams respectively. Whether the view limits should be 'round numbers' is controlled by `rcParams["axes.autolimit_mode"]` (default: `'data'`). In the original `'round_number'` mode, the view limits coincide with ticks.

The previous default can be restored by using:

```
mpl.rcParams['axes.autolimit_mode'] = 'round_numbers'
mpl.rcParams['axes.xmargin'] = 0
mpl.rcParams['axes.ymargin'] = 0
```

or setting:

```
axes.autolimit_mode: round_numbers
axes.xmargin: 0
axes.ymargin: 0
```

in your `matplotlibrc` file.

Z-order

- Ticks and grids are now plotted above solid elements such as filled contours, but below lines. To return to the previous behavior of plotting ticks and grids above lines, set `rcParams['axes.axisbelow'] = False`.

Ticks

Direction

To reduce the collision of tick marks with data, the default ticks now point outward by default. In addition, ticks are now drawn only on the bottom and left spines to prevent a porcupine appearance, and for a cleaner separation between subplots.

To restore the previous behavior set:

```
mpl.rcParams['xtick.direction'] = 'in'
mpl.rcParams['ytick.direction'] = 'in'
mpl.rcParams['xtick.top'] = True
mpl.rcParams['ytick.right'] = True
```

or set:

```
xtick.top: True
xtick.direction: in

ytick.right: True
ytick.direction: in
```

in your `matplotlibrc` file.

Number of ticks

The default *`Locator`* used for the x and y axis is *`AutoLocator`* which tries to find, up to some maximum number, 'nicely' spaced ticks. The locator now includes an algorithm to estimate the maximum number of ticks that will leave room for the tick labels. By default it also ensures that there are at least two ticks visible.

1.0
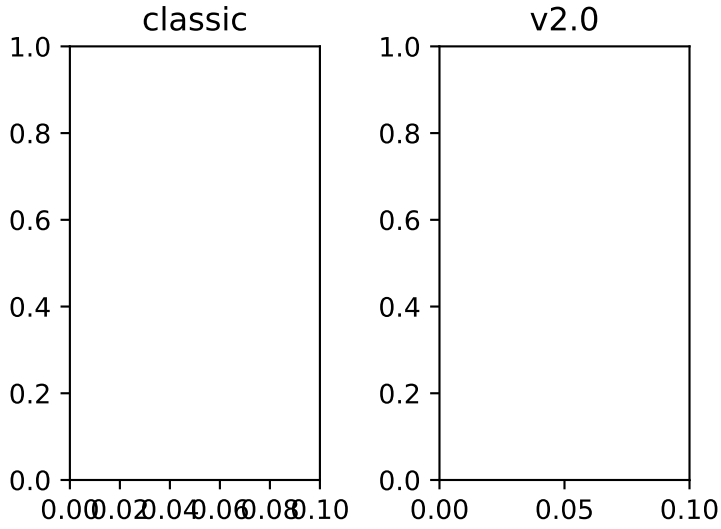
0
1
2
3
4



There is no way, other than using `mpl.style.use('classic')`, to restore the previous behavior as the default. On an axis-by-axis basis you may either control the existing locator via:

```
ax.xaxis.get_major_locator().set_params(nbins=9, steps=[1, 2, 5, 10])
```

or create a new *MaxNLocator*:

```
import matplotlib.ticker as mticker
ax.set_major_locator(mticker.MaxNLocator(nbins=9, steps=[1, 2, 5, 10])
```

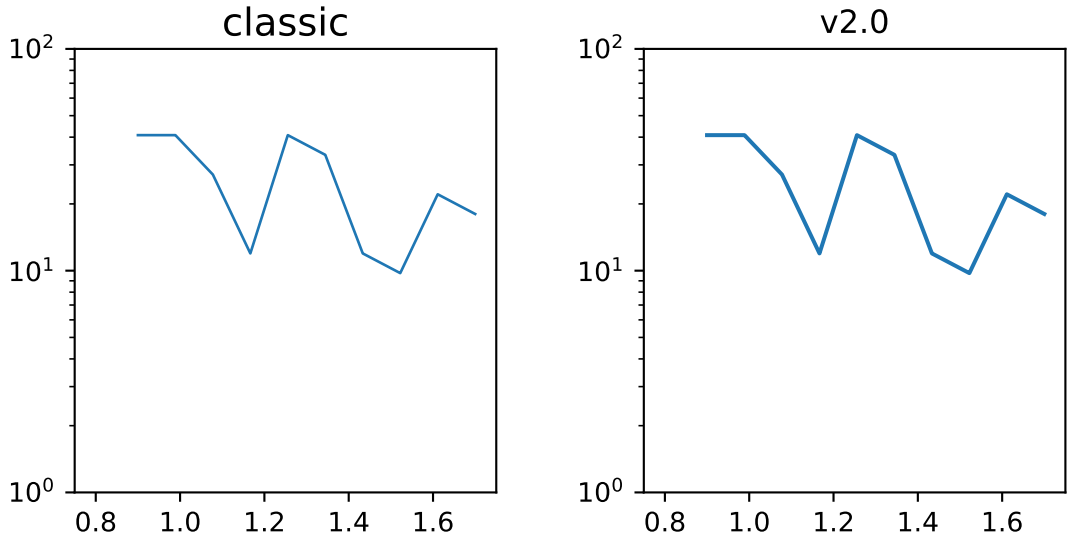
The algorithm used by *MaxNLocator* has been improved, and this may change the choice of tick locations in some cases. This also affects *AutoLocator*, which uses `MaxNLocator` internally.

For a log-scaled axis the default locator is the *LogLocator*. Previously the maximum number of ticks was set to 15, and could not be changed. Now there is a *numticks* kwarg for setting the maximum to any integer value, to the string 'auto', or to its default value of None which is equivalent to 'auto'. With the 'auto' setting the maximum number will be no larger than 9, and will be reduced depending on the length of the axis in units of the tick font size. As in the case of the AutoLocator, the heuristic algorithm reduces the incidence of overlapping tick labels but does not prevent it.

Tick label formatting

`LogFormatter` labeling of minor ticks

Minor ticks on a log axis are now labeled when the axis view limits span a range less than or equal to the interval between two major ticks. See *`LogFormatter`* for details. The minor tick labeling is turned off when using `mpl.style.use('classic')`, but cannot be controlled independently via *`rcParams`*.

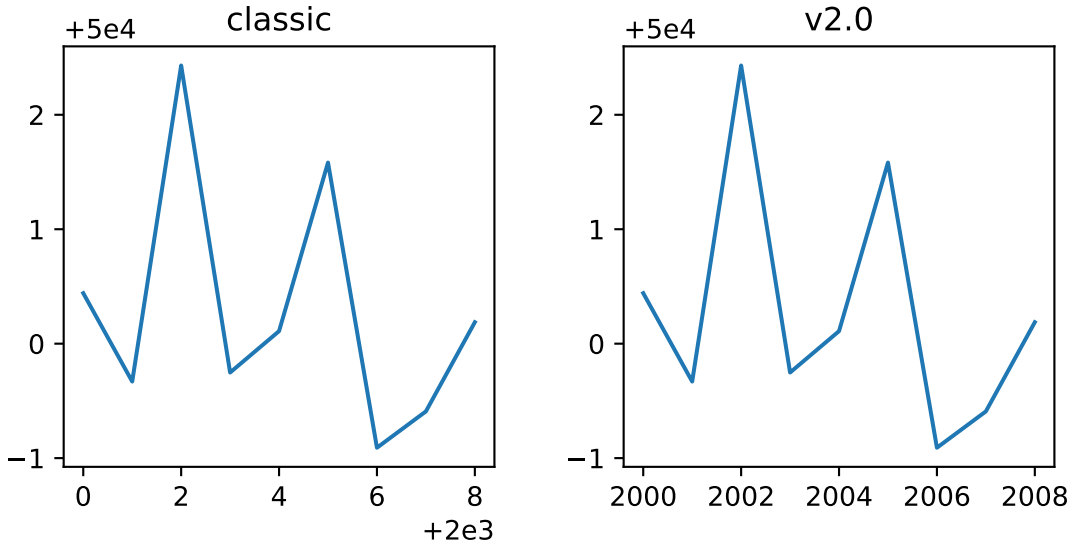


`ScalarFormatter` tick label formatting with offsets

With the default `rcParams["axes.formatter.useoffset"]` (default: `True`), an offset will be used when it will save 4 or more digits. This can be controlled with the new `rcParams["axes.formatter.offset_threshold"]` (default: `4`). To restore the previous behavior of using an offset to save 2 or more digits, use `rcParams['axes.formatter.offset_threshold'] = 2`.

`AutoDateFormatter` format strings

The default date formats are now all based on ISO format, i.e., with the slowest-moving value first. The date formatters are configurable through the `date.autoformatter.*` rcParams.



Threshold (tick interval >= than)	rcParam	classic	v2.0
365 days	'date.autoformatter.year'	'%Y'	'%Y'
30 days	'date.autoformatter.month'	'%b %Y'	'%Y-%m'
1 day	'date.autoformatter.day'	'%b %d %Y'	'%Y-%m-%d'
1 hour	'date.autoformatter.hour'	'%H:%M:%S'	'%H:%M'
1 minute	'date.autoformatter.minute'	'%H:%M:%S.%f'	'%H:%M:%S'
1 second	'date.autoformatter.second'	'%H:%M:%S.%f'	'%H:%M:%S'
1 microsecond	'date.autoformatter.microsecond'	'%H:%M:%S.%f'	'%H:%M:%S.%f'

Python's `%x` and `%X` date formats may be of particular interest to format dates based on the current locale.

The previous default can be restored by:

```
mpl.rcParams['date.autoformatter.year'] = '%Y'
mpl.rcParams['date.autoformatter.month'] = '%b %Y'
mpl.rcParams['date.autoformatter.day'] = '%b %d %Y'
mpl.rcParams['date.autoformatter.hour'] = '%H:%M:%S'
mpl.rcParams['date.autoformatter.minute'] = '%H:%M:%S.%f'
mpl.rcParams['date.autoformatter.second'] = '%H:%M:%S.%f'
mpl.rcParams['date.autoformatter.microsecond'] = '%H:%M:%S.%f'
```

or setting

```
date.autoformatter.year   : %Y
date.autoformatter.month  : %b %Y
```

(continues on next page)

(continued from previous page)

```
date.autoformatter.day    : %b %d %Y
date.autoformatter.hour   : %H:%M:%S
date.autoformatter.minute : %H:%M:%S.%f
date.autoformatter.second : %H:%M:%S.%f
date.autoformatter.microsecond : %H:%M:%S.%f
```

in your `matplotlibrc` file.

mplot3d

- mplot3d now obeys some style-related rcParams, rather than using hard-coded defaults. These include:
  - xtick.major.width
  - ytick.major.width
  - xtick.color
  - ytick.color
  - axes.linewidth
  - axes.edgecolor
  - grid.color
  - grid.linewidth
  - grid.linestyle

8.6.2 Improved color conversion API and RGBA support

The *colors* gained a new color conversion API with full support for the alpha channel. The main public functions are *is_color_like()*, *matplotlib.colors.to_rgba()*, *matplotlib.colors.to_rgba_array()* and *to_hex()*. RGBA quadruplets are encoded in hex format as "#rrggbbaa".

A side benefit is that the Qt options editor now allows setting the alpha channel of the artists as well.

8.6.3 New Configuration (rcParams)

New rcparams added

Parameter	Description
rcParams["date.autoformatter.year"] (default: '%Y')	format string for 'year' scale dates
rcParams["date.autoformatter.month"] (default: '%Y-%m')	format string for 'month' scale dates
rcParams["date.autoformatter.day"] (default: '%Y-%m-%d')	format string for 'day' scale dates
rcParams["date.autoformatter.hour"] (default: '%m-%d %H')	format string for 'hour' scale times
rcParams["date.autoformatter.minute"] (default: '%d %H:%M')	format string for 'minute' scale times
rcParams["date.autoformatter.second"] (default: '%H:%M:%S')	format string for 'second' scale times
rcParams["date.autoformatter.microsecond"] (default: '%M:%S.%f')	format string for 'microsecond' scale times
rcParams["scatter.marker"] (default: 'o')	default marker for scatter plot
rcParams["svg.hashsalt"] (default: None)	see note
rcParams["xtick.top"] (default: False), rcParams["xtick.major.top"] (default: True) rcParams["xtick.minor.top"] (default: True), rcParams["xtick.bottom"] (default: True), rcParams["xtick.major.bottom"] (default: True) rcParams["xtick.minor.bottom"] (default: True), rcParams["ytick.left"] (default: True), rcParams["ytick.minor.left"] (default: True), rcParams["ytick.major.left"] (default: True) rcParams["ytick.right"] (default: False), rcParams["ytick.minor.right"] (default: True), rcParams["ytick.major.right"] (default: True)	Control where major and minor ticks are drawn. The global values are anded with the corresponding major/minor values. corresponding major/minor values.
rcParams["hist.bins"] (default: 10)	The default number of bins to use in *hist*. This can be an int, a list of floats, or 'auto' if numpy >= 1.11 is installed.
rcParams["lines.scale_dashes"] (default: True)	Whether the line dash patterns should scale with linewidth.
rcParams["axes.formatter.offset_threshold"] (default: 4)	Minimum number of digits saved in tick labels that triggers using an offset.

Added `svg.hashsalt` key to rcParams

If `svg.hashsalt` is `None` (which it is by default), the svg backend uses `uuid4` to generate the hash salt. If it is not `None`, it must be a string that is used as the hash salt instead of `uuid4`. This allows for deterministic SVG output.

Removed the `svg.image_noscale` rcParam

As a result of the extensive changes to image handling, the `svg.image_noscale` rcParam has been removed. The same functionality may be achieved by setting `interpolation='none'` on individual images or globally using the `image.interpolation` rcParam.

8.6.4 Qualitative colormaps

ColorBrewer's "qualitative" colormaps ("Accent", "Dark2", "Paired", "Pastel1", "Pastel2", "Set1", "Set2", "Set3") were intended for discrete categorical data, with no implication of value, and therefore have been converted to `ListedColormap` instead of `LinearSegmentedColormap`, so the colors will no longer be interpolated and they can be used for choropleths, labeled image features, etc.

8.6.5 Axis offset label now responds to `labelcolor`

Axis offset labels are now colored the same as axis tick markers when `labelcolor` is altered.

8.6.6 Improved offset text choice

The default offset-text choice was changed to only use significant digits that are common to all ticks (e.g. 1231..1239 -> 1230, instead of 1231), except when they straddle a relatively large multiple of a power of ten, in which case that multiple is chosen (e.g. 1999..2001->2000).

8.6.7 Style parameter blacklist

In order to prevent unexpected consequences from using a style, style files are no longer able to set parameters that affect things unrelated to style. These parameters include:

```
'interactive', 'backend', 'backend.qt4', 'webagg.port',
'webagg.port_retries', 'webagg.open_in_browser', 'backend_fallback',
'toolbar', 'timezone', 'datapath', 'figure.max_open_warning',
'savefig.directory', 'tk.window_focus', 'docstring.hardcopy'
```

8.6.8 Change in default font

The default font used by matplotlib in text has been changed to DejaVu Sans and DejaVu Serif for the sans-serif and serif families, respectively. The DejaVu font family is based on the previous matplotlib default --Bitstream Vera-- but includes a much wider range of characters.

The default mathtext font has been changed from Computer Modern to the DejaVu family to maintain consistency with regular text. Two new options for the `mathtext.fontset` configuration parameter have been added: `dejavusans` (default) and `dejavuserif`. Both of these options use DejaVu glyphs whenever possible and fall back to STIX symbols when a glyph is not found in DejaVu. To return to the previous behavior, set the rcParam `mathtext.fontset` to `cm`.

8.6.9 Faster text rendering

Rendering text in the Agg backend is now less fuzzy and about 20% faster to draw.

8.6.10 Improvements for the Qt figure options editor

Various usability improvements were implemented for the Qt figure options editor, among which:

- Line style entries are now sorted without duplicates.
- The colormap and normalization limits can now be set for images.
- Line edits for floating values now display only as many digits as necessary to avoid precision loss. An important bug was also fixed regarding input validation using Qt5 and a locale where the decimal separator is ",".
- The axes selector now uses shorter, more user-friendly names for axes, and does not crash if there are no axes.
- Line and image entries using the default labels ("_lineX", "_imageX") are now sorted numerically even when there are more than 10 entries.

8.6.11 Improved image support

Prior to version 2.0, matplotlib resampled images by first applying the color map and then resizing the result. Since the resampling was performed on the colored image, this introduced colors in the output image that didn't actually exist in the color map. Now, images are resampled first (and entirely in floating-point, if the input image is floating-point), and then the color map is applied.

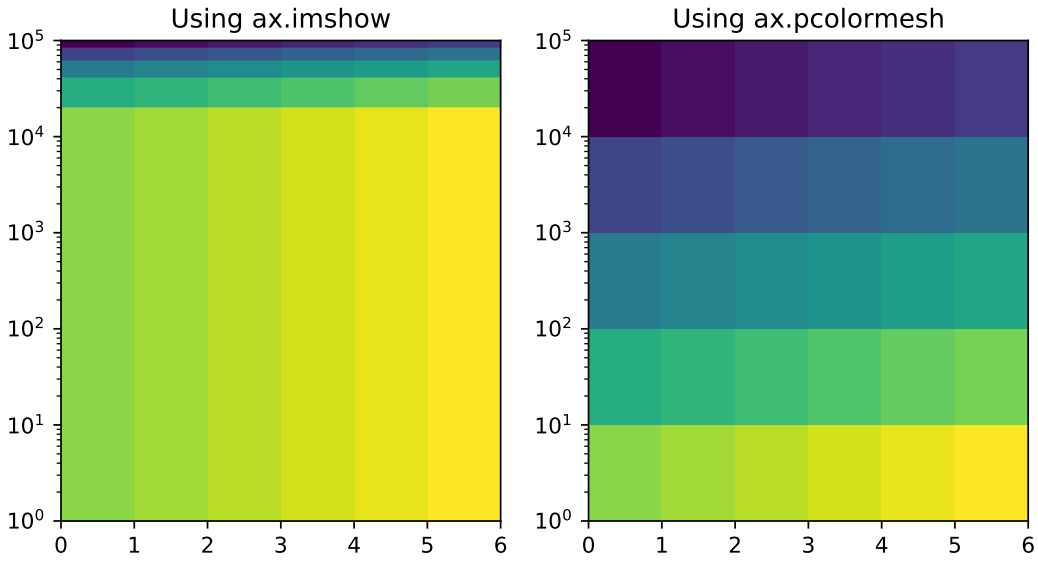
In order to make this important change, the image handling code was almost entirely rewritten. As a side effect, image resampling uses less memory and fewer datatype conversions than before.

The experimental private feature where one could "skew" an image by setting the private member `_image_skew_coordinate` has been removed. Instead, images will obey the transform of the axes on which they are drawn.

Non-linear scales on image plots

imshow now draws data at the requested points in data space after the application of non-linear scales.

The image on the left demonstrates the new, correct behavior. The old behavior can be recreated using *pcolormesh* as demonstrated on the right.



This can be understood by analogy to plotting a histogram with linearly spaced bins with a logarithmic x-axis. Equal sized bins will be displayed as wider for small x and narrower for large x.

8.6.12 Support for HiDPI (Retina) displays in the NbAgg and WebAgg backends

The NbAgg and WebAgg backends will now use the full resolution of your high-pixel-density display.

8.6.13 Change in the default animation codec

The default animation codec has been changed from `mpeg4` to `h264`, which is more efficient. It can be set via the `animation.codec` rcParam.

8.6.14 Deprecated support for mencoder in animation

The use of mencoder for writing video files with mpl is problematic; switching to ffmpeg is strongly advised. All support for mencoder will be removed in version 2.2.

8.6.15 Boxplot Zorder Keyword Argument

The *zorder* parameter now exists for *boxplot*. This allows the zorder of a boxplot to be set in the plotting function call.

```
boxplot(np.arange(10), zorder=10)
```

8.6.16 Filled + and x markers

New fillable *plus* and *x* markers have been added. See the *markers* module and marker reference examples.

8.6.17 *rcount* and *ccount* for `plot_surface`

As of v2.0, mplot3d's *plot_surface* now accepts *rcount* and *ccount* arguments for controlling the sampling of the input data for plotting. These arguments specify the maximum number of evenly spaced samples to take from the input data. These arguments are also the new default sampling method for the function, and is considered a style change.

The old *rstride* and *cstride* arguments, which specified the size of the evenly spaced samples, become the default when 'classic' mode is invoked, and are still available for use. There are no plans for deprecating these arguments.

8.6.18 Streamplot Zorder Keyword Argument Changes

The `zorder` parameter for *streamplot* now has default value of `None` instead of `2`. If `None` is given as `zorder`, *streamplot* has a default `zorder` of `matplotlib.lines.Line2D.zorder`.

8.6.19 Extension to `matplotlib.backend_bases.GraphicsContextBase`

To support standardizing hatch behavior across the backends we ship the *matplotlib.backend_bases.GraphicsContextBase.get_hatch_color* method as added to *matplotlib.backend_bases.GraphicsContextBase*. This is only used during the render process in the backends we ship so will not break any third-party backends.

If you maintain a third-party backend which extends *GraphicsContextBase* this method is now available to you and should be used to color hatch patterns.

8.7 New in matplotlib 1.5

Table of Contents

Note: matplotlib 1.5 supports Python 2.7, 3.4, and 3.5

8.7.1 Interactive OO usage

All *Artist*s now keep track of if their internal state has been changed but not reflected in the display ('stale') by a call to `draw`. It is thus possible to pragmatically determine if a given *Figure* needs to be re-drawn in an interactive session.

To facilitate interactive usage a `draw_all` method has been added to `pyplot` which will redraw all of the figures which are 'stale'.

To make this convenient for interactive use matplotlib now registers a function either with IPython's 'post_execute' event or with the displayhook in the standard python REPL to automatically call `plt.draw_all` just before control is returned to the REPL. This ensures that the draw command is deferred and only called once.

The upshot of this is that for interactive backends (including `%matplotlib notebook`) in interactive mode (with `plt.ion()`)

```
import matplotlib.pyplot as plt
fig, ax = plt.subplots()
ln, = ax.plot([0, 1, 4, 9, 16])
plt.show()
ln.set_color('g')
```

will automatically update the plot to be green. Any subsequent modifications to the `Artist` objects will do likewise.

This is the first step of a larger consolidation and simplification of the pyplot internals.

8.7.2 Working with labeled data like pandas DataFrames

Plot methods which take arrays as inputs can now also work with labeled data and unpack such data.

This means that the following two examples produce the same plot:

Example

```
df = pandas.DataFrame({"var1":[1,2,3,4,5,6], "var2":[1,2,3,4,5,6]})
plt.plot(df["var1"], df["var2"])
```

Example

```
plt.plot("var1", "var2", data=df)
```

This works for most plotting methods, which expect arrays/sequences as inputs. `data` can be anything which supports `__getitem__` (`dict`, `pandas.DataFrame`, `h5py`, ...) to access `array` like values with string keys.

In addition to this, some other changes were made, which makes working with labeled data (ex `pandas.Series`) easier:

- For plotting methods with `label` keyword argument, one of the data inputs is designated as the label source. If the user does not supply a `label` that value object will be introspected for a label, currently by looking for a `name` attribute. If the value object does not have a `name` attribute but was specified by as a key into the `data` kwarg, then the key is used. In the above examples, this results in an implicit `label="var2"` for both cases.
- `plot()` now uses the index of a `Series` instead of `np.arange(len(y))`, if no `x` argument is supplied.

8.7.3 Added `axes.prop_cycle` key to rcParams

This is a more generic form of the now-deprecated `axes.color_cycle` param. Now, we can cycle more than just colors, but also linestyles, hatches, and just about any other artist property. Cycler notation is used for defining property cycles. Adding cyclers together will be like you are `zip`-ing together two or more property cycles together:

```
axes.prop_cycle: cycler('color', 'rgb') + cycler('lw', [1, 2, 3])
```

You can even multiply cyclers, which is like using `itertools.product` on two or more property cycles.

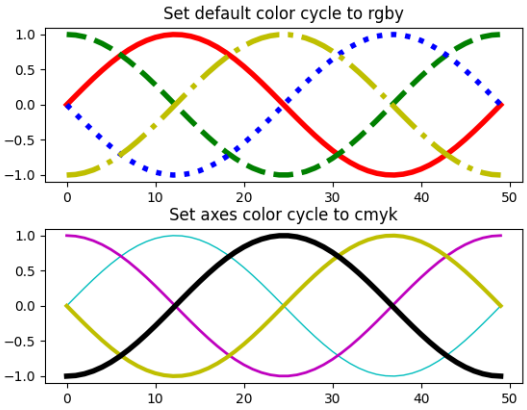


Fig. 5: Color Cycle

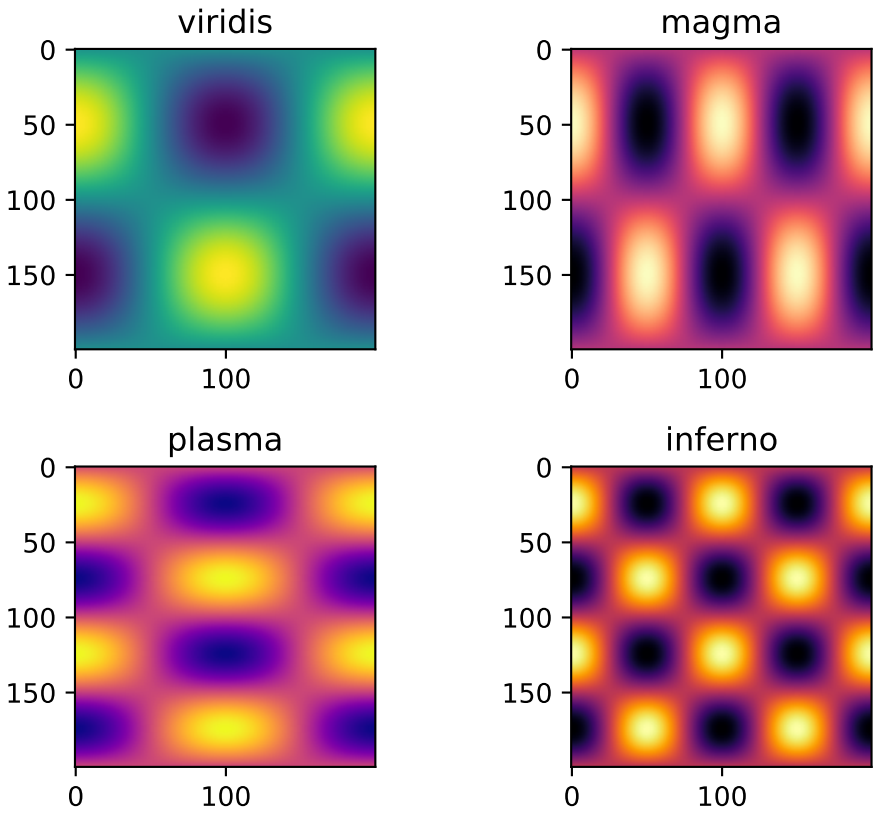
8.7.4 New Colormaps

All four of the colormaps proposed as the new default are available as `'viridis'` (the new default in 2.0), `'magma'`, `'plasma'`, and `'inferno'`



8.7.5 Styles

Several new styles have been added, including many styles from the Seaborn project. Additionally, in order to prep for the upcoming 2.0 style-change release, a 'classic' and 'default' style has been added. For this release, the 'default' and 'classic' styles are identical. By using them now in your scripts, you can help ensure a smooth transition during future upgrades of matplotlib, so that you can upgrade to the snazzy new defaults when you are ready!

```
import matplotlib.style
matplotlib.style.use('classic')
```

The 'default' style will give you matplotlib's latest plotting styles:

```
matplotlib.style.use('default')
```

8.7.6 Backends

New backend selection

The environment variable *MPLBACKEND* can now be used to set the matplotlib backend.

wx backend has been updated

The wx backend can now be used with both wxPython classic and Phoenix.

wxPython classic has to be at least version 2.8.12 and works on Python 2.x. As of May 2015 no official release of wxPython Phoenix is available but a current snapshot will work on Python 2.7+ and 3.4+.

If you have multiple versions of wxPython installed, then the user code is responsible setting the wxPython version. How to do this is explained in the comment at the beginning of the example /gallery/user_interfaces/embedding_in_wx2_sgskip.

8.7.7 Configuration (rcParams)

Some parameters have been added, others have been improved.

Parameter	Description
rcParams["xaxis.labelpad"], rcParams["yaxis.labelpad"]	mplot3d now respects these parameters
rcParams["axes.labelpad"] (default: 4.0)	Default space between the axis and the label
rcParams["errorbar.capsize"] (default: 0.0)	Default length of end caps on error bars
rcParams["xtick.minor.visible"] (default: False), rcParams["ytick.minor.visible"] (default: False)	Default visibility of minor x/y ticks
rcParams["legend.framealpha"] (default: 0.8)	Default transparency of the legend frame box
rcParams["legend.facecolor"] (default: 'inherit')	Default facecolor of legend frame box (or 'inherit' from rcParams["axes.facecolor"] (default: 'white'))
rcParams["legend.edgecolor"] (default: '0.8')	Default edgecolor of legend frame box (or 'inherit' from rcParams["axes.edgecolor"] (default: 'black'))
rcParams["figure.titlesize"] (default: 'large')	Default font size for figure suptitles
rcParams["figure.titleweight"] (default: 'normal')	Default font weight for figure suptitles
rcParams["image.composite_image"] (default: True)	Whether a vector graphics backend should composite several images into a single image or not when saving. Useful when needing to edit the files further in Inkscape or other programs.
rcParams["markers.fillstyle"] (default: 'full')	Default fillstyle of markers. Possible values are 'full' (the default), 'left', 'right', 'bottom', 'top' and 'none'
rcParams["toolbar"] (default: 'toolbar2')	Added 'toolmanager' as a valid value, enabling the experimental ToolManager feature.

8.7.8 Widgets

Active state of Selectors

All selectors now implement set_active and get_active methods (also called when accessing the active property) to properly update and query whether they are active.

Moved `ignore`, `set_active`, and `get_active` methods to base class `Widget`

Pushes up duplicate methods in child class to parent class to avoid duplication of code.

Adds enable/disable feature to MultiCursor

A MultiCursor object can be disabled (and enabled) after it has been created without destroying the object. Example:

```
multi_cursor.active = False
```

Improved RectangleSelector and new EllipseSelector Widget

Adds an *interactive* keyword which enables visible handles for manipulating the shape after it has been drawn.

Adds keyboard modifiers for:

- Moving the existing shape (default key = 'space')
- Making the shape square (default 'shift')
- Make the initial point the center of the shape (default 'control')
- Square and center can be combined

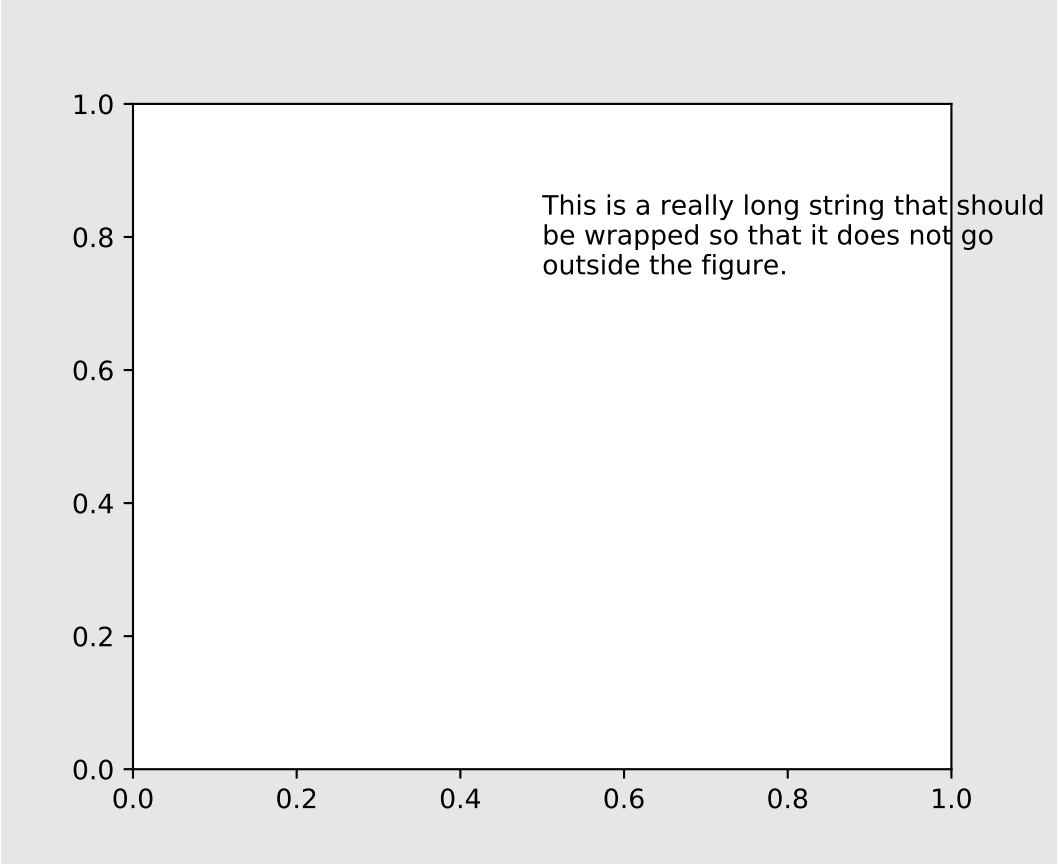
Allow Artists to Display Pixel Data in Cursor

Adds *get_cursor_data* and *format_cursor_data* methods to artists which can be used to add zdata to the cursor display in the status bar. Also adds an implementation for Images.

8.7.9 New plotting features

Auto-wrapping Text

Added the keyword argument "wrap" to Text, which automatically breaks long lines of text when being drawn. Works for any rotated text, different modes of alignment, and for text that are either labels or titles. This breaks at the `Figure`, not `Axes` edge.



Contour plot corner masking

Ian Thomas rewrote the C++ code that calculates contours to add support for corner masking. This is controlled by a new keyword argument `corner_mask` in the functions *`contour()`* and *`contourf()`*. The previous behaviour, which is now obtained using `corner_mask=False`, was for a single masked point to completely mask out all four quads touching that point. The new behaviour, obtained using `corner_mask=True`, only masks the corners of those quads touching the point; any triangular corners comprising three unmasked points are contoured as usual. If the `corner_mask` keyword argument is not specified, the default value is taken from rcParams.

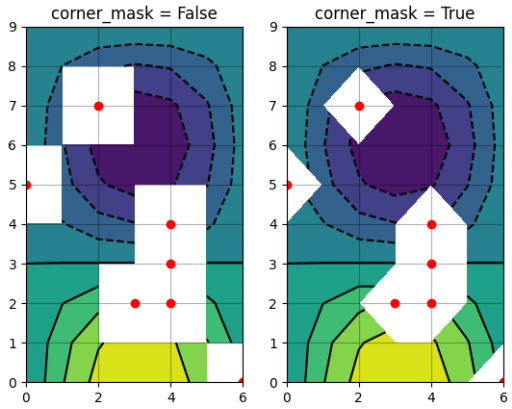


Fig. 6: Contour Corner Mask

Mostly unified linestyles for `Line2D`, `Patch` and `Collection`

The handling of linestyles for Lines, Patches and Collections has been unified. Now they all support defining linestyles with short symbols, like "--", as well as with full names, like "dashed". Also the definition using a dash pattern (`(0., [3., 3.])`) is supported for all methods using *`Line2D`*, *`Patch`* or *`Collection`*.

Legend marker order

Added ability to place the label before the marker in a legend box with `markerfirst` keyword

Support for legend for PolyCollection and stackplot

Added a *legend_handler* for *PolyCollection* as well as a *labels* argument to *stackplot()*.

Support for alternate pivots in mplot3d quiver plot

Added a `pivot` kwarg to *quiver()* that controls the pivot point around which the quiver line rotates. This also determines the placement of the arrow head along the quiver line.

Logit Scale

Added support for the 'logit' axis scale, a nonlinear transformation

$$x- > \log 10(x/(1-x))$$

for data between 0 and 1 excluded.

Add step kwargs to fill_between

Added `step` kwarg to *Axes.fill_between* to allow to fill between lines drawn using the 'step' draw style. The values of `step` match those of the `where` kwarg of *Axes.step*. The asymmetry of of the kwargs names is not ideal, but *Axes.fill_between* already has a `where` kwarg.

This is particularly useful for plotting pre-binned histograms.

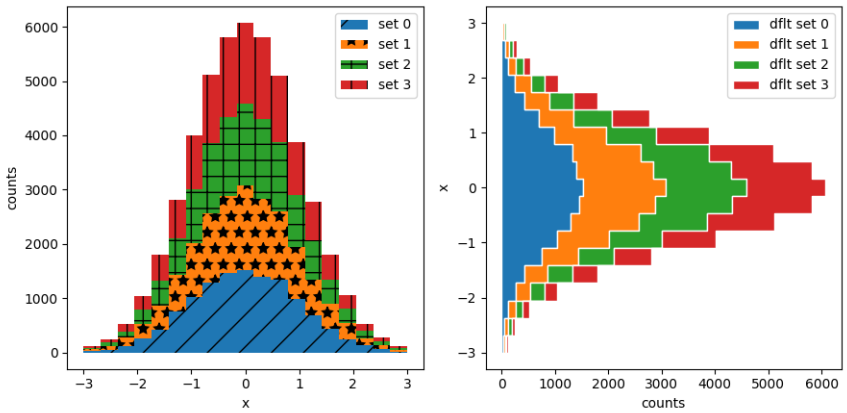

Fig. 7: Filled Step

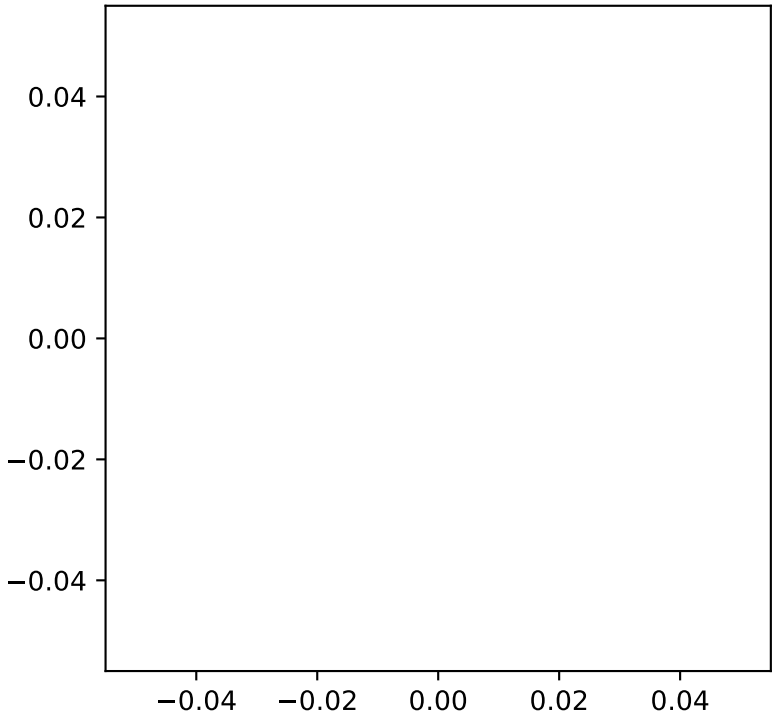
Square Plot

Implemented square plots feature as a new parameter in the axis function. When argument 'square' is specified, equal scaling is set, and the limits are set such that `xmax-xmin == ymax-ymin`.



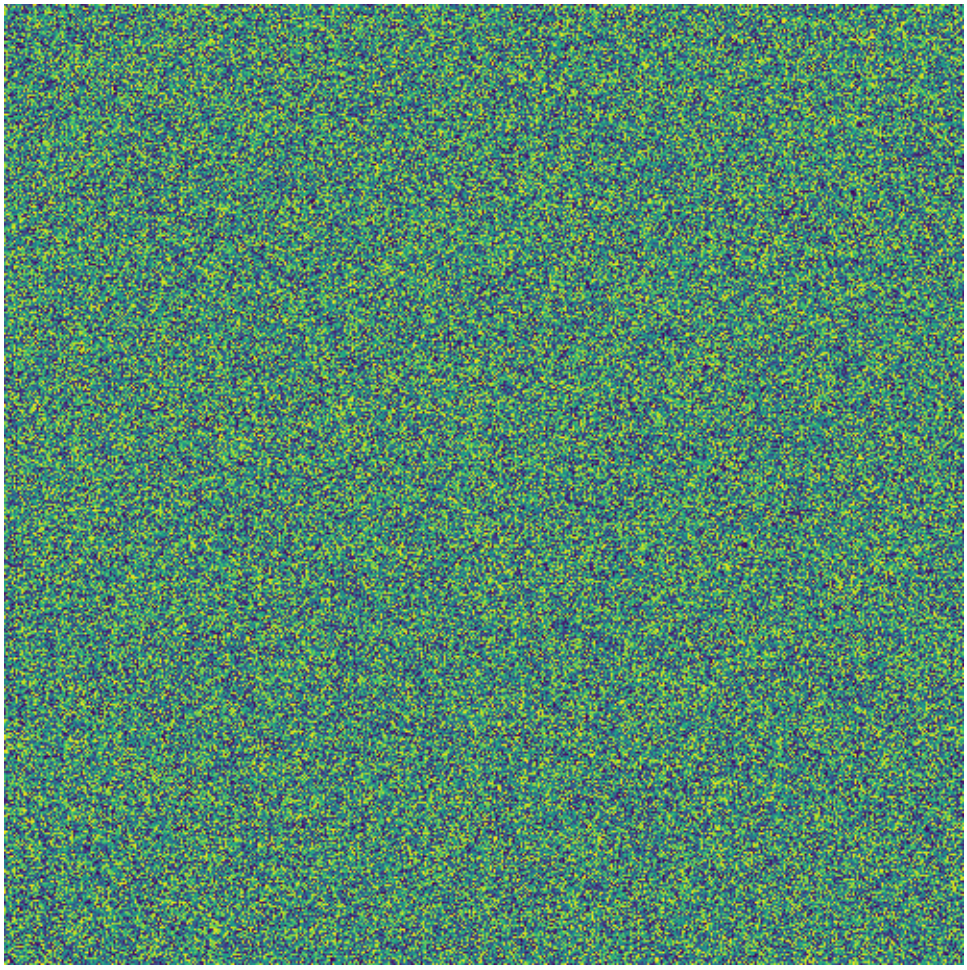
Updated figimage to take optional resize parameter

Added the ability to plot simple 2D-Array using `plt.figimage(X, resize=True)`. This is useful for plotting simple 2D-Array without the Axes or whitespacing around the image.

Updated Figure.savefig() can now use figure's dpi

Added support to save the figure with the same dpi as the figure on the screen using `dpi='figure'`:.

Example:



```
f = plt.figure(dpi=25)  # dpi set to 25
S = plt.scatter([1,2,3],[4,5,6])
f.savefig('output.png', dpi='figure')  # output savefig dpi set to 25 (same as figure)
```

Updated Table to control edge visibility

Added the ability to toggle the visibility of lines in Tables. Functionality added to the *pyplot.table* factory function under the keyword argument "edges". Values can be the strings "open", "closed", "horizontal", "vertical" or combinations of the letters "L", "R", "T", "B" which represent left, right, top, and bottom respectively.

Example:

```
table(..., edges="open")  # No line visible
table(..., edges="closed")  # All lines visible
table(..., edges="horizontal")  # Only top and bottom lines visible
table(..., edges="LT")  # Only left and top lines visible.
```

Zero r/cstride support in plot_wireframe

Adam Hughes added support to mplot3d's plot_wireframe to draw only row or column line plots.

Plot bar and barh with labels

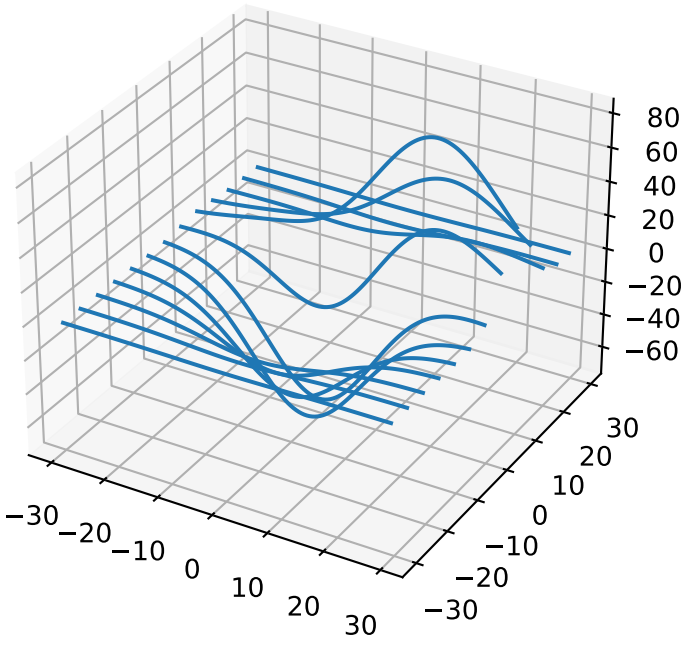
Added kwarg *tick_label* to *bar* and *barh* to support plotting bar graphs with a text label for each bar.

Added center and frame kwargs to pie

These control where the center of the pie graph are and if the Axes frame is shown.

Fixed 3D filled contour plot polygon rendering

Certain cases of 3D filled contour plots that produce polygons with multiple holes produced improper rendering due to a loss of path information between *PolyCollection* and *Poly3DCollection*. A function *set_verts_and_codes()* was added to allow path information to be retained for proper rendering.

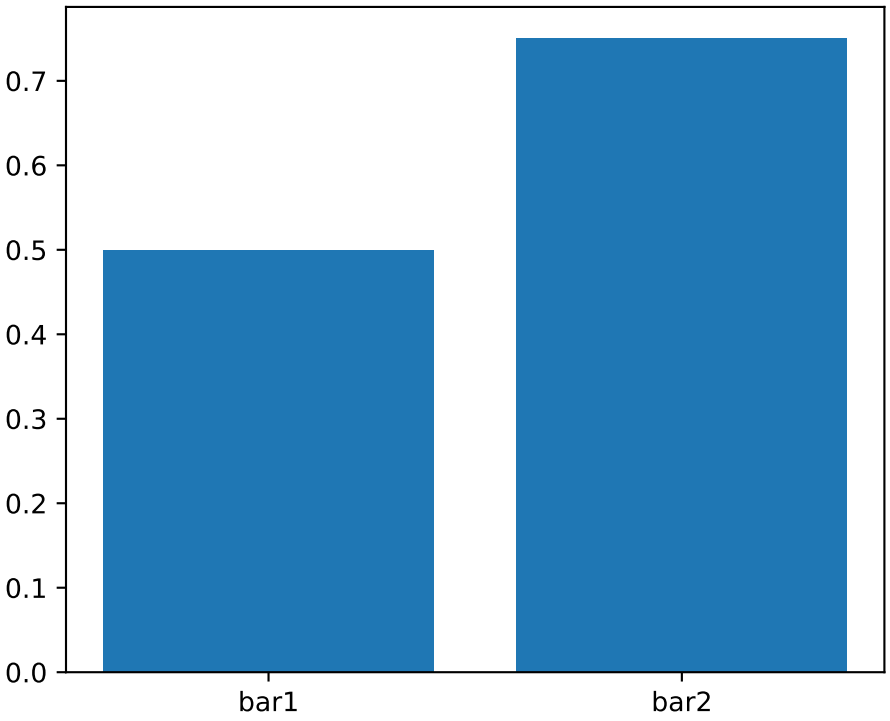


Dense colorbars are rasterized

Vector file formats (pdf, ps, svg) are efficient for many types of plot element, but for some they can yield excessive file size and even rendering artifacts, depending on the renderer used for screen display. This is a problem for colorbars that show a large number of shades, as is most commonly the case. Now, if a colorbar is showing 50 or more colors, it will be rasterized in vector backends.

DateFormatter strftime

DateFormatter's `__call__()` method will format a `datetime.datetime` object with the format string passed to the formatter's constructor. This method accepts datetimes with years before 1900, unlike `datetime.datetime.strftime()`.



Artist-level {get,set}_usetex for text

Add `{get,set}_usetex` methods to *Text* objects which allow artist-level control of LaTeX rendering vs. the internal mathtex rendering.

`Axes.remove()` works as expected

As with artists added to an *Axes*, *Axes* objects can be removed from their figure via *remove()*.

API Consistency fix within Locators set_params() function

set_params() function, which sets parameters within a *Locator* type instance, is now available to all *Locator* types. The implementation also prevents unsafe usage by strictly defining the parameters that a user can set.

To use, call `set_params()` on a *Locator* instance with desired arguments:

```
loc = matplotlib.ticker.LogLocator()
# Set given attributes for loc.
```

(continues on next page)

(continued from previous page)

```
loc.set_params(numticks=8, numdecs=8, subs=[2.0], base=8)
# The below will error, as there is no such parameter for LogLocator
# named foo
# loc.set_params(foo='bar')
```

Date Locators

Date Locators (derived from *DateLocator*) now implement the *tick_values* method. This is expected of all Locators derived from *Locator*.

The Date Locators can now be used easily without creating axes

```
from datetime import datetime
from matplotlib.dates import YearLocator
t0 = datetime(2002, 10, 9, 12, 10)
tf = datetime(2005, 10, 9, 12, 15)
loc = YearLocator()
values = loc.tick_values(t0, tf)
```

OffsetBoxes now support clipping

*Artist*s draw onto objects of type *OffsetBox* through *DrawingArea* and *TextArea*. The *TextArea* calculates the required space for the text and so the text is always within the bounds, for this nothing has changed.

However, *DrawingArea* acts as a parent for zero or more *Artist*s that draw on it and may do so beyond the bounds. Now child *Artist*s can be clipped to the bounds of the *DrawingArea*.

OffsetBoxes now considered by tight_layout

When *tight_layout()* or *Figure.tight_layout* or *GridSpec.tight_layout()* is called, *OffsetBox*es that are anchored outside the axes will not get chopped out. The *OffsetBox*es will also not get overlapped by other axes in case of multiple subplots.

Per-page pdf notes in multi-page pdfs (PdfPages)

Add a new method *attach_note()* to the PdfPages class, allowing the attachment of simple text notes to pages in a multi-page pdf of figures. The new note is visible in the list of pdf annotations in a viewer that has this facility (Adobe Reader, OSX Preview, Skim, etc.). Per default the note itself is kept off-page to prevent it to appear in print-outs.

PdfPages.attach_note needs to be called before *savefig* in order to be added to the correct figure.

Updated fignum_exists to take figure name

Added the ability to check the existence of a figure using its name instead of just the figure number. Example:

```
figure('figure')
fignum_exists('figure') #true
```

8.7.10 ToolManager

Federico Ariza wrote the new *ToolManager* that comes as replacement for *NavigationToolbar2*

ToolManager offers a new way of looking at the user interactions with the figures. Before we had the *NavigationToolbar2* with its own tools like `zoom/pan/home/save/ ...` and also we had the shortcuts like `yscale/grid/quit/.....` *ToolManager* relocate all those actions as `Tools` (located in *backend_tools*), and defines a way to access/trigger/reconfigure them.

The `Toolbars` are replaced for `ToolContainers` that are just GUI interfaces to `trigger` the tools. But don't worry the default backends include a `ToolContainer` called `toolbar`

Note: At the moment, we release this primarily for feedback purposes and should be treated as experimental until further notice as API changes will occur. For the moment the *ToolManager* works only with the GTK3 and Tk backends. Make sure you use one of those. Port for the rest of the backends is coming soon.

To activate the *ToolManager* include the following at the top of your file

```
>>> matplotlib.rcParams['toolbar'] = 'toolmanager'
```

Interact with the ToolContainer

The most important feature is the ability to easily reconfigure the ToolContainer (aka toolbar). For example, if we want to remove the "forward" button we would just do.

```
>>> fig.canvas.manager.toolmanager.remove_tool('forward')
```

Now if you want to programmatically trigger the "home" button

```
>>> fig.canvas.manager.toolmanager.trigger_tool('home')
```

New Tools for ToolManager

It is possible to add new tools to the ToolManager

A very simple tool that prints "You're awesome" would be:

```
from matplotlib.backend_tools import ToolBase
class AwesomeTool(ToolBase):
    def trigger(self, *args, **kwargs):
        print("You're awesome")
```

To add this tool to *ToolManager*

```
>>> fig.canvas.manager.toolmanager.add_tool('Awesome', AwesomeTool)
```

If we want to add a shortcut ("d") for the tool

```
>>> fig.canvas.manager.toolmanager.update_keymap('Awesome', 'd')
```

To add it to the toolbar inside the group 'foo'

```
>>> fig.canvas.manager.toolbar.add_tool('Awesome', 'foo')
```

There is a second class of tools, "Toggleable Tools", this are almost the same as our basic tools, just that belong to a group, and are mutually exclusive inside that group. For tools derived from *ToolToggleBase* there are two basic methods *enable* and *disable* that are called automatically whenever it is toggled.

A full example is located in /gallery/user_interfaces/toolmanager_sgskip

8.7.11 cbook.is_sequence_of_strings recognizes string objects

This is primarily how pandas stores a sequence of strings

```
import pandas as pd
import matplotlib.cbook as cbook

a = np.array(['a', 'b', 'c'])
print(cbook.is_sequence_of_strings(a))  # True

a = np.array(['a', 'b', 'c'], dtype=object)
print(cbook.is_sequence_of_strings(a))  # True

s = pd.Series(['a', 'b', 'c'])
print(cbook.is_sequence_of_strings(s))  # True
```

Previously, the last two prints returned false.

8.7.12 New close-figs argument for plot directive

Matplotlib has a sphinx extension plot_directive that creates plots for inclusion in sphinx documents. Matplotlib 1.5 adds a new option to the plot directive - close-figs - that closes any previous figure windows before creating the plots. This can help avoid some surprising duplicates of plots when using plot_directive.

8.7.13 Support for URL string arguments to imread

The *imread()* function now accepts URL strings that point to remote PNG files. This circumvents the generation of a HTTPResponse object directly.

8.7.14 Display hook for animations in the IPython notebook

Animation instances gained a _repr_html_ method to support inline display of animations in the notebook. The method used to display is controlled by the animation.html rc parameter, which currently supports values of none and html5. none is the default, performing no display. html5 converts the animation to an h264 encoded video, which is embedded directly in the notebook.

Users not wishing to use the _repr_html_ display hook can also manually call the to_html5_video method to get the HTML and display using IPython's HTML display class:

```
from IPython.display import HTML
HTML(anim.to_html5_video())
```

8.7.15 Prefixed pkg-config for building

Handling of pkg-config has been fixed in so far as it is now possible to set it using the environment variable PKG_CONFIG. This is important if your toolchain is prefixed. This is done in a simpilar way as setting CC or CXX before building. An example follows.

```
export PKG_CONFIG=x86_64-pc-linux-gnu-pkg-config
```

8.8 New in matplotlib 1.4

Thomas A. Caswell served as the release manager for the 1.4 release.

Table of Contents

Note: matplotlib 1.4 supports Python 2.6, 2.7, 3.3, and 3.4

8.8.1 New colormap

In heatmaps, a green-to-red spectrum is often used to indicate intensity of activity, but this can be problematic for the red/green colorblind. A new, colorblind-friendly colormap is now available at `matplotlib.cm.Wistia`. This colormap maintains the red/green symbolism while achieving deuteranopic legibility through brightness variations. See here for more information.

8.8.2 The nbagg backend

Phil Elson added a new backend, named "nbagg", which enables interactive figures in a live IPython notebook session. The backend makes use of the infrastructure developed for the webagg backend, which itself gives standalone server backed interactive figures in the browser, however nbagg does not require a dedicated matplotlib server as all communications are handled through the IPython Comm machinery.

As with other backends nbagg can be enabled inside the IPython notebook with:

```
import matplotlib
matplotlib.use('nbagg')
```

Once figures are created and then subsequently shown, they will placed in an interactive widget inside the notebook allowing panning and zooming in the same way as any other matplotlib backend. Because figures require a connection to the IPython notebook server for their interactivity, once the notebook is saved, each figure will

be rendered as a static image - thus allowing non-interactive viewing of figures on services such as nbviewer.

8.8.3 New plotting features

Power-law normalization

Ben Gamari added a power-law normalization method, *PowerNorm*. This class maps a range of values to the interval [0,1] with power-law scaling with the exponent provided by the constructor's *gamma* argument. Power law normalization can be useful for, e.g., emphasizing small populations in a histogram.

Fully customizable boxplots

Paul Hobson overhauled the *boxplot()* method such that it is now completely customizable in terms of the styles and positions of the individual artists. Under the hood, *boxplot()* relies on a new function (*boxplot_stats()*), which accepts any data structure currently compatible with *boxplot()*, and returns a list of dictionaries containing the positions for each element of the boxplots. Then a second method, *bxp* is called to draw the boxplots based on the stats.

The *boxplot()* function can be used as before to generate boxplots from data in one step. But now the user has the flexibility to generate the statistics independently, or to modify the output of *boxplot_stats()* prior to plotting with *bxp*.

Lastly, each artist (e.g., the box, outliers, cap, notches) can now be toggled on or off and their styles can be passed in through individual kwargs. See the examples: /gallery/statistics/boxplot and /gallery/statistics/bxp

Added a bool kwarg, `manage_xticks`, which if False disables the management of the ticks and limits on the x-axis by *bxp()*.

Support for datetime axes in 2d plots

Andrew Dawson added support for datetime axes to *contour()*, *contourf()*, *pcolormesh()* and *pcolor()*.

Support for additional spectrum types

Todd Jennings added support for new types of frequency spectrum plots: *magnitude_spectrum()*, *phase_spectrum()*, and *angle_spectrum()*, as well as corresponding functions in mlab.

He also added these spectrum types to *specgram()*, as well as adding support for linear scaling there (in addition to the existing dB scaling). Support for additional spectrum types was also added to *specgram()*.

He also increased the performance for all of these functions and plot types.

Support for detrending and windowing 2D arrays in mlab

Todd Jennings added support for 2D arrays in the *detrend_mean()*, *detrend_none()*, and *detrend()*, as well as adding *apply_window()* which support windowing 2D arrays.

Support for strides in mlab

Todd Jennings added some functions to mlab to make it easier to use numpy strides to create memory-efficient 2D arrays. This includes *stride_repeat()*, which repeats an array to create a 2D array, and *stride_windows()*, which uses a moving window to create a 2D array from a 1D array.

Formatter for new-style formatting strings

Added *StrMethodFormatter* which does the same job as *FormatStrFormatter*, but accepts new-style formatting strings instead of printf-style formatting strings

Consistent grid sizes in streamplots

streamplot() uses a base grid size of 30x30 for both `density=1` and `density=(1, 1)`. Previously a grid size of 30x30 was used for `density=1`, but a grid size of 25x25 was used for `density=(1, 1)`.

Get a list of all tick labels (major and minor)

Added the kwarg 'which' to *Axes.get_xticklabels*, *Axes.get_yticklabels* and *Axis.get_ticklabels*. 'which' can be 'major', 'minor', or 'both' select which ticks to return, like `set_ticks_position()`. If 'which' is `None` then the old behaviour (controlled by the bool *minor*).

Separate horizontal/vertical axes padding support in ImageGrid

The kwarg 'axes_pad' to *mpl_toolkits.axes_grid1.axes_grid.ImageGrid* can now be a tuple if separate horizontal/vertical padding is needed. This is supposed to be very helpful when you have a labelled legend next to every subplot and you need to make some space for legend's labels.

Support for skewed transformations

The *Affine2D* gained additional methods *skew* and *skew_deg* to create skewed transformations. Additionally, matplotlib internals were cleaned up to support using such transforms in *Axes*. This transform is important for some plot types, specifically the Skew-T used in meteorology.

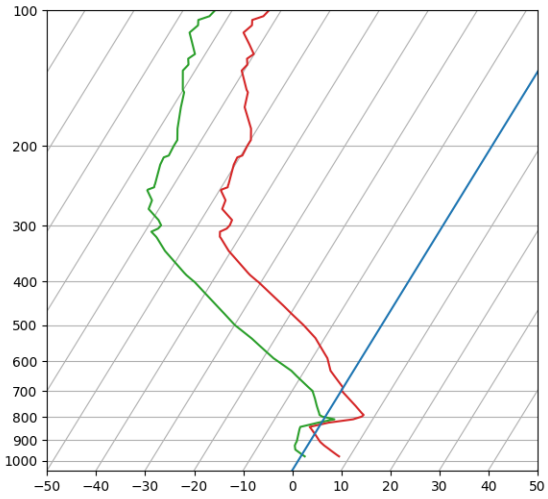


Fig. 8: Skewt

Support for specifying properties of wedge and text in pie charts.

Added the kwargs 'wedgeprops' and 'textprops' to *pie* to accept properties for wedge and text objects in a pie. For example, one can specify wedgeprops = {'linewidth':3} to specify the width of the borders of the wedges in the pie. For more properties that the user can specify, look at the docs for the wedge and text objects.

Fixed the direction of errorbar upper/lower limits

Larry Bradley fixed the *errorbar()* method such that the upper and lower limits (*lolims*, *uplims*, *xlolims*, *xuplims*) now point in the correct direction.

More consistent add-object API for Axes

Added the Axes method *add_image* to put image handling on a par with artists, collections, containers, lines, patches, and tables.

Violin Plots

Per Parker, Gregory Kelsie, Adam Ortiz, Kevin Chan, Geoffrey Lee, Deokjae Donald Seo, and Taesu Terry Lim added a basic implementation for violin plots. Violin plots can be used to represent the distribution of sample data. They are similar to box plots, but use a kernel density estimation function to present a smooth approximation of the data sample used. The added features are:

violin - Renders a violin plot from a collection of statistics. *violin_stats()* - Produces a collection of statistics suitable for rendering a violin plot. *violinplot()* - Creates a violin plot from a set of sample data. This method makes use of *violin_stats()* to process the input data, and *violin_stats()* to do the actual rendering. Users are also free to modify or replace the output of *violin_stats()* in order to customize the violin plots to their liking.

This feature was implemented for a software engineering course at the University of Toronto, Scarborough, run in Winter 2014 by Anya Tafliovich.

More `markevery` options to show only a subset of markers

Rohan Walker extended the `markevery` property in *Line2D*. You can now specify a subset of markers to show with an int, slice object, numpy fancy indexing, or float. Using a float shows markers at approximately equal display-coordinate-distances along the line.

Added size related functions to specialized `Collections`

Added the `get_size` and `set_size` functions to control the size of elements of specialized collections (*AsteriskPolygonCollection* *BrokenBarHCollection* *CircleCollection* *PathCollection* *PolyCollection* *RegularPolyCollection* *StarPolygonCollection*).

Fixed the mouse coordinates giving the wrong theta value in Polar graph

Added code to `transform_non_affine()` to ensure that the calculated theta value was between the range of 0 and 2 * pi since the problem was that the value can become negative after applying the direction and rotation to the theta calculation.

Simple quiver plot for mplot3d toolkit

A team of students in an *Engineering Large Software Systems* course, taught by Prof. Anya Tafliovich at the University of Toronto, implemented a simple version of a quiver plot in 3D space for the mplot3d toolkit as one of their term project. This feature is documented in *quiver()*. The team members are: Ryan Steve D'Souza, Victor B, xbtsw, Yang Wang, David, Caradec Bisesar and Vlad Vassilovski.

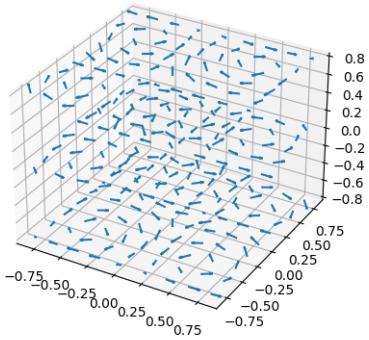

Fig. 9: Quiver3d

polar-plot r-tick locations

Added the ability to control the angular position of the r-tick labels on a polar plot via *set_rlabel_position*.

8.8.4 Date handling

n-d array support for date conversion

Andrew Dawson added support for n-d array handling to *matplotlib.dates.num2date()*, *matplotlib.dates.date2num()* and *matplotlib.dates.datestr2num()*. Support is also added to the unit conversion interfaces *matplotlib.dates.DateConverter* and *matplotlib.units.Registry*.

8.8.5 Configuration (rcParams)

`savefig.transparent` added

Controls whether figures are saved with a transparent background by default. Previously *savefig* always defaulted to a non-transparent background.

`axes.titleweight`

Added rcParam to control the weight of the title

`axes.formatter.useoffset` added

Controls the default value of *useOffset* in *ScalarFormatter*. If `True` and the data range is much smaller than the data average, then an offset will be determined such that the tick labels are meaningful. If `False` then the full number will be formatted in all conditions.

`nbagg.transparent` added

Controls whether nbagg figures have a transparent background. `nbagg.transparent` is `True` by default.

XDG compliance

Matplotlib now looks for configuration files (both rcparams and style) in XDG compliant locations.

8.8.6 `style` package added

You can now easily switch between different styles using the new `style` package:

```
>>> from matplotlib import style
>>> style.use('dark_background')
```

Subsequent plots will use updated colors, sizes, etc. To list all available styles, use:

```
>>> print style.available
```

You can add your own custom `<style name>.mplstyle` files to `~/.matplotlib/stylelib` or call `use` with a URL pointing to a file with `matplotlibrc` settings.

Note that this is an experimental feature, and the interface may change as users test out this new feature.

8.8.7 Backends

Qt5 backend

Martin Fitzpatrick and Tom Badran implemented a Qt5 backend. The differences in namespace locations between Qt4 and Qt5 was dealt with by shimming Qt4 to look like Qt5, thus the Qt5 implementation is the primary implementation. Backwards compatibility for Qt4 is maintained by wrapping the Qt5 implementation.

The Qt5Agg backend currently does not work with IPython's %matplotlib magic.

The 1.4.0 release has a known bug where the toolbar is broken. This can be fixed by:

```
cd path/to/installed/matplotlib
wget https://github.com/matplotlib/matplotlib/pull/3322.diff
# unix2dos 3322.diff (if on windows to fix line endings)
patch -p2 < 3322.diff
```

Qt4 backend

Rudolf Höfler changed the appearance of the subplottool. All sliders are vertically arranged now, buttons for tight layout and reset were added. Furthermore, the subplottool is now implemented as a modal dialog. It was previously a QMainWindow, leaving the SPT open if one closed the plot window.

In the figure options dialog one can now choose to (re-)generate a simple automatic legend. Any explicitly set legend entries will be lost, but changes to the curves' label, linestyle, et cetera will now be updated in the legend.

Interactive performance of the Qt4 backend has been dramatically improved under windows.

The mapping of key-signals from Qt to values matplotlib understands was greatly improved (For both Qt4 and Qt5).

Cairo backends

The Cairo backends are now able to use the cairocffi bindings which are more actively maintained than the pycairo bindings.

Gtk3Agg backend

The Gtk3Agg backend now works on Python 3.x, if the cairocffi bindings are installed.

PDF backend

Added context manager for saving to multi-page PDFs.

8.8.8 Text

Text URLs supported by SVG backend

The SVG backend will now render *Text* objects' url as a link in output SVGs. This allows one to make clickable text in saved figures using the url kwarg of the *Text* class.

Anchored sizebar font

Added the `fontproperties` kwarg to *AnchoredSizeBar* to control the font properties.

8.8.9 Sphinx extensions

The `:context:` directive in the *plot_directive* Sphinx extension can now accept an optional `reset` setting, which will cause the context to be reset. This allows more than one distinct context to be present in documentation. To enable this option, use `:context: reset` instead of `:context:` any time you want to reset the context.

8.8.10 Legend and PathEffects documentation

The *Legend guide* and *Path effects guide* have both been updated to better reflect the full potential of each of these powerful features.

8.8.11 Widgets

Span Selector

Added an option `span_stays` to the *SpanSelector* which makes the selector rectangle stay on the axes after you release the mouse.

8.8.12 GAE integration

Matplotlib will now run on google app engine.

8.9 New in matplotlib 1.3

Table of Contents

Note: matplotlib 1.3 supports Python 2.6, 2.7, 3.2, and 3.3

8.9.1 New in 1.3.1

1.3.1 is a bugfix release, primarily dealing with improved setup and handling of dependencies, and correcting and enhancing the documentation.

The following changes were made in 1.3.1 since 1.3.0.

Enhancements

- Added a context manager for creating multi-page pdfs (see *matplotlib.backends.backend_pdf.PdfPages*).
- The WebAgg backend should now have lower latency over heterogeneous Internet connections.

Bug fixes

- Histogram plots now contain the endline.
- Fixes to the Molleweide projection.
- Handling recent fonts from Microsoft and Macintosh-style fonts with non-ascii metadata is improved.
- Hatching of fill between plots now works correctly in the PDF backend.
- Tight bounding box support now works in the PGF backend.
- Transparent figures now display correctly in the Qt4Agg backend.
- Drawing lines from one subplot to another now works.
- Unit handling on masked arrays has been improved.

Setup and dependencies

- Now works with any version of pyparsing 1.5.6 or later, without displaying hundreds of warnings.
- Now works with 64-bit versions of Ghostscript on MS-Windows.
- When installing from source into an environment without Numpy, Numpy will first be downloaded and built and then used to build matplotlib.
- Externally installed backends are now always imported using a fully-qualified path to the module.
- Works with newer version of wxPython.
- Can now build with a PyCXX installed globally on the system from source.
- Better detection of Gtk3 dependencies.

Testing

- Tests should now work in non-English locales.
- PEP8 conformance tests now report on locations of issues.

8.9.2 New plotting features

`xkcd`-style sketch plotting

To give your plots a sense of authority that they may be missing, Michael Droettboom (inspired by the work of many others in PR #1329) has added an xkcd-style sketch plotting mode. To use it, simply call *`matplotlib.pyplot.xkcd`* before creating your plot. For really fine control, it is also possible to modify each artist's sketch parameters individually with *`matplotlib.artist.Artist.set_sketch_params()`*.

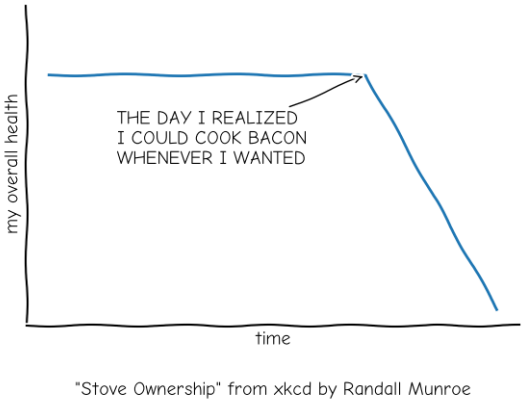

Fig. 10: xkcd

8.9.3 Updated Axes3D.contour methods

Damon McDougall updated the *`tricontour()`* and *`tricontourf()`* methods to allow 3D contour plots on abitrary unstructured user-specified triangulations.

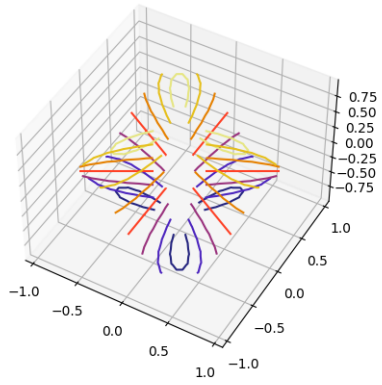

Fig. 11: Tricontour3d

New eventplot plot type

Todd Jennings added a *eventplot()* function to create multiple rows or columns of identical line segments

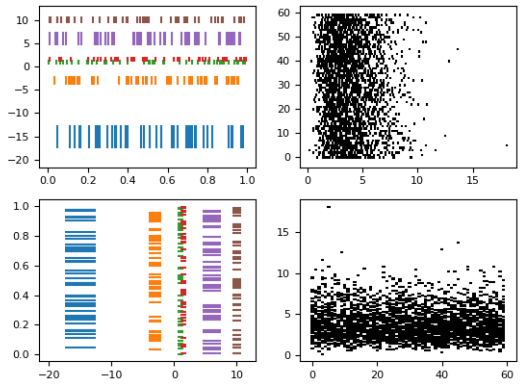

Fig. 12: Eventplot Demo

As part of this feature, there is a new *EventCollection* class that allows for plotting and manipulating rows or columns of identical line segments.

Triangular grid interpolation

Geoffroy Billotey and Ian Thomas added classes to perform interpolation within triangular grids: (*LinearTriInterpolator* and *CubicTriInterpolator*) and a utility class to find the triangles in which points lie (*TrapezoidMapTriFinder*). A helper class to perform mesh refinement and smooth contouring was also added (*UniformTriRefiner*). Finally, a class implementing some basic tools for triangular mesh improvement was added (*TriAnalyzer*).

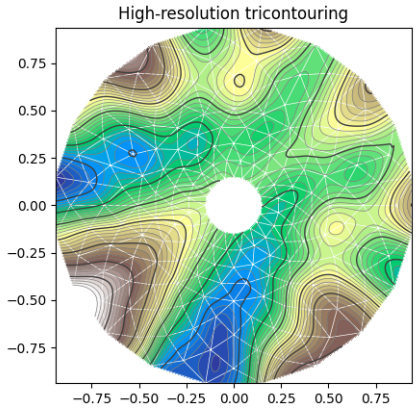

Fig. 13: Tricontour Smooth User

Baselines for stackplot

Till Stensitzki added non-zero baselines to *stackplot()*. They may be symmetric or weighted.

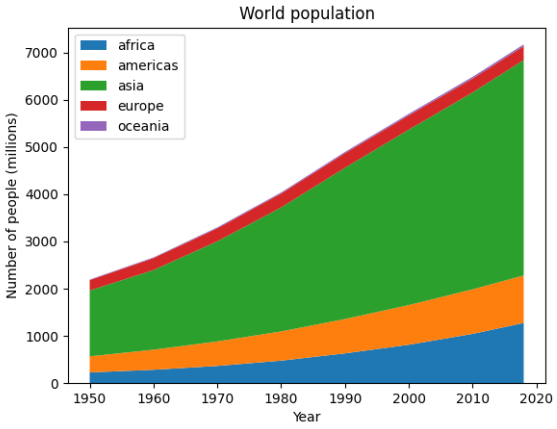

Fig. 14: Stackplot Demo2

Rectangular colorbar extensions

Andrew Dawson added a new keyword argument *extendrect* to *colorbar()* to optionally make colorbar extensions rectangular instead of triangular.

More robust boxplots

Paul Hobson provided a fix to the *boxplot()* method that prevent whiskers from being drawn inside the box for oddly distributed data sets.

Calling subplot() without arguments

A call to *subplot()* without any arguments now acts the same as `subplot(111)` or `subplot(1, 1, 1)` -- it creates one axes for the whole figure. This was already the behavior for both *axes()* and *subplots()*, and now this consistency is shared with *subplot()*.

8.9.4 Drawing

Independent alpha values for face and edge colors

Wes Campaigne modified how *Patch* objects are drawn such that (for backends supporting transparency) you can set different alpha values for faces and edges, by specifying their colors in RGBA format. Note that if you set the alpha attribute for the patch object (e.g. using *set_alpha()* or the `alpha` keyword argument), that value will override the alpha components set in both the face and edge colors.

Path effects on lines

Thanks to Jae-Joon Lee, path effects now also work on plot lines.

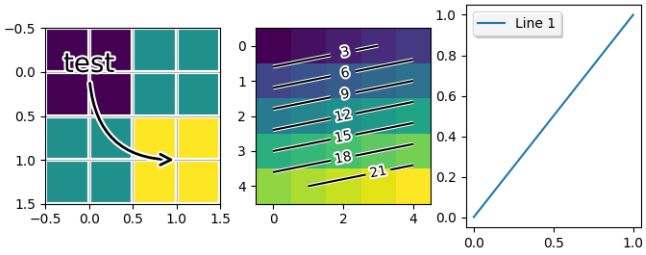

Fig. 15: Patheffect Demo

Easier creation of colormap and normalizer for levels with colors

Phil Elson added the *matplotlib.colors.from_levels_and_colors()* function to easily create a colormap and normalizer for representation of discrete colors for plot types such as *matplotlib.pyplot.pcolormesh()*, with a similar interface to that of *matplotlib.pyplot.contourf*.

Full control of the background color

Wes Campaigne and Phil Elson fixed the Agg backend such that PNGs are now saved with the correct background color when `fig.patch.get_alpha()` is not 1.

Improved `bbox_inches="tight"` functionality

Passing `bbox_inches="tight"` through to *pyplot.savefig* now takes into account *all* artists on a figure - this was previously not the case and led to several corner cases which did not function as expected.

Initialize a rotated rectangle

Damon McDougall extended the *Rectangle* constructor to accept an *angle* kwarg, specifying the rotation of a rectangle in degrees.

8.9.5 Text

Anchored text support

The SVG and pgf backends are now able to save text alignment information to their output formats. This allows to edit text elements in saved figures, using Inkscape for example, while preserving their intended position. For SVG please note that you'll have to disable the default text-to-path conversion (`mpl.rc('svg', fonttype='none')`).

Better vertical text alignment and multi-line text

The vertical alignment of text is now consistent across backends. You may see small differences in text placement, particularly with rotated text.

If you are using a custom backend, note that the *draw_text* renderer method is now passed the location of the baseline, not the location of the bottom of the text bounding box.

Multi-line text will now leave enough room for the height of very tall or very low text, such as superscripts and subscripts.

Left and right side axes titles

Andrew Dawson added the ability to add axes titles flush with the left and right sides of the top of the axes using a new keyword argument *loc* to *title()*.

Improved manual contour plot label positioning

Brian Mattern modified the manual contour plot label positioning code to interpolate along line segments and find the actual closest point on a contour to the requested position. Previously, the closest path vertex was used, which, in the case of straight contours was sometimes quite distant from the requested location. Much more precise label positioning is now possible.

8.9.6 Configuration (rcParams)

Quickly find rcParams

Phil Elson made it easier to search for rcParameters by passing a valid regular expression to *matplotlib.RcParams.find_all()*. *matplotlib.RcParams* now also has a pretty repr and str representation so that search results are printed prettily:

```
>>> import matplotlib
>>> print(matplotlib.rcParams.find_all('\.size'))
RcParams({'font.size': 12,
          'xtick.major.size': 4,
          'xtick.minor.size': 2,
          'ytick.major.size': 4,
          'ytick.minor.size': 2})
```

`axes.xmargin` and `axes.ymargin` added to rcParams

`rcParams["axes.xmargin"]` (default: `0.05`) and `rcParams["axes.ymargin"]` (default: `0.05`) were added to configure the default margins used. Previously they were hard-coded to default to 0, default value of both rcParam values is 0.

Changes to font rcParams

The `font.*` rcParams now affect only text objects created after the rcParam has been set, and will not retroactively affect already existing text objects. This brings their behavior in line with most other rcParams.

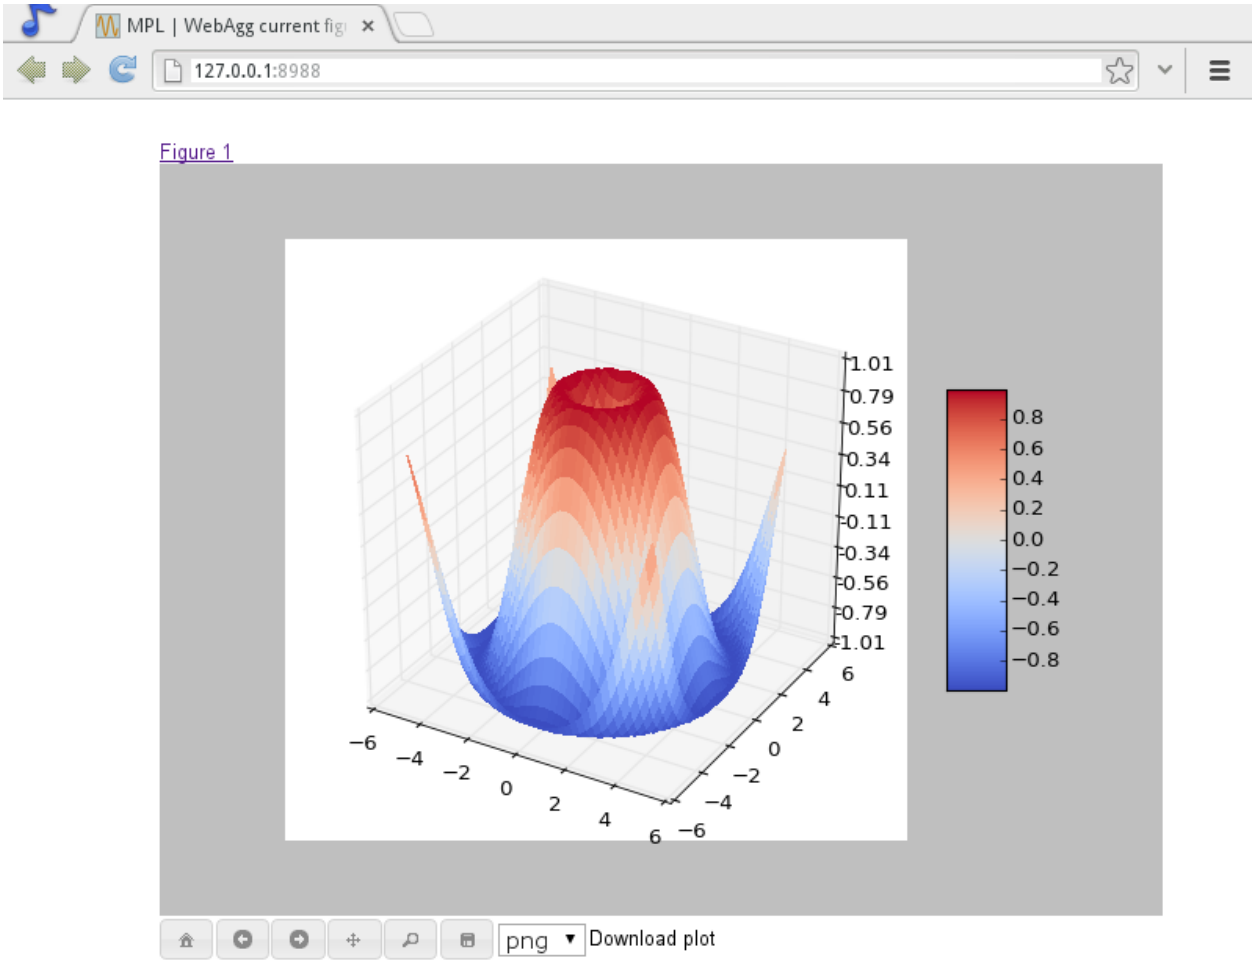
Added `rcParams["savefig.jpeg_quality"]` (default: `95`)

rcParam value `rcParams["savefig.jpeg_quality"]` (default: `95`) was added so that the user can configure the default quality used when a figure is written as a JPEG. The default quality is 95; previously, the default quality was 75. This change minimizes the artifacting inherent in JPEG images, particularly with images that have sharp changes in color as plots often do.

8.9.7 Backends

WebAgg backend

Michael Droettboom, Phil Elson and others have developed a new backend, WebAgg, to display figures in a web browser. It works with animations as well as being fully interactive.



Future versions of matplotlib will integrate this backend with the IPython notebook for a fully web browser based plotting frontend.

Remember save directory

Martin Spacek made the save figure dialog remember the last directory saved to. The default is configurable with the new `rcParams["savefig.directory"]` (default: `'~'`) rcParam in `matplotlibrc`.

8.9.8 Documentation and examples

Numpydoc docstrings

Nelle Varoquaux has started an ongoing project to convert matplotlib's docstrings to numpydoc format. See MEP10 for more information.

Example reorganization

Tony Yu has begun work reorganizing the examples into more meaningful categories. The new gallery page is the fruit of this ongoing work. See MEP12 for more information.

Examples now use subplots()

For the sake of brevity and clarity, most of the examples now use the newer *`subplots()`*, which creates a figure and one (or multiple) axes object(s) in one call. The old way involved a call to *`figure()`*, followed by one (or multiple) *`subplot()`* calls.

8.9.9 Infrastructure

Housecleaning

A number of features that were deprecated in 1.2 or earlier, or have not been in a working state for a long time have been removed. Highlights include removing the Qt version 3 backends, and the FltkAgg and Emf backends. See *Changes in 1.3.x* for a complete list.

New setup script

matplotlib 1.3 includes an entirely rewritten setup script. We now ship fewer dependencies with the tarballs and installers themselves. Notably, pytz, dateutil, pyparsing and six are no longer included with matplotlib. You can either install them manually first, or let pip install them as dependencies along with matplotlib. It is now possible to not include certain subcomponents, such as the unit test data, in the install. See `setup.cfg.template` for more information.

XDG base directory support

On Linux, matplotlib now uses the XDG base directory specification to find the `matplotlibrc` configuration file. `matplotlibrc` should now be kept in `~/.config/matplotlib`, rather than `~/.matplotlib`. If your configuration is found in the old location, it will still be used, but a warning will be displayed.

Catch opening too many figures using pyplot

Figures created through *`pyplot.figure`* are retained until they are explicitly closed. It is therefore common for new users of matplotlib to run out of memory when creating a large series of figures in a loop without closing them.

matplotlib will now display a `RuntimeWarning` when too many figures have been opened at once. By default, this is displayed for 20 or more figures, but the exact number may be controlled using the `figure.max_open_warning` rcParam.

8.10 New in matplotlib 1.2.2

Table of Contents

8.10.1 Improved collections

The individual items of a collection may now have different alpha values and be rendered correctly. This also fixes a bug where collections were always filled in the PDF backend.

8.10.2 Multiple images on same axes are correctly transparent

When putting multiple images onto the same axes, the background color of the axes will now show through correctly.

8.11 New in matplotlib 1.2

Table of Contents

Note: matplotlib 1.2 supports Python 2.6, 2.7, and 3.1

8.11.1 Python 3.x support

Matplotlib 1.2 is the first version to support Python 3.x, specifically Python 3.1 and 3.2. To make this happen in a reasonable way, we also had to drop support for Python versions earlier than 2.6.

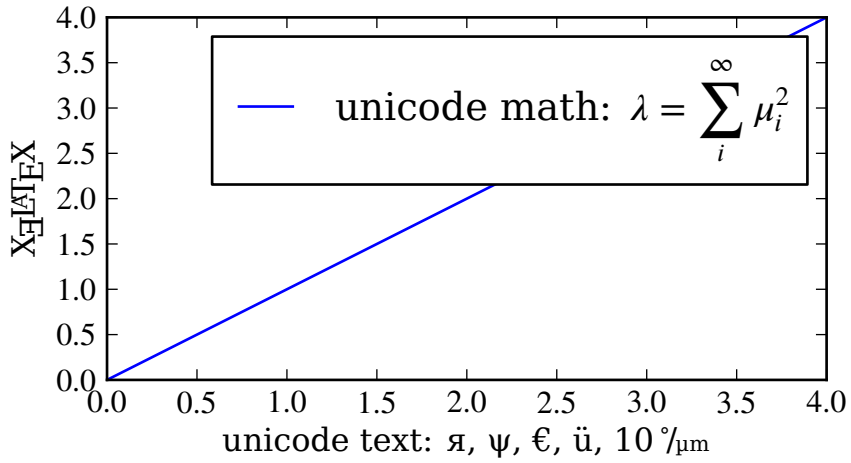
This work was done by Michael Droettboom, the Cape Town Python Users' Group, many others and supported financially in part by the SAGE project.

The following GUI backends work under Python 3.x: Gtk3Cairo, Qt4Agg, TkAgg and MacOSX. The other GUI backends do not yet have adequate bindings for Python 3.x, but continue to work on Python 2.6 and 2.7, particularly the Qt and QtAgg backends (which have been deprecated). The non-GUI backends, such as PDF, PS and SVG, work on both Python 2.x and 3.x.

Features that depend on the Python Imaging Library, such as JPEG handling, do not work, since the version of PIL for Python 3.x is not sufficiently mature.

8.11.2 PGF/TikZ backend

Peter Würtz wrote a backend that allows matplotlib to export figures as drawing commands for LaTeX. These can be processed by PdfLaTeX, XeLaTeX or LuaLaTeX using the PGF/TikZ package. Usage examples and documentation are found in *Typesetting With XeLaTeX/LuaLaTeX*.



8.11.3 Locator interface

Philip Elson exposed the intelligence behind the tick Locator classes with a simple interface. For instance, to get no more than 5 sensible steps which span the values 10 and 19.5:

```
>>> import matplotlib.ticker as mticker
>>> locator = mticker.MaxNLocator(nbins=5)
>>> print(locator.tick_values(10, 19.5))
[ 10.  12.  14.  16.  18.  20.]
```

8.11.4 Tri-Surface Plots

Damon McDougall added a new plotting method for the *mplot3d* toolkit called *plot_trisurf()*.

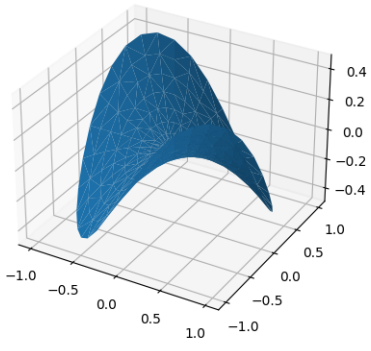


Fig. 16: Trisurf3d

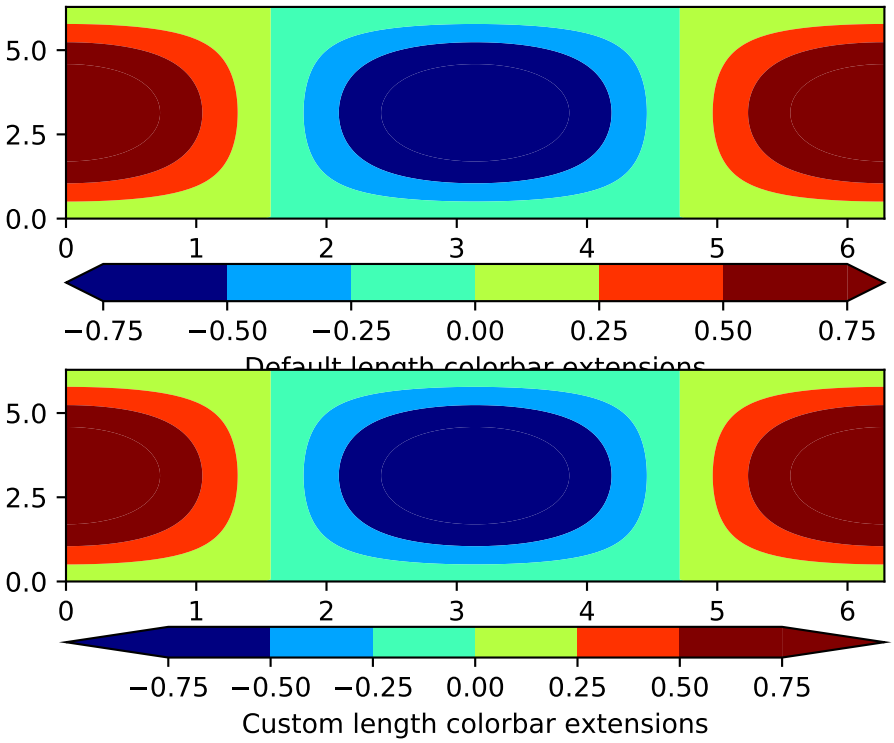
8.11.5 Control the lengths of colorbar extensions

Andrew Dawson added a new keyword argument *extendfrac* to *colorbar()* to control the length of minimum and maximum colorbar extensions.



8.11.6 Figures are picklable

Philip Elson added an experimental feature to make figures picklable for quick and easy short-term storage of plots. Pickle files are not designed for long term storage, are unsupported when restoring a pickle saved in another matplotlib version and are insecure when restoring a pickle from an untrusted source. Having said this, they are useful for short term storage for later modification inside matplotlib.

8.11.7 Set default bounding box in matplotlibrc

Two new defaults are available in the matplotlibrc configuration file: `savefig.bbox`, which can be set to 'standard' or 'tight', and `savefig.pad_inches`, which controls the bounding box padding.

8.11.8 New Boxplot Functionality

Users can now incorporate their own methods for computing the median and its confidence intervals into the *boxplot* method. For every column of data passed to boxplot, the user can specify an accompanying median and confidence interval.

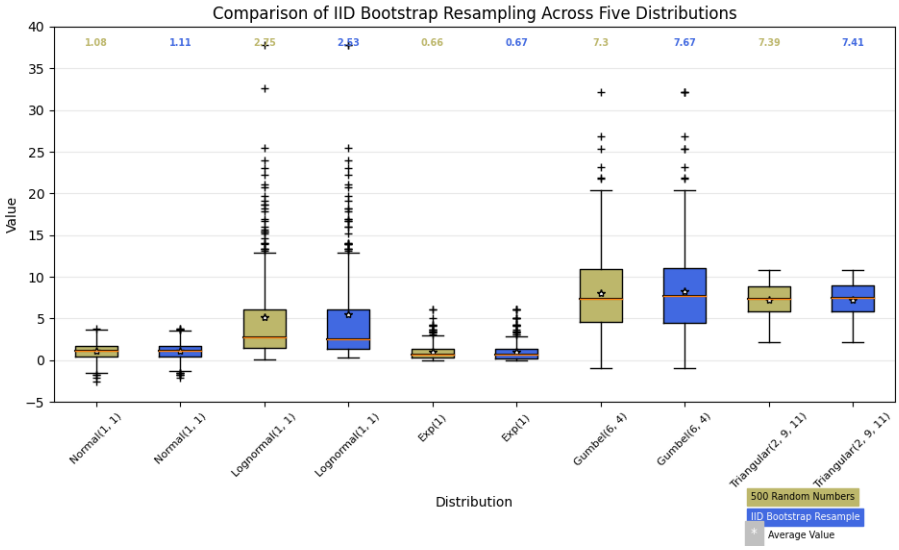


Fig. 17: Boxplot Demo3

8.11.9 New RC parameter functionality

Matthew Emmett added a function and a context manager to help manage RC parameters: *rc_file()* and *rc_context*. To load RC parameters from a file:

```
>>> mpl.rc_file('mpl.rc')
```

To temporarily use RC parameters:

```
>>> with mpl.rc_context(fname='mpl.rc', rc={'text.usetex': True}):
>>>     ...
```

8.11.10 Streamplot

Tom Flannaghan and Tony Yu have added a new *streamplot()* function to plot the streamlines of a vector field. This has been a long-requested feature and complements the existing *quiver()* function for plotting vector fields. In addition to simply plotting the streamlines of the vector field, *streamplot()* allows users to map the colors and/or line widths of the streamlines to a separate parameter, such as the speed or local intensity of the vector field.

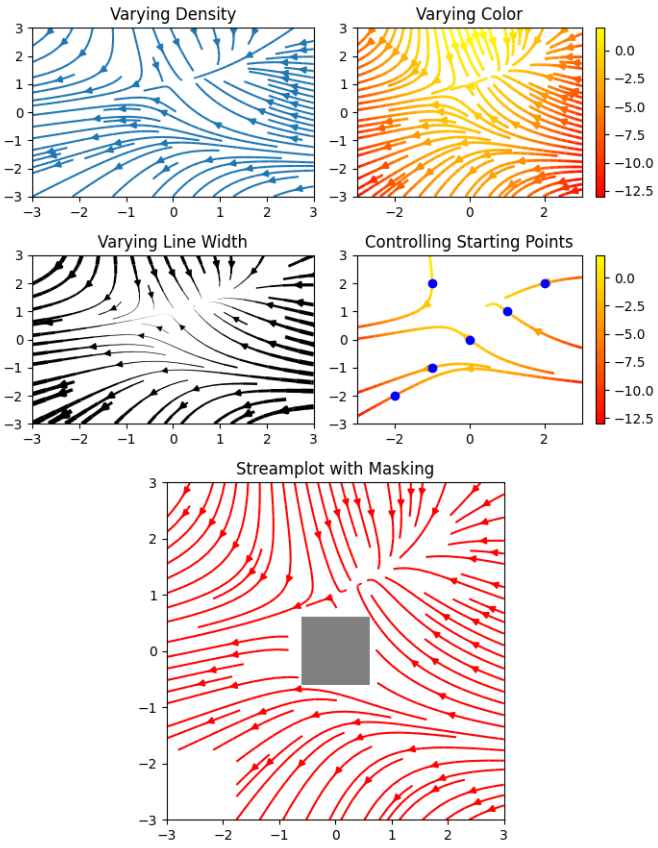

Fig. 18: Plot Streamplot

8.11.11 New hist functionality

Nic Eggert added a new *stacked* kwarg to *hist()* that allows creation of stacked histograms using any of the histogram types. Previously, this functionality was only available by using the `barstacked` histogram type. Now, when `stacked=True` is passed to the function, any of the histogram types can be stacked. The `barstacked` histogram type retains its previous functionality for backwards compatibility.

8.11.12 Updated shipped dependencies

The following dependencies that ship with matplotlib and are optionally installed alongside it have been updated:

- pytz 2012d
- **dateutil 1.5 on Python 2.x,**

  and 2.1 on Python 3.x

8.11.13 Face-centred colors in tripcolor plots

Ian Thomas extended *tripcolor()* to allow one color value to be specified for each triangular face rather than for each point in a triangulation.

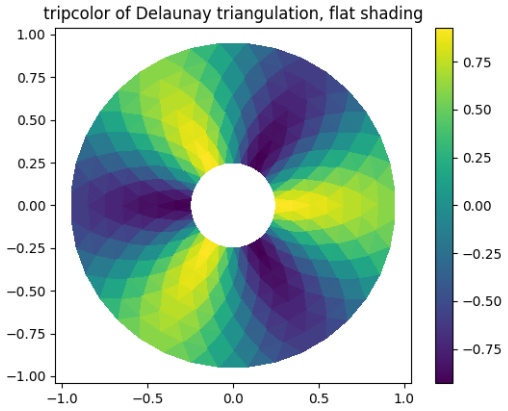

Fig. 19: Tripcolor Demo

8.11.14 Hatching patterns in filled contour plots, with legends

Phil Elson added support for hatching to *contourf()*, together with the ability to use a legend to identify contoured ranges.

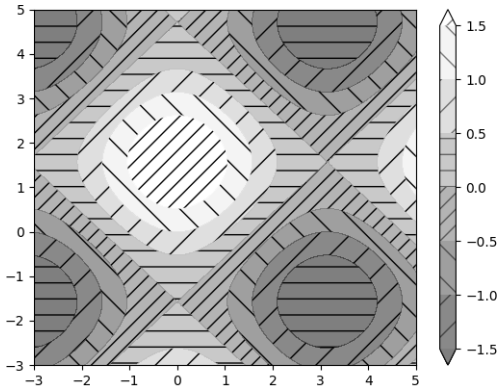

Fig. 20: Contourf Hatching

8.11.15 Known issues in the matplotlib 1.2 release

- When using the Qt4Agg backend with IPython 0.11 or later, the save dialog will not display. This should be fixed in a future version of IPython.

8.12 New in matplotlib 1.1

Table of Contents

- *Other improvements*

Note: matplotlib 1.1 supports Python 2.4 to 2.7

8.12.1 Sankey Diagrams

Kevin Davies has extended Yannick Copin's original Sankey example into a module (*sankey*) and provided new examples (/gallery/specialty_plots/sankey_basics, /gallery/specialty_plots/sankey_links, /gallery/specialty_plots/sankey_rankine).

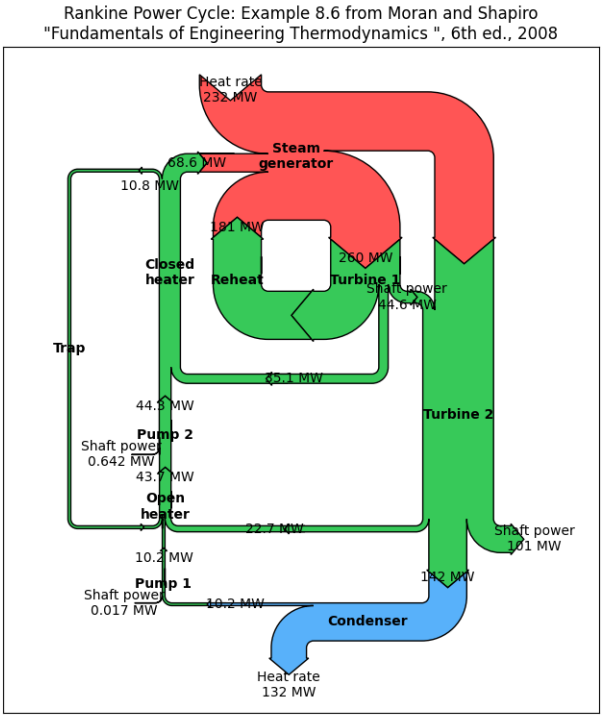

Fig. 21: Sankey Rankine

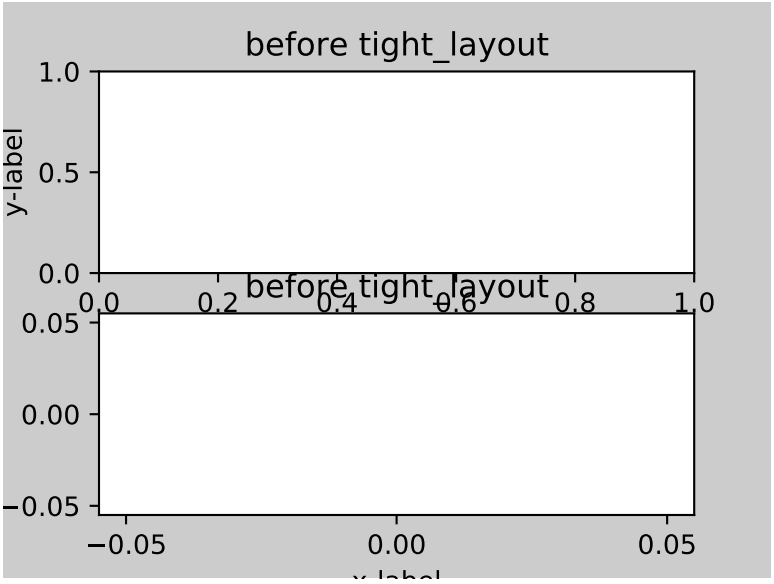
8.12.2 Animation

Ryan May has written a backend-independent framework for creating animated figures. The *animation* module is intended to replace the backend-specific examples formerly in the examples-index listings. Examples using the new framework are in animation-examples-index; see the entrancing `double pendulum <gallery/animation/double_pendulum_sgskip.py>` which uses *matplotlib.animation.Animation.save()* to create the movie below.

This should be considered as a beta release of the framework; please try it and provide feedback.

8.12.3 Tight Layout

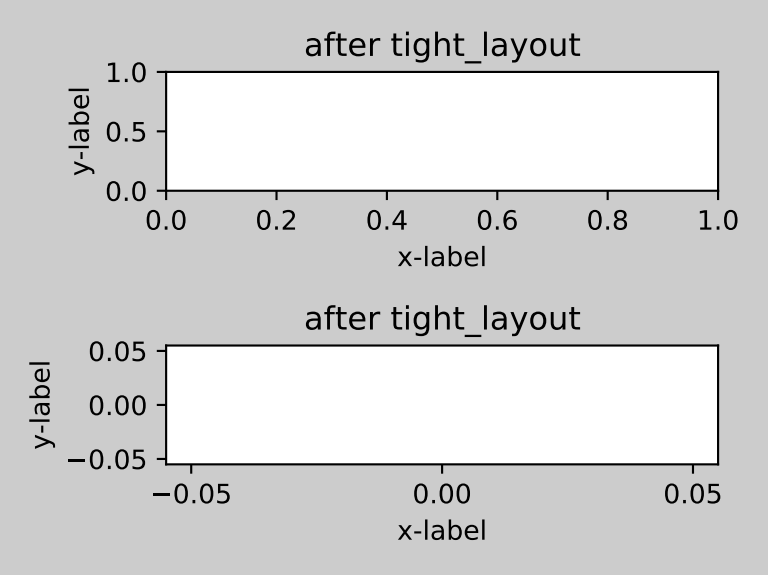
A frequent issue raised by users of matplotlib is the lack of a layout engine to nicely space out elements of the plots. While matplotlib still adheres to the philosophy of giving users complete control over the placement of plot elements, Jae-Joon Lee created the *tight_layout* module and introduced a new command *tight_layout()* to address the most common layout issues.



The usage of this functionality can be as simple as

```
plt.tight_layout()
```

and it will adjust the spacing between subplots so that the axis labels do not overlap with neighboring subplots. A *Tight Layout guide* has been created to show how to use this new tool.



8.12.4 PyQT4, PySide, and IPython

Gerald Storer made the Qt4 backend compatible with PySide as well as PyQT4. At present, however, PySide does not support the PyOS_InputHook mechanism for handling gui events while waiting for text input, so it cannot be used with the new version 0.11 of IPython. Until this feature appears in PySide, IPython users should use the PyQT4 wrapper for QT4, which remains the matplotlib default.

An rcParam entry, "backend.qt4", has been added to allow users to select PyQt4, PyQt4v2, or PySide. The latter two use the Version 2 Qt API. In most cases, users can ignore this rcParam variable; it is available to aid in testing, and to provide control for users who are embedding matplotlib in a PyQt4 or PySide app.

8.12.5 Legend

Jae-Joon Lee has improved plot legends. First, legends for complex plots such as *stem()* plots will now display correctly. Second, the 'best' placement of a legend has been improved in the presence of NANs.

See the *Legend guide* for more detailed explanation and examples.

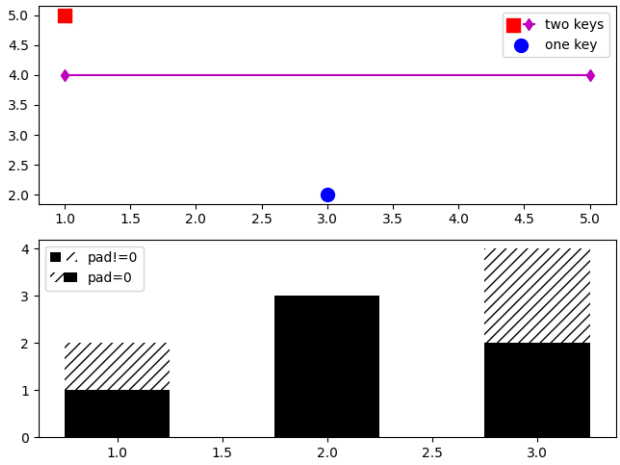


Fig. 22: Legend Demo4

8.12.6 mplot3d

In continuing the efforts to make 3D plotting in matplotlib just as easy as 2D plotting, Ben Root has made several improvements to the *mplot3d* module.

- *Axes3D* has been improved to bring the class towards feature-parity with regular Axes objects
- Documentation for *Getting started* was significantly expanded
- Axis labels and orientation improved
- Most 3D plotting functions now support empty inputs
- Ticker offset display added:

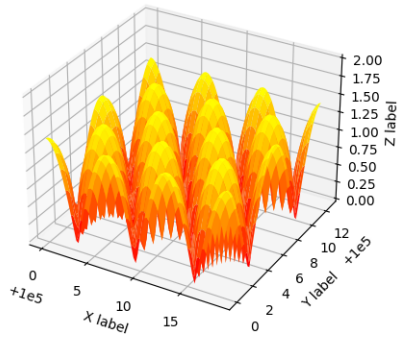

Fig. 23: Offset

- *contourf()* gains *zdir* and *offset* kwargs. You can now do this:

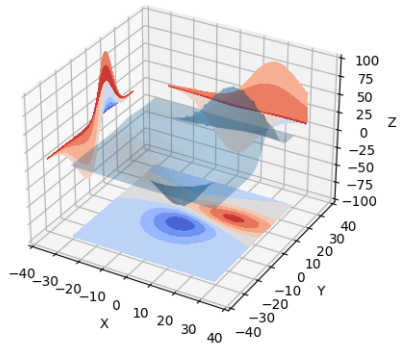

Fig. 24: Contourf3d 2

8.12.7 Numerix support removed

After more than two years of deprecation warnings, Numerix support has now been completely removed from matplotlib.

8.12.8 Markers

The list of available markers for *plot()* and *scatter()* has now been merged. While they were mostly similar, some markers existed for one function, but not the other. This merge did result in a conflict for the 'd' diamond marker. Now, 'd' will be interpreted to always mean "thin" diamond while 'D' will mean "regular" diamond.

Thanks to Michael Droettboom for this effort.

8.12.9 Other improvements

- Unit support for polar axes and *arrow()*
- *PolarAxes* gains getters and setters for "theta_direction", and "theta_offset" to allow for theta to go in either the clock-wise or counter-clockwise direction and to specify where zero degrees should be placed. *set_theta_zero_location()* is an added convenience function.
- Fixed error in argument handling for tri-functions such as *tripcolor()*
- `axes.labelweight` parameter added to rcParams.
- For *imshow()*, *interpolation*='*nearest*' will now always perform an interpolation. A "none" option has been added to indicate no interpolation at all.
- An error in the Hammer projection has been fixed.

- *clabel* for *contour()* now accepts a callable. Thanks to Daniel Hyams for the original patch.
- Jae-Joon Lee added the *HBoxDivider* and *VBoxDivider* classes.
- Christoph Gohlke reduced memory usage in *imshow()*.
- *scatter()* now accepts empty inputs.
- The behavior for 'symlog' scale has been fixed, but this may result in some minor changes to existing plots. This work was refined by ssyr.
- Peter Butterworth added named figure support to *figure()*.
- Michiel de Hoon has modified the MacOSX backend to make its interactive behavior consistent with the other backends.
- Pim Schellart added a new colormap called "cubehelix". Sameer Grover also added a colormap called "coolwarm". See it and all other colormaps *here*.
- Many bug fixes and documentation improvements.

8.13 New in matplotlib 1.0

Table of Contents

8.13.1 HTML5/Canvas backend

Simon Ratcliffe and Ludwig Schwardt have released an HTML5/Canvas backend for matplotlib. The backend is almost feature complete, and they have done a lot of work comparing their html5 rendered images with our core renderer Agg. The backend features client/server interactive navigation of matplotlib figures in an html5 compliant browser.

8.13.2 Sophisticated subplot grid layout

Jae-Joon Lee has written *gridspec*, a new module for doing complex subplot layouts, featuring row and column spans and more. See *Customizing Figure Layouts Using GridSpec and Other Functions* for a tutorial overview.

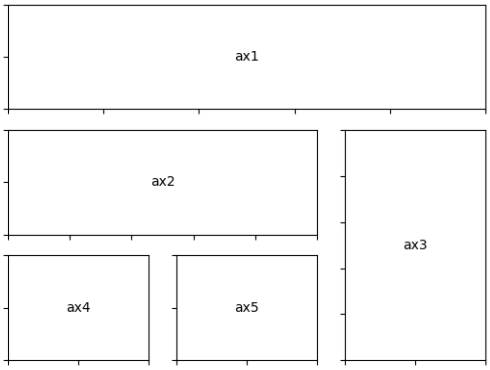

Fig. 25: Demo Gridspec01

8.13.3 Easy pythonic subplots

Fernando Perez got tired of all the boilerplate code needed to create a figure and multiple subplots when using the matplotlib API, and wrote a *subplots()* helper function. Basic usage allows you to create the figure and an array of subplots with numpy indexing (starts with 0). e.g.:

```
fig, axarr = plt.subplots(2, 2)
axarr[0,0].plot([1,2,3])   # upper, left
```

See /gallery/subplots_axes_and_figures/subplot_demo for several code examples.

8.13.4 Contour fixes and and triplot

Ian Thomas has fixed a long-standing bug that has vexed our most talented developers for years. *contourf()* now handles interior masked regions, and the boundaries of line and filled contours coincide.

Additionally, he has contributed a new module *tri* and helper function *triplot()* for creating and plotting unstructured triangular grids.

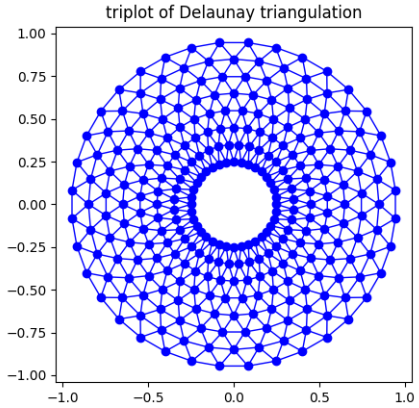

Fig. 26: Triplot Demo

8.13.5 multiple calls to show supported

A long standing request is to support multiple calls to *show()*. This has been difficult because it is hard to get consistent behavior across operating systems, user interface toolkits and versions. Eric Firing has done a lot of work on rationalizing show across backends, with the desired behavior to make show raise all newly created figures and block execution until they are closed. Repeated calls to show should raise newly created figures since the last call. Eric has done a lot of testing on the user interface toolkits and versions and platforms he has access to, but it is not possible to test them all, so please report problems to the mailing list and bug tracker.

8.13.6 mplot3d graphs can be embedded in arbitrary axes

You can now place an mplot3d graph into an arbitrary axes location, supporting mixing of 2D and 3D graphs in the same figure, and/or multiple 3D graphs in a single figure, using the "projection" keyword argument to add_axes or add_subplot. Thanks Ben Root.

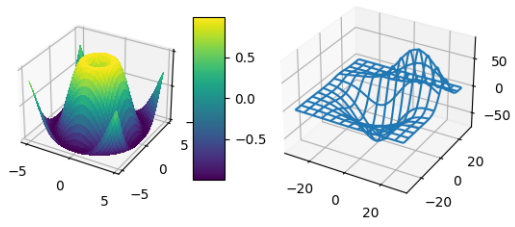

Fig. 27: What's New 1 Subplot3d

8.13.7 tick_params

Eric Firing wrote tick_params, a convenience method for changing the appearance of ticks and tick labels. See pyplot function *tick_params()* and associated Axes method *tick_params()*.

8.13.8 Lots of performance and feature enhancements

- Faster magnification of large images, and the ability to zoom in to a single pixel
- Local installs of documentation work better
- Improved "widgets" -- mouse grabbing is supported
- More accurate snapping of lines to pixel boundaries
- More consistent handling of color, particularly the alpha channel, throughout the API

8.13.9 Much improved software carpentry

The matplotlib trunk is probably in as good a shape as it has ever been, thanks to improved software carpentry. We now have a buildbot which runs a suite of nose regression tests on every svn commit, auto-generating a set of images and comparing them against a set of known-goods, sending emails to developers on failures with a pixel-by-pixel image comparison. Releases and release bugfixes happen in branches, allowing active new feature development to happen in the trunk while keeping the release branches stable. Thanks to Andrew Straw, Michael Droettboom and other matplotlib developers for the heavy lifting.

8.13.10 Bugfix marathon

Eric Firing went on a bug fixing and closing marathon, closing over 100 bugs on the (now-closed) SourceForge bug tracker with help from Jae-Joon Lee, Michael Droettboom, Christoph Gohlke and Michiel de Hoon.

8.14 New in matplotlib 0.99

Table of Contents

8.14.1 New documentation

Jae-Joon Lee has written two new guides *Legend guide* and *Advanced Annotations*. Michael Sarahan has written *Image tutorial*. John Hunter has written two new tutorials on working with paths and transformations: *Path Tutorial* and *Transformations Tutorial*.

8.14.2 mplot3d

Reinier Heeres has ported John Porter's mplot3d over to the new matplotlib transformations framework, and it is now available as a toolkit mpl_toolkits.mplot3d (which now comes standard with all mpl installs). See mplot3d-examples-index and *Getting started*

8.14.3 axes grid toolkit

Jae-Joon Lee has added a new toolkit to ease displaying multiple images in matplotlib, as well as some support for curvilinear grids to support the world coordinate system. The toolkit is included standard with all new mpl installs. See axes_grid1-examples-index, axisartist-examples-index, *What is axes_grid1 toolkit?* and *axisartist*

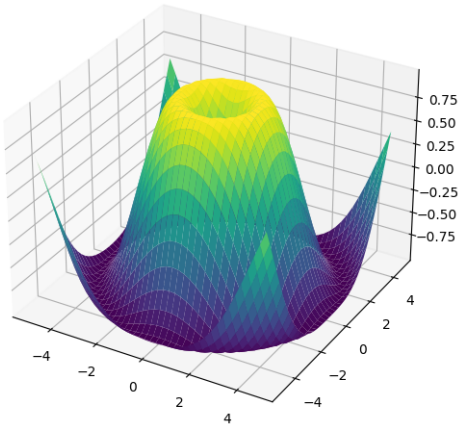

Fig. 28: What's New 99 Mplot3d

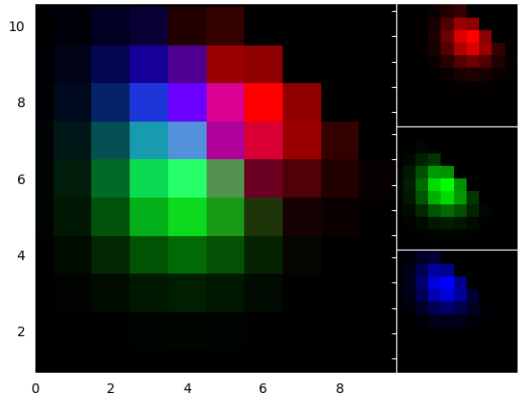

Fig. 29: What's New 99 Axes Grid

8.14.4 Axis spine placement

Andrew Straw has added the ability to place "axis spines" -- the lines that denote the data limits -- in various arbitrary locations. No longer are your axis lines constrained to be a simple rectangle around the figure -- you can turn on or off left, bottom, right and top, as well as "detach" the spine to offset it away from the data. See /gallery/ticks_and_spines/spine_placement_demo and *matplotlib.spines.Spine*.

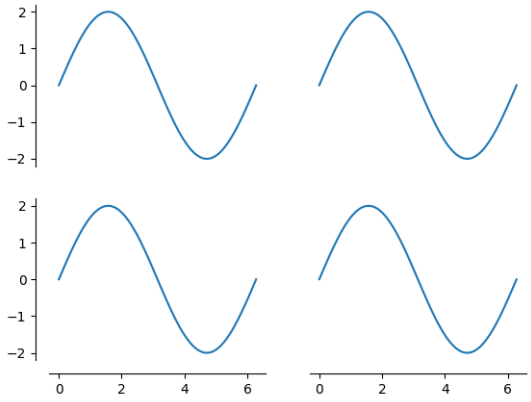

Fig. 30: What's New 99 Spines

8.15 New in matplotlib 0.98.4

Table of Contents

It's been four months since the last matplotlib release, and there are a lot of new features and bug-fixes.

Thanks to Charlie Moad for testing and preparing the source release, including binaries for OS X and Windows for python 2.4 and 2.5 (2.6 and 3.0 will not be available until numpy is available on those releases). Thanks to the many developers who con-

tributed to this release, with contributions from Jae-Joon Lee, Michael Droettboom, Ryan May, Eric Firing, Manuel Metz, Jouni K. Seppänen, Jeff Whitaker, Darren Dale, David Kaplan, Michiel de Hoon and many others who submitted patches

8.15.1 Legend enhancements

Jae-Joon has rewritten the legend class, and added support for multiple columns and rows, as well as fancy box drawing. See *legend()* and *matplotlib.legend.Legend*.

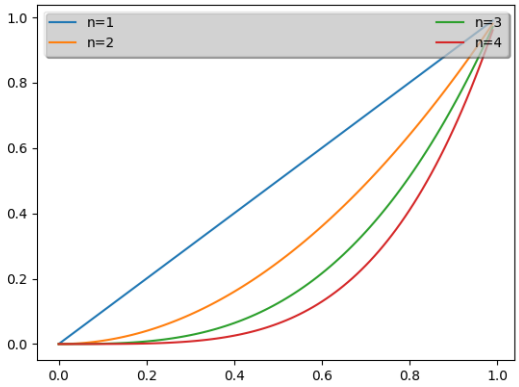

Fig. 31: What's New 98 4 Legend

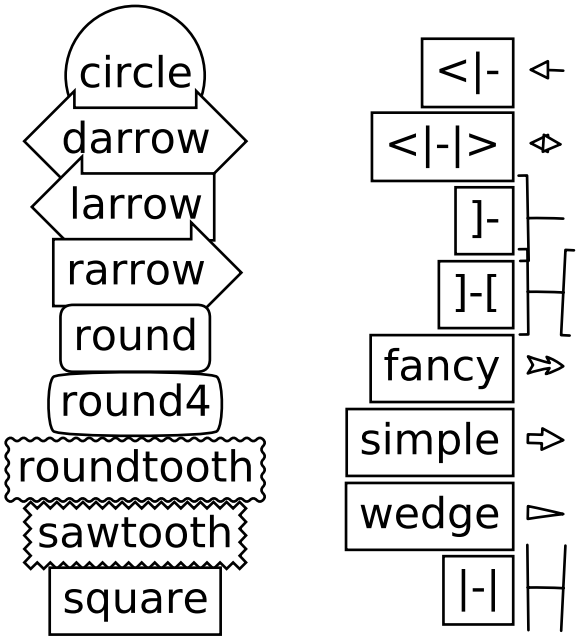
8.15.2 Fancy annotations and arrows

Jae-Joon has added lots of support to annotations for drawing fancy boxes and connectors in annotations. See *annotate()* and *BoxStyle*, *ArrowStyle*, and *ConnectionStyle*.

8.15.3 Native OS X backend

Michiel de Hoon has provided a native Mac OSX backend that is almost completely implemented in C. The backend can therefore use Quartz directly and, depending on the application, can be orders of magnitude faster than the existing backends. In addition, no third-party libraries are needed other than Python and NumPy. The backend is interactive from the usual terminal application on Mac using regular Python. It hasn't been tested with ipython yet, but in principle it should to work there as well. Set 'backend : macosx' in your matplotlibrc file, or run your script with:

```
> python myfile.py -dmacosx
```



8.15.4 psd amplitude scaling

Ryan May did a lot of work to rationalize the amplitude scaling of *psd()* and friends. See /gallery/lines_bars_and_markers/psd_demo. The changes should increase MATLAB compatibility and increase scaling options.

8.15.5 Fill between

Added a *fill_between()* function to make it easier to do shaded region plots in the presence of masked data. You can pass an *x* array and a *ylower* and *yupper* array to fill between, and an optional *where* argument which is a logical mask where you want to do the filling.

8.15.6 Lots more

Here are the 0.98.4 notes from the CHANGELOG:

```
Added mdehoon's native macosx backend from sf patch 2179017 - JDH

Removed the prints in the set_*style commands.  Return the list of
pretty-printed strings instead - JDH

Some of the changes Michael made to improve the output of the
```

(continues on next page)

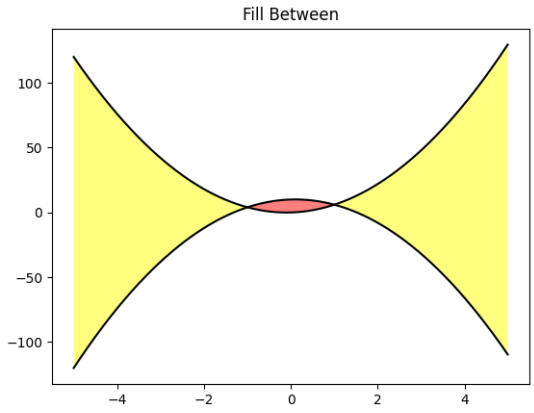


Fig. 32: What's New 98 4 Fill Between

(continued from previous page)

```
property tables in the rest docs broke of made difficult to use
some of the interactive doc helpers, e.g., setp and getp.  Having all
the rest markup in the ipython shell also confused the docstrings.
I added a new rc param docstring.harcopy, to format the docstrings
differently for hardcopy and other use.  The ArtistInspector
could use a little refactoring now since there is duplication of
effort between the rest out put and the non-rest output - JDH

Updated spectral methods (psd, csd, etc.) to scale one-sided
densities by a factor of 2 and, optionally, scale all densities by
the sampling frequency.  This gives better MATLAB
compatibility. -RM

Fixed alignment of ticks in colorbars. -MGD

drop the deprecated "new" keyword of np.histogram() for numpy 1.2
or later.  -JJL

Fixed a bug in svg backend that new_figure_manager() ignores
keywords arguments such as figsize, etc. -JJL

Fixed a bug that the handlelength of the new legend class set too
short when numpoints=1 -JJL

Added support for data with units (e.g., dates) to
Axes.fill_between. -RM

Added fancybox keyword to legend. Also applied some changes for
better look, including baseline adjustment of the multiline texts
so that it is center aligned. -JJL

The transmuter classes in the patches.py are reorganized as
subclasses of the Style classes. A few more box and arrow styles
```

(continues on next page)

(continued from previous page)

```
are added. -JJL

Fixed a bug in the new legend class that didn't allowed a tuple of
coordinate values as loc. -JJL

Improve checks for external dependencies, using subprocess
(instead of deprecated popen*) and distutils (for version
checking) - DSD

Reimplementation of the legend which supports baseline alignment,
multi-column, and expand mode. - JJL

Fixed histogram autoscaling bug when bins or range are given
explicitly (fixes Debian bug 503148) - MM

Added rcParam axes.unicode_minus which allows plain hyphen for
minus when False - JDH

Added scatterpoints support in Legend. patch by Erik Tollerud -
JJL

Fix crash in log ticking. - MGD

Added static helper method BrokenHBarCollection.span_where and
Axes/pyplot method fill_between.  See
examples/pylab/fill_between.py - JDH

Add x_isdata and y_isdata attributes to Artist instances, and use
them to determine whether either or both coordinates are used when
updating dataLim.  This is used to fix autoscaling problems that
had been triggered by axhline, axhspan, axvline, axvspan. - EF

Update the psd(), csd(), cohere(), and specgram() methods of Axes
and the csd() cohere(), and specgram() functions in mlab to be in
sync with the changes to psd().  In fact, under the hood, these
all call the same core to do computations. - RM

Add 'pad_to' and 'sides' parameters to mlab.psd() to allow
controlling of zero padding and returning of negative frequency
components, respectively.  These are added in a way that does not
change the API. - RM

Fix handling of c kwarg by scatter; generalize is_string_like to
accept numpy and numpy.ma string array scalars. - RM and EF

Fix a possible EINTR problem in dviread, which might help when
saving pdf files from the qt backend. - JKS

Fix bug with zoom to rectangle and twin axes - MGD

Added Jae Joon's fancy arrow, box and annotation enhancements --
```

(continues on next page)

(continued from previous page)

```
see examples/pylab_examples/annotation_demo2.py

Autoscaling is now supported with shared axes - EF

Fixed exception in dviread that happened with Minion - JKS

set_xlim, ylim now return a copy of the viewlim array to avoid
modify inplace surprises

Added image thumbnail generating function
matplotlib.image.thumbnail.  See examples/misc/image_thumbnail.py
- JDH

Applied scatleg patch based on ideas and work by Erik Tollerud and
Jae-Joon Lee. - MM

Fixed bug in pdf backend: if you pass a file object for output
instead of a filename, e.g., in a wep app, we now flush the object
at the end. - JKS

Add path simplification support to paths with gaps. - EF

Fix problem with AFM files that don't specify the font's full name
or family name. - JKS

Added 'scilimits' kwarg to Axes.ticklabel_format() method, for
easy access to the set_powerlimits method of the major
ScalarFormatter. - EF

Experimental new kwarg borderpad to replace pad in legend, based
on suggestion by Jae-Joon Lee.  - EF

Allow spy to ignore zero values in sparse arrays, based on patch
by Tony Yu.  Also fixed plot to handle empty data arrays, and
fixed handling of markers in figlegend. - EF

Introduce drawstyles for lines. Transparently split linestyles
like 'steps--' into drawstyle 'steps' and linestyle '--'.  Legends
always use drawstyle 'default'. - MM

Fixed quiver and quiverkey bugs (failure to scale properly when
resizing) and added additional methods for determining the arrow
angles - EF

Fix polar interpolation to handle negative values of theta - MGD

Reorganized cbook and mlab methods related to numerical
calculations that have little to do with the goals of those two
modules into a separate module numerical_methods.py Also, added
ability to select points and stop point selection with keyboard in
ginput and manual contour labeling code.  Finally, fixed contour
```

(continues on next page)

(continued from previous page)

```
labeling bug. - DMK

Fix backtick in Postscript output. - MGD

[ 2089958 ] Path simplification for vector output backends
Leverage the simplification code exposed through path_to_polygons
to simplify certain well-behaved paths in the vector backends
(PDF, PS and SVG).  "path.simplify" must be set to True in
matplotlibrc for this to work.  - MGD

Add "filled" kwarg to Path.intersects_path and
Path.intersects_bbox. - MGD

Changed full arrows slightly to avoid an xpdf rendering problem
reported by Friedrich Hagedorn. - JKS

Fix conversion of quadratic to cubic Bezier curves in PDF and PS
backends. Patch by Jae-Joon Lee. - JKS

Added 5-point star marker to plot command q- EF

Fix hatching in PS backend - MGD

Fix log with base 2 - MGD

Added support for bilinear interpolation in
NonUniformImage; patch by Gregory Lielens. - EF

Added support for multiple histograms with data of
different length - MM

Fix step plots with log scale - MGD

Fix masked arrays with markers in non-Agg backends - MGD

Fix clip_on kwarg so it actually works correctly - MGD

Fix locale problems in SVG backend - MGD

fix quiver so masked values are not plotted - JSW

improve interactive pan/zoom in qt4 backend on windows - DSD

Fix more bugs in NaN/inf handling.  In particular, path
simplification (which does not handle NaNs or infs) will be turned
off automatically when infs or NaNs are present.  Also masked
arrays are now converted to arrays with NaNs for consistent
handling of masks and NaNs - MGD and EF

Added support for arbitrary rasterization resolutions to the SVG
backend. - MW
```

8.16 List of changes to Matplotlib prior to 2015

This is a list of the changes made to Matplotlib from 2003 to 2015. For more recent changes, please refer to the what's new or the API changes.

2015-11-16 Levels passed to contour(f) and tricontour(f) must be in increasing

order.

2015-10-21 Added TextBox widget

2015-10-21 Added get_ticks_direction()

2015-02-27 Added the rcParam 'image.composite_image' to permit users

to decide whether they want the vector graphics backends to combine all images within a set of axes into a single composite image. (If images do not get combined, users can open vector graphics files in Adobe Illustrator or Inkscape and edit each image individually.)

2015-02-19 Rewrite of C++ code that calculates contours to add support for

corner masking. This is controlled by the 'corner_mask' keyword in plotting commands 'contour' and 'contourf'. - IMT

2015-01-23 Text bounding boxes are now computed with advance width rather than

ink area. This may result in slightly different placement of text.

2014-10-27 Allowed selection of the backend using the *MPLBACKEND* environment

variable. Added documentation on backend selection methods.

2014-09-27 Overhauled *colors.LightSource*. Added *LightSource.hillshade* to

allow the independent generation of illumination maps. Added new types of blending for creating more visually appealing shaded relief plots (e.g. `blend_mode="overlay"`, etc, in addition to the legacy "hsv" mode).

2014-06-10 Added Colorbar.remove()

2014-06-07 Fixed bug so radial plots can be saved as ps in py3k.

2014-06-01 Changed the fmt kwarg of errorbar to support the

the mpl convention that "none" means "don't draw it", and to default to the empty string, so that plotting of data points is done with the plot() function defaults. Deprecated use of the None object in place "none".

2014-05-22 Allow the linscale keyword parameter of symlog scale to be

smaller than one.

2014-05-20 Added logic to in FontManager to invalidate font-cache if

if font-family rcparams have changed.

2014-05-16 Fixed the positioning of multi-line text in the PGF backend.

2014-05-14 Added Axes.add_image() as the standard way to add AxesImage

instances to Axes. This improves the consistency with add_artist(), add_collection(), add_container(), add_line(), add_patch(), and add_table().

2014-05-02 Added colorblind-friendly colormap, named 'Wistia'.

2014-04-27 Improved input clean up in Axes.{h|v}lines

Coerce input into a 1D ndarrays (after dealing with units).

2014-04-27 removed un-needed cast to float in stem

2014-04-23 Updated references to "ipython -pylab"

The preferred method for invoking pylab is now using the "%pylab" magic. -Chris G.

2014-04-22 Added (re-)generate a simple automatic legend to "Figure Options"

dialog of the Qt4Agg backend.

2014-04-22 Added an example showing the difference between

interpolation = 'none' and interpolation = 'nearest' in *imshow* when saving vector graphics files.

2014-04-22 Added violin plotting functions. See *Axes.violinplot*,

Axes.violin, *cbook.violin_stats* and *mlab.GaussianKDE* for details.

2014-04-10 Fixed the triangular marker rendering error. The "Up" triangle was

rendered instead of "Right" triangle and vice-versa.

2014-04-08 Fixed a bug in parasite_axes.py by making a list out

of a generator at line 263.

2014-04-02 Added `clipon=False` to patch creation of wedges and shadows

in *pie*.

2014-02-25 In backend_qt4agg changed from using update -> repaint under

windows. See comment in source near `self._priv_update` for longer explanation.

2014-03-27 Added tests for pie ccw parameter. Removed pdf and svg images

from tests for pie linewidth parameter.

2014-03-24 Changed the behaviour of axes to not ignore leading or trailing

patches of height 0 (or width 0) while calculating the x and y axis limits. Patches having both height == 0 and width == 0 are ignored.

2014-03-24 Added bool kwarg (manage_xticks) to boxplot to enable/disable

the managemnet of the xlimits and ticks when making a boxplot. Default in True which maintains current behavior by default.

2014-03-23 Fixed a bug in projections/polar.py by making sure that the theta

value being calculated when given the mouse coordinates stays within the range of 0 and 2 * pi.

2014-03-22 Added the keyword arguments wedgeprops and textprops to pie.

Users can control the wedge and text properties of the pie in more detail, if they choose.

2014-03-17 Bug was fixed in append_axes from the AxesDivider class would not

append axes in the right location with respect to the reference locator axes

2014-03-13 Add parameter 'clockwise' to function pie, True by default.

2014-02-28 Added 'origin' kwarg to *spy*

2014-02-27 Implemented separate horizontal/vertical axes padding to the

ImageGrid in the AxesGrid toolkit

2014-02-27 Allowed markevery property of matplotlib.lines.Line2D to be, an int

numpy fancy index, slice object, or float. The float behaviour turns on markers at approximately equal display-coordinate-distances along the line.

2014-02-25 In backend_qt4agg changed from using update -> repaint under

windows. See comment in source near `self._priv_update` for longer explanation.

2014-01-02 *triplot* now returns the artist it adds and support of line and

marker kwargs has been improved. GBY

2013-12-30 Made streamplot grid size consistent for different types of density

argument. A 30x30 grid is now used for both density=1 and density=(1, 1).

2013-12-03 Added a pure boxplot-drawing method that allow a more complete

customization of boxplots. It takes a list of dicts contains stats. Also created a function (*cbook.boxplot_stats*) that generates the stats needed.

2013-11-28 Added qhull extension module to perform Delaunay triangulation more

robustly than before. It is used by tri.Triangulation (and hence all pyplot.tri* methods) and mlab.griddata. Deprecated matplotlib.delaunay module. - IMT

2013-11-05 Add power-law normalization method. This is useful for,

e.g., showing small populations in a "hist2d" histogram.

2013-10-27 Added get_rlabel_position and set_rlabel_position methods to

PolarAxes to control angular position of radial tick labels.

2013-10-06 Add stride-based functions to mlab for easy creation of 2D arrays

with less memory.

2013-10-06 Improve window and detrend functions in mlab, particulart support for

2D arrays.

2013-10-06 Improve performance of all spectrum-related mlab functions and plots.

2013-10-06 Added support for magnitude, phase, and angle spectrums to

axes.specgram, and support for magnitude, phase, angle, and complex spectrums to mlab-specgram.

2013-10-06 Added magnitude_spectrum, angle_spectrum, and phase_spectrum plots,

as well as magnitude_spectrum, angle_spectrum, phase_spectrum, and complex_spectrum functions to mlab

2013-07-12 Added support for datetime axes to 2d plots. Axis values are passed

through Axes.convert_xunits/Axes.convert_yunits before being used by contour/contourf, pcolormesh and pcolor.

2013-07-12 Allowed matplotlib.dates.date2num, matplotlib.dates.num2date,

and matplotlib.dates.datestr2num to accept n-d inputs. Also factored in support for n-d arrays to matplotlib.dates.DateConverter and matplotlib.units.Registry.

2013-06-26 Refactored the axes module: the axes module is now a folder,

containing the following submodule:

- _subplots.py, containing all the subplots helper methods

- _base.py, containing several private methods and a new _AxesBase class. This _AxesBase class contains all the methods that are not directly linked to plots of the "old" Axes
- _axes.py contains the Axes class. This class now inherits from _AxesBase: it contains all "plotting" methods and labelling methods.

This refactoring should not affect the API. Only private methods are not importable from the axes module anymore.

2013-05-18 Added support for arbitrary rasterization resolutions to the

SVG backend. Previously the resolution was hard coded to 72 dpi. Now the backend class takes a image_dpi argument for its constructor, adjusts the image bounding box accordingly and forwards a magnification factor to the image renderer. The code and results now resemble those of the PDF backend. - MW

2013-05-08 Changed behavior of hist when given stacked=True and normed=True.

Histograms are now stacked first, then the sum is normalized. Previously, each histogram was normalized, then they were stacked.

2013-04-25 Changed all instances of:

from matplotlib import MatplotlibDeprecationWarning as mplDeprecation
to:

from cbook import mplDeprecation

and removed the import into the matplotlib namespace in __init__.py Thomas Caswell

2013-04-15 Added 'axes.xmargin' and 'axes.ymargin' to rpParams to set default

margins on auto-scaleing. - TAC

2013-04-16 Added patheffect support for Line2D objects. -JJL

2013-03-31 Added support for arbitrary unstructured user-specified

triangulations to Axes3D.tricontour[f] - Damon McDougall

2013-03-19 Added support for passing *linestyle* kwarg to *step* so all *plot*

kwargs are passed to the underlying *plot* call. -TAC

2013-02-25 Added classes CubicTriInterpolator, UniformTriRefiner, TriAnalyzer

to matplotlib.tri module. - GBy

2013-01-23 Add 'savefig.directory' to rcParams to remember and fill in the last

directory saved to for figure save dialogs - Martin Spacek

2013-01-13 Add eventplot method to axes and pyplot and EventCollection class

to collections.

2013-01-08 Added two extra titles to axes which are flush with the left and

right edges of the plot respectively. Andrew Dawson

2013-01-07 Add framealpha keyword argument to legend - PO

2013-01-16 Till Stensitzki added a baseline feature to stackplot

2012-12-22 Added classes for interpolation within triangular grids

(LinearTriInterpolator) and to find the triangles in which points lie (TrapezoidMapTriFinder) to matplotlib.tri module. - IMT

2012-12-05 Added MatplotlibDeprecationWarning class for signaling deprecation.

Matplotlib developers can use this class as follows:

from matplotlib import MatplotlibDeprecationWarning as mplDeprecation

In light of the fact that Python builtin DeprecationWarnings are ignored by default as of Python 2.7, this class was put in to allow for the signaling of deprecation, but via UserWarnings which are not ignored by default. - PI

2012-11-27 Added the *mtext* parameter for supplying matplotlib.text.Text

instances to RendererBase.draw_tex and RendererBase.draw_text. This allows backends to utilize additional text attributes, like the alignment of text elements. - pwuertz

2012-11-26 deprecate matplotlib/mpl.py, which was used only in pylab.py and is

now replaced by the more suitable `import matplotlib as mpl`. - PI

2012-11-25 Make rc_context available via pyplot interface - PI

2012-11-16 plt.set_cmap no longer throws errors if there is not already

an active colorable artist, such as an image, and just sets up the colormap to use from that point forward. - PI

2012-11-16 Added the funcction _get_rbga_face, which is identical to

_get_rbg_face except it return a (r,g,b,a) tuble, to line2D. Modified Line2D.draw to use _get_rbga_face to get the markerface color so that any alpha set by markerfacecolor will respected. - Thomas Caswell

2012-11-13 Add a symmetric log normalization class to colors.py.

Also added some tests for the normalization class. Till Stensitzki

2012-11-12 Make axes.stem take at least one argument.

Uses a default range(n) when the first arg not provided. Damon McDougall

2012-11-09 Make plt.subplot() without arguments act as subplot(111) - PI

2012-11-08 Replaced plt.figure and plt.subplot calls by the newer, more

convenient single call to plt.subplots() in the documentation examples - PI

2012-10-05 Add support for saving animations as animated GIFs. - JVDP

2012-08-11 Fix path-closing bug in patches.Polygon, so that regardless

of whether the path is the initial one or was subsequently set by set_xy(), get_xy() will return a closed path if and only if get_closed() is True. Thanks to Jacob Vanderplas. - EF

2012-08-05 When a norm is passed to contourf, either or both of the

vmin, vmax attributes of that norm are now respected. Formerly they were respected only if both were specified. In addition, vmin and/or vmax can now be passed to contourf directly as kwargs. - EF

2012-07-24 Contourf handles the extend kwarg by mapping the extended

ranges outside the normed 0-1 range so that they are handled by colormap colors determined by the set_under and set_over methods. Previously the extended ranges were mapped to 0 or 1 so that the "under" and "over" colormap colors were ignored. This change also increases slightly the color contrast for a given set of contour levels. - EF

2012-06-24 Make use of mathtext in tick labels configurable - DSD

2012-06-05 Images loaded through PIL are now ordered correctly - CG

2012-06-02 Add new Axes method and pyplot function, hist2d. - PO

2012-05-31 Remove support for 'cairo.<format>' style of backend specification.

Deprecate 'cairo.format' and 'savefig.extension' rcParams and replace with 'savefig.format'. - Martin Spacek

2012-05-29 pcolormesh now obeys the passed in "edgecolor" kwarg.

To support this, the "shading" argument to pcolormesh now only takes "flat" or "gouraud". To achieve the old "faceted" behavior, pass "edgecolors='k'". - MGD

2012-05-22 Added radius kwarg to pie charts. - HH

2012-05-22 Collections now have a setting "offset_position" to select whether

the offsets are given in "screen" coordinates (default, following the old behavior) or "data" coordinates. This is currently used internally to improve the performance of hexbin.

As a result, the "draw_path_collection" backend methods have grown a new argument "offset_position". - MGD

2012-05-04 Add a new argument to pie charts - startingangle - that

allows one to specify the angle offset for the first wedge of the chart. - EP

2012-05-03 symlog scale now obeys the logarithmic base. Previously, it was

completely ignored and always treated as base e. - MGD

2012-05-03 Allow linscalex/y keyword to symlog scale that allows the size of

the linear portion relative to the logarithmic portion to be adjusted. - MGD

2012-04-14 Added new plot style: stackplot. This new feature supports stacked

area plots. - Damon McDougall

2012-04-06 When path clipping changes a LINETO to a MOVETO, it also

changes any CLOSEPOLY command to a LINETO to the initial point. This fixes a problem with pdf and svg where the CLOSEPOLY would then draw a line to the latest MOVETO position instead of the intended initial position. - JKS

2012-03-27 Add support to ImageGrid for placing colorbars only at

one edge of each column/row. - RMM

2012-03-07 Refactor movie writing into useful classes that make use

of pipes to write image data to ffmpeg or mencoder. Also improve settings for these and the ability to pass custom options. - RMM

2012-02-29 errorevery keyword added to errorbar to enable errorbar

subsampling. fixes issue #600.

2012-02-28 Added plot_trisurf to the mplot3d toolkit. This supports plotting

three dimensional surfaces on an irregular grid. - Damon McDougall

2012-01-23 The radius labels in polar plots no longer use a fixed

padding, but use a different alignment depending on the quadrant they are in. This fixes numerical problems when (rmax - rmin) gets too small. - MGD

2012-01-08 Add axes.streamplot to plot streamlines of a velocity field.

Adapted from Tom Flannaghan streamplot implementation. -TSY

2011-12-29 ps and pdf markers are now stroked only if the line width

is nonzero for consistency with agg, fixes issue #621. - JKS

2011-12-27 Work around an EINTR bug in some versions of subprocess. - JKS

2011-10-25 added support for operatorname to mathtext,

including the ability to insert spaces, such as $operatorname{arg,max}$ - PI

2011-08-18 Change api of Axes.get_tightbbox and add an optional

keyword parameter *call_axes_locator*. - JJL

2011-07-29 A new rcParam "axes.formatter.use_locale" was added, that,

when True, will use the current locale to format tick labels. This means that, for example, in the fr_FR locale, ',' will be used as a decimal separator. - MGD

2011-07-15 The set of markers available in the plot() and scatter()

commands has been unified. In general, this gives more options to both than were previously available, however, there is one backward-incompatible change to the markers in scatter:

> "d" used to mean "diamond", it now means "narrow diamond". "D" can be used for a "diamond".

-MGD

2011-07-13 Fix numerical problems in symlog scale, particularly when

linthresh <= 1.0. Symlog plots may look different if one was depending on the old broken behavior - MGD

2011-07-10 Fixed argument handling error in tripcolor/triplot/tricontour,

issue #203. - IMT

2011-07-08 Many functions added to mplot3d.axes3d to bring Axes3D

objects more feature-parity with regular Axes objects. Significant revisions to the documentation as well. - BVR

2011-07-07 Added compatibility with IPython strategy for picking

a version of Qt4 support, and an rcParam for making the choice explicitly: backend.qt4. - EF

2011-07-07 Modified AutoMinorLocator to improve automatic choice of

the number of minor intervals per major interval, and to allow one to specify this number via a kwarg. - EF

2011-06-28 3D versions of scatter, plot, plot_wireframe, plot_surface,

bar3d, and some other functions now support empty inputs. - BVR

2011-06-22 Add set_theta_offset, set_theta_direction and

set_theta_zero_location to polar axes to control the location of 0 and directionality of theta. - MGD

2011-06-22 Add axes.labelweight parameter to set font weight to axis

labels - MGD.

2011-06-20 Add pause function to pyplot. - EF

2011-06-16 Added *bottom* keyword parameter for the stem command.

Also, implemented a legend handler for the stem plot. - JJL

2011-06-16 Added legend.frameon rcParams. - Mike Kaufman

2011-05-31 Made backend_qt4 compatible with PySide . - Gerald Storer

2011-04-17 Disable keyboard auto-repeat in qt4 backend by ignoring

key events resulting from auto-repeat. This makes constrained zoom/pan work. - EF

2011-04-14 interpolation="nearest" always interpolate images. A new

mode "none" is introduced for no interpolation - JJL

2011-04-03 Fixed broken pick interface to AsteriskCollection objects

used by scatter. - EF

2011-04-01 The plot directive Sphinx extension now supports all of the

features in the Numpy fork of that extension. These include doctest formatting, an 'include-source' option, and a number of new configuration options. - MGD

2011-03-29 Wrapped ViewVCCachedServer definition in a factory function.

This class now inherits from urllib2.HTTPSHandler in order to fetch data from github, but HTTPSHandler is not defined if python was built without SSL support. - DSD

2011-03-10 Update pytz version to 2011c, thanks to Simon Cross. - JKS

2011-03-06 Add standalone tests.py test runner script. - JKS

2011-03-06 Set edgecolor to 'face' for scatter asterisk-type

symbols; this fixes a bug in which these symbols were not responding to the c kwarg. The symbols have no face area, so only the edgecolor is visible. - EF

2011-02-27 Support libpng version 1.5.x; suggestion by Michael

Albert. Changed installation specification to a minimum of libpng version 1.2. - EF

2011-02-20 clabel accepts a callable as an fmt kwarg; modified

patch by Daniel Hyams. - EF

2011-02-18 scatter([], []) is now valid. Also fixed issues

with empty collections - BVR

2011-02-07 Quick workaround for dviread bug #3175113 - JKS

2011-02-05 Add cbook memory monitoring for Windows, using

tasklist. - EF

2011-02-05 Speed up Normalize and LogNorm by using in-place

operations and by using float32 for float32 inputs and for ints of 2 bytes or shorter; based on patch by Christoph Gohlke. - EF

2011-02-04 Changed imshow to use rgba as uint8 from start to

finish, instead of going through an intermediate step as double precision; thanks to Christoph Gohlke. - EF

2011-01-13 Added zdir and offset arguments to contourf3d to

bring contourf3d in feature parity with contour3d. - BVR

2011-01-04 Tag 1.0.1 for release at r8896

2011-01-03 Added display of ticker offset to 3d plots. - BVR

2011-01-03 Turn off tick labeling on interior subplots for

pyplots.subplots when sharex/sharey is True. - JDH

2010-12-29 Implement axes_divider.HBox and VBox. -JJL

2010-11-22 Fixed error with Hammer projection. - BVR

2010-11-12 Fixed the placement and angle of axis labels in 3D plots. - BVR

2010-11-07 New rc parameters examples.download and examples.directory

allow bypassing the download mechanism in get_sample_data. - JKS

2010-10-04 Fix JPEG saving bug: only accept the kwargs documented

by PIL for JPEG files. - JKS

2010-09-15 Remove unused _wxagg extension and numerix.h. - EF

2010-08-25 Add new framework for doing animations with examples.- RM

2010-08-21 Remove unused and inappropriate methods from Tick classes:

set_view_interval, get_minpos, and get_data_interval are properly found in the Axis class and don't need to be duplicated in XTick and YTick. - EF

2010-08-21 Change Axis.set_view_interval() so that when updating an

existing interval, it respects the orientation of that interval, and can enlarge but not reduce the interval. This fixes a bug in which Axis.set_ticks would change the view limits of an inverted axis. Whether set_ticks should be affecting the viewLim at all remains an open question. - EF

2010-08-16 Handle NaN's correctly in path analysis routines. Fixes a

bug where the best location for a legend was not calculated correctly when the line contains NaNs. - MGD

2010-08-14 Fix bug in patch alpha handling, and in bar color kwarg - EF

2010-08-12 Removed all traces of numerix module after 17 months of

deprecation warnings. - EF

2010-08-05 Added keyword arguments 'thetaunits' and 'runits' for polar

plots. Fixed PolarAxes so that when it set default Formatters, it marked them as such. Fixed semilogx and semilogy to no longer blindly reset the ticker information on the non-log axis. Axes.arrow can now accept unitized data. - JRE

2010-08-03 Add support for MPLSETUPCFG variable for custom setup.cfg

filename. Used by sage buildbot to build an mpl w/ no gui support - JDH

2010-08-01 Create directory specified by MPLCONFIGDIR if it does

not exist. - ADS

2010-07-20 Return Qt4's default cursor when leaving the canvas - DSD

2010-07-06 Tagging for mpl 1.0 at r8502

2010-07-05 Added Ben Root's patch to put 3D plots in arbitrary axes,

allowing you to mix 3d and 2d in different axes/subplots or to have multiple 3D plots in one figure. See examples/mplot3d/subplot3d_demo.py - JDH

2010-07-05 Preferred kwarg names in set_xlim are now 'left' and

'right'; in set_ylim, 'bottom' and 'top'; original kwargs are still accepted without complaint. - EF

2010-07-05 TkAgg and FltkAgg backends are now consistent with other

interactive backends: when used in scripts from the command line (not from ipython -pylab), show blocks, and can be called more than once. - EF

2010-07-02 Modified CXX/WrapPython.h to fix "swab bug" on solaris so

mpl can compile on Solaris with CXX6 in the trunk. Closes tracker bug 3022815 - JDH

2010-06-30 Added autoscale convenience method and corresponding

pyplot function for simplified control of autoscaling; and changed axis, set_xlim, and set_ylim so that by default, they turn off the autoscaling on the relevant axis or axes. Therefore one can call set_xlim before plotting a line, for example, and the limits will be retained. - EF

2010-06-20 Added Axes.tick_params and corresponding pyplot function

to control tick and tick label appearance after an Axes has been created. - EF

2010-06-09 Allow Axes.grid to control minor gridlines; allow

Axes.grid and Axis.grid to control major and minor gridlines in the same method call. - EF

2010-06-06 Change the way we do split/dividend adjustments in

finance.py to handle dividends and fix the zero division bug reported in sf bug 2949906 and 2123566. Note that volume is not adjusted because the Yahoo CSV does not distinguish between share split and dividend adjustments making it near impossible to get volume adjustment right (unless we want to guess based on the size of the adjustment or scrape the html tables, which we don't) - JDH

2010-06-06 Updated dateutil to 1.5 and pytz to 2010h.

2010-06-02 Add error_kw kwarg to Axes.bar(). - EF

2010-06-01 Fix pcolormesh() and QuadMesh to pass on kwargs as

appropriate. - RM

2010-05-18 Merge mpl_toolkits.gridspec into the main tree. - JJL

2010-05-04 Improve backend_qt4 so it displays figures with the

correct size - DSD

2010-04-20 Added generic support for connecting to a timer for events. This

adds TimerBase, TimerGTK, TimerQT, TimerWx, and TimerTk to the backends and a new_timer() method to each backend's canvas to allow ease of creating a new timer. - RM

2010-04-20 Added margins() Axes method and pyplot function. - EF

2010-04-18 update the axes_grid documentation. -JJL

2010-04-18 Control MaxNLocator parameters after instantiation,

and via Axes.locator_params method, with corresponding pyplot function. -EF

2010-04-18 Control ScalarFormatter offsets directly and via the

Axes.ticklabel_format() method, and add that to pyplot. -EF

2010-04-16 Add a close_event to the backends. -RM

2010-04-06 modify axes_grid examples to use axes_grid1 and axisartist. -JJL

2010-04-06 rebase axes_grid using axes_grid1 and axisartist modules. -JJL

2010-04-06 axes_grid toolkit is split into two separate modules,

axes_grid1 and axisartist. -JJL

2010-04-05 Speed up import: import pytz only if and when it is

needed. It is not needed if the rc timezone is UTC. - EF

2010-04-03 Added color kwarg to Axes.hist(), based on work by

Jeff Klukas. - EF

2010-03-24 refactor colorbar code so that no cla() is necessary when

mappable is changed. -JJL

2010-03-22 fix incorrect rubber band during the zoom mode when mouse

leaves the axes. -JJL

2010-03-21 x/y key during the zoom mode only changes the x/y limits. -JJL

2010-03-20 Added pyplot.sca() function suggested by JJL. - EF

2010-03-20 Added conditional support for new Tooltip API in gtk backend. - EF

2010-03-20 Changed plt.fig_subplot() to plt.subplots() after discussion on

list, and changed its API to return axes as a numpy object array (with control of dimensions via squeeze keyword). FP.

2010-03-13 Manually brought in commits from branch:

```
  ------------------------------------------------------------------------
  r8191 | leejjoon | 2010-03-13 17:27:57 -0500 (Sat, 13 Mar 2010) | 1 line

fix the bug that handles for scatter are incorrectly set when dpi!=72.
Thanks to Ray Speth for the bug report.
```

2010-03-03 Manually brought in commits from branch via diff/patch (svnmerge is broken):

```
------------------------------------------------------------------------
r8175 | leejjoon | 2010-03-03 10:03:30 -0800 (Wed, 03 Mar 2010) | 1 line

fix arguments of allow_rasterization.draw_wrapper
------------------------------------------------------------------------
r8174 | jdh2358 | 2010-03-03 09:15:58 -0800 (Wed, 03 Mar 2010) | 1 line

added support for favicon in docs build
------------------------------------------------------------------------
r8173 | jdh2358 | 2010-03-03 08:56:16 -0800 (Wed, 03 Mar 2010) | 1 line

applied Mattias get_bounds patch
------------------------------------------------------------------------
r8172 | jdh2358 | 2010-03-03 08:31:42 -0800 (Wed, 03 Mar 2010) | 1 line

fix svnmerge download instructions
------------------------------------------------------------------------
r8171 | jdh2358 | 2010-03-03 07:47:48 -0800 (Wed, 03 Mar 2010) | 1 line
```

2010-02-25 add annotation_demo3.py that demonstrates new functionality. -JJL

2010-02-25 refactor Annotation to support arbitrary Transform as xycoords

or textcoords. Also, if a tuple of two coordinates is provided, they are interpreted as coordinates for each x and y position. -JJL

2010-02-24 Added pyplot.fig_subplot(), to create a figure and a group of

subplots in a single call. This offers an easier pattern than manually making figures and calling add_subplot() multiple times. FP

2010-02-17 Added Gokhan's and Mattias' customizable keybindings patch

for the toolbar. You can now set the keymap.* properties in the matplotlibrc file. Newbindings were added for toggling log scaling on the x-axis. JDH

2010-02-16 Committed TJ's filled marker patch for

left|right|bottom|top|full filled markers. See examples/pylab_examples/filledmarker_demo.py. JDH

2010-02-11 Added 'bootstrap' option to boxplot. This allows bootstrap

estimates of median confidence intervals. Based on an initial patch by Paul Hobson. - ADS

2010-02-06 Added setup.cfg "basedirlist" option to override setting

in setupext.py "basedir" dictionary; added "gnu0" platform requested by Benjamin Drung. - EF

2010-02-06 Added 'xy' scaling option to EllipseCollection. - EF

2010-02-03 Made plot_directive use a custom PlotWarning category, so that

warnings can be turned into fatal errors easily if desired. - FP

2010-01-29 Added draggable method to Legend to allow mouse drag

placement. Thanks Adam Fraser. JDH

2010-01-25 Fixed a bug reported by Olle Engdegard, when using

histograms with stepfilled and log=True - MM

2010-01-16 Upgraded CXX to 6.1.1 - JDH

2009-01-16 Don't create minor ticks on top of existing major

ticks. Patch by Neil Crighton. -ADS

2009-01-16 Ensure three minor ticks always drawn (SF# 2924245). Patch

by Neil Crighton. -ADS

2010-01-16 Applied patch by Ian Thomas to fix two contouring

problems: now contourf handles interior masked regions, and the boundaries of line and filled contours coincide. - EF

2009-01-11 The color of legend patch follows the rc parameters

axes.facecolor and axes.edgecolor. -JJL

2009-01-11 adjustable of Axes can be "box-forced" which allow

sharing axes. -JJL

2009-01-11 Add add_click and pop_click methods in

BlockingContourLabeler. -JJL

2010-01-03 Added rcParams['axes.color_cycle'] - EF

2010-01-03 Added Pierre's qt4 formlayout editor and toolbar button - JDH

2009-12-31 Add support for using math text as marker symbols (Thanks to tcb)

- MGD

2009-12-31 Commit a workaround for a regression in PyQt4-4.6.{0,1} - DSD

2009-12-22 Fix cmap data for gist_earth_r, etc. -JJL

2009-12-20 spines: put spines in data coordinates, add set_bounds()

call. -ADS

2009-12-18 Don't limit notch size in boxplot to q1-q3 range, as this

is effectively making the data look better than it is. - ADS

2009-12-18 mlab.prctile handles even-length data, such that the median

is the mean of the two middle values. - ADS

2009-12-15 Add raw-image (unsampled) support for the ps backend. - JJL

2009-12-14 Add patch_artist kwarg to boxplot, but keep old default.

Convert boxplot_demo2.py to use the new patch_artist. - ADS

2009-12-06 axes_grid: reimplemented AxisArtist with FloatingAxes support.

Added new examples. - JJL

2009-12-01 Applied Laurent Dufrechou's patch to improve blitting with

the qt4 backend - DSD

2009-11-13 The pdf backend now allows changing the contents of

a pdf file's information dictionary via PdfPages.infodict. - JKS

2009-11-12 font_manager.py should no longer cause EINTR on Python 2.6

(but will on the 2.5 version of subprocess). Also the fc-list command in that file was fixed so now it should actually find the list of fontconfig fonts. - JKS

2009-11-10 Single images, and all images in renderers with

option_image_nocomposite (i.e. agg, macosx and the svg backend when rcParams['svg.image_noscale'] is True), are now drawn respecting the zorder relative to other artists. (Note that there may now be inconsistencies across backends when more than one image is drawn at varying zorders, but this change introduces correct behavior for the backends in which it's easy to do so.)

2009-10-21 Make AutoDateLocator more configurable by adding options

to control the maximum and minimum number of ticks. Also add control of the intervals to be used for ticking. This does not change behavior but opens previously hard-coded behavior to runtime modification`. - RMM

2009-10-19 Add "path_effects" support for Text and Patch. See

examples/pylab_examples/patheffect_demo.py -JJL

2009-10-19 Add "use_clabeltext" option to clabel. If True, clabels

will be created with ClabelText class, which recalculates rotation angle of the label during the drawing time. -JJL

2009-10-16 Make AutoDateFormatter actually use any specified

timezone setting.This was only working correctly when no timezone was specified. - RMM

2009-09-27 Beginnings of a capability to test the pdf backend. - JKS

2009-09-27 Add a savefig.extension rcparam to control the default

filename extension used by savefig. - JKS

2009-09-21 Tagged for release 0.99.1

2009-09-20 Fix usetex spacing errors in pdf backend. - JKS

2009-09-20 Add Sphinx extension to highlight IPython console sessions,

originally authored (I think) by Michael Droetboom. - FP

2009-09-20 Fix off-by-one error in dviread.Tfm, and additionally protect

against exceptions in case a dvi font is missing some metrics. - JKS

2009-09-15 Implement draw_text and draw_tex method of backend_base using

the textpath module. Implement draw_tex method of the svg backend. - JJL

2009-09-15 Don't fail on AFM files containing floating-point bounding boxes - JKS

2009-09-13 AxesGrid

[add modified version of colorbar. Add colorbar] location howto. - JJL

2009-09-07 AxesGrid

[implemented axisline style.] Added a demo examples/axes_grid/demo_axisline_style.py- JJL

2009-09-04 Make the textpath class as a separate module

(textpath.py). Add support for mathtext and tex.- JJL

2009-09-01 Added support for Gouraud interpolated triangles.

pcolormesh now accepts shading='gouraud' as an option. - MGD

2009-08-29 Added matplotlib.testing package, which contains a Nose

plugin and a decorator that lets tests be marked as KnownFailures - ADS

2009-08-20 Added scaled dict to AutoDateFormatter for customized

scales - JDH

2009-08-15 Pyplot interface: the current image is now tracked at the

figure and axes level, addressing tracker item 1656374. - EF

2009-08-15 Docstrings are now manipulated with decorators defined

in a new module, docstring.py, thanks to Jason Coombs. - EF

2009-08-14 Add support for image filtering for agg back end. See the example

demo_agg_filter.py. -JJL

2009-08-09 AnnotationBbox added. Similar to Annotation, but works with

OffsetBox instead of Text. See the example demo_annotation_box.py. -JJL

2009-08-07 BboxImage implemented. Two examples, demo_bboximage.py and

demo_ribbon_box.py added. - JJL

2009-08-07 In an effort to simplify the backend API, all clipping rectangles

and paths are now passed in using GraphicsContext objects, even on collections and images. Therefore:

draw_path_collection(self, master_transform, cliprect, clippath,

clippath_trans, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds, urls)

becomes:

draw_path_collection(self, gc, master_transform, paths, all_transforms,

offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds, urls)

draw_quad_mesh(self, master_transform, cliprect, clippath,

clippath_trans, meshWidth, meshHeight, coordinates, offsets, offsetTrans, facecolors, antialiased, showedges)

becomes:

draw_quad_mesh(self, gc, master_transform, meshWidth, meshHeight,

coordinates, offsets, offsetTrans, facecolors, antialiased, showedges)

draw_image(self, x, y, im, bbox, clippath=None, clippath_trans=None)

becomes:

draw_image(self, gc, x, y, im)

- MGD

2009-08-06 Tagging the 0.99.0 release at svn r7397 - JDH

- fixed an alpha colormapping bug posted on sf 2832575
- fix typo in axes_divider.py. use nanmin, nanmax in angle_helper.py (patch by Christoph Gohlke)
- remove dup gui event in enter/leave events in gtk
- lots of fixes for os x binaries (Thanks Russell Owen)
- attach gtk events to mpl events -- fixes sf bug 2816580
- applied sf patch 2815064 (middle button events for wx) and patch 2818092 (resize events for wx)
- fixed boilerplate.py so it doesn't break the ReST docs.
- removed a couple of cases of mlab.load
- fixed rec2csv win32 file handle bug from sf patch 2831018
- added two examples from Josh Hemann: examples/pylab_examples/barchart_demo2.py and examples/pylab_examples/boxplot_demo2.py
- handled sf bugs 2831556 and 2830525; better bar error messages and backend driver configs
- added miktex win32 patch from sf patch 2820194
- apply sf patches 2830233 and 2823885 for osx setup and 64 bit; thanks Michiel

2009-08-04 Made cbook.get_sample_data make use of the ETag and Last-Modified

headers of mod_dav_svn. - JKS

2009-08-03 Add PathCollection; modify contourf to use complex

paths instead of simple paths with cuts. - EF

2009-08-03 Fixed boilerplate.py so it doesn't break the ReST docs. - JKS

2009-08-03 pylab no longer provides a load and save function. These

are available in matplotlib.mlab, or you can use numpy.loadtxt and numpy.savetxt for text files, or np.save and np.load for binary numpy arrays. - JDH

2009-07-31 Added cbook.get_sample_data for urllib enabled fetching and

caching of data needed for examples. See examples/misc/sample_data_demo.py - JDH

2009-07-31 Tagging 0.99.0.rc1 at 7314 - MGD

2009-07-30 Add set_cmap and register_cmap, and improve get_cmap,

to provide convenient handling of user-generated colormaps. Reorganized _cm and cm modules. - EF

2009-07-28 Quiver speed improved, thanks to tip by Ray Speth. -EF

2009-07-27 Simplify argument handling code for plot method. -EF

2009-07-25 Allow "plot(1, 2, 'r*')" to work. - EF

2009-07-22 Added an 'interp' keyword to griddata so the faster linear

interpolation method can be chosen. Default is 'nn', so default behavior (using natural neighbor method) is unchanged (JSW)

2009-07-22 Improved boilerplate.py so that it generates the correct

signatures for pyplot functions. - JKS

2009-07-19 Fixed the docstring of Axes.step to reflect the correct

meaning of the kwargs "pre" and "post" - See SF bug https://sourceforge.net/tracker/index.php?func=detail&aid=2823304&group_id=80706&ati
- JDH

2009-07-18 Fix support for hatches without color fills to pdf and svg

backends. Add an example of that to hatch_demo.py. - JKS

2009-07-17 Removed fossils from swig version of agg backend. - EF

2009-07-14 initial submission of the annotation guide. -JJL

2009-07-14 axes_grid

[minor improvements in anchored_artists and] inset_locator. -JJL

2009-07-14 Fix a few bugs in ConnectionStyle algorithms. Add

ConnectionPatch class. -JJL

2009-07-11 Added a fillstyle Line2D property for half filled markers

-- see examples/pylab_examples/fillstyle_demo.py JDH

2009-07-08 Attempt to improve performance of qt4 backend, do not call

qApp.processEvents while processing an event. Thanks Ole Streicher for tracking this down - DSD

2009-06-24 Add withheader option to mlab.rec2csv and changed

use_mrecords default to False in mlab.csv2rec since this is partially broken - JDH

2009-06-24 backend_agg.draw_marker quantizes the main path (as in the

draw_path). - JJL

2009-06-24 axes_grid: floating axis support added. - JJL

2009-06-14 Add new command line options to backend_driver.py to support

running only some directories of tests - JKS

2009-06-13 partial cleanup of mlab and its importation in pylab - EF

2009-06-13 Introduce a rotation_mode property for the Text artist. See

examples/pylab_examples/demo_text_rotation_mode.py -JJL

2009-06-07 add support for bz2 files per sf support request 2794556 -

JDH

2009-06-06 added a properties method to the artist and inspector to

return a dict mapping property name -> value; see sf feature request 2792183 - JDH

2009-06-06 added Neil's auto minor tick patch; sf patch #2789713 - JDH

2009-06-06 do not apply alpha to rgba color conversion if input is

already rgba - JDH

2009-06-03 axes_grid

[Initial check-in of curvelinear grid support. See] examples/axes_grid/demo_curvelinear_grid.py - JJL

2009-06-01 Add set_color method to Patch - EF

2009-06-01 Spine is now derived from Patch - ADS

2009-06-01 use cbook.is_string_like() instead of isinstance() for spines - ADS

2009-06-01 cla() support for spines - ADS

2009-06-01 Removed support for gtk < 2.4. - EF

2009-05-29 Improved the animation_blit_qt4 example, which was a mix

of the object-oriented and pylab interfaces. It is now strictly object-oriented - DSD

2009-05-28 Fix axes_grid toolkit to work with spine patch by ADS. - JJL

2009-05-28 Applied fbianco's patch to handle scroll wheel events in

the qt4 backend - DSD

2009-05-26 Add support for "axis spines" to have arbitrary location. -ADS

2009-05-20 Add an empty matplotlibrc to the tests/ directory so that running

tests will use the default set of rcparams rather than the user's config. - RMM

2009-05-19 Axis.grid(): allow use of which='major,minor' to have grid

on major and minor ticks. -ADS

2009-05-18 Make psd(), csd(), and cohere() wrap properly for complex/two-sided

versions, like specgram() (SF #2791686) - RMM

2009-05-18 Fix the linespacing bug of multiline text (#1239682). See

examples/pylab_examples/multiline.py -JJL

2009-05-18 Add *annotation_clip* attr. for text.Annotation class.

If True, annotation is only drawn when the annotated point is inside the axes area. -JJL

2009-05-17 Fix bug(#2749174) that some properties of minor ticks are

not conserved -JJL

2009-05-17 applied Michiel's sf patch 2790638 to turn off gtk event

loop in setupext for pygtk>=2.15.10 - JDH

2009-05-17 applied Michiel's sf patch 2792742 to speed up Cairo and

macosx collections; speedups can be 20x. Also fixes some bugs in which gc got into inconsistent state

---

2008-05-17 Release 0.98.5.3 at r7107 from the branch - JDH

2009-05-13 An optional offset and bbox support in restore_bbox.

Add animation_blit_gtk2.py. -JJL

2009-05-13 psfrag in backend_ps now uses baseline-alignment

when preview.sty is used ((default is bottom-alignment). Also, a small API improvement in OffsetBox-JJL

2009-05-13 When the x-coordinate of a line is monotonically

increasing, it is now automatically clipped at the stage of generating the transformed path in the draw method; this greatly speeds up zooming and panning when one is looking at a short segment of a long time series, for example. - EF

2009-05-11 aspect=1 in log-log plot gives square decades. -JJL

2009-05-08 clabel takes new kwarg, rightside_up; if False, labels

will not be flipped to keep them rightside-up. This allows the use of clabel to make streamfunction arrows, as requested by Evan Mason. - EF

2009-05-07 'labelpad' can now be passed when setting x/y labels. This allows controlling the spacing between the label and its axis. - RMM

2009-05-06 print_ps now uses mixed-mode renderer. Axes.draw rasterize artists whose zorder smaller than rasterization_zorder. -JJL

2009-05-06 Per-artist Rasterization, originally by Eric Bruning. -JJ

2009-05-05 Add an example that shows how to make a plot that updates using data from another process. Thanks to Robert Cimrman - RMM

2009-05-05 Add Axes.get_legend_handles_labels method. - JJL

2009-05-04 Fix bug that Text.Annotation is still drawn while set to not visible. - JJL

2009-05-04 Added TJ's fill_betweenx patch - JDH

2009-05-02 Added options to plotfile based on question from Joseph Smidt and patch by Matthias Michler. - EF

2009-05-01 Changed add_artist and similar Axes methods to return their argument. - EF

2009-04-30 Incorrect eps bbox for landscape mode fixed - JJL

2009-04-28 Fixed incorrect bbox of eps output when usetex=True. - JJL

2009-04-24 Changed use of os.open* to instead use subprocess.Popen. os.popen* are deprecated in 2.6 and are removed in 3.0. - RMM

2009-04-20 Worked on axes_grid documentation. Added axes_grid.inset_locator. - JJL

2009-04-17 Initial check-in of the axes_grid toolkit. - JJL

2009-04-17 Added a support for bbox_to_anchor in offsetbox.AnchoredOffsetbox. Improved a documentation. - JJL

2009-04-16 Fixed a offsetbox bug that multiline texts are not correctly aligned. - JJL

2009-04-16 Fixed a bug in mixed mode renderer that images produced by an rasterizing backend are placed with incorrect size. - JJL

2009-04-14 Added Jonathan Taylor's Reinier Heeres' port of John Porters' mplot3d to svn trunk. Package in mpl_toolkits.mplot3d and demo is examples/mplot3d/demo.py. Thanks Reiner

2009-04-06 The pdf backend now escapes newlines and linefeeds in strings.

Fixes sf bug #2708559; thanks to Tiago Pereira for the report.

2009-04-06 texmanager.make_dvi now raises an error if LaTeX failed to

create an output file. Thanks to Joao Luis Silva for reporting this. - JKS

2009-04-05 _png.read_png() reads 12 bit PNGs (patch from

Tobias Wood) - ADS

2009-04-04 Allow log axis scale to clip non-positive values to

small positive value; this is useful for errorbars. - EF

2009-03-28 Make images handle nan in their array argument.

A helper, cbook.safe_masked_invalid() was added. - EF

2009-03-25 Make contour and contourf handle nan in their Z argument. - EF

2009-03-20 Add AuxTransformBox in offsetbox.py to support some transformation.

anchored_text.py example is enhanced and renamed (anchored_artists.py). - JJL

2009-03-20 Add "bar" connection style for annotation - JJL

2009-03-17 Fix bugs in edge color handling by contourf, found

by Jae-Joon Lee. - EF

2009-03-14 Added 'LightSource' class to colors module for

creating shaded relief maps. shading_example.py added to illustrate usage. - JSW

2009-03-11 Ensure wx version >= 2.8; thanks to Sandro Tosi and

Chris Barker. - EF

2009-03-10 Fix join style bug in pdf. - JKS

2009-03-07 Add pyplot access to figure number list - EF

2009-02-28 hashing of FontProperties accounts current rcParams - JJL

2009-02-28 Prevent double-rendering of shared axis in twinx, twiny - EF

2009-02-26 Add optional bbox_to_anchor argument for legend class - JJL

2009-02-26 Support image clipping in pdf backend. - JKS

2009-02-25 Improve tick location subset choice in FixedLocator. - EF

2009-02-24 Deprecate numerix, and strip out all but the numpy

part of the code. - EF

2009-02-21 Improve scatter argument handling; add an early error
message, allow inputs to have more than one dimension. - EF

2009-02-16 Move plot_directive.py to the installed source tree. Add
support for inline code content - MGD

2009-02-16 Move mathmpl.py to the installed source tree so it is
available to other projects. - MGD

2009-02-14 Added the legend title support - JJL

2009-02-10 Fixed a bug in backend_pdf so it doesn't break when the setting
pdf.use14corefonts=True is used. Added test case in unit/test_pdf_use14corefonts.py. - NGR

2009-02-08 Added a new imsave function to image.py and exposed it in
the pyplot interface - GR

2009-02-04 Some reorgnization of the legend code. anchored_text.py
added as an example. - JJL

2009-02-04 Add extent keyword arg to hexbin - ADS

2009-02-04 Fix bug in mathtext related to dots and ldots - MGD

2009-02-03 Change default joinstyle to round - MGD

2009-02-02 Reduce number of marker XObjects in pdf output - JKS

2009-02-02 Change default resolution on polar plot to 1 - MGD

2009-02-02 Avoid malloc errors in ttconv for fonts that don't have
e.g., PostName (a version of Tahoma triggered this) - JKS

2009-01-30 Remove support for pyExcelerator in exceltools -- use xlwt
instead - JDH

2009-01-29 Document 'resolution' kwarg for polar plots. Support it
when using pyplot.polar, not just Figure.add_axes. - MGD

2009-01-29 Rework the nan-handling/clipping/quantizing/simplification
framework so each is an independent part of a pipeline. Expose the C++-implementation of all of this so it can be used from all Python backends. Add rcParam "path.simplify_threshold" to control the threshold of similarity below which vertices will be removed.

2009-01-26 Improved tight bbox option of the savefig. - JJL

2009-01-26 Make curves and NaNs play nice together - MGD

2009-01-21 Changed the defaults of acorr and xcorr to use

usevlines=True, maxlags=10 and normed=True since these are the best defaults

2009-01-19 Fix bug in quiver argument handling. - EF

2009-01-19 Fix bug in backend_gtk: don't delete nonexistent toolbar. - EF

2009-01-16 Implement bbox_inches option for savefig. If bbox_inches is

"tight", try to determine the tight bounding box. - JJL

2009-01-16 Fix bug in is_string_like so it doesn't raise an

unnecessary exception. - EF

2009-01-16 Fix an infinite recursion in the unit registry when searching

for a converter for a sequence of strings. Add a corresponding test. - RM

2009-01-16 Bugfix of C typedef of MPL_Int64 that was failing on

Windows XP 64 bit, as reported by George Goussard on numpy mailing list. - ADS

2009-01-16 Added helper function LinearSegmentedColormap.from_list to

facilitate building simple custom colomaps. See examples/pylab_examples/custom_cmap_fromlist.py - JDH

2009-01-16 Applied Michiel's patch for macosx backend to fix rounding

bug. Closed sf bug 2508440 - JSW

2009-01-10 Applied Michiel's hatch patch for macosx backend and

draw_idle patch for qt. Closes sf patched 2497785 and 2468809 - JDH

2009-01-10 Fix bug in pan/zoom with log coordinates. - EF

2009-01-06 Fix bug in setting of dashed negative contours. - EF

2009-01-06 Be fault tolerant when len(linestyles)>NLev in contour. - MM

2009-01-06 Added marginals kwarg to hexbin to plot marginal densities

JDH

2009-01-06 Change user-visible multipage pdf object to PdfPages to

avoid accidents with the file-like PdfFile. - JKS

2009-01-05 Fix a bug in pdf usetex: allow using non-embedded fonts. - JKS

2009-01-05 optional use of preview.sty in usetex mode. - JJL

2009-01-02 Allow multipage pdf files. - JKS

2008-12-31 Improve pdf usetex by adding support for font effects

(slanting and extending). - JKS

2008-12-29 Fix a bug in pdf usetex support, which occurred if the same

Type-1 font was used with different encodings, e.g., with Minion Pro and Mn-Symbol. - JKS

2008-12-20 fix the dpi-dependent offset of Shadow. - JJL

2008-12-20 fix the hatch bug in the pdf backend. minor update

in docs and example - JJL

2008-12-19 Add axes_locator attribute in Axes. Two examples are added.

- JJL

2008-12-19 Update Axes.legend documentation. /api/api_changes.rst is also

updated to describe changes in keyword parameters. Issue a warning if old keyword parameters are used. - JJL

2008-12-18 add new arrow style, a line + filled triangles. -JJL

2008-12-18 Re-Released 0.98.5.2 from v0_98_5_maint at r6679

Released 0.98.5.2 from v0_98_5_maint at r6667

2008-12-18 Removed configobj, experimental traits and doc/mpl_data link - JDH

2008-12-18 Fix bug where a line with NULL data limits prevents

subsequent data limits from calculating correctly - MGD

2008-12-17 Major documentation generator changes - MGD

2008-12-17 Applied macosx backend patch with support for path

collections, quadmesh, etc... - JDH

2008-12-17 fix dpi-dependent behavior of text bbox and arrow in annotate

-JJL

2008-12-17 Add group id support in artist. Two examples which

demonstrate svg filter are added. -JJL

2008-12-16 Another attempt to fix dpi-dependent behavior of Legend. -JJL

2008-12-16 Fixed dpi-dependent behavior of Legend and fancybox in Text.

2008-12-16 Added markevery property to Line2D to support subsampling

of markers - JDH

2008-12-15 Removed mpl_data symlink in docs. On platforms that do not

support symlinks, these become copies, and the font files are large, so the distro becomes unnecessarily bloated. Keeping the mpl_examples dir because relative links are harder for the plot directive and the *.py files are not so large. - JDH

2008-12-15 Fix $ in non-math text with usetex off. Document

differences between usetex on/off - MGD

2008-12-15 Fix anti-aliasing when auto-snapping - MGD

2008-12-15 Fix grid lines not moving correctly during pan and zoom - MGD

2008-12-12 Preparations to eliminate maskedarray rcParams key: its

use will now generate a warning. Similarly, importing the obsolote numerix.npyma will generate a warning. - EF

2008-12-12 Added support for the numpy.histogram() weights parameter

to the axes hist() method. Docs taken from numpy - MM

2008-12-12 Fixed warning in hist() with numpy 1.2 - MM

2008-12-12 Removed external packages: configobj and enthought.traits

which are only required by the experimental traited config and are somewhat out of date. If needed, install them independently, see:

http://code.enthought.com/pages/traits.html

and:

http://www.voidspace.org.uk/python/configobj.html

2008-12-12 Added support to assign labels to histograms of multiple

data. - MM

2008-12-11 Released 0.98.5 at svn r6573

2008-12-11 Use subprocess.Popen instead of os.popen in dviread

(Windows problem reported by Jorgen Stenarson) - JKS

2008-12-10 Added Michael's font_manager fix and Jae-Joon's

figure/subplot fix. Bumped version number to 0.98.5 - JDH

2008-12-09 Released 0.98.4 at svn r6536

2008-12-08 Added mdehoon's native macosx backend from sf patch 2179017 - JDH

2008-12-08 Removed the prints in the set_*style commands. Return the

list of pprinted strings instead - JDH

2008-12-08 Some of the changes Michael made to improve the output of

the property tables in the rest docs broke of made difficult to use some of the interactive doc helpers, e.g., setp and getp. Having all the rest markup in the ipython shell also confused the docstrings. I added a new rc param docstring.hardcopy, to format the docstrings differently for hard copy and other use.

The ArtistInspector could use a little refactoring now since there is duplication of effort between the rest out put and the non-rest output - JDH

2008-12-08 Updated spectral methods (psd, csd, etc.) to scale one-sided

densities by a factor of 2 and, optionally, scale all densities by the sampling frequency. This gives better MatLab compatibility. -RM

2008-12-08 Fixed alignment of ticks in colorbars. -MGD

2008-12-07 drop the deprecated "new" keyword of np.histogram() for

numpy 1.2 or later. -JJL

2008-12-06 Fixed a bug in svg backend that new_figure_manager()

ignores keywords arguments such as figsize, etc. -JJL

2008-12-05 Fixed a bug that the handlelength of the new legend class

set too short when numpoints=1 -JJL

2008-12-04 Added support for data with units (e.g., dates) to

Axes.fill_between. -RM

2008-12-04 Added fancybox keyword to legend. Also applied some changes

for better look, including baseline adjustment of the multiline texts so that it is center aligned. -JJL

2008-12-02 The transmuter classes in the patches.py are reorganized as

subclasses of the Style classes. A few more box and arrow styles are added. -JJL

2008-12-02 Fixed a bug in the new legend class that didn't allowed

a tuple of coordinate values as loc. -JJL

2008-12-02 Improve checks for external dependencies, using subprocess

(instead of deprecated popen*) and distutils (for version checking) - DSD

2008-11-30 Reimplementation of the legend which supports baseline alignment,

multi-column, and expand mode. - JJL

2008-12-01 Fixed histogram autoscaling bug when bins or range are given

explicitly (fixes Debian bug 503148) - MM

2008-11-25 Added rcParam axes.unicode_minus which allows plain hyphen

for minus when False - JDH

2008-11-25 Added scatterpoints support in Legend. patch by Erik

Tollerud - JJL

2008-11-24 Fix crash in log ticking. - MGD

2008-11-20 Added static helper method BrokenHBarCollection.span_where

and Axes/pyplot method fill_between. See examples/pylab/fill_between.py - JDH

2008-11-12 Add x_isdata and y_isdata attributes to Artist instances,

and use them to determine whether either or both coordinates are used when updating dataLim. This is used to fix autoscaling problems that had been triggered by axhline, axhspan, axvline, axvspan. - EF

2008-11-11 Update the psd(), csd(), cohere(), and specgram() methods

of Axes and the csd() cohere(), and specgram() functions in mlab to be in sync with the changes to psd(). In fact, under the hood, these all call the same core to do computations. - RM

2008-11-11 Add 'pad_to' and 'sides' parameters to mlab.psd() to

allow controlling of zero padding and returning of negative frequency components, respecitively. These are added in a way that does not change the API. - RM

2008-11-10 Fix handling of c kwarg by scatter; generalize

is_string_like to accept numpy and numpy.ma string array scalars. - RM and EF

2008-11-09 Fix a possible EINTR problem in dviread, which might help

when saving pdf files from the qt backend. - JKS

2008-11-05 Fix bug with zoom to rectangle and twin axes - MGD

2008-10-24 Added Jae Joon's fancy arrow, box and annotation

enhancements -- see examples/pylab_examples/annotation_demo2.py

2008-10-23 Autoscaling is now supported with shared axes - EF

2008-10-23 Fixed exception in dviread that happened with Minion - JKS

2008-10-21 set_xlim, ylim now return a copy of the viewlim array to

avoid modify inplace surprises

2008-10-20 Added image thumbnail generating function

matplotlib.image.thumbnail. See examples/misc/image_thumbnail.py - JDH

2008-10-20 Applied scatleg patch based on ideas and work by Erik

Tollerud and Jae-Joon Lee. - MM

2008-10-11 Fixed bug in pdf backend: if you pass a file object for

output instead of a filename, e.g., in a wep app, we now flush the object at the end. - JKS

2008-10-08 Add path simplification support to paths with gaps. - EF

2008-10-05 Fix problem with AFM files that don't specify the font's

full name or family name. - JKS

2008-10-04 Added 'scilimits' kwarg to Axes.ticklabel_format() method,

for easy access to the set_powerlimits method of the major ScalarFormatter. - EF

2008-10-04 Experimental new kwarg borderpad to replace pad in legend,

based on suggestion by Jae-Joon Lee. - EF

2008-09-27 Allow spy to ignore zero values in sparse arrays, based

on patch by Tony Yu. Also fixed plot to handle empty data arrays, and fixed handling of markers in figlegend. - EF

2008-09-24 Introduce drawstyles for lines. Transparently split linestyles

like 'steps--' into drawstyle 'steps' and linestyle '--'. Legends always use drawstyle 'default'. - MM

2008-09-18 Fixed quiver and quiverkey bugs (failure to scale properly

when resizing) and added additional methods for determining the arrow angles - EF

2008-09-18 Fix polar interpolation to handle negative values of theta - MGD

2008-09-14 Reorganized cbook and mlab methods related to numerical

calculations that have little to do with the goals of those two modules into a separate module numerical_methods.py Also, added ability to select points and stop point selection with keyboard in ginput and manual contour labeling code. Finally, fixed contour labeling bug. - DMK

2008-09-11 Fix backtick in Postscript output. - MGD

2008-09-10 [2089958] Path simplification for vector output backends

Leverage the simplification code exposed through path_to_polygons to simplify certain well-behaved paths in the vector backends (PDF, PS and SVG). "path.simplify" must be set to True in matplotlibrc for this to work. - MGD

2008-09-10 Add "filled" kwarg to Path.intersects_path and

Path.intersects_bbox. - MGD

2008-09-07 Changed full arrows slightly to avoid an xpdf rendering

problem reported by Friedrich Hagedorn. - JKS

2008-09-07 Fix conversion of quadratic to cubic Bezier curves in PDF

and PS backends. Patch by Jae-Joon Lee. - JKS

2008-09-06 Added 5-point star marker to plot command - EF

2008-09-05 Fix hatching in PS backend - MGD

2008-09-03 Fix log with base 2 - MGD

2008-09-01 Added support for bilinear interpolation in

NonUniformImage; patch by Gregory Lielens. - EF

2008-08-28 Added support for multiple histograms with data of

different length - MM

2008-08-28 Fix step plots with log scale - MGD

2008-08-28 Fix masked arrays with markers in non-Agg backends - MGD

2008-08-28 Fix clip_on kwarg so it actually works correctly - MGD

2008-08-25 Fix locale problems in SVG backend - MGD

2008-08-22 fix quiver so masked values are not plotted - JSW

2008-08-18 improve interactive pan/zoom in qt4 backend on windows - DSD

2008-08-11 Fix more bugs in NaN/inf handling. In particular, path simplification

(which does not handle NaNs or infs) will be turned off automatically when infs or NaNs are present. Also masked arrays are now converted to arrays with NaNs for consistent handling of masks and NaNs - MGD and EF

2008-08-03 Released 0.98.3 at svn r5947

2008-08-01 Backported memory leak fixes in _ttconv.cpp - MGD

2008-07-31 Added masked array support to griddata. - JSW

2008-07-26 Added optional C and reduce_C_function arguments to

axes.hexbin(). This allows hexbin to accumulate the values of C based on the x,y coordinates and display in hexagonal bins. - ADS

2008-07-24 Deprecated (raise NotImplementedError) all the mlab2

functions from matplotlib.mlab out of concern that some of them were not clean room implementations. JDH

2008-07-24 Rewrite of a significant portion of the clabel code (class

ContourLabeler) to improve inlining. - DMK

2008-07-22 Added Barbs polygon collection (similar to Quiver) for plotting

wind barbs. Added corresponding helpers to Axes and pyplot as well. (examples/pylab_examples/barb_demo.py shows it off.) - RMM

2008-07-21 Added scikits.delaunay as matplotlib.delaunay. Added griddata

function in matplotlib.mlab, with example (griddata_demo.py) in pylab_examples. griddata function will use mpl_toolkits._natgrid if installed. - JSW

2008-07-21 Re-introduced offset_copy that works in the context of the

new transforms. - MGD

2008-07-21 Committed patch by Ryan May to add get_offsets and

set_offsets to Collections base class - EF

2008-07-21 Changed the "asarray" strategy in image.py so that

colormapping of masked input should work for all image types (thanks Klaus Zimmerman) - EF

2008-07-20 Rewrote cbook.delete_masked_points and corresponding

unit test to support rgb color array inputs, datetime inputs, etc. - EF

2008-07-20 Renamed unit/axes_unit.py to cbook_unit.py and modified

in accord with Ryan's move of delete_masked_points from axes to cbook. - EF

2008-07-18 Check for nan and inf in axes.delete_masked_points().

This should help hexbin and scatter deal with nans. - ADS

2008-07-17 Added ability to manually select contour label locations.

Also added a waitforbuttonpress function. - DMK

2008-07-17 Fix bug with NaNs at end of path (thanks, Andrew Straw for

the report) - MGD

2008-07-16 Improve error handling in texmanager, thanks to Ian Henry

for reporting - DSD

2008-07-12 Added support for external backends with the

"module://my_backend" syntax - JDH

2008-07-11 Fix memory leak related to shared axes. Grouper should

store weak references. - MGD

2008-07-10 Bugfix: crash displaying fontconfig pattern - MGD

2008-07-10 Bugfix: [2013963] update_datalim_bounds in Axes not works - MGD

2008-07-10 Bugfix: [2014183] multiple imshow() causes gray edges - MGD

2008-07-09 Fix rectangular axes patch on polar plots bug - MGD

2008-07-09 Improve mathtext radical rendering - MGD

2008-07-08 Improve mathtext superscript placement - MGD

2008-07-07 Fix custom scales in pcolormesh (thanks Matthew Turk) - MGD

2008-07-03 Implemented findobj method for artist and pyplot - see

examples/pylab_examples/findobj_demo.py - JDH

2008-06-30 Another attempt to fix TextWithDash - DSD

2008-06-30 Removed Qt4 NavigationToolbar2.destroy -- it appears to

have been unnecessary and caused a bug reported by P. Raybaut - DSD

2008-06-27 Fixed tick positioning bug - MM

2008-06-27 Fix dashed text bug where text was at the wrong end of the

dash - MGD

2008-06-26 Fix mathtext bug for expressions like $x_{leftarrow}$ - MGD

2008-06-26 Fix direction of horizontal/vertical hatches - MGD

2008-06-25 Figure.figurePatch renamed Figure.patch, Axes.axesPatch

renamed Axes.patch, Axes.axesFrame renamed Axes.frame, Axes.get_frame, which returns Axes.patch, is deprecated. Examples and users guide updated - JDH

2008-06-25 Fix rendering quality of pcolor - MGD

2008-06-24 Released 0.98.2 at svn r5667 - (source only for debian) JDH

2008-06-24 Added "transparent" kwarg to savefig. - MGD

2008-06-24 Applied Stefan's patch to draw a single centered marker over

a line with numpoints==1 - JDH

2008-06-23 Use splines to render circles in scatter plots - MGD

2008-06-22 Released 0.98.1 at revision 5637

2008-06-22 Removed axes3d support and replaced it with a

NotImplementedError for one release cycle

2008-06-21 fix marker placement bug in backend_ps - DSD

2008-06-20 [1978629] scale documentation missing/incorrect for log - MGD

2008-06-20 Added closed kwarg to PolyCollection. Fixes bug [1994535

] still missing lines on graph with svn (r 5548). - MGD

2008-06-20 Added set/get_closed method to Polygon; fixes error

in hist - MM

2008-06-19 Use relative font sizes (e.g., 'medium' and 'large') in

rcsetup.py and matplotlibrc.template so that text will be scaled by default when changing rcParams['font.size'] - EF

2008-06-17 Add a generic PatchCollection class that can contain any

kind of patch. - MGD

2008-06-13 Change pie chart label alignment to avoid having labels

overwrite the pie - MGD

2008-06-12 Added some helper functions to the mathtext parser to

return bitmap arrays or write pngs to make it easier to use mathtext outside the context of an mpl figure. modified the mathpng sphinxext to use the mathtext png save functionality - see examples/api/mathtext_asarray.py - JDH

2008-06-11 Use matplotlib.mathtext to render math expressions in

online docs - MGD

2008-06-11 Move PNG loading/saving to its own extension module, and

remove duplicate code in _backend_agg.cpp and _image.cpp that does the same thing - MGD

2008-06-11 Numerous mathtext bugfixes, primarily related to

dpi-independence - MGD

2008-06-10 Bar now applies the label only to the first patch only, and

sets '_nolegend_' for the other patch labels. This lets autolegend work as expected for hist and bar - see https://sourceforge.net/tracker/index.php?func=detail&aid=1986597&group_id=80706&ati
JDH

2008-06-10 Fix text baseline alignment bug. [1985420] Repair of

baseline alignment in Text._get_layout. Thanks Stan West - MGD

2008-06-09 Committed Gregor's image resample patch to downsampling

images with new rcparam image.resample - JDH

2008-06-09 Don't install Enthought.Traits along with matplotlib. For

matplotlib developers convenience, it can still be installed by setting an option in setup.cfg while we figure decide if there is a future for the traited config - DSD

2008-06-09 Added range keyword arg to hist() - MM

2008-06-07 Moved list of backends to rcsetup.py; made use of lower

case for backend names consistent; use validate_backend when importing backends subpackage - EF

2008-06-06 hist() revision, applied ideas proposed by Erik Tollerud and

Olle Engdegard: make histtype='step' unfilled by default and introduce histtype='stepfilled'; use default color cycle; introduce reverse cumulative histogram; new align keyword - MM

2008-06-06 Fix closed polygon patch and also provide the option to

not close the polygon - MGD

2008-06-05 Fix some dpi-changing-related problems with PolyCollection,

as called by Axes.scatter() - MGD

2008-06-05 Fix image drawing so there is no extra space to the right

or bottom - MGD

2006-06-04 Added a figure title command suptitle as a Figure method

and pyplot command -- see examples/figure_title.py - JDH

2008-06-02 Added support for log to hist with histtype='step' and fixed

a bug for log-scale stacked histograms - MM

2008-05-29 Released 0.98.0 at revision 5314

2008-05-29 matplotlib.image.imread now no longer always returns RGBA

-- if the image is luminance or RGB, it will return a MxN or MxNx3 array if possible. Also uint8 is no longer always forced to float.

2008-05-29 Implement path clipping in PS backend - JDH

2008-05-29 Fixed two bugs in texmanager.py:

improved comparison of dvipng versions fixed a bug introduced when get_grey method was added - DSD

2008-05-28 Fix crashing of PDFs in xpdf and ghostscript when two-byte

characters are used with Type 3 fonts - MGD

2008-05-28 Allow keyword args to configure widget properties as

requested in http://sourceforge.net/tracker/index.php?func=detail&aid=1866207&group_id=
- JDH

2008-05-28 Replaced '-' with u'u2212' for minus sign as requested in

http://sourceforge.net/tracker/index.php?func=detail&aid=1962574&group_id=80706&atid

2008-05-28 zero width/height Rectangles no longer influence the

autoscaler. Useful for log histograms with empty bins - JDH

2008-05-28 Fix rendering of composite glyphs in Type 3 conversion

(particularly as evidenced in the Eunjin.ttf Korean font) Thanks Jae-Joon Lee for finding this!

2008-05-27 Rewrote the cm.ScalarMappable callback infrastructure to

use cbook.CallbackRegistry rather than custom callback handling. Amy users of add_observer/notify of the cm.ScalarMappable should uae the cm.ScalarMappable.callbacksSM CallbackRegistry instead. JDH

2008-05-27 Fix TkAgg build on Ubuntu 8.04 (and hopefully a more

general solution for other platforms, too.)

2008-05-24 Added PIL support for loading images to imread (if PIL is

available) - JDH

2008-05-23 Provided a function and a method for controlling the

plot color cycle. - EF

2008-05-23 Major revision of hist(). Can handle 2D arrays and create

stacked histogram plots; keyword 'width' deprecated and rwidth (relative width) introduced; align='edge' changed to center of bin - MM

2008-05-22 Added support for ReST-based doumentation using Sphinx.

Documents are located in doc/, and are broken up into a users guide and an API reference. To build, run the make.py files. Sphinx-0.4 is needed to build generate xml, which will be useful for rendering equations with mathml, use sphinx from svn until 0.4 is released - DSD

2008-05-21 Fix segfault in TkAgg backend - MGD

2008-05-21 Fix a "local variable unreferenced" bug in plotfile - MM

2008-05-19 Fix crash when Windows can not access the registry to

determine font path [Bug 1966974, thanks Patrik Simons] - MGD

2008-05-16 removed some unneeded code w/ the python 2.4 requirement.

cbook no longer provides compatibility for reversed, enumerate, set or izip. removed lib/subprocess, mpl1, sandbox/units, and the swig code. This stuff should remain on the maintenance branch for archival purposes. JDH

2008-05-16 Reorganized examples dir - JDH

2008-05-16 Added 'elinewidth' keyword arg to errorbar, based on patch

by Christopher Brown - MM

2008-05-16 Added 'cumulative' keyword arg to hist to plot cumulative

histograms. For normed hists, this is normalized to one - MM

2008-05-15 Fix Tk backend segfault on some machines - MGD

2008-05-14 Don't use stat on Windows (fixes font embedding problem) - MGD

2008-05-09 Fix /singlequote (') in Postscript backend - MGD

2008-05-08 Fix kerning in SVG when embedding character outlines - MGD

2008-05-07 Switched to future numpy histogram semantic in hist - MM

2008-05-06 Fix strange colors when blitting in QtAgg and Qt4Agg - MGD

2008-05-05 pass notify_axes_change to the figure's add_axobserver

in the qt backends, like we do for the other backends. Thanks Glenn Jones for the report - DSD

2008-05-02 Added step histograms, based on patch by Erik Tollerud. - MM

2008-05-02 On PyQt <= 3.14 there is no way to determine the underlying

Qt version. [1851364] - MGD

2008-05-02 Don't call sys.exit() when pyemf is not found [1924199] -

MGD

2008-05-02 Update _subprocess.c from upstream Python 2.5.2 to get a

few memory and reference-counting-related bugfixes. See bug 1949978. - MGD

2008-04-30 Added some record array editing widgets for gtk -- see

examples/rec_edit*.py - JDH

2008-04-29 Fix bug in mlab.sqrtm - MM

2008-04-28 Fix bug in SVG text with Mozilla-based viewers (the symbol

tag is not supported) - MGD

2008-04-27 Applied patch by Michiel de Hoon to add hexbin

axes method and pyplot function - EF

2008-04-25 Enforce python >= 2.4; remove subprocess build - EF

2008-04-25 Enforce the numpy requirement at build time - JDH

2008-04-24 Make numpy 1.1 and python 2.3 required when importing

matplotlib - EF

2008-04-24 Fix compilation issues on VS2003 (Thanks Martin Spacek for

all the help) - MGD

2008-04-24 Fix sub/superscripts when the size of the font has been

changed - MGD

2008-04-22 Use "svg.embed_char_paths" consistently everywhere - MGD

2008-04-20 Add support to MaxNLocator for symmetric axis autoscaling. - EF

2008-04-20 Fix double-zoom bug. - MM

2008-04-15 Speed up color mapping. - EF

2008-04-12 Speed up zooming and panning of dense images. - EF

2008-04-11 Fix global font rcParam setting after initialization

time. - MGD

2008-04-11 Revert commits 5002 and 5031, which were intended to

avoid an unnecessary call to draw(). 5002 broke saving figures before show(). 5031 fixed the problem created in 5002, but broke interactive plotting. Unnecessary call to draw still needs resolution - DSD

2008-04-07 Improve color validation in rc handling, suggested

by Lev Givon - EF

2008-04-02 Allow to use both linestyle definition arguments, '-' and

'solid' etc. in plots/collections - MM

2008-03-27 Fix saving to Unicode filenames with Agg backend

(other backends appear to already work...) (Thanks, Christopher Barker) - MGD

2008-03-26 Fix SVG backend bug that prevents copying and pasting in

Inkscape (thanks Kaushik Ghose) - MGD

2008-03-24 Removed an unnecessary call to draw() in the backend_qt*

mouseReleaseEvent. Thanks to Ted Drain - DSD

2008-03-23 Fix a pdf backend bug which sometimes caused the outermost

gsave to not be balanced with a grestore. - JKS

2008-03-20 Fixed a minor bug in ContourSet._process_linestyles when

len(linestyles)==Nlev - MM

2008-03-19 Changed ma import statements to "from numpy import ma";

this should work with past and future versions of numpy, whereas "import numpy.ma as ma" will work only with numpy >= 1.05, and "import numerix.npyma as ma" is obsolete now that maskedarray is replacing the earlier implementation, as of numpy 1.05.

2008-03-14 Removed an apparently unnecessary call to

FigureCanvasAgg.draw in backend_qt*agg. Thanks to Ted Drain - DSD

2008-03-10 Workaround a bug in backend_qt4agg's blitting due to a

buffer width/bbox width mismatch in _backend_agg's copy_from_bbox - DSD

2008-02-29 Fix class Wx toolbar pan and zoom functions (Thanks Jeff

Peery) - MGD

2008-02-16 Added some new rec array functionality to mlab

(rec_summarize, rec2txt and rec_groupby). See examples/rec_groupby_demo.py. Thanks to Tim M for rec2txt.

2008-02-12 Applied Erik Tollerud's span selector patch - JDH

2008-02-11 Update plotting() doc string to refer to getp/setp. - JKS

2008-02-10 Fixed a problem with square roots in the pdf backend with usetex. - JKS

2008-02-08 Fixed minor __str__ bugs so getp(gca()) works. - JKS

2008-02-05 Added getters for title, xlabel, ylabel, as requested by Brandon Kieth - EF

2008-02-05 Applied Gael's ginput patch and created examples/ginput_demo.py - JDH

2008-02-03 Expose interpnames, a list of valid interpolation methods, as an AxesImage class attribute. - EF

2008-02-03 Added BoundaryNorm, with examples in colorbar_only.py and image_masked.py. - EF

2008-02-03 Force dpi=72 in pdf backend to fix picture size bug. - JKS

2008-02-01 Fix doubly-included font problem in Postscript backend - MGD

2008-02-01 Fix reference leak in ft2font Glyph objects. - MGD

2008-01-31 Don't use unicode strings with usetex by default - DSD

2008-01-31 Fix text spacing problems in PDF backend with *some* fonts, such as STIXGeneral.

2008-01-31 Fix sqrt with radical number (broken by making [and] work below) - MGD

2008-01-27 Applied Martin Teichmann's patch to improve the Qt4 backend. Uses Qt's builtin toolbars and statusbars. See bug 1828848 - DSD

2008-01-10 Moved toolkits to mpl_toolkits, made mpl_toolkits a namespace package - JSWHIT

2008-01-10 Use setup.cfg to set the default parameters (tkagg, numpy) when building windows installers - DSD

2008-01-10 Fix bug displaying [and] in mathtext - MGD

2008-01-10 Fix bug when displaying a tick value offset with scientific notation. (Manifests itself as a warning that the times symbol can not be found). - MGD

2008-01-10 Use setup.cfg to set the default parameters (tkagg,

numpy) when building windows installers - DSD

2008-01-06 Released 0.91.2 at revision 4802

2007-12-26 Reduce too-late use of matplotlib.use() to a warning

instead of an exception, for backwards compatibility - EF

2007-12-25 Fix bug in errorbar, identified by Noriko Minakawa - EF

2007-12-25 Changed masked array importing to work with the upcoming

numpy 1.05 (now the maskedarray branch) as well as with earlier versions. - EF

2007-12-16 rec2csv saves doubles without losing precision. Also, it

does not close filehandles passed in open. - JDH,ADS

2007-12-13 Moved rec2gtk to matplotlib.toolkits.gtktools and rec2excel

to matplotlib.toolkits.exceltools - JDH

2007-12-12 Support alpha-blended text in the Agg and Svg backends -

MGD

2007-12-10 Fix SVG text rendering bug. - MGD

2007-12-10 Increase accuracy of circle and ellipse drawing by using an

8-piece bezier approximation, rather than a 4-piece one. Fix PDF, SVG and Cairo backends so they can draw paths (meaning ellipses as well). - MGD

2007-12-07 Issue a warning when drawing an image on a non-linear axis. - MGD

2007-12-06 let widgets.Cursor initialize to the lower x and y bounds

rather than 0,0, which can cause havoc for dates and other transforms - DSD

2007-12-06 updated references to mpl data directories for py2exe - DSD

2007-12-06 fixed a bug in rcsetup, see bug 1845057 - DSD

2007-12-05 Fix how fonts are cached to avoid loading the same one multiple times.

(This was a regression since 0.90 caused by the refactoring of font_manager.py) - MGD

2007-12-05 Support arbitrary rotation of usetex text in Agg backend. - MGD

2007-12-04 Support '|' as a character in mathtext - MGD

2007-11-27 Released 0.91.1 at revision 4517

2007-11-27 Released 0.91.0 at revision 4478

2007-11-13 All backends now support writing to a file-like object, not

just a regular file. savefig() can be passed a file-like object in place of a file path. - MGD

2007-11-13 Improved the default backend selection at build time:

SVG -> Agg -> TkAgg -> WXAgg -> GTK -> GTKAgg. The last usable backend in this progression will be chosen in the default config file. If a backend is defined in setup.cfg, that will be the default backend - DSD

2007-11-13 Improved creation of default config files at build time for

traited config package - DSD

2007-11-12 Exposed all the build options in setup.cfg. These options are

read into a dict called "options" by setupext.py. Also, added "-mpl" tags to the version strings for packages provided by matplotlib. Versions provided by mpl will be identified and updated on subsequent installs - DSD

2007-11-12 Added support for STIX fonts. A new rcParam,

mathtext.fontset, can be used to choose between:

'cm':

The TeX/LaTeX Computer Modern fonts

'stix':

The STIX fonts (see stixfonts.org)

'stixsans':

The STIX fonts, using sans-serif glyphs by default

'custom':

A generic Unicode font, in which case the mathtext font must be specified using mathtext.bf, mathtext.it, mathtext.sf etc.

Added a new example, stix_fonts_demo.py to show how to access different fonts and unusual symbols.

- MGD

2007-11-12 Options to disable building backend extension modules moved

from setup.py to setup.cfg - DSD

2007-11-09 Applied Martin Teichmann's patch 1828813: a QPainter is used in

paintEvent, which has to be destroyed using the method end(). If matplotlib raises an exception before the call to end - and it does if you feed it with bad data - this method end() is never called and Qt4 will start spitting error messages

2007-11-09 Moved pyparsing back into matplotlib namespace. Don't use

system pyparsing, API is too variable from one release to the next - DSD

2007-11-08 Made pylab use straight numpy instead of oldnumeric

by default - EF

2007-11-08 Added additional record array utilities to mlab (rec2excel,

rec2gtk, rec_join, rec_append_field, rec_drop_field) - JDH

2007-11-08 Updated pytz to version 2007g - DSD

2007-11-08 Updated pyparsing to version 1.4.8 - DSD

2007-11-08 Moved csv2rec to recutils and added other record array

utilities - JDH

2007-11-08 If available, use existing pyparsing installation - DSD

2007-11-07 Removed old enthought.traits from lib/matplotlib, added

Gael Varoquaux's enthought.traits-2.6b1, which is stripped of setuptools. The package is installed to site-packages if not already available - DSD

2007-11-05 Added easy access to minor tick properties; slight mod

of patch by Pierre G-M - EF

2007-11-02 Committed Phil Thompson's patch 1599876, fixes to Qt4Agg

backend and qt4 blitting demo - DSD

2007-11-02 Committed Phil Thompson's patch 1599876, fixes to Qt4Agg

backend and qt4 blitting demo - DSD

2007-10-31 Made log color scale easier to use with contourf;

automatic level generation now works. - EF

2007-10-29 TRANSFORMS REFACTORING

The primary goal of this refactoring was to make it easier to extend matplotlib to support new kinds of projections. This is primarily an internal improvement, and the possible user-visible changes it allows are yet to come.

The transformation framework was completely rewritten in Python (with Numpy). This will make it easier to add news kinds of transformations without writing C/C++ code.

Transforms are composed into a 'transform tree', made of transforms whose value depends on other transforms (their children). When the contents of children change, their parents are automatically updated to reflect those changes. To do this an "invalidation" method is used: when children change, all of their ancestors are marked as "invalid". When the value of a transform is accessed at a later time, its value is recomputed only if it is invalid, otherwise a cached value may be used. This prevents unnecessary

recomputations of transforms, and contributes to better interactive performance.

The framework can be used for both affine and non-affine transformations. However, for speed, we want use the backend renderers to perform affine transformations whenever possible. Therefore, it is possible to perform just the affine or non-affine part of a transformation on a set of data. The affine is always assumed to occur after the non-affine. For any transform:

full transform == non-affine + affine

Much of the drawing has been refactored in terms of compound paths. Therefore, many methods have been removed from the backend interface and replaced with a a handful to draw compound paths. This will make updating the backends easier, since there is less to update. It also should make the backends more consistent in terms of functionality.

User visible changes:

- POLAR PLOTS: Polar plots are now interactively zoomable, and the r-axis labels can be interactively rotated. Straight line segments are now interpolated to follow the curve of the r-axis.
- Non-rectangular clipping works in more backends and with more types of objects.
- Sharing an axis across figures is now done in exactly the same way as sharing an axis between two axes in the same figure:

```
fig1 = figure()
fig2 = figure()

 ax1 = fig1.add_subplot(111)
 ax2 = fig2.add_subplot(111, sharex=ax1, sharey=ax1)
```

- linestyles now include steps-pre, steps-post and steps-mid. The old step still works and is equivalent to step-pre.
- Multiple line styles may be provided to a collection.

See API_CHANGES for more low-level information about this refactoring.

2007-10-24 Added ax kwarg to Figure.colorbar and pyplot.colorbar - EF

2007-10-19 Removed a gsave/grestore pair surrounding _draw_ps, which

was causing a loss graphics state info (see "EPS output problem - scatter & edgecolors" on mpl-dev, 2007-10-29) - DSD

2007-10-15 Fixed a bug in patches.Ellipse that was broken for

aspect='auto'. Scale free ellipses now work properly for equal and auto on Agg and PS, and they fall back on a polygonal approximation for nonlinear transformations until we convince oursleves that the spline approximation holds for non-

linear transformations. Added unit/ellipse_compare.py to compare spline with vertex approx for both aspects. JDH

2007-10-05 remove generator expressions from texmanager and mpltraits.

generator expressions are not supported by python-2.3 - DSD

2007-10-01 Made matplotlib.use() raise an exception if called after

backends has been imported. - EF

2007-09-30 Modified update* methods of Bbox and Interval so they

work with reversed axes. Prior to this, trying to set the ticks on a reversed axis failed with an uninformative error message. - EF

2007-09-30 Applied patches to axes3d to fix index error problem - EF

2007-09-24 Applied Eike Welk's patch reported on mpl-dev on 2007-09-22

Fixes a bug with multiple plot windows in the qt backend, ported the changes to backend_qt4 as well - DSD

2007-09-21 Changed cbook.reversed to yield the same result as the

python reversed builtin - DSD

2007-09-13 The usetex support in the pdf backend is more usable now,

so I am enabling it. - JKS

2007-09-12 Fixed a Axes.bar unit bug - JDH

2007-09-10 Made skiprows=1 the default on csv2rec - JDH

2007-09-09 Split out the plotting part of pylab and put it in

pyplot.py; removed numerix from the remaining pylab.py, which imports everything from pyplot.py. The intention is that apart from cleanups, the result of importing from pylab is nearly unchanged, but there is the new alternative of importing from pyplot to get the state-engine graphics without all the numeric functions. Numpified examples; deleted two that were obsolete; modified some to use pyplot. - EF

2007-09-08 Eliminated gd and paint backends - EF

2007-09-06 .bmp file format is now longer an alias for .raw

2007-09-07 Added clip path support to pdf backend. - JKS

2007-09-06 Fixed a bug in the embedding of Type 1 fonts in PDF.

Now it doesn't crash Preview.app. - JKS

2007-09-06 Refactored image saving code so that all GUI backends can

save most image types. See FILETYPES for a matrix of backends and their supported file types. Backend canvases should no longer write their own print_figure() method -- instead they should write a print_xxx method for each

filetype they can output and add an entry to their class-scoped filetypes dictionary. - MGD

2007-09-05 Fixed Qt version reporting in setupext.py - DSD

2007-09-04 Embedding Type 1 fonts in PDF, and thus usetex support

via dviread, sort of works. To test, enable it by renaming _draw_tex to draw_tex. - JKS

2007-09-03 Added ability of errorbar show limits via caret or

arrowhead ends on the bars; patch by Manual Metz. - EF

2007-09-03 Created type1font.py, added features to AFM and FT2Font

(see API_CHANGES), started work on embedding Type 1 fonts in pdf files. - JKS

2007-09-02 Continued work on dviread.py. - JKS

2007-08-16 Added a set_extent method to AxesImage, allow data extent

to be modified after initial call to imshow - DSD

2007-08-14 Fixed a bug in pyqt4 subplots-adjust. Thanks to

Xavier Gnata for the report and suggested fix - DSD

2007-08-13 Use pickle to cache entire fontManager; change to using

font_manager module-level function findfont wrapper for the fontManager.findfont method - EF

2007-08-11 Numpification and cleanup of mlab.py and some examples - EF

2007-08-06 Removed mathtext2

2007-07-31 Refactoring of distutils scripts.

- Will not fail on the entire build if an optional Python package (e.g., Tkinter) is installed but its development headers are not (e.g., tk-devel). Instead, it will continue to build all other extensions.
- Provide an overview at the top of the output to display what dependencies and their versions were found, and (by extension) what will be built.
- Use pkg-config, when available, to find freetype2, since this was broken on Mac OS-X when using MacPorts in a non- standard location.

2007-07-30 Reorganized configuration code to work with traited config

objects. The new config system is located in the matplotlib.config package, but it is disabled by default. To enable it, set NEWCONFIG=True in matplotlib.__init__.py. The new configuration system will still use the old matplotlibrc files by default. To switch to the experimental, traited configuration, set USE_TRAITED_CONFIG=True in config.__init__.py.

2007-07-29 Changed default pcolor shading to flat; added aliases

to make collection kwargs agree with setter names, so updating works; related minor cleanups. Removed quiver_classic, scatter_classic, pcolor_classic. - EF

2007-07-26 Major rewrite of mathtext.py, using the TeX box layout model.

There is one (known) backward incompatible change. The font commands (cal, rm, it, tt) now behave as TeX does: they are in effect until the next font change command or the end of the grouping. Therefore uses of $cal{R}$ should be changed to ${cal R}$. Alternatively, you may use the new LaTeX-style font commands (mathcal, mathrm, mathit, mathtt) which do affect the following group, e.g., $mathcal{R}$.

Other new features include:

- Math may be interspersed with non-math text. Any text with an even number of $'s (non-escaped) will be sent to the mathtext parser for layout.
- Sub/superscripts are less likely to accidentally overlap.
- Support for sub/superscripts in either order, e.g., x^i_j and x_j^i are equivalent.
- Double sub/superscripts (e.g., x_i_j) are considered ambiguous and raise an exception. Use braces to disambiguate.
- $frac{x}{y}$ can be used for displaying fractions.
- $sqrt[3]{x}$ can be used to display the radical symbol with a root number and body.
- $left(frac{x}{y}right)$ may be used to create parentheses and other delimiters that automatically resize to the height of their contents.
- Spacing around operators etc. is now generally more like TeX.
- Added support (and fonts) for boldface (bf) and sans-serif (sf) symbols.
- Log-like function name shortcuts are supported. For example, $sin(x)$ may be used instead of ${rm sin}(x)$
- Limited use of kerning for the easy case (same font)

Behind the scenes, the pyparsing.py module used for doing the math parsing was updated to the latest stable version (1.4.6). A lot of duplicate code was refactored out of the Font classes.

- MGD

2007-07-19 completed numpification of most trivial cases - NN

2007-07-19 converted non-numpy relicts throughout the code - NN

2007-07-19 replaced the Python code in numerix/ by a minimal wrapper around

numpy that explicitly mentions all symbols that need to be addressed for further numpification - NN

2007-07-18 make usetex respect changes to rcParams. texmanager used to
only configure itself when it was created, now it reconfigures when rcParams are changed. Thank you Alexander Schmolck for contributing a patch - DSD

2007-07-17 added validation to setting and changing rcParams - DSD

2007-07-17 bugfix segfault in transforms module. Thanks Ben North for
the patch. - ADS

2007-07-16 clean up some code in ticker.ScalarFormatter, use unicode to
render multiplication sign in offset ticklabel - DSD

2007-07-16 fixed a formatting bug in ticker.ScalarFormatter's scientific
notation (10^0 was being rendered as 10 in some cases) - DSD

2007-07-13 Add MPL_isfinite64() and MPL_isinf64() for testing
doubles in (the now misnamed) MPL_isnan.h. - ADS

2007-07-13 The matplotlib._isnan module removed (use numpy.isnan) - ADS

2007-07-13 Some minor cleanups in _transforms.cpp - ADS

2007-07-13 Removed the rest of the numerix extension code detritus,
numpified axes.py, and cleaned up the imports in axes.py - JDH

2007-07-13 Added legend.loc as configurable option that could in
future default to 'best'. - NN

2007-07-12 Bugfixes in mlab.py to coerce inputs into numpy arrays. -ADS

2007-07-11 Added linespacing kwarg to text.Text - EF

2007-07-11 Added code to store font paths in SVG files. - MGD

2007-07-10 Store subset of TTF font as a Type 3 font in PDF files. - MGD

2007-07-09 Store subset of TTF font as a Type 3 font in PS files. - MGD

2007-07-09 Applied Paul's pick restructure pick and add pickers,
sourceforge patch 1749829 - JDH

2007-07-09 Applied Allan's draw_lines agg optimization. JDH

2007-07-08 Applied Carl Worth's patch to fix cairo draw_arc - SC

2007-07-07 fixed bug 1712099: xpdf distiller on windows - DSD

2007-06-30 Applied patches to tkagg, gtk, and wx backends to reduce
memory leakage. Patches supplied by Mike Droettboom; see tracker numbers 1745400, 1745406, 1745408. Also made unit/memleak_gui.py more flexible with command-line options. - EF

2007-06-30 Split defaultParams into separate file rcdefaults (together with

validation code). Some heavy refactoring was necessary to do so, but the overall behavior should be the same as before. - NN

2007-06-27 Added MPLCONFIGDIR for the default location for mpl data

and configuration. useful for some apache installs where HOME is not writable. Tried to clean up the logic in _get_config_dir to support non-writable HOME where are writable HOME/.matplotlib already exists - JDH

2007-06-27 Fixed locale bug reported at

http://sourceforge.net/tracker/index.php?func=detail&aid=1744154&group_id=80706&atid
by adding a cbook.unicode_safe function - JDH

2007-06-27 Applied Micheal's tk savefig bugfix described at

http://sourceforge.net/tracker/index.php?func=detail&aid=1716732&group_id=80706&atid
Thanks Michael!

2007-06-27 Patch for get_py2exe_datafiles() to work with new directory

layout. (Thanks Tocer and also Werner Bruhin.) -ADS

2007-06-27 Added a scroll event to the mpl event handling system and

implemented it for backends GTK* -- other backend users/developers/maintainers, please add support for your backend. - JDH

2007-06-25 Changed default to clip=False in colors.Normalize;

modified ColorbarBase for easier colormap display - EF

2007-06-13 Added maskedarray option to rc, numerix - EF

2007-06-11 Python 2.5 compatibility fix for mlab.py - EF

2007-06-10 In matplotlibrc file, use 'dashed' | 'solid' instead

of a pair of floats for contour.negative_linestyle - EF

2007-06-08 Allow plot and fill fmt string to be any mpl string

colorspec - EF

2007-06-08 Added gnuplot file plotfile function to pylab -- see

examples/plotfile_demo.py - JDH

2007-06-07 Disable build of numarray and Numeric extensions for

internal MPL use and the numerix layer. - ADS

2007-06-07 Added csv2rec to matplotlib.mlab to support automatically

converting csv files to record arrays using type introspection, and turned on native datetime support using the new units support in matplotlib.dates. See examples/loadrec.py ! JDH

2007-06-07 Simplified internal code of _auto_legend_data - NN

2007-06-04 Added labeldistance arg to Axes.pie to control the raidal

distance of the wedge labels - JDH

2007-06-03 Turned mathtext in SVG into single <text> with multiple <tspan>

objects (easier to edit in inkscape). - NN

2007-06-02 Released 0.90.1 at revision 3352

2007-06-02 Display only meaningful labels when calling legend()

without args. - NN

2007-06-02 Have errorbar follow the color cycle even if line is not plotted.

Suppress plotting of errorbar caps for capsize=0. - NN

2007-06-02 Set markers to same alpha value as line. - NN

2007-06-02 Fix mathtext position in svg backend. - NN

2007-06-01 Deprecate Numeric and numarray for use as numerix. Props to

Travis -- job well done. - ADS

2007-05-18 Added LaTeX unicode support. Enable with the

'text.latex.unicode' rcParam. This requires the ucs and inputenc LaTeX packages. - ADS

2007-04-23 Fixed some problems with polar -- added general polygon

clipping to clip the lines and grids to the polar axes. Added support for set_rmax to easily change the maximum radial grid. Added support for polar legend - JDH

2007-04-16 Added Figure.autofmt_xdate to handle adjusting the bottom

and rotating the tick labels for date plots when the ticks often overlap - JDH

2007-04-09 Beginnings of usetex support for pdf backend. -JKS

2007-04-07 Fixed legend/LineCollection bug. Added label support

to collections. - EF

2007-04-06 Removed deprecated support for a float value as a gray-scale;

now it must be a string, like '0.5'. Added alpha kwarg to ColorConverter.to_rgba_list. - EF

2007-04-06 Fixed rotation of ellipses in pdf backend

(sf bug #1690559) -JKS

2007-04-04 More matshow tweaks; documentation updates; new method

set_bounds() for formatters and locators. - EF

2007-04-02 Fixed problem with imshow and matshow of integer arrays;

fixed problems with changes to color autoscaling. - EF

2007-04-01 Made image color autoscaling work correctly with

a tracking colorbar; norm.autoscale now scales unconditionally, while norm.autoscale_None changes only None-valued vmin, vmax. - EF

2007-03-31 Added a qt-based subplot-adjustment dialog - DSD

2007-03-30 Fixed a bug in backend_qt4, reported on mpl-dev - DSD

2007-03-26 Removed colorbar_classic from figure.py; fixed bug in

Figure.clf() in which _axobservers was not getting cleared. Modernization and cleanups. - EF

2007-03-26 Refactored some of the units support -- units now live in

the respective x and y Axis instances. See also API_CHANGES for some alterations to the conversion interface. JDH

2007-03-25 Fix masked array handling in quiver.py for numpy. (Numeric

and numarray support for masked arrays is broken in other ways when using quiver. I didn't pursue that.) - ADS

2007-03-23 Made font_manager.py close opened files. - JKS

2007-03-22 Made imshow default extent match matshow - EF

2007-03-22 Some more niceties for xcorr -- a maxlags option, normed

now works for xcorr as well as axorr, usevlines is supported, and a zero correlation hline is added. See examples/xcorr_demo.py. Thanks Sameer for the patch. - JDH

2007-03-21 Axes.vlines and Axes.hlines now create and returns a

LineCollection, not a list of lines. This is much faster. The kwarg signature has changed, so consult the docs. Modified Axes.errorbar which uses vlines and hlines. See API_CHANGES; the return signature for these three functions is now different

2007-03-20 Refactored units support and added new examples - JDH

2007-03-19 Added Mike's units patch - JDH

2007-03-18 Matshow as an Axes method; test version matshow1() in

pylab; added 'integer' Boolean kwarg to MaxNLocator initializer to force ticks at integer locations. - EF

2007-03-17 Preliminary support for clipping to paths agg - JDH

2007-03-17 Text.set_text() accepts anything convertible with '%s' - EF

2007-03-14 Add masked-array support to hist. - EF

2007-03-03 Change barh to take a kwargs dict and pass it to bar.

Fixes sf bug #1669506.

2007-03-02 Add rc parameter pdf.inheritcolor, which disables all

color-setting operations in the pdf backend. The idea is that you include the resulting file in another program and set the colors (both stroke and fill color) there, so you can use the same pdf file for e.g., a paper and a presentation and have them in the surrounding color. You will probably not want to draw figure and axis frames in that case, since they would be filled in the same color. - JKS

2007-02-26 Prevent building _wxagg.so with broken Mac OS X wxPython. - ADS

2007-02-23 Require setuptools for Python 2.3 - ADS

2007-02-22 WXAgg accelerator updates - KM

WXAgg's C++ accelerator has been fixed to use the correct wxBitmap constructor.

The backend has been updated to use new wxPython functionality to provide fast blit() animation without the C++ accelerator. This requires wxPython 2.8 or later. Previous versions of wxPython can use the C++ acclerator or the old pure Python routines.

setup.py no longer builds the C++ accelerator when wxPython >= 2.8 is present.

The blit() method is now faster regardless of which agg/wxPython conversion routines are used.

2007-02-21 Applied the PDF backend patch by Nicolas Grilly.

This impacts several files and directories in matplotlib:

- Created the directory lib/matplotlib/mpl-data/fonts/pdfcorefonts, holding AFM files for the 14 PDF core fonts. These fonts are embedded in every PDF viewing application.
- setup.py: Added the directory pdfcorefonts to package_data.
- lib/matplotlib/__init__.py: Added the default parameter 'pdf.use14corefonts'. When True, the PDF backend uses only the 14 PDF core fonts.
- lib/matplotlib/afm.py: Added some keywords found in recent AFM files. Added a little workaround to handle Euro symbol.
- lib/matplotlib/fontmanager.py: Added support for the 14 PDF core fonts. These fonts have a dedicated cache (file pdfcorefont.cache), not the same as for other AFM files (file .afmfont.cache). Also cleaned comments to conform to CODING_GUIDE.
- lib/matplotlib/backends/backend_pdf.py: Added support for 14 PDF core fonts. Fixed some issues with incorrect character widths and encodings (works only for the most common encoding, WinAnsiEncoding, defined by

the official PDF Reference). Removed parameter 'dpi' because it causes alignment issues.

-JKS (patch by Nicolas Grilly)

2007-02-17 Changed ft2font.get_charmap, and updated all the files where

get_charmap is mentioned - ES

2007-02-13 Added barcode demo- JDH

2007-02-13 Added binary colormap to cm - JDH

2007-02-13 Added twiny to pylab - JDH

2007-02-12 Moved data files into lib/matplotlib so that setuptools'

develop mode works. Re-organized the mpl-data layout so that this source structure is maintained in the installation. (i.e., the 'fonts' and 'images' sub-directories are maintained in site-packages.) Suggest removing site-packages/matplotlib/mpl-data and ~/.matplotlib/ttffont.cache before installing - ADS

2007-02-07 Committed Rob Hetland's patch for qt4: remove

references to text()/latin1(), plus some improvements to the toolbar layout - DSD

2007-02-06 Released 0.90.0 at revision 3003

2007-01-22 Extended the new picker API to text, patches and patch

collections. Added support for user customizable pick hit testing and attribute tagging of the PickEvent - Details and examples in examples/pick_event_demo.py - JDH

2007-01-16 Begun work on a new pick API using the mpl event handling

frameowrk. Artists will define their own pick method with a configurable epsilon tolerance and return pick attrs. All artists that meet the tolerance threshold will fire a PickEvent with artist dependent attrs; e.g., a Line2D can set the indices attribute that shows the indices into the line that are within epsilon of the pick point. See examples/pick_event_demo.py. The implementation of pick for the remaining Artists remains to be done, but the core infrastructure at the level of event handling is in place with a proof-of-concept implementation for Line2D - JDH

2007-01-16 src/_image.cpp: update to use Py_ssize_t (for 64-bit systems).

Use return value of fread() to prevent warning messages - SC.

2007-01-15 src/_image.cpp: combine buffer_argb32() and buffer_bgra32() into

a new method color_conv(format) - SC

2007-01-14 backend_cairo.py: update draw_arc() so that

examples/arctest.py looks correct - SC

2007-01-12 backend_cairo.py: enable clipping. Update draw_image() so that

examples/contour_demo.py looks correct - SC

2007-01-12 backend_cairo.py: fix draw_image() so that examples/image_demo.py

now looks correct - SC

2007-01-11 Added Axes.xcorr and Axes.acorr to plot the cross

correlation of x vs. y or the autocorrelation of x. pylab wrappers also provided. See examples/xcorr_demo.py - JDH

2007-01-10 Added "Subplot.label_outer" method. It will set the

visibility of the ticklabels so that yticklabels are only visible in the first column and xticklabels are only visible in the last row - JDH

2007-01-02 Added additional kwarg documentation - JDH

2006-12-28 Improved error message for nonpositive input to log

transform; added log kwarg to bar, barh, and hist, and modified bar method to behave sensibly by default when the ordinate has a log scale. (This only works if the log scale is set before or by the call to bar, hence the utility of the log kwarg.) - EF

2006-12-27 backend_cairo.py: update draw_image() and _draw_mathtext() to work

with numpy - SC

2006-12-20 Fixed xpdf dependency check, which was failing on windows.

Removed ps2eps dependency check. - DSD

2006-12-19 Added Tim Leslie's spectral patch - JDH

2006-12-17 Added rc param 'axes.formatter.limits' to control

the default threshold for switching to scientific notation. Added convenience method Axes.ticklabel_format() for turning scientific notation on or off on either or both axes. - EF

2006-12-16 Added ability to turn control scientific notation

in ScalarFormatter - EF

2006-12-16 Enhanced boxplot to handle more flexible inputs - EF

2006-12-13 Replaced calls to where() in colors.py with much faster

clip() and putmask() calls; removed inappropriate uses of getmaskorNone (which should be needed only very rarely); all in response to profiling by David Cournapeau. Also fixed bugs in my 2-D array support from 12-09. - EF

2006-12-09 Replaced spy and spy2 with the new spy that combines

marker and image capabilities - EF

2006-12-09 Added support for plotting 2-D arrays with plot:

columns are plotted as in Matlab - EF

2006-12-09 Added linewidth kwarg to bar and barh; fixed arg

checking bugs - EF

2006-12-07 Made pcolormesh argument handling match pcolor;

fixed kwarg handling problem noted by Pierre GM - EF

2006-12-06 Made pcolor support vector X and/or Y instead of

requiring 2-D arrays - EF

2006-12-05 Made the default Artist._transform None (rather than

invoking identity_transform for each artist only to have it overridden later). Use artist.get_transform() rather than artist._transform, even in derived classes, so that the default transform will be created lazily as needed - JDH

2006-12-03 Added LogNorm to colors.py as illustrated by

examples/pcolor_log.py, based on suggestion by Jim McDonald. Colorbar modified to handle LogNorm. Norms have additional "inverse" method. - EF

2006-12-02 Changed class names in colors.py to match convention:

normalize -> Normalize, no_norm -> NoNorm. Old names are still available. Changed __init__.py rc defaults to match those in matplotlibrc - EF

2006-11-22 Fixed bug in set_*lim that I had introduced on 11-15 - EF

2006-11-22 Added examples/clippedline.py, which shows how to clip line

data based on view limits -- it also changes the marker style when zoomed in - JDH

2006-11-21 Some spy bug-fixes and added precision arg per Robert C's

suggestion - JDH

2006-11-19 Added semi-automatic docstring generation detailing all the

kwargs that functions take using the artist introspection tools; e.g., 'help text now details the scatter kwargs that control the Text properties - JDH

2006-11-17 Removed obsolete scatter_classic, leaving a stub to

raise NotImplementedError; same for pcolor_classic - EF

2006-11-15 Removed obsolete pcolor_classic - EF

2006-11-15 Fixed 1588908 reported by Russel Owen; factored

nonsingular method out of ticker.py, put it into transforms.py as a function, and used it in set_xlim and set_ylim. - EF

2006-11-14 Applied patch 1591716 by Ulf Larssen to fix a bug in

apply_aspect. Modified and applied patch 1594894 by mdehoon to fix bugs and improve formatting in lines.py. Applied patch 1573008 by Greg Willden to make psd etc. plot full frequency range for complex inputs. - EF

2006-11-14 Improved the ability of the colorbar to track

changes in corresponding image, pcolor, or contourf. - EF

2006-11-11 Fixed bug that broke Numeric compatibility;

added support for alpha to colorbar. The alpha information is taken from the mappable object, not specified as a kwarg. - EF

2006-11-05 Added broken_barh function for makring a sequence of

horizontal bars broken by gaps -- see examples/broken_barh.py

2006-11-05 Removed lineprops and markerprops from the Annotation code

and replaced them with an arrow configurable with kwarg arrowprops. See examples/annotation_demo.py - JDH

2006-11-02 Fixed a pylab subplot bug that was causing axes to be

deleted with hspace or wspace equals zero in subplots_adjust - JDH

2006-10-31 Applied axes3d patch 1587359

http://sourceforge.net/tracker/index.php?func=detail&aid=1587359&group_id=80706&atid
JDH

2006-10-26 Released 0.87.7 at revision 2835

2006-10-25 Made "tiny" kwarg in Locator.nonsingular much smaller - EF

2006-10-17 Closed sf bug 1562496 update line props dash/solid/cap/join

styles - JDH

2006-10-17 Complete overhaul of the annotations API and example code -

See matplotlib.text.Annotation and examples/annotation_demo.py JDH

2006-10-12 Committed Manuel Metz's StarPolygon code and

examples/scatter_star_poly.py - JDH

2006-10-11 commented out all default values in matplotlibrc.template

Default values should generally be taken from defaultParam in __init__.py - the file matplotlib should only contain those values that the user wants to explicitly

change from the default. (see thread "marker color handling" on matplotlib-devel)

2006-10-10 Changed default comment character for load to '#' - JDH

2006-10-10 deactivated rcfile-configurability of markerfacecolor

and markeredgecolor. Both are now hardcoded to the special value 'auto' to follow the line color. Configurability at run-time (using function arguments) remains functional. - NN

2006-10-07 introduced dummy argument magnification=1.0 to

FigImage.make_image to satisfy unit test figimage_demo.py The argument is not yet handled correctly, which should only show up when using non-standard DPI settings in PS backend, introduced by patch #1562394. - NN

2006-10-06 add backend-agnostic example: simple3d.py - NN

2006-09-29 fix line-breaking for SVG-inline images (purely cosmetic) - NN

2006-09-29 reworked set_linestyle and set_marker

markeredgecolor and markerfacecolor now default to a special value "auto" that keeps the color in sync with the line color further, the intelligence of axes.plot is cleaned up, improved and simplified. Complete compatibility cannot be guaranteed, but the new behavior should be much more predictable (see patch #1104615 for details) - NN

2006-09-29 changed implementation of clip-path in SVG to work around a

limitation in inkscape - NN

2006-09-29 added two options to matplotlibrc:

svg.image_inline svg.image_noscale see patch #1533010 for details - NN

2006-09-29 axes.py: cleaned up kwargs checking - NN

2006-09-29 setup.py: cleaned up setup logic - NN

2006-09-29 setup.py: check for required pygtk versions, fixes bug #1460783 - SC

2006-09-27 Released 0.87.6 at revision 2783

2006-09-24 Added line pointers to the Annotation code, and a pylab

interface. See matplotlib.text.Annotation, examples/annotation_demo.py and examples/annotation_demo_pylab.py - JDH

2006-09-18 mathtext2.py: The SVG backend now supports the same things that

the AGG backend does. Fixed some bugs with rendering, and out of bounds errors in the AGG backend - ES. Changed the return values of math_parse_s_ft2font_svg to support lines (fractions etc.)

2006-09-17 Added an Annotation class to facilitate annotating objects

and an examples file examples/annotation_demo.py. I want to add dash support as in TextWithDash, but haven't decided yet whether inheriting from TextWithDash is the right base class or if another approach is needed - JDH

2006-09-05 Released 0.87.5 at revision 2761

2006-09-04 Added nxutils for some numeric add-on extension code --

specifically a better/more efficient inside polygon tester (see unit/inside_poly_*.py) - JDH

2006-09-04 Made bitstream fonts the rc default - JDH

2006-08-31 Fixed alpha-handling bug in ColorConverter, affecting

collections in general and contour/contourf in particular. - EF

2006-08-30 ft2font.cpp: Added draw_rect_filled method (now used by mathtext2

to draw the fraction bar) to FT2Font - ES

2006-08-29 setupext.py: wrap calls to tk.getvar() with str(). On some

systems, getvar returns a Tcl_Obj instead of a string - DSD

2006-08-28 mathtext2.py: Sub/superscripts can now be complex (i.e.

fractions etc.). The demo is also updated - ES

2006-08-28 font_manager.py: Added /usr/local/share/fonts to list of

X11 font directories - DSD

2006-08-28 mahtext2.py: Initial support for complex fractions. Also,

rendering is now completely separated from parsing. The sub/superscripts now work better. Updated the mathtext2_demo.py - ES

2006-08-27 qt backends: don't create a QApplication when backend is

imported, do it when the FigureCanvasQt is created. Simplifies applications where mpl is embedded in qt. Updated embedding_in_qt* examples - DSD

2006-08-27 mahtext2.py: Now the fonts are searched in the OS font dir and

in the mpl-data dir. Also env is not a dict anymore. - ES

2006-08-26 minor changes to __init__.py, mathtex2_demo.py. Added matplotlibrc

key "mathtext.mathtext2" (removed the key "mathtext2") - ES

2006-08-21 mathtext2.py: Initial support for fractions

Updated the mathtext2_demo.py _mathtext_data.py: removed "" from the unicode dicts mathtext.py: Minor modification (because of _mathtext_data.py)- ES

2006-08-20 Added mathtext2.py: Replacement for mathtext.py. Supports _ ^,

rm, cal etc., sin, cos etc., unicode, recursive nestings, inline math mode. The only backend currently supported is Agg __init__.py: added new rc params for mathtext2 added mathtext2_demo.py example - ES

2006-08-19 Added embedding_in_qt4.py example - DSD

2006-08-11 Added scale free Ellipse patch for Agg - CM

2006-08-10 Added converters to and from julian dates to matplotlib.dates

(num2julian and julian2num) - JDH

2006-08-08 Fixed widget locking so multiple widgets could share the

event handling - JDH

2006-08-07 Added scale free Ellipse patch to SVG and PS - CM

2006-08-05 Re-organized imports in numerix for numpy 1.0b2 -- TEO

2006-08-04 Added draw_markers to PDF backend. - JKS

2006-08-01 Fixed a bug in postscript's rendering of dashed lines - DSD

2006-08-01 figure.py: savefig() update docstring to add support for 'format'

argument. backend_cairo.py: print_figure() add support 'format' argument. - SC

2006-07-31 Don't let postscript's xpdf distiller compress images - DSD

2006-07-31 Added shallowcopy() methods to all Transformations;

removed copy_bbox_transform and copy_bbox_transform_shallow from transforms.py; added offset_copy() function to transforms.py to facilitate positioning artists with offsets. See examples/transoffset.py. - EF

2006-07-31 Don't let postscript's xpdf distiller compress images - DSD

2006-07-29 Fixed numerix polygon bug reported by Nick Fotopoulos.

Added inverse_numerix_xy() transform method. Made autoscale_view() preserve axis direction (e.g., increasing down).- EF

2006-07-28 Added shallow bbox copy routine for transforms -- mainly

useful for copying transforms to apply offset to. - JDH

2006-07-28 Added resize method to FigureManager class

for Qt and Gtk backend - CM

2006-07-28 Added subplots_adjust button to Qt backend - CM

2006-07-26 Use numerix more in collections.

Quiver now handles masked arrays. - EF

2006-07-22 Fixed bug #1209354 - DSD

2006-07-22 make scatter() work with the kwarg "color". Closes bug

1285750 - DSD

2006-07-20 backend_cairo.py: require pycairo 1.2.0.

print_figure() update to output SVG using cairo.

2006-07-19 Added blitting for Qt4Agg - CM

2006-07-19 Added lasso widget and example examples/lasso_demo.py - JDH

2006-07-18 Added blitting for QtAgg backend - CM

2006-07-17 Fixed bug #1523585: skip nans in semilog plots - DSD

2006-07-12 Add support to render the scientific notation label

over the right-side y-axis - DSD

2006-07-11 Released 0.87.4 at revision 2558

2006-07-07 Fixed a usetex bug with older versions of latex - DSD

2006-07-07 Add compatibility for NumPy 1.0 - TEO

2006-06-29 Added a Qt4Agg backend. Thank you James Amundson - DSD

2006-06-26 Fixed a usetex bug. On Windows, usetex will process

postscript output in the current directory rather than in a temp directory. This is due to the use of spaces and tildes in windows paths, which cause problems with latex. The subprocess module is no longer used. - DSD

2006-06-22 Various changes to bar(), barh(), and hist().

Added 'edgecolor' keyword arg to bar() and barh(). The x and y args in barh() have been renamed to width and bottom respectively, and their order has been swapped to maintain a (position, value) order ala matlab. left, height, width and bottom args can now all be scalars or sequences. barh() now defaults to edge alignment instead of center alignment. Added a keyword arg 'align' to bar(), barh() and hist() that controls between edge or center bar alignment. Fixed ignoring the rcParams['patch.facecolor'] for bar color in bar() and barh(). Fixed ignoring the rcParams['lines.color'] for error bar color in bar() and barh(). Fixed a bug where patches would be cleared when error bars were plotted if rcParams['axes.hold'] was False. - MAS

2006-06-22 Added support for numerix 2-D arrays as alternatives to

a sequence of (x,y) tuples for specifying paths in collections, quiver, contour, pcolor, transforms. Fixed contour bug involving setting limits for color mapping. Added numpy-style all() to numerix. - EF

2006-06-20 Added custom FigureClass hook to pylab interface - see

examples/custom_figure_class.py

2006-06-16 Added colormaps from gist (gist_earth, gist_stern,

gist_rainbow, gist_gray, gist_yarg, gist_heat, gist_ncar) - JW

2006-06-16 Added a pointer to parent in figure canvas so you can

access the container with fig.canvas.manager. Useful if you want to set the window title, e.g., in gtk fig.canvas.manager.window.set_title, though a GUI neutral method would be preferable JDH

2006-06-16 Fixed colorbar.py to handle indexed colors (i.e.,

norm = no_norm()) by centering each colored region on its index. - EF

2006-06-15 Added scalex and scaley to Axes.autoscale_view to support

selective autoscaling just the x or y axis, and supported these command in plot so you can say plot(something, scaley=False) and just the x axis will be autoscaled. Modified axvline and axhline to support this, so for example axvline will no longer autoscale the y axis. JDH

2006-06-13 Fix so numpy updates are backward compatible - TEO

2006-06-12 Updated numerix to handle numpy restructuring of

oldnumeric - TEO

2006-06-12 Updated numerix.fft to handle numpy restructuring

Added ImportError to numerix.linear_algebra for numpy -TEO

2006-06-11 Added quiverkey command to pylab and Axes, using

QuiverKey class in quiver.py. Changed pylab and Axes to use quiver2 if possible, but drop back to the newly-renamed quiver_classic if necessary. Modified examples/quiver_demo.py to illustrate the new quiver and quiverkey. Changed LineCollection implementation slightly to improve compatibility with PolyCollection. - EF

2006-06-11 Fixed a usetex bug for windows, running latex on files

with spaces in their names or paths was failing - DSD

2006-06-09 Made additions to numerix, changes to quiver to make it

work with all numeric flavors. - EF

2006-06-09 Added quiver2 function to pylab and method to axes,

with implementation via a Quiver class in quiver.py. quiver2 will replace quiver before the next release; it is placed alongside it initially to facilitate testing and transition. See also examples/quiver2_demo.py. - EF

2006-06-08 Minor bug fix to make ticker.py draw proper minus signs

with usetex - DSD

2006-06-06 Released 0.87.3 at revision 2432

2006-05-30 More partial support for polygons with outline or fill,

but not both. Made LineCollection inherit from ScalarMappable. - EF

2006-05-29 Yet another revision of aspect-ratio handling. - EF

2006-05-27 Committed a patch to prevent stroking zero-width lines in

the svg backend - DSD

2006-05-24 Fixed colorbar positioning bug identified by Helge

Avlesen, and improved the algorithm; added a 'pad' kwarg to control the spacing between colorbar and parent axes. - EF

2006-05-23 Changed color handling so that collection initializers

can take any mpl color arg or sequence of args; deprecated float as grayscale, replaced by string representation of float. - EF

2006-05-19 Fixed bug: plot failed if all points were masked - EF

2006-05-19 Added custom symbol option to scatter - JDH

2006-05-18 New example, multi_image.py; colorbar fixed to show

offset text when the ScalarFormatter is used; FixedFormatter augmented to accept and display offset text. - EF

2006-05-14 New colorbar; old one is renamed to colorbar_classic.

New colorbar code is in colorbar.py, with wrappers in figure.py and pylab.py. Fixed aspect-handling bug reported by Michael Mossey. Made backend_bases.draw_quad_mesh() run.- EF

2006-05-08 Changed handling of end ranges in contourf: replaced

"clip-ends" kwarg with "extend". See docstring for details. -EF

2006-05-08 Added axisbelow to rc - JDH

2006-05-08 If using PyGTK require version 2.2+ - SC

2006-04-19 Added compression support to PDF backend, controlled by

new pdf.compression rc setting. - JKS

2006-04-19 Added Jouni's PDF backend

2006-04-18 Fixed a bug that caused agg to not render long lines

2006-04-16 Masked array support for pcolormesh; made pcolormesh support the

same combinations of X,Y,C dimensions as pcolor does; improved (I hope) description of grid used in pcolor, pcolormesh. - EF

2006-04-14 Reorganized axes.py - EF

2006-04-13 Fixed a bug Ryan found using usetex with sans-serif fonts and

exponential tick labels - DSD

2006-04-11 Refactored backend_ps and backend_agg to prevent module-level

texmanager imports. Now these imports only occur if text.usetex rc setting is true - DSD

2006-04-10 Committed changes required for building mpl on win32

platforms with visual studio. This allows wxpython blitting for fast animations. - CM

2006-04-10 Fixed an off-by-one bug in Axes.change_geometry.

2006-04-10 Fixed bug in pie charts where wedge wouldn't have label in

legend. Submitted by Simon Hildebrandt. - ADS

2006-05-06 Usetex makes temporary latex and dvi files in a temporary

directory, rather than in the user's current working directory - DSD

2006-04-05 Applied Ken's wx deprecation warning patch closing sf patch

#1465371 - JDH

2006-04-05 Added support for the new API in the postscript backend.

Allows values to be masked using nan's, and faster file creation - DSD

2006-04-05 Use python's subprocess module for usetex calls to

external programs. subprocess catches when they exit abnormally so an error can be raised. - DSD

2006-04-03 Fixed the bug in which widgets would not respond to

events. This regressed the twinx functionality, so I also updated subplots_adjust to update axes that share an x or y with a subplot instance. - CM

2006-04-02 Moved PBox class to transforms and deleted pbox.py;

made pylab axis command a thin wrapper for Axes.axis; more tweaks to aspect-ratio handling; fixed Axes.specgram to account for the new imshow default of unit aspect ratio; made contour set the Axes.dataLim. - EF

2006-03-31 Fixed the Qt "Underlying C/C++ object deleted" bug. - JRE

2006-03-31 Applied Vasily Sulatskov's Qt Navigation Toolbar enhancement. - JRE

2006-03-31 Ported Norbert's rewriting of Halldor's stineman_interp

algorithm to make it numerix compatible and added code to matplotlib.mlab. See examples/interp_demo.py - JDH

2006-03-30 Fixed a bug in aspect ratio handling; blocked potential

crashes when panning with button 3; added axis('image') support. - EF

2006-03-28 More changes to aspect ratio handling; new PBox class

in new file pbox.py to facilitate resizing and repositioning axes; made PolarAxes maintain unit aspect ratio. - EF

2006-03-23 Refactored TextWithDash class to inherit from, rather than

delegate to, the Text class. Improves object inspection and closes bug # 1357969 - DSD

2006-03-22 Improved aspect ratio handling, including pylab interface.

Interactive resizing, pan, zoom of images and plots (including panels with a shared axis) should work. Additions and possible refactoring are still likely. - EF

2006-03-21 Added another colorbrewer colormap (RdYlBu) - JSWHIT

2006-03-21 Fixed tickmarks for logscale plots over very large ranges.

Closes bug # 1232920 - DSD

2006-03-21 Added Rob Knight's arrow code; see examples/arrow_demo.py - JDH

2006-03-20 Added support for masking values with nan's, using ADS's

isnan module and the new API. Works for *Agg backends - DSD

2006-03-20 Added contour.negative_linestyle rcParam - ADS

2006-03-20 Added _isnan extension module to test for nan with Numeric

- ADS

2006-03-17 Added Paul and Alex's support for faceting with quadmesh

in sf patch 1411223 - JDH

2006-03-17 Added Charle Twardy's pie patch to support colors=None.

Closes sf patch 1387861 - JDH

2006-03-17 Applied sophana's patch to support overlapping axes with

toolbar navigation by toggling activation with the 'a' key. Closes sf patch 1432252 - JDH

2006-03-17 Applied Aarre's linestyle patch for backend EMF; closes sf

patch 1449279 - JDH

2006-03-17 Applied Jordan Dawe's patch to support kwarg properties

for grid lines in the grid command. Closes sf patch 1451661 - JDH

2006-03-17 Center postscript output on page when using usetex - DSD

2006-03-17 subprocess module built if Python <2.4 even if subprocess

can be imported from an egg - ADS

2006-03-17 Added _subprocess.c from Python upstream and hopefully

enabled building (without breaking) on Windows, although not tested. - ADS

2006-03-17 Updated subprocess.py to latest Python upstream and

reverted name back to subprocess.py - ADS

2006-03-16 Added John Porter's 3D handling code

2006-03-16 Released 0.87.2 at revision 2150

2006-03-15 Fixed bug in MaxNLocator revealed by daigos@infinito.it.

The main change is that Locator.nonsingular now adjusts vmin and vmax if they are nearly the same, not just if they are equal. A new kwarg, "tiny", sets the threshold. - EF

2006-03-14 Added import of compatibility library for newer numpy

linear_algebra - TEO

2006-03-12 Extended "load" function to support individual columns and

moved "load" and "save" into matplotlib.mlab so they can be used outside of pylab -- see examples/load_converter.py - JDH

2006-03-12 Added AutoDateFormatter and AutoDateLocator submitted

by James Evans. Try the load_converter.py example for a demo. - ADS

2006-03-11 Added subprocess module from python-2.4 - DSD

2006-03-11 Fixed landscape orientation support with the usetex

option. The backend_ps print_figure method was getting complicated, I added a _print_figure_tex method to maintain some degree of sanity - DSD

2006-03-11 Added "papertype" savefig kwarg for setting

postscript papersizes. papertype and ps.papersize rc setting can also be set to "auto" to autoscale pagesizes - DSD

2006-03-09 Apply P-J's patch to make pstoeps work on windows

patch report # 1445612 - DSD

2006-03-09 Make backend rc parameter case-insensitive - DSD

2006-03-07 Fixed bug in backend_ps related to C0-C6 papersizes,

which were causing problems with postscript viewers. Supported page sizes include letter, legal, ledger, A0-A10, and B0-B10 - DSD

2006-03-07 Released 0.87.1

2006-03-04 backend_cairo.py:

fix get_rgb() bug reported by Keith Briggs. Require pycairo 1.0.2. Support saving png to file-like objects. - SC

2006-03-03 Fixed pcolor handling of vmin, vmax - EF

2006-03-02 improve page sizing with usetex with the latex

geometry package. Closes bug # 1441629 - DSD

2006-03-02 Fixed dpi problem with usetex png output. Accepted a

modified version of patch # 1441809 - DSD

2006-03-01 Fixed axis('scaled') to deal with case xmax < xmin - JSWHIT

2006-03-01 Added reversed colormaps (with '_r' appended to name) - JSWHIT

2006-02-27 Improved eps bounding boxes with usetex - DSD

2006-02-27 Test svn commit, again!

2006-02-27 Fixed two dependency checking bugs related to usetex

on Windows - DSD

2006-02-27 Made the rc deprecation warnings a little more human

readable.

2006-02-26 Update the previous gtk.main_quit() bug fix to use gtk.main_level()

- SC

2006-02-24 Implemented alpha support in contour and contourf - EF

2006-02-22 Fixed gtk main quit bug when quit was called before

mainloop. - JDH

2006-02-22 Small change to colors.py to workaround apparent

bug in numpy masked array module - JSWHIT

2006-02-22 Fixed bug in ScalarMappable.to_rgba() reported by

Ray Jones, and fixed incorrect fix found by Jeff Whitaker - EF

2006-02-22 Released 0.87

2006-02-21 Fixed portrait/landscape orientation in postscript backend - DSD

2006-02-21 Fix bug introduced in yesterday's bug fix - SC

2006-02-20 backend_gtk.py FigureCanvasGTK.draw(): fix bug reported by

David Tremouilles - SC

2006-02-20 Remove the "pygtk.require('2.4')" error from

examples/embedding_in_gtk2.py - SC

2006-02-18 backend_gtk.py FigureCanvasGTK.draw(): simplify to use (rather than

duplicate) the expose_event() drawing code - SC

2006-02-12 Added stagger or waterfall plot capability to LineCollection;

illustrated in examples/collections.py. - EF

2006-02-11 Massive cleanup of the usetex code in the postscript backend. Possibly

fixed the clipping issue users were reporting with older versions of ghostscript - DSD

2006-02-11 Added autolim kwarg to axes.add_collection. Changed

collection get_verts() methods accordingly. - EF

2006-02-09 added a temporary rc parameter text.dvipnghack, to allow Mac users to get

results with the usetex option. - DSD

2006-02-09 Fixed a bug related to setting font sizes with the usetex option. - DSD

2006-02-09 Fixed a bug related to usetex's latex code. - DSD

2006-02-09 Modified behavior of font.size rc setting. You should define font.size in pts,

which will set the "medium" or default fontsize. Special text sizes like axis labels or tick labels can be given relative font sizes like small, large, x-large, etc. and will scale accordingly. - DSD

2006-02-08 Added py2exe specific datapath check again. Also added new

py2exe helper function get_py2exe_datafiles for use in py2exe setup.py scripts. - CM

2006-02-02 Added box function to pylab

2006-02-02 Fixed a problem in setupext.py, tk library formatted in unicode

caused build problems - DSD

2006-02-01 Dropped TeX engine support in usetex to focus on LaTeX. - DSD

2006-01-29 Improved usetex option to respect the serif, sans-serif, monospace,

and cursive rc settings. Removed the font.latex.package rc setting, it is no longer required - DSD

2006-01-29 Fixed tex's caching to include font.family rc information - DSD

2006-01-29 Fixed subpixel rendering bug in *Agg that was causing

uneven gridlines - JDH

2006-01-28 Added fontcmd to backend_ps's RendererPS.draw_tex, to support other

font families in eps output - DSD

2006-01-28 Added MaxNLocator to ticker.py, and changed contour.py to

use it by default. - EF

2006-01-28 Added fontcmd to backend_ps's RendererPS.draw_tex, to support other

font families in eps output - DSD

2006-01-27 Buffered reading of matplotlibrc parameters in order to allow

'verbose' settings to be processed first (allows verbose.report during rc validation process) - DSD

2006-01-27 Removed setuptools support from setup.py and created a

separate setupegg.py file to replace it. - CM

2006-01-26 Replaced the ugly datapath logic with a cleaner approach from

http://wiki.python.org/moin/DistutilsInstallDataScattered. Overrides the install_data command. - CM

2006-01-24 Don't use character typecodes in cntr.c --- changed to use

defined typenumbers instead. - TEO

2006-01-24 Fixed some bugs in usetex's and ps.usedistiller's dependency

2006-01-24 Added masked array support to scatter - EF

2006-01-24 Fixed some bugs in usetex's and ps.usedistiller's dependency

checking - DSD

2006-01-24 Released 0.86.2

2006-01-20 Added a converters dict to pylab load to convert selected

columns to float -- especially useful for files with date strings, uses a datestr2num converter - JDH

2006-01-20 Added datestr2num to matplotlib dates to convert a string

or sequence of strings to a matplotlib datenum

2006-01-18 Added quadrilateral pcolormesh patch 1409190 by Alex Mont

and Paul Kienzle -- this is *Agg only for now. See examples/quadmesh_demo.py - JDH

2006-01-18 Added Jouni's boxplot patch - JDH

2006-01-18 Added comma delimiter for pylab save - JDH

2006-01-12 Added Ryan's legend patch - JDH

2006-1-12 Fixed numpy / numeric to use .dtype.char to keep in SYNC with numpy SVN

2006-1-11 Released 0.86.1

2006-1-11 Fixed setup.py for win32 build and added rc template to the MANIFEST.in

2006-1-10 Added xpdf distiller option. matplotlibrc ps.usedistiller can now be

none, false, ghostscript, or xpdf. Validation checks for dependencies. This needs testing, but the xpdf option should produce the highest-quality output and small file sizes - DSD

2006-01-10 For the usetex option, backend_ps now does all the LaTeX work in the

os's temp directory - DSD

2006-1-10 Added checks for usetex dependencies. - DSD

2006-1-9 Released 0.86

2006-1-4 Changed to support numpy (new name for scipy_core) - TEO

2006-1-4 Added Mark's scaled axes patch for shared axis

2005-12-28 Added Chris Barker's build_wxagg patch - JDH

2005-12-27 Altered numerix/scipy to support new scipy package

structure - TEO

2005-12-20 Fixed Jame's Boyles date tick reversal problem - JDH

2005-12-20 Added Jouni's rc patch to support lists of keys to set on -

JDH

2005-12-12 Updated pyparsing and mathtext for some speed enhancements

(Thanks Paul McGuire) and minor fixes to scipy numerix and setuptools

2005-12-12 Matplotlib data is now installed as package_data in

the matplotlib module. This gets rid of checking the many possibilities in matplotlib._get_data_path() - CM

2005-12-11 Support for setuptools/pkg_resources to build and use

matplotlib as an egg. Still allows matplotlib to exist using a traditional distutils install. - ADS

2005-12-03 Modified setup to build matplotlibrc based on compile time

findings. It will set numerix in the order of scipy, numarray, Numeric depending on which are founds, and backend as in preference order GTKAgg, WXAgg, TkAgg, GTK, Agg, PS

2005-12-03 Modified scipy patch to support Numeric, scipy and numarray

Some work remains to be done because some of the scipy imports are broken if only the core is installed. e.g., apparently we need from scipy.basic.fftpack import * rather than from scipy.fftpack import *

2005-12-03 Applied some fixes to Nicholas Young's nonuniform image

patch

2005-12-01 Applied Alex Gontmakher hatch patch - PS only for now

2005-11-30 Added Rob McMullen's EMF patch

2005-11-30 Added Daishi's patch for scipy

2005-11-30 Fixed out of bounds draw markers segfault in agg

2005-11-28 Got TkAgg blitting working 100% (cross fingers) correctly. - CM

2005-11-27 Multiple changes in cm.py, colors.py, figure.py, image.py,

contour.py, contour_demo.py; new _cm.py, examples/image_masked.py. 1) Separated the color table data from cm.py out into a new file, _cm.py, to make it easier to find the actual code in cm.py and to add new colormaps. Also added some line breaks to the color data dictionaries. Everything from _cm.py is imported by cm.py, so the split should be transparent. 2) Enabled automatic generation of a colormap from a list of colors in contour; see modified examples/contour_demo.py. 3) Support for imshow of a masked array, with the ability to specify colors (or no color at all) for masked regions, and for regions that are above or below the normally mapped region. See examples/image_masked.py. 4) In support of the above, added two new classes, ListedColormap, and no_norm, to colors.py, and modified the Colormap class to include common functionality. Added a clip kwarg to the normalize class. Reworked color handling in contour.py, especially in the ContourLabeller mixin. - EF

2005-11-25 Changed text.py to ensure color is hashable. EF

2005-11-16 Released 0.85

2005-11-16 Changed the default default linewidth in rc to 1.0

2005-11-16 Replaced agg_to_gtk_drawable with pure pygtk pixbuf code in

backend_gtkagg. When the equivalent is doe for blit, the agg extension code will no longer be needed

2005-11-16 Added a maxdict item to cbook to prevent caches from

growing w/o bounds

2005-11-15 Fixed a colorup/colordown reversal bug in finance.py --

Thanks Gilles

2005-11-15 Applied Jouni K Steppanen's boxplot patch SF patch#1349997

- JDH

2005-11-09 added axisbelow attr for Axes to determine whether ticks and such

are above or below the actors

2005-11-08 Added Nicolas' irregularly spaced image patch

2005-11-08 Deprecated HorizontalSpanSelector and replaced with

SpanSelection that takes a third arg, direction. The new SpanSelector supports horizontal and vertical span selection, and the appropriate min/max is returned. - CM

2005-11-08 Added lineprops dialog for gtk

2005-11-03 Added FIFOBuffer class to mlab to support real time feeds

and examples/fifo_buffer.py

2005-11-01 Contributed Nickolas Young's patch for afm mathtext to

support mathtext based upon the standard postscript Symbol font when ps.usetex = True.

2005-10-26 Added support for scatter legends - thanks John Gill

2005-10-20 Fixed image clipping bug that made some tex labels

disappear. JDH

2005-10-14 Removed sqrt from dvipng 1.6 alpha channel mask.

2005-10-14 Added width kwarg to hist function

2005-10-10 Replaced all instances of os.rename with shutil.move

2005-10-05 Added Michael Brady's ydate patch

2005-10-04 Added rkern's texmanager patch

2005-09-25 contour.py modified to use a single ContourSet class

that handles filled contours, line contours, and labels; added keyword arg (clip_ends) to contourf. Colorbar modified to work with new ContourSet object; if the ContourSet has lines rather than polygons, the colorbar will follow suit. Fixed a bug introduced in 0.84, in which contourf(...,colors=...) was broken - EF

2005-09-19 Released 0.84

2005-09-14 Added a new 'resize_event' which triggers a callback with a

backend_bases.ResizeEvent object - JDH

2005-09-14 font_manager.py: removed chkfontpath from x11FontDirectory() - SC

2005-09-14 Factored out auto date locator/formatter factory code into

matplotlib.date.date_ticker_factory; applies John Bryne's quiver patch.

2005-09-13 Added Mark's axes positions history patch #1286915

2005-09-09 Added support for auto canvas resizing with

fig.set_figsize_inches(9,5,forward=True) # inches OR fig.resize(400,300) # pixels

2005-09-07 figure.py: update Figure.draw() to use the updated

renderer.draw_image() so that examples/figimage_demo.py works again. examples/stock_demo.py: remove data_clipping (which no longer exists) - SC

2005-09-06 Added Eric's tick.direction patch: in or out in rc

2005-09-06 Added Martin's rectangle selector widget

2005-09-04 Fixed a logic err in text.py that was preventing rgxsuper

from matching - JDH

2005-08-29 Committed Ken's wx blit patch #1275002

2005-08-26 colorbar modifications - now uses contourf instead of imshow

so that colors used by contourf are displayed correctly. Added two new keyword args (cspacing and clabels) that are only relevant for ContourMappable images - JSWHIT

2005-08-24 Fixed a PS image bug reported by Darren - JDH

2005-08-23 colors.py: change hex2color() to accept unicode strings as well as

normal strings. Use isinstance() instead of types.IntType etc - SC

2005-08-16 removed data_clipping line and rc property - JDH

2005-08-22 backend_svg.py: Remove redundant "x=0.0 y=0.0" from svg element.

Increase svg version from 1.0 to 1.1. Add viewBox attribute to svg element to allow SVG documents to scale-to-fit into an arbitrary viewport - SC

2005-08-16 Added Eric's dot marker patch - JDH

2005-08-08 Added blitting/animation for TkAgg - CM

2005-08-05 Fixed duplicate tickline bug - JDH

2005-08-05 Fixed a GTK animation bug that cropped up when doing

animations in gtk//gtkagg canvases that had widgets packed above them

2005-08-05 Added Clovis Goldemberg patch to the tk save dialog

2005-08-04 Removed origin kwarg from backend.draw_image. origin is

handled entirely by the frontend now.

2005-07-03 Fixed a bug related to TeX commands in backend_ps

2005-08-03 Fixed SVG images to respect upper and lower origins.

2005-08-03 Added flipud method to image and removed it from to_str.

2005-07-29 Modified figure.figaspect to take an array or number;

modified backend_svg to write utf-8 - JDH

2005-07-30 backend_svg.py: embed png image files in svg rather than linking

to a separate png file, fixes bug #1245306 (thanks to Norbert Nemec for the patch) - SC

2005-07-29 Released 0.83.2

2005-07-27 Applied SF patch 1242648: minor rounding error in

IndexDateFormatter in dates.py

2005-07-27 Applied sf patch 1244732: Scale axis such that circle

looks like circle - JDH

2005-07-29 Improved message reporting in texmanager and backend_ps - DSD

2005-07-28 backend_gtk.py: update FigureCanvasGTK.draw() (needed due to the

recent expose_event() change) so that examples/anim.py works in the usual way - SC

2005-07-26 Added new widgets Cursor and HorizontalSpanSelector to

matplotlib.widgets. See examples/widgets/cursor.py and examples/widgets/span_selector.py - JDH

2005-07-26 added draw event to mpl event hierarchy -- triggered on

figure.draw

2005-07-26 backend_gtk.py: allow 'f' key to toggle window fullscreen mode

2005-07-26 backend_svg.py: write "<.../>" elements all on one line and remove

surplus spaces - SC

2005-07-25 backend_svg.py: simplify code by deleting GraphicsContextSVG and

RendererSVG.new_gc(), and moving the gc.get_capstyle() code into RendererSVG._get_gc_props_svg() - SC

2005-07-24 backend_gtk.py: call FigureCanvasBase.motion_notify_event() on

all motion-notify-events, not just ones where a modifier key or button has been pressed (fixes bug report from Niklas Volbers) - SC

2005-07-24 backend_gtk.py: modify print_figure() use own pixmap, fixing

problems where print_figure() overwrites the display pixmap. return False from all button/key etc events - to allow the event to propagate further - SC

2005-07-23 backend_gtk.py: change expose_event from using set_back_pixmap();

clear() to draw_drawable() - SC

2005-07-23 backend_gtk.py: removed pygtk.require()

matplotlib/__init__.py: delete 'FROZEN' and 'McPLError' which are no longer used - SC

2005-07-22 backend_gdk.py: removed pygtk.require() - SC

2005-07-21 backend_svg.py: Remove unused imports. Remove methods doc strings

which just duplicate the docs from backend_bases.py. Rename draw_mathtext to _draw_mathtext. - SC

2005-07-17 examples/embedding_in_gtk3.py: new example demonstrating placing

a FigureCanvas in a gtk.ScrolledWindow - SC

2005-07-14 Fixed a Windows related bug (#1238412) in texmanager - DSD

2005-07-11 Fixed color kwarg bug, setting color=1 or 0 caused an

exception - DSD

2005-07-07 Added Eric's MA set_xdata Line2D fix - JDH

2005-07-06 Made HOME/.matplotlib the new config dir where the

matplotlibrc file, the ttf.cache, and the tex.cache live. The new default filenames in .matplotlib have no leading dot and are not hidden. e.g., the new names are matplotlibrc tex.cache ttffont.cache. This is how ipython does it so it must be right. If old files are found, a warning is issued and they are moved to the new location. Also fixed texmanager to put all files, including temp files in ~/.matplotlib/tex.cache, which allows you to usetex in non-writable dirs.

2005-07-05 Fixed bug #1231611 in subplots adjust layout. The problem

was that the text caching mechanism was not using the transformation affine in the key. - JDH

2005-07-05 Fixed default backend import problem when using API (SF bug

1209354 - see API_CHANGES for more info - JDH

2005-07-04 backend_gtk.py: require PyGTK version 2.0.0 or higher - SC

2005-06-30 setupext.py: added numarray_inc_dirs for building against

numarray when not installed in standard location - ADS

2005-06-27 backend_svg.py: write figure width, height as int, not float.

Update to fix some of the pychecker warnings - SC

2005-06-23 Updated examples/agg_test.py to demonstrate curved paths

and fills - JDH

2005-06-21 Moved some texmanager and backend_agg tex caching to class

level rather than instance level - JDH

2005-06-20 setupext.py: fix problem where _nc_backend_gdk is installed to the

wrong directory - SC

2005-06-19 Added 10.4 support for CocoaAgg. - CM

2005-06-18 Move Figure.get_width_height() to FigureCanvasBase and return

int instead of float. - SC

2005-06-18 Applied Ted Drain's QtAgg patch: 1) Changed the toolbar to

be a horizontal bar of push buttons instead of a QToolbar and updated the layout algorithms in the main window accordingly. This eliminates the ability to drag and drop the toolbar and detach it from the window. 2) Updated the resize algorithm in the main window to show the correct size for the plot widget as

requested. This works almost correctly right now. It looks to me like the final size of the widget is off by the border of the main window but I haven't figured out a way to get that information yet. We could just add a small margin to the new size but that seems a little hacky. 3) Changed the x/y location label to be in the toolbar like the Tk backend instead of as a status line at the bottom of the widget. 4) Changed the toolbar pixmaps to use the ppm files instead of the png files. I noticed that the Tk backend buttons looked much nicer and it uses the ppm files so I switched them.

2005-06-17 Modified the gtk backend to not queue mouse motion events.

This allows for live updates when dragging a slider. - CM

2005-06-17 Added starter CocoaAgg backend. Only works on OS 10.3 for

now and requires PyObjC. (10.4 is high priority) - CM

2005-06-17 Upgraded pyparsing and applied Paul McGuire's suggestions

for speeding things up. This more than doubles the speed of mathtext in my simple tests. JDH

2005-06-16 Applied David Cooke's subplot make_key patch

2005-06-15 0.82 released

2005-06-15 Added subplot config tool to GTK* backends -- note you must

now import the NavigationToolbar2 from your backend of choice rather than from backend_gtk because it needs to know about the backend specific canvas -- see examples/embedding_in_gtk2.py. Ditto for wx backend -- see examples/embedding_in_wxagg.py

2005-06-15 backend_cairo.py: updated to use pycairo 0.5.0 - SC

2005-06-14 Wrote some GUI neutral widgets (Button, Slider,

RadioButtons, CheckButtons) in matplotlib.widgets. See examples/widgets/*.py - JDH

2005-06-14 Exposed subplot parameters as rc vars and as the fig

SubplotParams instance subplotpars. See figure.SubplotParams, figure.Figure.subplots_adjust and the pylab method subplots_adjust and examples/subplots_adjust.py . Also added a GUI neutral widget for adjusting subplots, see examples/subplot_toolbar.py - JDH

2005-06-13 Exposed cap and join style for lines with new rc params and

line properties

lines.dash_joinstyle : miter # miter|round|bevel lines.dash_capstyle : butt # butt|round|projecting lines.solid_joinstyle : miter # miter|round|bevel lines.solid_capstyle : projecting # butt|round|projecting

2005-06-13 Added kwargs to Axes init

2005-06-13 Applied Baptiste's tick patch - JDH

2005-06-13 Fixed rc alias 'l' bug reported by Fernando by removing

aliases for mainlevel rc options. - JDH

2005-06-10 Fixed bug #1217637 in ticker.py - DSD

2005-06-07 Fixed a bug in texmanager.py: .aux files not being removed - DSD

2005-06-08 Added Sean Richard's hist binning fix -- see API_CHANGES - JDH

2005-06-07 Fixed a bug in texmanager.py: .aux files not being removed

- DSD

2005-06-07 matplotlib-0.81 released

2005-06-06 Added autoscale_on prop to axes

2005-06-06 Added Nick's picker "among" patch - JDH

2005-06-05 Fixed a TeX/LaTeX font discrepency in backend_ps. - DSD

2005-06-05 Added a ps.distill option in rc settings. If True, postscript

output will be distilled using ghostscript, which should trim the file size and allow it to load more quickly. Hopefully this will address the issue of large ps files due to font definitions. Tested with gnu-ghostscript-8.16. - DSD

2005-06-03 Improved support for tex handling of text in backend_ps. - DSD

2005-06-03 Added rc options to render text with tex or latex, and to select

the latex font package. - DSD

2005-06-03 Fixed a bug in ticker.py causing a ZeroDivisionError

2005-06-02 backend_gtk.py remove DBL_BUFFER, add line to expose_event to

try to fix pygtk 2.6 redraw problem - SC

2005-06-01 The default behavior of ScalarFormatter now renders scientific

notation and large numerical offsets in a label at the end of the axis. - DSD

2005-06-01 Added Nicholas' frombyte image patch - JDH

2005-05-31 Added vertical TeX support for agg - JDH

2005-05-31 Applied Eric's cntr patch - JDH

2005-05-27 Finally found the pesky agg bug (which Maxim was kind

enough to fix within hours) that was causing a segfault in the win32 cached marker drawing. Now windows users can get the enormouse performance benefits of caced markers w/o those occasional pesy screenshots. - JDH

2005-05-27 Got win32 build system working again, using a more recent

version of gtk and pygtk in the win32 build, gtk 2.6 from https://web.archive.org/web/20050527002647/https://www.gimp.org/~tml/gimp/win32/downloads.html (you will also need libpng12.dll to use these). I haven't tested whether this binary build of mpl for win32 will work with older gtk runtimes, so you may need to upgrade.

2005-05-27 Fixed bug where 2nd wxapp could be started if using wxagg

backend. - ADS

2005-05-26 Added Daishi text with dash patch -- see examples/dashtick.py

2005-05-26 Moved backend_latex functionality into backend_ps. If

text.usetex=True, the PostScript backend will use LaTeX to generate the .ps or .eps file. Ghostscript is required for eps output. - DSD

2005-05-24 Fixed alignment and color issues in latex backend. - DSD

2005-05-21 Fixed raster problem for small rasters with dvipng -- looks

like it was a premultipled alpha problem - JDH

2005-05-20 Added linewidth and faceted kwarg to scatter to control

edgewidth and color. Also added autolegend patch to inspect line segments.

2005-05-18 Added Orsay and JPL qt fixes - JDH

2005-05-17 Added a psfrag latex backend -- some alignment issues need

to be worked out. Run with -dLaTeX and a *.tex file and *.eps file are generated. latex and dvips the generated latex file to get ps output. Note xdvi *does* not work, you must generate ps.- JDH

2005-05-13 Added Florent Rougon's Axis set_label1

patch

2005-05-17 pcolor optimization, fixed bug in previous pcolor patch - JSWHIT

2005-05-16 Added support for masked arrays in pcolor - JSWHIT

2005-05-12 Started work on TeX text for antigrain using pngdvi -- see

examples/tex_demo.py and the new module matplotlib.texmanager. Rotated text not supported and rendering small glyps is not working right yet. BUt large fontsizes and/or high dpi saved figs work great.

2005-05-10 New image resize options interpolation options. New values

for the interp kwarg are

'nearest', 'bilinear', 'bicubic', 'spline16', 'spline36', 'hanning', 'hamming', 'hermite', 'kaiser', 'quadric', 'catrom', 'gaussian', 'bessel', 'mitchell', 'sinc', 'lanczos', 'blackman'

See help(imshow) for details, particularly the interpolation, filternorm and filterrad kwargs

2005-05-10 Applied Eric's contour mem leak fixes - JDH

2005-05-10 Extended python agg wrapper and started implementing

backend_agg2, an agg renderer based on the python wrapper. This will be more flexible and easier to extend than the current backend_agg. See also examples/agg_test.py - JDH

2005-05-09 Added Marcin's no legend patch to exclude lines from the

autolegend builder

plot(x, y, label='nolegend')

2005-05-05 Upgraded to agg23

2005-05-05 Added newscalarformatter_demo.py to examples. -DSD

2005-05-04 Added NewScalarFormatter. Improved formatting of ticklabels,

scientific notation, and the ability to plot large large numbers with small ranges, by determining a numerical offset. See ticker.NewScalarFormatter for more details. -DSD

2005-05-03 Added the option to specify a delimiter in pylab.load -DSD

2005-04-28 Added Darren's line collection example

2005-04-28 Fixed aa property in agg - JDH

2005-04-27 Set postscript page size in .matplotlibrc - DSD

2005-04-26 Added embedding in qt example. - JDH

2005-04-14 Applied Michael Brady's qt backend patch: 1) fix a bug

where keyboard input was grabbed by the figure and not released 2) turn on cursor changes 3) clean up a typo and commented-out print statement. - JDH

2005-04-14 Applied Eric Firing's masked data lines patch and contour

patch. Support for masked arrays has been added to the plot command and to the Line2D object. Only the valid points are plotted. A "valid_only" kwarg was added to the get_xdata() and get_ydata() methods of Line2D; by default it is False, so that the original data arrays are returned. Setting it to True returns the plottable points. - see examples/masked_demo.py - JDH

2005-04-13 Applied Tim Leslie's arrow key event handling patch - JDH

0.80 released

2005-04-11 Applied a variant of rick's xlim/ylim/axis patch. These

functions now take kwargs to let you selectively alter only the min or max if desired. e.g., xlim(xmin=2) or axis(ymax=3). They always return the new lim. - JDH

2005-04-11 Incorporated Werner's wx patch -- wx backend should be

compatible with wxpython2.4 and recent versions of 2.5. Some early versions of wxpython 2.5 will not work because there was a temporary change in the dc API that was rolled back to make it 2.4 compliant

2005-04-11 modified tkagg show so that new figure window pops up on

call to figure

2005-04-11 fixed wxapp init bug

2005-04-02 updated backend_ps.draw_lines, draw_markers for use with the

new API - DSD

2005-04-01 Added editable polygon example

2005-03-31 0.74 released

2005-03-30 Fixed and added checks for floating point inaccuracy in

ticker.Base - DSD

2005-03-30 updated /ellipse definition in backend_ps.py to address bug

#1122041 - DSD

2005-03-29 Added unicode support for Agg and PS - JDH

2005-03-28 Added Jarrod's svg patch for text - JDH

2005-03-28 Added Ludal's arrow and quiver patch - JDH

2005-03-28 Added label kwarg to Axes to facilitate forcing the

creation of new Axes with otherwise identical attributes

2005-03-28 Applied boxplot and OSX font search patches

2005-03-27 Added ft2font NULL check to fix Japanase font bug - JDH

2005-03-27 Added sprint legend patch plus John Gill's tests and fix --

see examples/legend_auto.py - JDH

2005-03-19 0.73.1 released

2005-03-19 Reverted wxapp handling because it crashed win32 - JDH

2005-03-18 Add .number attribute to figure objects returned by figure() - FP

2005-03-18 0.73 released

2005-03-16 Fixed labelsep bug

2005-03-16 Applied Darren's ticker fix for small ranges - JDH

2005-03-16 Fixed tick on horiz colorbar - JDH

2005-03-16 Added Japanese winreg patch - JDH

2005-03-15 backend_gtkagg.py: changed to use double buffering, this fixes

the problem reported Joachim Berdal Haga - "Parts of plot lagging from previous frame in animation". Tested with anim.py and it makes no noticeable difference to performance (23.7 before, 23.6 after) - SC

2005-03-14 add src/_backend_gdk.c extension to provide a substitute function

for pixbuf.get_pixels_array(). Currently pixbuf.get_pixels_array() only works with Numeric, and then only works if pygtk has been compiled with Numeric support. The change provides a function pixbuf_get_pixels_array() which works with Numeric and numarray and is always available. It means that backend_gtk should be able to display images and mathtext in all circumstances. - SC

2005-03-11 Upgraded CXX to 5.3.1

2005-03-10 remove GraphicsContextPS.set_linestyle()

and GraphicsContextSVG.set_linestyle() since they do no more than the base class GraphicsContext.set_linestyle() - SC

2005-03-09 Refactored contour functionality into dedicated module

2005-03-09 Added Eric's contourf updates and Nadia's clabel functionality

2005-03-09 Moved colorbar to figure.Figure to expose it for API developers

- JDH

2005-03-09 backend_cairo.py: implemented draw_markers() - SC

2005-03-09 cbook.py: only use enumerate() (the python version) if the builtin

version is not available.

Add new function 'izip' which is set to itertools.izip if available and the python equivalent if not available. - SC

2005-03-07 backend_gdk.py: remove PIXELS_PER_INCH from points_to_pixels(), but

still use it to adjust font sizes. This allows the GTK version of

line_styles.py to more closely match GTKAgg, previously the markers were being drawn too large. - SC

2005-03-01 Added Eric's contourf routines

2005-03-01 Added start of proper agg SWIG wrapper. I would like to

expose agg functionality directly a the user level and this module will serve that purpose eventually, and will hopefully take over most of the functionality of the current _image and _backend_agg modules. - JDH

2005-02-28 Fixed polyfit / polyval to convert input args to float

arrays - JDH

2005-02-25 Add experimental feature to backend_gtk.py to enable/disable

double buffering (DBL_BUFFER=True/False) - SC

2005-02-24 colors.py change ColorConverter.to_rgb() so it always returns rgb

(and not rgba), allow cnames keys to be cached, change the exception raised from RuntimeError to ValueError (like hex2color()) hex2color() use a regular expression to check the color string is valid - SC

2005-02-23 Added rc param ps.useafm so backend ps can use native afm

fonts or truetype. afme breaks mathtext but causes much smaller font sizes and may result in images that display better in some contexts (e.g., pdfs incorporated into latex docs viewed in acrobat reader). I would like to extend this approach to allow the user to use truetype only for mathtext, which should be easy.

2005-02-23 Used sequence protocol rather than tuple in agg collection

drawing routines for greater flexibility - JDH

2005-02-22 0.72.1 released

2005-02-21 fixed linestyles for collections -- contour now dashes for

levels <0

2005-02-21 fixed ps color bug - JDH

2005-02-15 fixed missing qt file

2005-02-15 banished error_msg and report_error. Internal backend

methods like error_msg_gtk are preserved. backend writers, check your backends, and diff against 0.72 to make sure I did the right thing! - JDH

2005-02-14 Added enthought traits to matplotlib tree - JDH

2005-02-14 0.72 released

2005-02-14 fix bug in cbook alltrue() and onetrue() - SC

2005-02-11 updated qtagg backend from Ted - JDH

2005-02-11 matshow fixes for figure numbering, return value and docs - FP

2005-02-09 new zorder example for fine control in zorder_demo.py - FP

2005-02-09 backend renderer draw_lines now has transform in backend,

as in draw_markers; use numerix in _backend_agg, aded small line optimization to agg

2005-02-09 subplot now deletes axes that it overlaps

2005-02-08 Added transparent support for gzipped files in load/save - Fernando

Perez (FP from now on).

2005-02-08 Small optimizations in PS backend. They may have a big impact for

large plots, otherwise they don't hurt - FP

2005-02-08 Added transparent support for gzipped files in load/save - Fernando

Perez (FP from now on).

2005-02-07 Added newstyle path drawing for markers - only implemented

in agg currently - JDH

2005-02-05 Some superscript text optimizations for ticking log plots

2005-02-05 Added some default key press events to pylab figures: 'g'

toggles grid - JDH

2005-02-05 Added some support for handling log switching for lines

that have nonpos data - JDH

2005-02-04 Added Nadia's contour patch - contour now has matlab

compatible syntax; this also fixed an unequal sized contour array bug- JDH

2005-02-04 Modified GTK backends to allow the FigureCanvas to be resized

smaller than its original size - SC

2005-02-02 Fixed a bug in dates mx2num - JDH

2005-02-02 Incorporated Fernando's matshow - JDH

2005-02-01 Added Fernando's figure num patch, including experimental

support for pylab backend switching, LineCOllection.color warns, savefig now a figure method, fixed a close(fig) bug - JDH

2005-01-31 updated datalim in contour - JDH

2005-01-30 Added backend_qtagg.py provided by Sigve Tjora - SC

2005-01-28 Added tk.inspect rc param to .matplotlibrc. IDLE users

should set tk.pythoninspect:True and interactive:True and backend:TkAgg

2005-01-28 Replaced examples/interactive.py with an updated script from

Fernando Perez - SC

2005-01-27 Added support for shared x or y axes. See

examples/shared_axis_demo.py and examples/ganged_plots.py

2005-01-27 Added Lee's patch for missing symbols leq and LEFTbracket

to _mathtext_data - JDH

2005-01-26 Added Baptiste's two scales patch -- see help(twinx) in the

pylab interface for more info. See also examples/two_scales.py

2005-01-24 Fixed a mathtext parser bug that prevented font changes in

sub/superscripts - JDH

2005-01-24 Fixed contour to work w/ interactive changes in colormaps,

clim, etc - JDH

2005-01-21 matplotlib-0.71 released

2005-01-21 Refactored numerix to solve vexing namespace issues - JDH

2005-01-21 Applied Nadia's contour bug fix - JDH

2005-01-20 Made some changes to the contour routine - particularly

region=1 seems t fix a lot of the zigzag strangeness. Added colormaps as default for contour - JDH

2005-01-19 Restored builtin names which were overridden (min, max,

abs, round, and sum) in pylab. This is a potentially significant change for those who were relying on an array version of those functions that previously overrode builtin function names. - ADS

2005-01-18 Added accents to mathtext: hat, breve, grave, bar,

acute, tilde, vec, dot, ddot. All of them have the same syntax, e.g., to make an overbar you do bar{o} or to make an o umlaut you do ddot{o}. The shortcuts are also provided, e.g., "o 'e `e ~n .x ^y - JDH

2005-01-18 Plugged image resize memory leaks - JDH

2005-01-18 Fixed some mathtext parser problems relating to superscripts

2005-01-17 Fixed a yticklabel problem for colorbars under change of

clim - JDH

2005-01-17 Cleaned up Destroy handling in wx reducing memleak/fig from
approx 800k to approx 6k- JDH

2005-01-17 Added kappa to latex_to_bakoma - JDH

2005-01-15 Support arbitrary colorbar axes and horizontal colorbars - JDH

2005-01-15 Fixed colormap number of colors bug so that the colorbar
has the same discretization as the image - JDH

2005-01-15 Added Nadia's x,y contour fix - JDH

2005-01-15 backend_cairo: added PDF support which requires pycairo 0.1.4.

Its not usable yet, but is ready for when the Cairo PDF backend matures - SC

2005-01-15 Added Nadia's x,y contour fix

2005-01-12 Fixed set clip_on bug in artist - JDH

2005-01-11 Reverted pythoninspect in tkagg - JDH

2005-01-09 Fixed a backend_bases event bug caused when an event is
triggered when location is None - JDH

2005-01-07 Add patch from Stephen Walton to fix bug in pylab.load()
when the % character is included in a comment. - ADS

2005-01-07 Added markerscale attribute to Legend class. This allows
the marker size in the legend to be adjusted relative to that in the plot. - ADS

2005-01-06 Add patch from Ben Vanhaeren to make the FigureManagerGTK vbox a

public attribute - SC

2004-12-30 Release 0.70

2004-12-28 Added coord location to key press and added a
examples/picker_demo.py

2004-12-28 Fixed coords notification in wx toolbar - JDH

2004-12-28 Moved connection and disconnection event handling to the
FigureCanvasBase. Backends now only need to connect one time for each of the button press, button release and key press/release functions. The base class deals with callbacks and multiple connections. This fixes flakiness on some backends (tk, wx) in the presence of multiple connections and/or disconnect - JDH

2004-12-27 Fixed PS mathtext bug where color was not set - Jochen
please verify correct - JDH

2004-12-27 Added Shadow class and added shadow kwarg to legend and pie

for shadow effect - JDH

2004-12-27 Added pie charts and new example/pie_demo.py

2004-12-23 Fixed an agg text rotation alignment bug, fixed some text

kwarg processing bugs, and added examples/text_rotation.py to explain and demonstrate how text rotations and alignment work in matplotlib. - JDH

2004-12-22 0.65.1 released - JDH

2004-12-22 Fixed colorbar bug which caused colorbar not to respond to

changes in colormap in some instances - JDH

2004-12-22 Refactored NavigationToolbar in tkagg to support app

embedding , init now takes (canvas, window) rather than (canvas, figman) - JDH

2004-12-21 Refactored axes and subplot management - removed

add_subplot and add_axes from the FigureManager. classic toolbar updates are done via an observer pattern on the figure using add_axobserver. Figure now maintains the axes stack (for gca) and supports axes deletion. Ported changes to GTK, Tk, Wx, and FLTK. Please test! Added delaxes - JDH

2004-12-21 Lots of image optimizations - 4x performance boost over

0.65 JDH

2004-12-20 Fixed a figimage bug where the axes is shown and modified

tkagg to move the destroy binding into the show method.

2004-12-18 Minor refactoring of NavigationToolbar2 to support

embedding in an application - JDH

2004-12-14 Added linestyle to collections (currently broken) - JDH

2004-12-14 Applied Nadia's setupext patch to fix libstdc++ link

problem with contour and solaris -JDH

2004-12-14 A number of pychecker inspired fixes, including removal of

True and False from cbook which I erroneously thought was needed for python2.2 - JDH

2004-12-14 Finished porting doc strings for set introspection.

Used silent_list for many get funcs that return lists. JDH

2004-12-13 dates.py: removed all timezone() calls, except for UTC - SC

2004-12-13 0.65 released - JDH

2004-12-13 colors.py: rgb2hex(), hex2color() made simpler (and faster), also

rgb2hex() - added round() instead of integer truncation hex2color() - changed 256.0 divisor to 255.0, so now '#ffffff' becomes (1.0,1.0,1.0) not (0.996,0.996,0.996) - SC

2004-12-11 Added ion and ioff to pylab interface - JDH

2004-12-11 backend_template.py: delete FigureCanvasTemplate.realize() - most

backends don't use it and its no longer needed

backend_ps.py, backend_svg.py: delete show() and draw_if_interactive() - they are not needed for image backends

backend_svg.py: write direct to file instead of StringIO - SC

2004-12-10 Added zorder to artists to control drawing order of lines,

patches and text in axes. See examples/zoder_demo.py - JDH

2004-12-10 Fixed colorbar bug with scatter - JDH

2004-12-10 Added Nadia Dencheva <dencheva@stsci.edu> contour code - JDH

2004-12-10 backend_cairo.py: got mathtext working - SC

2004-12-09 Added Norm Peterson's svg clipping patch

2004-12-09 Added Matthew Newville's wx printing patch

2004-12-09 Migrated matlab to pylab - JDH

2004-12-09 backend_gtk.py: split into two parts

- backend_gdk.py - an image backend
- backend_gtk.py - A GUI backend that uses GDK - SC

2004-12-08 backend_gtk.py: remove quit_after_print_xvfb(*args), show_xvfb(),

Dialog_MeasureTool(gtk.Dialog) one month after sending mail to matplotlib-users asking if anyone still uses these functions - SC

2004-12-02 backend_bases.py, backend_template.py: updated some of the method

documentation to make them consistent with each other - SC

2004-12-04 Fixed multiple bindings per event for TkAgg mpl_connect and

mpl_disconnect. Added a "test_disconnect" command line parameter to coords_demo.py JTM

2004-12-04 Fixed some legend bugs JDH

2004-11-30 Added over command for oneoff over plots. e.g., over(plot, x,
y, lw=2). Works with any plot function.

2004-11-30 Added bbox property to text - JDH

2004-11-29 Zoom to rect now respect reversed axes limits (for both
linear and log axes). - GL

2004-11-29 Added the over command to the matlab interface. over
allows you to add an overlay plot regardless of hold state. - JDH

2004-11-25 Added Printf to mplutils for printf style format string
formatting in C++ (should help write better exceptions)

2004-11-24 IMAGE_FORMAT: remove from agg and gtkagg backends as its no longer
used - SC

2004-11-23 Added matplotlib compatible set and get introspection. See
set_and_get.py

2004-11-23 applied Norbert's patched and exposed legend configuration
to kwargs - JDH

2004-11-23 backend_gtk.py: added a default exception handler - SC

2004-11-18 backend_gtk.py: change so that the backend knows about all image
formats and does not need to use IMAGE_FORMAT in other backends - SC

2004-11-18 Fixed some report_error bugs in string interpolation as
reported on SF bug tracker- JDH

2004-11-17 backend_gtkcairo.py: change so all print_figure() calls render using
Cairo and get saved using backend_gtk.print_figure() - SC

2004-11-13 backend_cairo.py: Discovered the magic number (96) required for
Cairo PS plots to come out the right size. Restored Cairo PS output and added support for landscape mode - SC

2004-11-13 Added ishold - JDH

2004-11-12 Added many new matlab colormaps - autumn bone cool copper
flag gray hot hsv jet pink prism spring summer winter - PG

2004-11-11 greatly simplify the emitted postscript code - JV

2004-11-12 Added new plotting functions spy, spy2 for sparse matrix

visualization - JDH

2004-11-11 Added rgrids, thetragrids for customizing the grid

locations and labels for polar plots - JDH

2004-11-11 make the Gtk backends build without an X-server connection - JV

2004-11-10 matplotlib/__init__.py: Added FROZEN to signal we are running under

py2exe (or similar) - is used by backend_gtk.py - SC

2004-11-09 backend_gtk.py: Made fix suggested by maffew@cat.org.au

to prevent problems when py2exe calls pygtk.require(). - SC

2004-11-09 backend_cairo.py: Added support for printing to a fileobject.

Disabled cairo PS output which is not working correctly. - SC

2004-11-08 matplotlib-0.64 released

2004-11-04 Changed -dbackend processing to only use known backends, so

we don't clobber other non-matplotlib uses of -d, like -debug.

2004-11-04 backend_agg.py: added IMAGE_FORMAT to list the formats that the

backend can save to. backend_gtkagg.py: added support for saving JPG files by using the GTK backend - SC

2004-10-31 backend_cairo.py: now produces png and ps files (although the figure

sizing needs some work). pycairo did not wrap all the necessary functions, so I wrapped them myself, they are included in the backend_cairo.py doc string. - SC

2004-10-31 backend_ps.py: clean up the generated PostScript code, use

the PostScript stack to hold itermediate values instead of storing them in the dictionary. - JV

2004-10-30 backend_ps.py, ft2font.cpp, ft2font.h: fix the position of

text in the PostScript output. The new FT2Font method get_descent gives the distance between the lower edge of the bounding box and the baseline of a string. In backend_ps the text is shifted upwards by this amount. - JV

2004-10-30 backend_ps.py: clean up the code a lot. Change the

PostScript output to be more DSC compliant. All definitions for the generated PostScript are now in a PostScript dictionary 'mpldict'. Moved the long comment about drawing ellipses from the PostScript output into a Python comment. - JV

2004-10-30 backend_gtk.py: removed FigureCanvasGTK.realize() as its no longer

needed. Merged ColorManager into GraphicsContext backend_bases.py: For set_capstyle/joinstyle() only set cap or joinstyle if there is no error. - SC

2004-10-30 backend_gtk.py: tidied up print_figure() and removed some of the

dependency on widget events - SC

2004-10-28 backend_cairo.py: The renderer is complete except for mathtext,

draw_image() and clipping. gtkcairo works reasonably well. cairo does not yet create any files since I can't figure how to set the 'target surface', I don't think pycairo wraps the required functions - SC

2004-10-28 backend_gtk.py: Improved the save dialog (GTK 2.4 only) so it

presents the user with a menu of supported image formats - SC

2004-10-28 backend_svg.py: change print_figure() to restore original face/edge

color backend_ps.py : change print_figure() to ensure original face/edge colors are restored even if there's an IOError - SC

2004-10-27 Applied Norbert's errorbar patch to support barsabove kwarg

2004-10-27 Applied Norbert's legend patch to support None handles

2004-10-27 Added two more backends: backend_cairo.py, backend_gtkcairo.py

They are not complete yet, currently backend_gtkcairo just renders polygons, rectangles and lines - SC

2004-10-21 Added polar axes and plots - JDH

2004-10-20 Fixed corrcoef bug exposed by corrcoef(X) where X is matrix

- JDH

2004-10-19 Added kwarg support to xticks and yticks to set ticklabel

text properties -- thanks to T. Edward Whalen for the suggestion

2004-10-19 Added support for PIL images in imshow(), image.py - ADS

2004-10-19 Re-worked exception handling in _image.py and _transforms.py

to avoid masking problems with shared libraries. - JTM

2004-10-16 Streamlined the matlab interface wrapper, removed the

noplot option to hist - just use mlab.hist instead.

2004-09-30 Added Andrew Dalke's strftime code to extend the range of

dates supported by the DateFormatter - JDH

2004-09-30 Added barh - JDH

2004-09-30 Removed fallback to alternate array package from numerix

so that ImportErrors are easier to debug. JTM

2004-09-30 Add GTK+ 2.4 support for the message in the toolbar. SC

2004-09-30 Made some changes to support python22 - lots of doc

fixes. - JDH

2004-09-29 Added a Verbose class for reporting - JDH

2004-09-28 Released 0.63.0

2004-09-28 Added save to file object for agg - see

examples/print_stdout.py

2004-09-24 Reorganized all py code to lib subdir

2004-09-24 Fixed axes resize image edge effects on interpolation -

required upgrade to agg22 which fixed an agg bug related to this problem

2004-09-20 Added toolbar2 message display for backend_tkagg. JTM

2004-09-17 Added coords formatter attributes. These must be callable,

and return a string for the x or y data. These will be used to format the x and y data for the coords box. Default is the axis major formatter. e.g.:

format the coords message box def price(x): return '$%1.2f'%x ax.format_xdata = DateFormatter('%Y-%m-%d') ax.format_ydata = price

2004-09-17 Total rewrite of dates handling to use python datetime with

num2date, date2num and drange. pytz for timezone handling, dateutils for sophisticated ticking. date ranges from 0001-9999 are supported. rrules allow arbitrary date ticking. examples/date_demo*.py converted to show new usage. new example examples/date_demo_rrule.py shows how to use rrules in date plots. The date locators are much more general and almost all of them have different constructors. See matplotlib.dates for more info.

2004-09-15 Applied Fernando's backend __init__ patch to support easier

backend maintenance. Added his numutils to mlab. JDH

2004-09-16 Re-designated all files in matplotlib/images as binary and

w/o keyword substitution using "cvs admin -kb *.svg ...". See binary files in "info cvs" under Linux. This was messing up builds from CVS on windows since CVS was doing lf -> cr/lf and keyword substitution on the bitmaps. - JTM

2004-09-15 Modified setup to build array-package-specific extensions

for those extensions which are array-aware. Setup builds extensions automatically for either Numeric, numarray, or both, depending on what you have installed. Python proxy modules for the array-aware extensions import the version optimized for numarray or Numeric determined by numerix. - JTM

2004-09-15 Moved definitions of infinity from mlab to numerix to avoid

divide by zero warnings for numarray - JTM

2004-09-09 Added axhline, axvline, axhspan and axvspan

2004-08-30 matplotlib 0.62.4 released

2004-08-30 Fixed a multiple images with different extent bug,

Fixed markerfacecolor as RGB tuple

2004-08-27 Mathtext now more than 5x faster. Thanks to Paul Mcguire

for fixes both to pyparsing and to the matplotlib grammar! mathtext broken on python2.2

2004-08-25 Exposed Darren's and Greg's log ticking and formatting

options to semilogx and friends

2004-08-23 Fixed grid w/o args to toggle grid state - JDH

2004-08-11 Added Gregory's log patches for major and minor ticking

2004-08-18 Some pixel edge effects fixes for images

2004-08-18 Fixed TTF files reads in backend_ps on win32.

2004-08-18 Added base and subs properties for logscale plots, user

modifiable using set_[x,y]scale('log',base=b,subs=[mt1,mt2,...]) - GL

2004-08-18 fixed a bug exposed by trying to find the HOME dir on win32

thanks to Alan Issac for pointing to the light - JDH

2004-08-18 fixed errorbar bug in setting ecolor - JDH

2004-08-12 Added Darren Dale's exponential ticking patch

2004-08-11 Added Gregory's fltkagg backend

2004-08-09 matplotlib-0.61.0 released

2004-08-08 backend_gtk.py: get rid of the final PyGTK deprecation warning by

replacing gtkOptionMenu with gtkMenu in the 2.4 version of the classic toolbar.

2004-08-06 Added Tk zoom to rect rectangle, proper idle drawing, and

keybinding - JDH

2004-08-05 Updated installing.html and INSTALL - JDH

2004-08-01 backend_gtk.py: move all drawing code into the expose_event()

2004-07-28 Added Greg's toolbar2 and backend_*agg patches - JDH

2004-07-28 Added image.imread with support for loading png into

numerix arrays

2004-07-28 Added key modifiers to events - implemented dynamic updates

and rubber banding for interactive pan/zoom - JDH

2004-07-27 did a readthrough of SVG, replacing all the string

additions with string interps for efficiency, fixed some layout problems, added font and image support (through external pngs) - JDH

2004-07-25 backend_gtk.py: modify toolbar2 to make it easier to support GTK+

2.4. Add GTK+ 2.4 toolbar support. - SC

2004-07-24 backend_gtk.py: Simplified classic toolbar creation - SC

2004-07-24 Added images/matplotlib.svg to be used when GTK+ windows are

minimised - SC

2004-07-22 Added right mouse click zoom for NavigationToolbar2 panning

mode. - JTM

2004-07-22 Added NavigationToolbar2 support to backend_tkagg.

Minor tweak to backend_bases. - JTM

2004-07-22 Incorporated Gergory's renderer cache and buffer object

cache - JDH

2004-07-22 Backend_gtk.py: Added support for GtkFileChooser, changed

FileSelection/FileChooser so that only one instance pops up, and made them both modal. - SC

2004-07-21 Applied backend_agg memory leak patch from hayden -

jocallo@online.no. Found and fixed a leak in binary operations on transforms. Moral of the story: never incref where you meant to decref! Fixed several leaks in ft2font: moral of story: almost always return Py::asObject over Py::Object - JDH

2004-07-21 Fixed a to string memory allocation bug in agg and image

modules - JDH

2004-07-21 Added mpl_connect and mpl_disconnect to matlab interface -

JDH

2004-07-21 Added beginnings of users_guide to CVS - JDH

2004-07-20 ported toolbar2 to wx

2004-07-20 upgraded to agg21 - JDH

2004-07-20 Added new icons for toolbar2 - JDH

2004-07-19 Added vertical mathtext for *Agg and GTK - thanks Jim

Benson! - JDH

2004-07-16 Added ps/eps/svg savefig options to wx and gtk JDH

2004-07-15 Fixed python framework tk finder in setupext.py - JDH

2004-07-14 Fixed layer images demo which was broken by the 07/12 image

extent fixes - JDH

2004-07-13 Modified line collections to handle arbitrary length

segments for each line segment. - JDH

2004-07-13 Fixed problems with image extent and origin -

set_image_extent deprecated. Use imshow(blah, blah, extent=(xmin, xmax, ymin, ymax) instead - JDH

2004-07-12 Added prototype for new nav bar with codifed event

handling. Use mpl_connect rather than connect for matplotlib event handling. toolbar style determined by rc toolbar param. backend status: gtk: prototype, wx: in progress, tk: not started - JDH

2004-07-11 backend_gtk.py: use builtin round() instead of redefining it.

- SC

2004-07-10 Added embedding_in_wx3 example - ADS

2004-07-09 Added dynamic_image_wxagg to examples - ADS

2004-07-09 added support for embedding TrueType fonts in PS files - PEB

2004-07-09 fixed a sfnt bug exposed if font cache is not built

2004-07-09 added default arg None to matplotlib.matlab grid command to

toggle current grid state

2004-07-08 0.60.2 released

2004-07-08 fixed a mathtext bug for '6'

2004-07-08 added some numarray bug workarounds

2004-07-07 0.60 released

2004-07-07 Fixed a bug in dynamic_demo_wx

2004-07-07 backend_gtk.py: raise SystemExit immediately if

'import pygtk' fails - SC

2004-07-05 Added new mathtext commands over{sym1}{sym2} and

under{sym1}{sym2}

2004-07-05 Unified image and patch collections colormapping and

scaling args. Updated docstrings for all - JDH

2004-07-05 Fixed a figure legend bug and added

examples/figlegend_demo.py - JDH

2004-07-01 Fixed a memory leak in image and agg to string methods

2004-06-25 Fixed fonts_demo spacing problems and added a kwargs

version of the fonts_demo fonts_demo_kw.py - JDH

2004-06-25 finance.py: handle case when urlopen() fails - SC

2004-06-24 Support for multiple images on axes and figure, with

blending. Support for upper and lower image origins. clim, jet and gray functions in matlab interface operate on current image - JDH

2004-06-23 ported code to Perry's new colormap and norm scheme. Added

new rc attributes image.aspect, image.interpolation, image.cmap, image.lut, image.origin

2004-06-20 backend_gtk.py: replace gtk.TRUE/FALSE with True/False.

simplified _make_axis_menu(). - SC

2004-06-19 anim_tk.py: Updated to use TkAgg by default (not GTK)

backend_gtk_py: Added '_' in front of private widget creation functions - SC

2004-06-17 backend_gtk.py: Create a GC once in realise(), not every

time draw() is called. - SC

2004-06-16 Added new py2exe FAQ entry and added frozen support in

get_data_path for py2exe - JDH

2004-06-16 Removed GTKGD, which was always just a proof-of-concept

backend - JDH

2004-06-16 backend_gtk.py updates to replace deprecated functions

gtk.mainquit(), gtk.mainloop().

Update NavigationToolbar to use the new GtkToolbar API - SC

2004-06-15 removed set_default_font from font_manager to unify font

customization using the new function rc. See API_CHANGES for more info. The examples fonts_demo.py and fonts_demo_kw.py are ported to the new API - JDH

2004-06-15 Improved (yet again!) axis scaling to properly handle

singleton plots - JDH

2004-06-15 Restored the old FigureCanvasGTK.draw() - SC

2004-06-11 More memory leak fixes in transforms and ft2font - JDH

2004-06-11 Eliminated numerix .numerix file and environment variable

NUMERIX. Fixed bug which prevented command line overrides: --numarray or --numeric. - JTM

2004-06-10 Added rc configuration function rc; deferred all rc param

setting until object creation time; added new rc attrs: lines.markerfacecolor, lines.markeredgecolor, lines.markeredgewidth, patch.linewidth, patch.facecolor, patch.edgecolor, patch.antialiased; see examples/customize_rc.py for usage - JDH

2004-06-09 0.54.2 released

2004-06-08 Rewrote ft2font using CXX as part of general memory leak

fixes; also fixed transform memory leaks - JDH

2004-06-07 Fixed several problems with log ticks and scaling - JDH

2004-06-07 Fixed width/height issues for images - JDH

2004-06-03 Fixed draw_if_interactive bug for semilogx;

2004-06-02 Fixed text clipping to clip to axes - JDH

2004-06-02 Fixed leading newline text and multiple newline text - JDH

2004-06-02 Fixed plot_date to return lines - JDH

2004-06-01 Fixed plot to work with x or y having shape N,1 or 1,N - JDH

2004-05-31 Added renderer markeredgewidth attribute of Line2D. - ADS

2004-05-29 Fixed tick label clipping to work with navigation.

2004-05-28 Added renderer grouping commands to support groups in

SVG/PS. - JDH

2004-05-28 Fixed, this time I really mean it, the singleton plot

plot([0]) scaling bug; Fixed Flavio's shape = N,1 bug - JDH

2004-05-28 added colorbar - JDH

2004-05-28 Made some changes to the matplotlib.colors.Colormap to

properly support clim - JDH

2004-05-27 0.54.1 released

2004-05-27 Lots of small bug fixes: rotated text at negative angles,

errorbar capsize and autoscaling, right tick label position, gtkagg on win98, alpha of figure background, singleton plots - JDH

2004-05-26 Added Gary's errorbar stuff and made some fixes for length

one plots and constant data plots - JDH

2004-05-25 Tweaked TkAgg backend so that canvas.draw() works

more like the other backends. Fixed a bug resulting in 2 draws per figure manager show(). - JTM

2004-05-19 0.54 released

2004-05-18 Added newline separated text with rotations to text.Text

layout - JDH

2004-05-16 Added fast pcolor using PolyCollections. - JDH

2004-05-14 Added fast polygon collections - changed scatter to use

them. Added multiple symbols to scatter. 10x speedup on large scatters using *Agg and 5X speedup for ps. - JDH

2004-05-14 On second thought... created an "nx" namespace in

in numerix which maps type names onto typecodes the same way for both numarray and Numeric. This undoes my previous change immediately below. To get a typename for Int16 usable in a Numeric extension: say nx.Int16. - JTM

2004-05-15 Rewrote transformation class in extension code, simplified

all the artist constructors - JDH

2004-05-14 Modified the type definitions in the numarray side of

numerix so that they are Numeric typecodes and can be used with Numeric compilex extensions. The original numarray types were renamed to type<old_name>. - JTM

2004-05-06 Gary Ruben sent me a bevy of new plot symbols and markers.

See matplotlib.matlab.plot - JDH

2004-05-06 Total rewrite of mathtext - factored ft2font stuff out of

layout engine and defined abstract class for font handling to lay groundwork for ps mathtext. Rewrote parser and made layout engine much more precise. Fixed all the layout hacks. Added spacing commands / and hspace. Added composite chars and defined angstrom. - JDH

2004-05-05 Refactored text instances out of backend; aligned

text with arbitrary rotations is now supported - JDH

2004-05-05 Added a Matrix capability for numarray to numerix. JTM

2004-05-04 Updated whats_new.html.template to use dictionary and

template loop, added anchors for all versions and items; updated goals.txt to use those for links. PG

2004-05-04 Added fonts_demo.py to backend_driver, and AFM and TTF font

caches to font_manager.py - PEB

2004-05-03 Redid goals.html.template to use a goals.txt file that

has a pseudo restructured text organization. PG

2004-05-03 Removed the close buttons on all GUIs and added the python

#! bang line to the examples following Steve Chaplin's advice on matplotlib dev

2004-04-29 Added CXX and rewrote backend_agg using it; tracked down

and fixed agg memory leak - JDH

2004-04-29 Added stem plot command - JDH

2004-04-28 Fixed PS scaling and centering bug - JDH

2004-04-26 Fixed errorbar autoscale problem - JDH

2004-04-22 Fixed copy tick attribute bug, fixed singular datalim

ticker bug; fixed mathtext fontsize interactive bug. - JDH

2004-04-21 Added calls to draw_if_interactive to axes(), legend(),

and pcolor(). Deleted duplicate pcolor(). - JTM

2004-04-21 matplotlib 0.53 release

2004-04-19 Fixed vertical alignment bug in PS backend - JDH

2004-04-17 Added support for two scales on the "same axes" with tick

different ticking and labeling left right or top bottom. See examples/two_scales.py - JDH

2004-04-17 Added default dirs as list rather than single dir in

setupext.py - JDH

2004-04-16 Fixed wx exception swallowing bug (and there was much

rejoicing!) - JDH

2004-04-16 Added new ticker locator a formatter, fixed default font

return - JDH

2004-04-16 Added get_name method to FontProperties class. Fixed font lookup

in GTK and WX backends. - PEB

2004-04-16 Added get- and set_fontstyle msethods. - PEB

2004-04-10 Mathtext fixes: scaling with dpi, - JDH

2004-04-09 Improved font detection algorithm. - PEB

2004-04-09 Move deprecation warnings from text.py to __init__.py - PEB

2004-04-09 Added default font customization - JDH

2004-04-08 Fixed viewlim set problem on axes and axis. - JDH

2004-04-07 Added validate_comma_sep_str and font properties parameters to

__init__. Removed font families and added rcParams to FontProperties __init__ arguments in font_manager. Added default font property parameters to .matplotlibrc file with descriptions. Added deprecation warnings to the get_ - and set_fontXXX methods of the Text object. - PEB

2004-04-06 Added load and save commands for ASCII data - JDH

2004-04-05 Improved font caching by not reading AFM fonts until needed.

Added better documentation. Changed the behaviour of the get_family, set_family, and set_name methods of FontProperties. - PEB

2004-04-05 Added WXAgg backend - JDH

2004-04-04 Improved font caching in backend_agg with changes to

font_manager - JDH

2004-03-29 Fixed fontdicts and kwargs to work with new font manager -

JDH

This is the Old, stale, never used changelog

2002-12-10 - Added a TODO file and CHANGELOG. Lots to do -- get

crackin'!

- Fixed y zoom tool bug
- Adopted a compromise fix for the y data clipping problem. The problem was that for solid lines, the y data clipping (as opposed to the gc clipping) caused artifactual horizontal solid lines near the ylim boundaries. I did a 5% offset hack in Axes set_ylim functions which helped, but didn't cure the problem for very high gain y zooms. So I disabled y data clipping for connected lines . If you need extensive y clipping, either plot(y,x) because x data clipping is always enabled, or change the _set_clip code to 'if 1' as indicated in the lines.py src. See _set_clip in lines.py and set_ylim in figure.py for more information.

2002-12-11 - Added a measurement dialog to the figure window to

measure axes position and the delta x delta y with a left mouse drag. These defaults can be overridden by deriving from Figure and overriding button_press_event, button_release_event, and motion_notify_event, and _dialog_measure_tool.

- fixed the navigation dialog so you can check the axes the navigation buttons apply to.

2003-04-23 Released matplotlib v0.1

2003-04-24 Added a new line style PixelLine2D which is the plots the

markers as pixels (as small as possible) with format symbol ','

Added a new class Patch with derived classes Rectangle, RegularPolygon and Circle

2003-04-25 Implemented new functions errorbar, scatter and hist

Added a new line type '|' which is a vline. syntax is plot(x, Y, '|') where y.shape = len(x),2 and each row gives the ymin,ymax for the respective values of x. Previously I had implemented vlines as a list of lines, but I needed the efficientcy of the numeric clipping for large numbers of vlines outside the viewport, so I wrote a dedicated class Vline2D which derives from Line2D

2003-05-01

Fixed ytick bug where grid and tick show outside axis viewport with gc clip

2003-05-14

Added new ways to specify colors 1) matlab format string 2) html-style hex string, 3) rgb tuple. See examples/color_demo.py

2003-05-28

Changed figure rendering to draw form a pixmap to reduce flicker. See examples/system_monitor.py for an example where the plot is continusouly updated w/o flicker. This example is meant to simulate a system monitor that shows free CPU, RAM, etc...

2003-08-04

Added Jon Anderson's GTK shell, which doesn't require pygtk to have threading built-in and looks nice!

2003-08-25

Fixed deprecation warnings for python2.3 and pygtk-1.99.18

2003-08-26

Added figure text with new example examples/figtext.py

2003-08-27

Fixed bugs i figure text with font override dictionairies and fig text that was placed outside the window bounding box

2003-09-1 through 2003-09-15

Added a postscript and a GD module backend

2003-09-16

Fixed font scaling and point scaling so circles, squares, etc on lines will scale with DPI as will fonts. Font scaling is not fully implemented on the gtk backend because I have not figured out how to scale fonts to arbitrary sizes with GTK

2003-09-17

Fixed figure text bug which crashed X windows on long figure text extending beyond display area. This was, I believe, due to the vestigial erase functionality that was no longer needed since I began rendering to a pixmap

2003-09-30 Added legend

2003-10-01 Fixed bug when colors are specified with rgb tuple or hex

string.

2003-10-21 Andrew Straw provided some legend code which I modified

and incorporated. Thanks Andrew!

2003-10-27 Fixed a bug in axis.get_view_distance that affected zoom in

versus out with interactive scrolling, and a bug in the axis text reset system that prevented the text from being redrawn on a interactive gtk view lim set with the widget

Fixed a bug in that prevented the manual setting of ticklabel strings from working properly

2003-11-02 - Do a nearest neighbor color pick on GD when

allocate fails

2003-11-02

- Added pcolor plot
- Added MRI example
- Fixed bug that screwed up label position if xticks or yticks were empty
- added nearest neighbor color picker when GD max colors exceeded
- fixed figure background color bug in GD backend

2003-11-10 - 2003-11-11

- major refactoring.
  - Ticks (with labels, lines and grid) handled by dedicated class
  - Artist now know bounding box and dpi
  - Bounding boxes and transforms handled by dedicated classes
  - legend in dedicated class. Does a better job of alignment and bordering. Can be initialized with specific line instances. See examples/legend_demo2.py

2003-11-14 Fixed legend positioning bug and added new position args

2003-11-16 Finished porting GD to new axes API

2003-11-20 - add TM for matlab on website and in docs

2003-11-20 - make a nice errorbar and scatter screenshot

2003-11-20 - auto line style cycling for multiple line types

broken

2003-11-18 (using inkrect) :logical rect too big on gtk backend

2003-11-18 ticks don't reach edge of axes in gtk mode --

rounding error?

2003-11-20 - port Gary's errorbar code to new API before 0.40

2003-11-20 - problem with stale _set_font. legend axes box

doesn't resize on save in GTK backend -- see htdocs legend_demo.py

2003-11-21 - make a dash-dot dict for the GC

2003-12-15 - fix install path bug

CHAPTER

NINE

LICENSE

Matplotlib only uses BSD compatible code, and its license is based on the PSF license. See the Open Source Initiative licenses page for details on individual licenses. Non-BSD compatible licenses (e.g., LGPL) are acceptable in matplotlib toolkits. For a discussion of the motivations behind the licencing choice, see *Licenses*.

9.1 Copyright Policy

John Hunter began matplotlib around 2003. Since shortly before his passing in 2012, Michael Droettboom has been the lead maintainer of matplotlib, but, as has always been the case, matplotlib is the work of many.

Prior to July of 2013, and the 1.3.0 release, the copyright of the source code was held by John Hunter. As of July 2013, and the 1.3.0 release, matplotlib has moved to a shared copyright model.

matplotlib uses a shared copyright model. Each contributor maintains copyright over their contributions to matplotlib. But, it is important to note that these contributions are typically only changes to the repositories. Thus, the matplotlib source code, in its entirety, is not the copyright of any single person or institution. Instead, it is the collective copyright of the entire matplotlib Development Team. If individual contributors want to maintain a record of what changes/contributions they have specific copyright on, they should indicate their copyright in the commit message of the change, when they commit the change to one of the matplotlib repositories.

The Matplotlib Development Team is the set of all contributors to the matplotlib project. A full list can be obtained from the git version control logs.

9.2 License agreement for matplotlib 3.3.3

1. This LICENSE AGREEMENT is between the Matplotlib Development Team ("MDT"), and the Individual or Organization ("Licensee") accessing and otherwise using matplotlib software in source or binary form and its associated documentation.

2. Subject to the terms and conditions of this License Agreement, MDT hereby grants Licensee a nonexclusive, royalty-free, world-wide license to reproduce, analyze, test, perform and/or display publicly, prepare derivative works, distribute, and otherwise use matplotlib 3.3.3 alone or in any derivative version, provided, however, that MDT's License Agreement and MDT's notice of copyright, i.e., "Copyright (c) 2012-2013 Matplotlib Development Team; All Rights Reserved" are retained in matplotlib 3.3.3 alone or in any derivative version prepared by Licensee.

3. In the event Licensee prepares a derivative work that is based on or incorporates matplotlib 3.3.3 or any part thereof, and wants to make the derivative work available to others as provided herein, then Licensee hereby agrees to include in any such work a brief summary of the changes made to matplotlib 3.3.3.

4. MDT is making matplotlib 3.3.3 available to Licensee on an "AS IS" basis. MDT MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED. BY WAY OF EXAMPLE, BUT NOT LIMITATION, MDT MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF MATPLOTLIB 3.3.3 WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

5. MDT SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF MATPLOTLIB 3.3.3 FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING MATPLOTLIB 3.3.3, OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF THE POSSIBILITY THEREOF.

6. This License Agreement will automatically terminate upon a material breach of its terms and conditions.

7. Nothing in this License Agreement shall be deemed to create any relationship of agency, partnership, or joint venture between MDT and Licensee. This License Agreement does not grant permission to use MDT trademarks or trade name in a trademark sense to endorse or promote products or services of Licensee, or any third party.

8. By copying, installing or otherwise using matplotlib 3.3.3, Licensee agrees to be bound by the terms and conditions of this License Agreement.

9.3 License agreement for matplotlib versions prior to 1.3.0

1. This LICENSE AGREEMENT is between John D. Hunter ("JDH"), and the Individual or Organization ("Licensee") accessing and otherwise using matplotlib software in source or binary form and its associated documentation.

2. Subject to the terms and conditions of this License Agreement, JDH hereby grants Licensee a nonexclusive, royalty-free, world-wide license to reproduce, analyze, test, perform and/or display publicly, prepare derivative works, distribute, and otherwise use matplotlib 3.3.3 alone or in any derivative version, provided, however, that JDH's License Agreement and JDH's notice of copyright, i.e., "Copyright (c) 2002-2009 John D. Hunter; All Rights Reserved" are retained in matplotlib 3.3.3 alone or in any derivative version prepared by Licensee.

3. In the event Licensee prepares a derivative work that is based on or incorporates matplotlib 3.3.3 or any part thereof, and wants to make the derivative work available to others as provided herein, then Licensee hereby agrees to include in any such work a brief summary of the changes made to matplotlib 3.3.3.

4. JDH is making matplotlib 3.3.3 available to Licensee on an "AS IS" basis. JDH MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED. BY WAY OF EXAMPLE, BUT NOT LIMITATION, JDH MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF MATPLOTLIB 3.3.3 WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

5. JDH SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF MATPLOTLIB 3.3.3 FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING MATPLOTLIB 3.3.3, OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF THE POSSIBILITY THEREOF.

6. This License Agreement will automatically terminate upon a material breach of its terms and conditions.

7. Nothing in this License Agreement shall be deemed to create any relationship of agency, partnership, or joint venture between JDH and Licensee. This License Agreement does not grant permission to use JDH trademarks or trade name in a trademark sense to endorse or promote products or services of Licensee, or any third party.

8. By copying, installing or otherwise using matplotlib 3.3.3, Licensee agrees to be bound by the terms and conditions of this License Agreement.

Charles Twardy, Gary Ruben, John Gill, David Moore, Paul Barrett, Jared Wahlstrand, Jim Benson, Paul Mcguire, Andrew Dalke, Nadia Dencheva, Baptiste Carvello, Sigve Tjoraand, Ted Drain, James Amundson, Daishi Harada, Nicolas Young, Paul Kienzle, John Porter, and Jonathon Taylor.

Thanks to Tony Yu for the original logo design.

We also thank all who have reported bugs, commented on proposed changes, or otherwise contributed to Matplotlib's development and usefulness.

Part II

The Matplotlib FAQ

CHAPTER

TWELVE

INSTALLATION

Contents

12.1 Report a compilation problem

See *Getting help*.

12.2 Matplotlib compiled fine, but nothing shows up when I use it

The first thing to try is a *clean install* and see if that helps. If not, the best way to test your install is by running a script, rather than working interactively from a python shell or an integrated development environment such as `IDLE` which add additional complexities. Open up a UNIX shell or a DOS command prompt and run, for example:

```
python -c "from pylab import *; set_loglevel('debug'); plot(); show()"
```

This will give you additional information about which backends Matplotlib is loading, version information, and more. At this point you might want to make sure you understand Matplotlib's *configuration* process, governed by the `matplotlibrc` configuration file which contains instructions within and the concept of the Matplotlib backend.

If you are still having trouble, see *Getting help*.

12.3 How to completely remove Matplotlib

Occasionally, problems with Matplotlib can be solved with a clean installation of the package. In order to fully remove an installed Matplotlib:

1. Delete the caches from your *Matplotlib configuration directory*.
2. Delete any Matplotlib directories or eggs from your *installation directory*.

12.4 Linux Notes

To install Matplotlib at the system-level, we recommend that you use your distribution's package manager. This will guarantee that Matplotlib's dependencies will be installed as well.

If, for some reason, you cannot use the package manager, you may use the wheels available on PyPI:

```
python -mpip install matplotlib
```

or *build Matplotlib from source*.

12.5 OSX Notes

12.5.1 Which python for OSX?

Apple ships OSX with its own Python, in `/usr/bin/python`, and its own copy of Matplotlib. Unfortunately, the way Apple currently installs its own copies of NumPy, Scipy and Matplotlib means that these packages are difficult to upgrade (see system python packages). For that reason we strongly suggest that you install a fresh version of Python and use that as the basis for installing libraries such as NumPy and Matplotlib. One convenient way to install Matplotlib with other useful Python software is to use the Anaconda Python scientific software collection, which includes Python itself and a wide range of libraries; if you need a library that is not available from the collection, you can install it yourself using standard methods such as *pip*. See the Ananconda web page for installation support.

Other options for a fresh Python install are the standard installer from python.org, or installing Python using a general OSX package management system such as homebrew or macports. Power users on OSX will likely want one of homebrew or macports on their system to install open source software packages, but it is perfectly possible to use these systems with another source for your Python binary, such as Anaconda or Python.org Python.

12.5.2 Installing OSX binary wheels

If you are using Python from https://www.python.org, Homebrew, or Macports, then you can use the standard pip installer to install Matplotlib binaries in the form of wheels.

pip is installed by default with python.org and Homebrew Python, but needs to be manually installed on Macports with

```
sudo port install py36-pip
```

Once pip is installed, you can install Matplotlib and all its dependencies with from the Terminal.app command line:

```
python3 -mpip install matplotlib
```

(`sudo python3.6 ...` on Macports).

You might also want to install IPython or the Jupyter notebook (`python3 -mpip install ipython notebook`).

12.5.3 Checking your installation

The new version of Matplotlib should now be on your Python "path". Check this at the Terminal.app command line:

```
python3 -c 'import matplotlib; print(matplotlib.__version__, matplotlib.__file__)'
```

You should see something like

```
3.0.0 /Library/Frameworks/Python.framework/Versions/3.6/lib/python3.6/site-packages/
↪matplotlib/__init__.py
```

where `3.0.0` is the Matplotlib version you just installed, and the path following depends on whether you are using Python.org Python, Homebrew or Macports. If you see another version, or you get an error like

```
Traceback (most recent call last):
  File "<string>", line 1, in <module>
ImportError: No module named matplotlib
```

then check that the Python binary is the one you expected by running

```
which python3
```

If you get a result like `/usr/bin/python...`, then you are getting the Python installed with OSX, which is probably not what you want. Try closing and restarting Terminal.app before running the check again. If that doesn't fix the problem, depending on which Python you wanted to use, consider reinstalling Python.org Python, or check your homebrew or macports setup. Remember that the disk image installer only works for Python.org Python, and will not get picked up by other Pythons. If all these fail, please *let us know*.

12.6 Install from source

A C compiler is required. Typically, on Linux, you will need `gcc`, which should be installed using your distribution's package manager; on macOS, you will need xcode; on Windows, you will need Visual Studio 2015 or later.

Clone the main source using one of:

```
git clone git@github.com:matplotlib/matplotlib.git
```

or:

```
git clone git://github.com/matplotlib/matplotlib.git
```

and build and install with:

```
cd matplotlib
python -mpip install .
```

If you want to be able to follow the development branch as it changes just replace the last step with:

```
python -mpip install -e .
```

This creates links and installs the command line script in the appropriate places.

Then, if you want to update your Matplotlib at any time, just do:

```
git pull
```

When you run `git pull`, if the output shows that only Python files have been updated, you are all set. If C files have changed, you need to run `pip install -e .` again to compile them.

There is more information on *using git* in the developer docs.

CHAPTER

THIRTEEN

HOW-TO

Contents

13.1 How-to: Plotting

13.1.1 Plot `numpy.datetime64` values

As of Matplotlib 2.2, `numpy.datetime64` objects are handled the same way as `datetime.datetime` objects.

If you prefer the pandas converters and locators, you can register them. This is done automatically when calling a pandas plot function and may be unnecessary when using pandas instead of Matplotlib directly.

```
from pandas.plotting import register_matplotlib_converters
register_matplotlib_converters()
```

13.1.2 Check whether a figure is empty

Empty can actually mean different things. Does the figure contain any artists? Does a figure with an empty *Axes* still count as empty? Is the figure empty if it was rendered pure white (there may be artists present, but they could be outside the drawing area or transparent)?

For the purpose here, we define empty as: "The figure does not contain any artists except it's background patch." The exception for the background is necessary, because by default every figure contains a *Rectangle* as it's background patch. This definition could be checked via:

```
def is_empty(figure):
    """
    Return whether the figure contains no Artists (other than the default
    background patch).
    """
    contained_artists = figure.get_children()
    return len(contained_artists) <= 1
```

We've decided not to include this as a figure method because this is only one way of defining empty, and checking the above is only rarely necessary. Usually the user or program handling the figure know if they have added something to the figure.

Checking whether a figure would render empty cannot be reliably checked except by actually rendering the figure and investigating the rendered result.

13.1.3 Find all objects in a figure of a certain type

Every Matplotlib artist (see *Artist tutorial*) has a method called *findobj()* that can be used to recursively search the artist for any artists it may contain that meet some criteria (e.g., match all *Line2D* instances or match some arbitrary filter function). For example, the following snippet finds every object in the figure which has a `set_color` property and makes the object blue:

```
def myfunc(x):
    return hasattr(x, 'set_color')

for o in fig.findobj(myfunc):
    o.set_color('blue')
```

You can also filter on class instances:

```
import matplotlib.text as text
for o in fig.findobj(text.Text):
    o.set_fontstyle('italic')
```

13.1.4 How to prevent ticklabels from having an offset

The default formatter will use an offset to reduce the length of the ticklabels. To turn this feature off on a per-axis basis:

```
ax.get_xaxis().get_major_formatter().set_useOffset(False)
```

set `rcParams["axes.formatter.useoffset"]` (default: `True`), or use a different formatter. See *ticker* for details.

13.1.5 Save transparent figures

The *savefig()* command has a keyword argument *transparent* which, if 'True', will make the figure and axes backgrounds transparent when saving, but will not affect the displayed image on the screen.

If you need finer grained control, e.g., you do not want full transparency or you want to affect the screen displayed version as well, you can set the alpha properties directly. The figure has a *Rectangle* instance called *patch* and the axes has a Rectangle instance called *patch*. You can set any property on them directly (*facecolor*, *edgecolor*, *linewidth*, *linestyle*, *alpha*). e.g.:

```
fig = plt.figure()
fig.patch.set_alpha(0.5)
ax = fig.add_subplot(111)
ax.patch.set_alpha(0.5)
```

If you need *all* the figure elements to be transparent, there is currently no global alpha setting, but you can set the alpha channel on individual elements, e.g.:

```
ax.plot(x, y, alpha=0.5)
ax.set_xlabel('volts', alpha=0.5)
```

13.1.6 Save multiple plots to one pdf file

Many image file formats can only have one image per file, but some formats support multi-page files. Currently only the pdf backend has support for this. To make a multi-page pdf file, first initialize the file:

```
from matplotlib.backends.backend_pdf import PdfPages
pp = PdfPages('multipage.pdf')
```

You can give the *PdfPages* object to *savefig()*, but you have to specify the format:

```
plt.savefig(pp, format='pdf')
```

An easier way is to call *PdfPages.savefig*:

```
pp.savefig()
```

Finally, the multipage pdf object has to be closed:

```
pp.close()
```

The same can be done using the pgf backend:

```
from matplotlib.backends.backend_pgf import PdfPages
```

13.1.7 Move the edge of an axes to make room for tick labels

For subplots, you can control the default spacing on the left, right, bottom, and top as well as the horizontal and vertical spacing between multiple rows and columns using the *matplotlib.figure.Figure.subplots_adjust()* method (in pyplot it is *subplots_adjust()*). For example, to move the bottom of the subplots up to make room for some rotated x tick labels:

```
fig = plt.figure()
fig.subplots_adjust(bottom=0.2)
ax = fig.add_subplot(111)
```

You can control the defaults for these parameters in your `matplotlibrc` file; see *Customizing Matplotlib with style sheets and rcParams*. For example, to make the above setting permanent, you would set:

```
figure.subplot.bottom : 0.2   # the bottom of the subplots of the figure
```

The other parameters you can configure are, with their defaults

***left* = 0.125**

the left side of the subplots of the figure

***right* = 0.9**

the right side of the subplots of the figure

***bottom* = 0.1**

the bottom of the subplots of the figure

***top* = 0.9**

the top of the subplots of the figure

***wspace* = 0.2**

the amount of width reserved for space between subplots, expressed as a fraction of the average axis width

***hspace* = 0.2**

the amount of height reserved for space between subplots, expressed as a fraction of the average axis height

If you want additional control, you can create an *Axes* using the *axes()* command (or equivalently the figure *add_axes()* method), which allows you to specify the location explicitly:

```
ax = fig.add_axes([left, bottom, width, height])
```

where all values are in fractional (0 to 1) coordinates. See /gallery/subplots_axes_and_figures/axes_demo for an example of placing axes manually.

13.1.8 Automatically make room for tick labels

Note: This is now easier to handle than ever before. Calling *tight_layout()* or alternatively using `constrained_layout=True` argument in *subplots()* can fix many common layout issues. See the *Tight Layout guide* and *Constrained Layout Guide* for more details.

The information below is kept here in case it is useful for other purposes.

In most use cases, it is enough to simply change the subplots adjust parameters as described in *Move the edge of an axes to make room for tick labels*. But in some cases, you don't know ahead of time what your tick labels will be, or how large they will be

(data and labels outside your control may be being fed into your graphing application), and you may need to automatically adjust your subplot parameters based on the size of the tick labels. Any *Text* instance can report its extent in window coordinates (a negative x coordinate is outside the window), but there is a rub.

The *RendererBase* instance, which is used to calculate the text size, is not known until the figure is drawn (*draw()*). After the window is drawn and the text instance knows its renderer, you can call *get_window_extent()*. One way to solve this chicken and egg problem is to wait until the figure is draw by connecting (*mpl_connect()*) to the "on_draw" signal (*DrawEvent*) and get the window extent there, and then do something with it, e.g., move the left of the canvas over; see *Event handling and picking*.

Here is an example that gets a bounding box in relative figure coordinates (0..1) of each of the labels and uses it to move the left of the subplots over so that the tick labels fit in the figure:

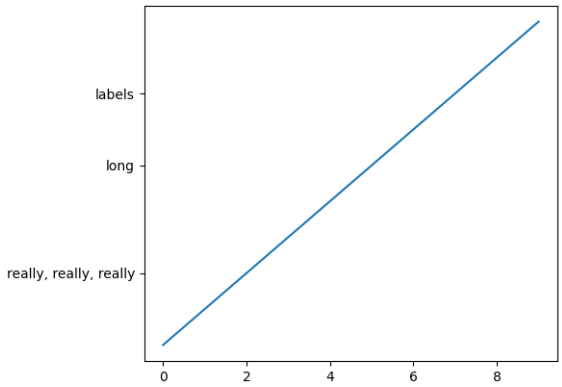

Fig. 1: Auto Subplots Adjust

13.1.9 Configure the tick widths

Wherever possible, it is recommended to use the *tick_params()* or *set_tick_params()* methods to modify tick properties:

```
import matplotlib.pyplot as plt

fig, ax = plt.subplots()
ax.plot(range(10))

ax.tick_params(width=10)

plt.show()
```

For more control of tick properties that are not provided by the above methods, it is important to know that in Matplotlib, the ticks are *markers*. All *Line2D* objects support a line (solid, dashed, etc) and a marker (circle, square, tick). The tick width is

controlled by the "markeredgewidth" property, so the above effect can also be achieved by:

```
import matplotlib.pyplot as plt

fig, ax = plt.subplots()
ax.plot(range(10))

for line in ax.get_xticklines() + ax.get_yticklines():
    line.set_markeredgewidth(10)

plt.show()
```

The other properties that control the tick marker, and all markers, are markerfacecolor, markeredgecolor, markeredgewidth, markersize. For more information on configuring ticks, see *Axis containers* and *Tick containers*.

13.1.10 Align my ylabels across multiple subplots

If you have multiple subplots over one another, and the y data have different scales, you can often get ylabels that do not align vertically across the multiple subplots, which can be unattractive. By default, Matplotlib positions the x location of the ylabel so that it does not overlap any of the y ticks. You can override this default behavior by specifying the coordinates of the label. The example below shows the default behavior in the left subplots, and the manual setting in the right subplots.

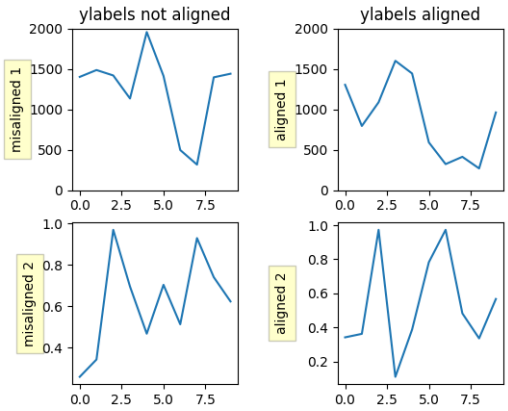

Fig. 2: Align Ylabels

13.1.11 Skip dates where there is no data

When plotting time series, e.g., financial time series, one often wants to leave out days on which there is no data, e.g., weekends. By passing in dates on the x-xaxis, you get large horizontal gaps on periods when there is not data. The solution is to pass in some proxy x-data, e.g., evenly sampled indices, and then use a custom formatter to format these as dates. /gallery/text_labels_and_annotations/date_index_formatter demonstrates how to use an 'index formatter' to achieve the desired plot.

13.1.12 Control the depth of plot elements

Within an axes, the order that the various lines, markers, text, collections, etc appear is determined by the *set_zorder()* property. The default order is patches, lines, text, with collections of lines and collections of patches appearing at the same level as regular lines and patches, respectively:

```
line, = ax.plot(x, y, zorder=10)
```

You can also use the Axes property *set_axisbelow()* to control whether the grid lines are placed above or below your other plot elements.

13.1.13 Make the aspect ratio for plots equal

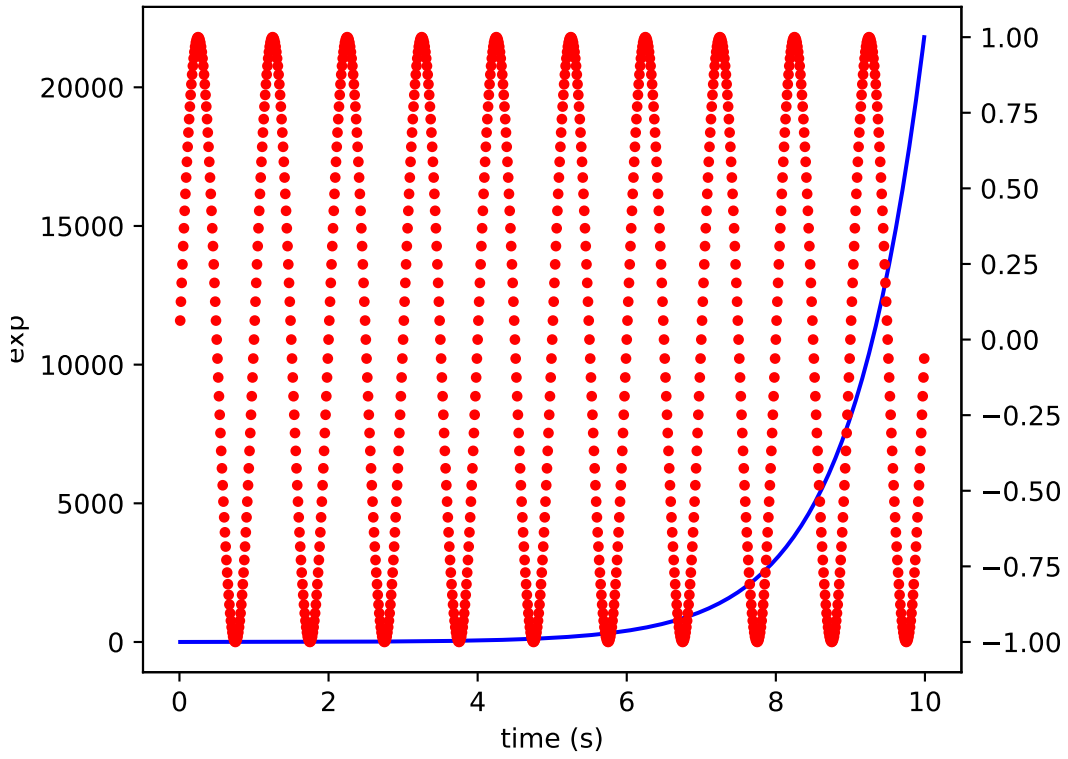
The Axes property *set_aspect()* controls the aspect ratio of the axes. You can set it to be 'auto', 'equal', or some ratio which controls the ratio:

```
ax = fig.add_subplot(111, aspect='equal')
```

13.1.14 Multiple y-axis scales

A frequent request is to have two scales for the left and right y-axis, which is possible using *twinx()* (more than two scales are not currently supported, though it is on the wish list). This works pretty well, though there are some quirks when you are trying to interactively pan and zoom, because both scales do not get the signals.

The approach uses *twinx()* (and its sister *twiny()*) to use *2 different axes*, turning the axes rectangular frame off on the 2nd axes to keep it from obscuring the first, and manually setting the tick locs and labels as desired. You can use separate `matplotlib.ticker` formatters and locators as desired because the two axes are independent.



13.1.15 Generate images without having a window appear

Simply do not call *show*, and directly save the figure to the desired format:

```
import matplotlib.pyplot as plt
plt.plot([1, 2, 3])
plt.savefig('myfig.png')
```

See also:

How to use Matplotlib in a web application server for information about running matplotlib inside of a web application.

13.1.16 Use `show()`

When you want to view your plots on your display, the user interface backend will need to start the GUI mainloop. This is what *show()* does. It tells Matplotlib to raise all of the figure windows created so far and start the mainloop. Because this mainloop is blocking by default (i.e., script execution is paused), you should only call this once per script, at the end. Script execution is resumed after the last window is closed. Therefore, if you are using Matplotlib to generate only images and do not want a user

interface window, you do not need to call `show` (see *Generate images without having a window appear* and *What is a backend?*).

Note: Because closing a figure window unregisters it from pyplot, you must call *`savefig`* *before* calling `show` if you wish to save the figure as well as view it.

Whether `show` blocks further execution of the script or the python interpreter depends on whether Matplotlib is set to use interactive mode. In non-interactive mode (the default setting), execution is paused until the last figure window is closed. In interactive mode, the execution is not paused, which allows you to create additional figures (but the script won't finish until the last figure window is closed).

Because it is expensive to draw, you typically will not want Matplotlib to redraw a figure many times in a script such as the following:

```
plot([1, 2, 3])          # draw here?
xlabel('time')           # and here?
ylabel('volts')          # and here?
title('a simple plot')   # and here?
show()
```

However, it is *possible* to force Matplotlib to draw after every command, which might be what you want when working interactively at the python console (see *Interactive Figures*), but in a script you want to defer all drawing until the call to `show`. This is especially important for complex figures that take some time to draw. *`show()`* is designed to tell Matplotlib that you're all done issuing commands and you want to draw the figure now.

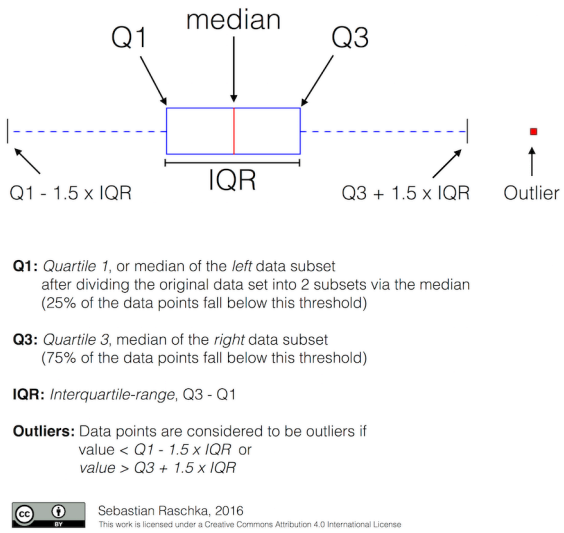
Note: *`show()`* should typically only be called at most once per script and it should be the last line of your script. At that point, the GUI takes control of the interpreter. If you want to force a figure draw, use *`draw()`* instead.

New in version v1.0.0: Matplotlib 1.0.0 and 1.0.1 added support for calling `show` multiple times per script, and harmonized the behavior of interactive mode, across most backends.

13.1.17 Interpreting box plots and violin plots

Tukey's box plots (Robert McGill, John W. Tukey and Wayne A. Larsen: "The American Statistician" Vol. 32, No. 1, Feb., 1978, pp. 12-16) are statistical plots that provide useful information about the data distribution such as skewness. However, bar plots with error bars are still the common standard in most scientific literature, and thus, the interpretation of box plots can be challenging for the unfamiliar reader. The figure below illustrates the different visual features of a box plot.

Violin plots are closely related to box plots but add useful information such as the



distribution of the sample data (density trace). Violin plots were added in Matplotlib 1.4.

13.1.18 Working with threads

Matplotlib is not thread-safe: in fact, there are known race conditions that affect certain artists. Hence, if you work with threads, it is your responsibility to set up the proper locks to serialize access to Matplotlib artists.

You may be able to work on separate figures from separate threads. However, you must in that case use a *non-interactive backend* (typically Agg), because most GUI backends *require* being run from the main thread as well.

13.2 How-to: Contributing

13.2.1 Request a new feature

Is there a feature you wish Matplotlib had? Then ask! The best way to get started is to email the developer mailing list for discussion. This is an open source project developed primarily in the contributors free time, so there is no guarantee that your feature will be added. The *best* way to get the feature you need added is to contribute it your self.

13.2.2 Reporting a bug or submitting a patch

The development of Matplotlib is organized through github. If you would like to report a bug or submit a patch please use that interface.

To report a bug create an issue on github (this requires having a github account). Please include a Short, Self Contained, Correct (Compilable), Example demonstrating what the bug is. Including a clear, easy to test example makes it easy for the developers to evaluate the bug. Expect that the bug reports will be a conversation. If you do not want to register with github, please email bug reports to the mailing list.

The easiest way to submit patches to Matplotlib is through pull requests on github. Please see the *The Matplotlib Developers' Guide* for the details.

13.2.3 Contribute to Matplotlib documentation

Matplotlib is a big library, which is used in many ways, and the documentation has only scratched the surface of everything it can do. So far, the place most people have learned all these features are through studying the examples-index, which is a recommended and great way to learn, but it would be nice to have more official narrative documentation guiding people through all the dark corners. This is where you come in.

There is a good chance you know more about Matplotlib usage in some areas, the stuff you do every day, than many of the core developers who wrote most of the documentation. Just pulled your hair out compiling Matplotlib for Windows? Write a FAQ or a section for the *Installation* page. Are you a digital signal processing wizard? Write a tutorial on the signal analysis plotting functions like *xcorr()*, *psd()* and *specgram()*. Do you use Matplotlib with django or other popular web application servers? Write a FAQ or tutorial and we'll find a place for it in the *User's Guide*. And so on... I think you get the idea.

Matplotlib is documented using the sphinx extensions to restructured text (ReST). sphinx is an extensible python framework for documentation projects which generates HTML and PDF, and is pretty easy to write; you can see the source for this document or any page on this site by clicking on the *Show Source* link at the end of the page in the sidebar.

The sphinx website is a good resource for learning sphinx, but we have put together a cheat-sheet at *Writing documentation* which shows you how to get started, and outlines the Matplotlib conventions and extensions, e.g., for including plots directly from external code in your documents.

Once your documentation contributions are working (and hopefully tested by actually *building* the docs) you can submit them as a patch against git. See *Install git* and *Reporting a bug or submitting a patch*. Looking for something to do? Search for TODO or look at the open issues on github.

13.3 How to use Matplotlib in a web application server

In general, the simplest solution when using Matplotlib in a web server is to completely avoid using pyplot (pyplot maintains references to the opened figures to make *show* work, but this will cause memory leaks unless the figures are properly closed). Since Matplotlib 3.1, one can directly create figures using the *Figure* constructor and save them to in-memory buffers. The following example uses Flask, but other frameworks work similarly:

```
import base64
from io import BytesIO

from flask import Flask
from matplotlib.figure import Figure

app = Flask(__name__)

@app.route("/")
def hello():
    # Generate the figure **without using pyplot**.
    fig = Figure()
    ax = fig.subplots()
    ax.plot([1, 2])
    # Save it to a temporary buffer.
    buf = BytesIO()
    fig.savefig(buf, format="png")
    # Embed the result in the html output.
    data = base64.b64encode(buf.getbuffer()).decode("ascii")
    return f"<img src='{data}'/>"
```

When using Matplotlib versions older than 3.1, it is necessary to explicitly instantiate an Agg canvas; see e.g. /gallery/user_interfaces/canvasagg.

13.3.1 Clickable images for HTML

Andrew Dalke of Dalke Scientific has written a nice article on how to make html click maps with Matplotlib agg PNGs. We would also like to add this functionality to SVG. If you are interested in contributing to these efforts that would be great.

CHAPTER

FOURTEEN

TROUBLESHOOTING

Contents

14.1 Obtaining Matplotlib version

To find out your Matplotlib version number, import it and print the `__version__` attribute:

```
>>> import matplotlib
>>> matplotlib.__version__
'0.98.0'
```

14.2 `matplotlib` install location

You can find what directory Matplotlib is installed in by importing it and printing the `__file__` attribute:

```
>>> import matplotlib
>>> matplotlib.__file__
'/home/jdhunter/dev/lib64/python2.5/site-packages/matplotlib/__init__.pyc'
```

14.3 `matplotlib` configuration and cache directory locations

Each user has a Matplotlib configuration directory which may contain a *matplotlibrc* file. To locate your `matplotlib/` configuration directory, use *matplotlib.get_configdir()*:

```
>>> import matplotlib as mpl
>>> mpl.get_configdir()
'/home/darren/.config/matplotlib'
```

On unix-like systems, this directory is generally located in your *HOME* directory under the `.config/` directory.

In addition, users have a cache directory. On unix-like systems, this is separate from the configuration directory by default. To locate your `.cache/` directory, use *matplotlib.get_cachedir()*:

```
>>> import matplotlib as mpl
>>> mpl.get_cachedir()
'/home/darren/.cache/matplotlib'
```

On windows, both the config directory and the cache directory are the same and are in your `Documents and Settings` or `Users` directory by default:

```
>>> import matplotlib as mpl
>>> mpl.get_configdir()
'C:\\Documents and Settings\\jdhunter\\.matplotlib'
>>> mpl.get_cachedir()
'C:\\Documents and Settings\\jdhunter\\.matplotlib'
```

If you would like to use a different configuration directory, you can do so by specifying the location in your *MPLCONFIGDIR* environment variable -- see *Setting environment variables in Linux and macOS*. Note that *MPLCONFIGDIR* sets the location of both the configuration directory and the cache directory.

14.4 Getting help

There are a number of good resources for getting help with Matplotlib. There is a good chance your question has already been asked:

- The mailing list archive.
- GitHub issues.
- Stackoverflow questions tagged matplotlib.

If you are unable to find an answer to your question through search, please provide the following information in your e-mail to the mailing list:

- Your operating system (Linux/UNIX users: post the output of `uname -a`).

- Matplotlib version:

```
python -c "import matplotlib; print(matplotlib.__version__)"
```

- Where you obtained Matplotlib (e.g., your Linux distribution's packages, GitHub, PyPI, or Anaconda).
- Any customizations to your `matplotlibrc` file (see *Customizing Matplotlib with style sheets and rcParams*).
- If the problem is reproducible, please try to provide a *minimal*, standalone Python script that demonstrates the problem. This is *the* critical step. If you can't post a piece of code that we can run and reproduce your error, the chances of getting help are significantly diminished. Very often, the mere act of trying to minimize your code to the smallest bit that produces the error will help you find a bug in *your* code that is causing the problem.
- Matplotlib provides debugging information through the `logging` library, and a helper function to set the logging level: one can call

```
plt.set_loglevel("info")  # or "debug" for more info
```

  to obtain this debugging information.

  Standard functions from the `logging` module are also applicable; e.g. one could call `logging.basicConfig(level="DEBUG")` even before importing Matplotlib (this is in particular necessary to get the logging info emitted during Matplotlib's import), or attach a custom handler to the "matplotlib" logger. This may be useful if you use a custom logging configuration.

If you compiled Matplotlib yourself, please also provide:

- any changes you have made to `setup.py` or `setupext.py`.
- the output of:

```
rm -rf build
python setup.py build
```

  The beginning of the build output contains lots of details about your platform that are useful for the Matplotlib developers to diagnose your problem.

- your compiler version -- e.g., `gcc --version`.

Including this information in your first e-mail to the mailing list will save a lot of time.

You will likely get a faster response writing to the mailing list than filing a bug in the bug tracker. Most developers check the bug tracker only periodically. If your problem has been determined to be a bug and can not be quickly solved, you may be asked to file a bug in the tracker so the issue doesn't get lost.

14.5 Problems with recent git versions

First make sure you have a clean build and install (see *How to completely remove Matplotlib*), get the latest git update, install it and run a simple test script in debug mode:

```
rm -rf /path/to/site-packages/matplotlib*
git clean -xdf
git pull
python -mpip install -v . > build.out
python -c "from pylab import *; set_loglevel('debug'); plot(); show()" > run.out
```

and post `build.out` and `run.out` to the matplotlib-devel mailing list (please do not post git problems to the users list).

Of course, you will want to clearly describe your problem, what you are expecting and what you are getting, but often a clean build and install will help. See also *Getting help*.

CHAPTER

FIFTEEN

ENVIRONMENT VARIABLES

Contents

`DISPLAY`
: The server and screen on which to place windows. This is interpreted by GUI toolkits in a backend-specific manner, but generally refers to an X.org display name.

`HOME`
: The user's home directory. On Linux, `~` is shorthand for *`HOME`*.

`MPLBACKEND`
: This optional variable can be set to choose the Matplotlib backend. See *What is a backend?*.

`MPLCONFIGDIR`
: This is the directory used to store user customizations to Matplotlib, as well as some caches to improve performance. If *`MPLCONFIGDIR`* is not defined, *`HOME`*`/.config/matplotlib` and *`HOME`*`/.cache/matplotlib` are used on Linux, and *`HOME`*`/.matplotlib` on other platforms, if they are writable. Otherwise, the Python standard library's `tempfile.gettempdir` is used to find a base directory in which the `matplotlib` subdirectory is created.

`PATH`
: The list of directories searched to find executable programs.

`PYTHONPATH`
: The list of directories that are added to Python's standard search list when importing packages and modules.

`QT_API`
: The Python Qt wrapper to prefer when using Qt-based backends. See *the entry in the usage guide* for more information.

15.1 Setting environment variables in Linux and macOS

To list the current value of *PYTHONPATH*, which may be empty, try:

```
echo $PYTHONPATH
```

The procedure for setting environment variables in depends on what your default shell is. Common shells include `bash` and `csh`. You should be able to determine which by running at the command prompt:

```
echo $SHELL
```

To create a new environment variable:

```
export PYTHONPATH=~/Python  # bash/ksh
setenv PYTHONPATH ~/Python  # csh/tcsh
```

To prepend to an existing environment variable:

```
export PATH=~/bin:${PATH}  # bash/ksh
setenv PATH ~/bin:${PATH}  # csh/tcsh
```

The search order may be important to you, do you want `~/bin` to be searched first or last? To append to an existing environment variable:

```
export PATH=${PATH}:~/bin  # bash/ksh
setenv PATH ${PATH}:~/bin  # csh/tcsh
```

To make your changes available in the future, add the commands to your `~/.bashrc`/`.cshrc` file.

15.2 Setting environment variables in Windows

Open the `Control Panel` (*Start* ▸ *Control Panel*), start the `System` program. Click the *Advanced* tab and select the *Environment Variables* button. You can edit or add to the *User Variables*.

Part III

API Overview

CHAPTER

SIXTEEN

API CHANGES

If updating Matplotlib breaks your scripts, this list may help you figure out what caused the breakage and how to fix it by updating your code.

For API changes in older versions see

16.1 Old API Changes

16.1.1 API Changes for 3.3.1

Deprecations

Reverted deprecation of `num2epoch` and `epoch2num`

These two functions were deprecated in 3.3.0, and did not return an accurate Matplotlib datenum relative to the new Matplotlib epoch handling (*`get_epoch`* and `rcParams["date.epoch"]` (default: `'1970-01-01T00:00:00'`)). This version reverts the deprecation.

Functions `epoch2num` and `dates.julian2num` use `date.epoch` rcParam

Now *`epoch2num`* and (undocumented) `julian2num` return floating point days since *`get_epoch`* as set by `rcParams["date.epoch"]` (default: `'1970-01-01T00:00:00'`), instead of floating point days since the old epoch of "0000-12-31T00:00:00". If needed, you can translate from the new to old values as `old = new + mdates.date2num(np.datetime64('0000-12-31'))`

16.1.2 API Changes for 3.3.0

Behaviour changes

`Formatter.fix_minus`

`Formatter.fix_minus` now performs hyphen-to-unicode-minus replacement whenever `rcParams["axes.unicode_minus"]` (default: `True`) is True; i.e. its behavior matches the one of `ScalarFormatter.fix_minus` (*`ScalarFormatter`* now just inherits that implementation).

This replacement is now used by the `format_data_short` method of the various builtin formatter classes, which affects the cursor value in the GUI toolbars.

`FigureCanvasBase` now always has a `manager` attribute, which may be None

Previously, it did not necessarily have such an attribute. A check for `hasattr(figure.canvas, "manager")` should now be replaced by `figure.canvas.manager is not None` (or `getattr(figure.canvas, "manager", None) is not None` for back-compatibility).

`cbook.CallbackRegistry` now propagates exceptions when no GUI event loop is running

`cbook.CallbackRegistry` now defaults to propagating exceptions thrown by callbacks when no interactive GUI event loop is running. If a GUI event loop *is* running, *`cbook.CallbackRegistry`* still defaults to just printing a traceback, as unhandled exceptions can make the program completely `abort()` in that case.

`Axes.locator_params()` validates `axis` parameter

axes.Axes.locator_params used to accept any value for `axis` and silently did nothing, when passed an unsupported value. It now raises a `ValueError`.

`Axis.set_tick_params()` validates `which` parameter

Axis.set_tick_params (and the higher level *axes.Axes.tick_params* and *pyplot.tick_params*) used to accept any value for `which` and silently did nothing, when passed an unsupported value. It now raises a `ValueError`.

`Axis.set_ticklabels()` must match `FixedLocator.locs`

If an axis is using a *ticker.FixedLocator*, typically set by a call to *Axis.set_ticks*, then the number of ticklabels supplied must match the number of locations available (`FixedFormattor.locs`). If not, a `ValueError` is raised.

`backend_pgf.LatexManager.latex`

`backend_pgf.LatexManager.latex` is now created with `encoding="utf-8"`, so its `stdin`, `stdout`, and `stderr` attributes are utf8-encoded.

`pyplot.xticks()` and `pyplot.yticks()`

Previously, passing labels without passing the ticks to either *pyplot.xticks* and *pyplot.yticks* would result in

> TypeError: object of type 'NoneType' has no len()

It now raises a `TypeError` with a proper description of the error.

Setting the same property under multiple aliases now raises a TypeError

Previously, calling e.g. `plot(..., color=somecolor, c=othercolor)` would emit a warning because `color` and `c` actually map to the same Artist property. This now raises a TypeError.

`FileMovieWriter` temporary frames directory

FileMovieWriter now defaults to writing temporary frames in a temporary directory, which is always cleared at exit. In order to keep the individual frames saved on the filesystem, pass an explicit *frame_prefix*.

`Axes.plot` no longer accepts *x* and *y* being both 2D and with different numbers of columns

Previously, calling *Axes.plot* e.g. with *x* of shape `(n, 3)` and *y* of shape `(n, 2)` would plot the first column of *x* against the first column of *y*, the second column of *x* against the second column of *y*, **and** the first column of *x* against the third column of *y*. This now raises an error instead.

`Text.update_from` now copies usetex state from the source Text

`stem` now defaults to `use_line_collection=True`

This creates the stem plot as a *LineCollection* rather than individual *Line2D* objects, greatly improving performance.

rcParams color validator is now stricter

Previously, rcParams entries whose values were color-like accepted "spurious" extra letters or characters in the "middle" of the string, e.g. `"(0, 1a, '0.5')"` would be interpreted as `(0, 1, 0.5)`. These extra characters (including the internal quotes) now cause a ValueError to be raised.

`SymLogNorm` now has a *base* parameter

Previously, *SymLogNorm* had no *base* keyword argument, and defaulted to `base=np.e` whereas the documentation said it was `base=10`. In preparation to make the default 10, calling *SymLogNorm* without the new *base* keyword argument emits a deprecation warning.

`errorbar` now color cycles when only errorbar color is set

Previously setting the *ecolor* would turn off automatic color cycling for the plot, leading to the the lines and markers defaulting to whatever the first color in the color cycle was in the case of multiple plot calls.

`rcsetup.validate_color_for_prop_cycle` now always raises TypeError for bytes input

It previously raised `TypeError`, **except** when the input was of the form `b"C[number]"` in which case it raised a ValueError.

`FigureCanvasPS.print_ps` and `FigureCanvasPS.print_eps` no longer apply edgecolor and facecolor

These methods now assume that the figure edge and facecolor have been correctly applied by *`FigureCanvasBase.print_figure`*, as they are normally called through it.

This behavior is consistent with other figure saving methods (*`FigureCanvasAgg.print_png`*, *`FigureCanvasPdf.print_pdf`*, *`FigureCanvasSVG.print_svg`*).

`pyplot.subplot()` now raises TypeError when given an incorrect number of arguments

This is consistent with other signature mismatch errors. Previously a ValueError was raised.

Shortcut for closing all figures

Shortcuts for closing all figures now also work for the classic toolbar. There is no default shortcut any more because unintentionally closing all figures by a key press might happen too easily. You can configure the shortcut yourself using `rcParams["keymap.quit_all"]` (default: `[]`).

Autoscale for arrow

Calling ax.arrow() will now autoscale the axes.

`set_tick_params(label1On=False)` now also makes the offset text (if any) invisible

... because the offset text can rarely be interpreted without tick labels anyways.

`Axes.annotate` and `pyplot.annotate` parameter name changed

The parameter `s` to *Axes.annotate* and *pyplot.annotate* is renamed to `text`, matching *Annotation*.

The old parameter name remains supported, but support for it will be dropped in a future Matplotlib release.

`font_manager.json_dump` now locks the font manager dump file

... to prevent multiple processes from writing to it at the same time.

`pyplot.rgrids` and `pyplot.thetagrids` now act as setters also when called with only kwargs

Previously, keyword arguments were silently ignored when no positional arguments were given.

`Axis.get_minorticklabels` and `Axis.get_majorticklabels` now returns plain list

Previously, *Axis.get_minorticklabels* and *Axis.get_majorticklabels* returns silent_list. Their return type is now changed to normal list. *get_xminorticklabels*, *get_yminorticklabels*, *get_zminorticklabels*, *Axis.get_ticklabels*, *get_xmajorticklabels*, *get_ymajorticklabels* and *get_zmajorticklabels* methods will be affected by this change.

Default slider formatter

The default method used to format *Slider* values has been changed to use a *ScalarFormatter* adapted the slider values limits. This should ensure that values are displayed with an appropriate number of significant digits even if they are much smaller or much bigger than 1. To restore the old behavior, explicitly pass a "%1.2f" as the *valfmt* parameter to *Slider*.

Add *normalize* keyword argument to `Axes.pie`

`pie()` used to draw a partial pie if the sum of the values was < 1. This behavior is deprecated and will change to always normalizing the values to a full pie by default. If you want to draw a partial pie, please pass `normalize=False` explicitly.

`table.CustomCell` is now an alias for `table.Cell`

All the functionality of `CustomCell` has been moved to its base class *Cell*.

wx Timer interval

Setting the timer interval on a not-yet-started `TimerWx` won't start it anymore.

"step"-type histograms default to the zorder of `Line2D`

This ensures that they go above gridlines by default. The old `zorder` can be kept by passing it as a keyword argument to *Axes.hist*.

`Legend` and `OffsetBox` visibility

Legend and *OffsetBox* subclasses (*PaddedBox*, *AnchoredOffsetbox*, and *AnnotationBbox*) no longer directly keep track of the visibility of their underlying *Patch* artist, but instead pass that flag down to the *Patch*.

`Legend` and `Table` no longer allow invalid locations

This affects legends produced on an Axes (*Axes.legend* and *pyplot.legend*) and on a Figure (*Figure.legend* and *pyplot.figlegend*). Figure legends also no longer accept the unsupported `'best'` location. Previously, invalid Axes locations would use `'best'` and invalid Figure locations would used `'upper right'`.

Passing Line2D's *drawstyle* together with *linestyle* is removed

Instead of `plt.plot(..., linestyle="steps--")`, use `plt.plot(..., linestyle="--", drawstyle="steps")`. `ds` is also an alias for `drawstyle`.

Upper case color strings

Support for passing single-letter colors (one of "rgbcmykw") as UPPERCASE characters is removed; these colors are now case-sensitive (lowercase).

tight/constrained_layout no longer worry about titles that are too wide

tight_layout and *constrained_layout* shrink axes to accommodate "decorations" on the axes. However, if an xlabel or title is too long in the x direction, making the axes smaller in the x-direction doesn't help. The behavior of both has been changed to ignore the width of the title and xlabel and the height of the ylabel in the layout logic.

This also means there is a new keyword argument for *axes.Axes.get_tightbbox* and *axis.Axis.get_tightbbox*: `for_layout_only`, which defaults to *False*, but if *True* returns a bounding box using the rules above.

`rcParams["savefig.facecolor"]` (default: `'auto'`) and `rcParams["savefig.edgecolor"]` (default: `'auto'`) now default to "auto"

This newly allowed value for `rcParams["savefig.facecolor"]` (default: `'auto'`) and `rcParams["savefig.edgecolor"]` (default: `'auto'`), as well as the *facecolor* and *edgecolor* parameters to *Figure.savefig*, means "use whatever facecolor and edgecolor the figure current has".

When using a single dataset, `Axes.hist` no longer wraps the added artist in a `silent_list`

When *Axes.hist* is called with a single dataset, it adds to the axes either a *BarContainer* object (when `histtype="bar"` or `"barstacked"`), or a *Polygon* object (when `histype="step"` or `"stepfilled"`) -- the latter being wrapped in a list-of-one-element. Previously, either artist would be wrapped in a *silent_list*. This is no longer the case: the *BarContainer* is now returned as is (this is an API breaking change if you were directly relying on the concrete `list` API; however, *BarContainer* inherits from `tuple` so most common operations remain available), and the list-of-one *Polygon* is returned as is. This makes the `repr` of the returned artist more accurate: it is now

```
<BarContainer object of of 10 artists>  # "bar", "barstacked"
[<matplotlib.patches.Polygon object at 0xdeadbeef>]  # "step", "stepfilled"
```

instead of

```
<a list of 10 Patch objects>  # "bar", "barstacked"
<a list of 1 Patch objects>  # "step", "stepfilled"
```

When *Axes.hist* is called with multiple artists, it still wraps its return value in a *silent_list*, but uses more accurate type information

```
<a list of 3 BarContainer objects>  # "bar", "barstacked"
<a list of 3 List[Polygon] objects>  # "step", "stepfilled"
```

instead of

```
<a list of 3 Lists of Patches objects>  # "bar", "barstacked"
<a list of 3 Lists of Patches objects>  # "step", "stepfilled"
```

Qt and wx backends no longer create a status bar by default

The coordinates information is now displayed in the toolbar, consistently with the other backends. This is intended to simplify embedding of Matplotlib in larger GUIs, where Matplotlib may control the toolbar but not the status bar.

`rcParams["text.hinting"]` (default: `'force_autohint'`) now supports names mapping to FreeType flags

`rcParams["text.hinting"]` (default: `'force_autohint'`) now supports the values "default", "no_autohint", "force_autohint", and "no_hinting", which directly map to the FreeType flags FT_LOAD_DEFAULT, etc. The old synonyms (respectively "either", "native", "auto", and "none") are still supported, but their use is discouraged. To get normalized values, use *backend_agg.get_hinting_flag*, which returns integer flag values.

`cbook.get_sample_data` auto-loads numpy arrays

When *cbook.get_sample_data* is used to load a npy or npz file and the keyword-only parameter `np_load` is True, the file is automatically loaded using `numpy.load`. `np_load` defaults to False for backwards compatibility, but will become True in a later release.

`get_text_width_height_descent` now checks `ismath` rather than `rcParams["text.usetex"]` (default: `False`)

... to determine whether a string should be passed to the usetex machinery or not. This allows single strings to be marked as not-usetex even when the rcParam is True.

`Axes.vlines`, `Axes.hlines`, `pyplot.vlines` and `pyplot.hlines` *colors* parameter default change

The *colors* parameter will now default to `rcParams["lines.color"]` (default: `'C0'`), while previously it defaulted to 'k'.

Aggressively autoscale clim in `ScalerMappable` classes

Previously some plotting methods would defer autoscaling until the first draw if only one of the *vmin* or *vmax* keyword arguments were passed (*Axes.scatter*, *Axes.hexbin*, *Axes.imshow*, *Axes.pcolorfast*) but would scale based on the passed data if neither was passed (independent of the *norm* keyword arguments). Other methods (*Axes.pcolor*, *Axes.pcolormesh*) always autoscaled base on the initial data.

All of the plotting methods now resolve the unset *vmin* or *vmax* at the initial call time using the data passed in.

If you were relying on exactly one of the *vmin* or *vmax* remaining unset between the time when the method is called and the first time the figure is rendered you get back the old behavior by manually setting the relevant limit back to `None`

```
cm_obj.norm.vmin = None
# or
cm_obj.norm.vmax = None
```

which will be resolved during the draw process.

Deprecations

`figure.add_axes()` without arguments

Calling `fig.add_axes()` with no arguments currently does nothing. This call will raise an error in the future. Adding a free-floating axes needs a position rectangle. If you want a figure-filling single axes, use `add_subplot()` instead.

`backend_wx.DEBUG_MSG`

`backend_wx.DEBUG_MSG` is deprecated. The wx backends now use regular logging.

`Colorbar.config_axis()`

`Colorbar.config_axis()` is considered internal. Its use is deprecated.

`NonUniformImage.is_grayscale` and `PcolorImage.is_grayscale`

These attributes are deprecated, for consistency with `AxesImage.is_grayscale`, which was removed back in Matplotlib 2.0.0. (Note that previously, these attributes were only available *after rendering the image*).

`den` parameter and attribute to `mpl_toolkits.axisartist.angle_helper`

For all locator classes defined in *mpl_toolkits.axisartist.angle_helper*, the `den` parameter has been renamed to `nbins`, and the `den` attribute deprecated in favor of its (pre-existing) synonym `nbins`, for consistency with locator classes defined in *matplotlib.ticker*.

`backend_pgf.LatexManager.latex_stdin_utf8`

`backend_pgf.LatexManager.latex` is now created with `encoding="utf-8"`, so its `stdin` attribute is already utf8-encoded; the `latex_stdin_utf8` attribute is thus deprecated.

Flags containing "U" passed to `cbook.to_filehandle` and `cbook.open_file_cm`

Please remove "U" from flags passed to *cbook.to_filehandle* and *cbook.open_file_cm*. This is consistent with their removal from `open` in Python 3.9.

PDF and PS character tracking internals

The `used_characters` attribute and `track_characters` and `merge_used_characters` methods of *RendererPdf*, *PdfFile*, and *RendererPS* are deprecated.

Case-insensitive capstyles and joinstyles

Please pass capstyles ("miter", "round", "bevel") and joinstyles ("butt", "round", "projecting") as lowercase.

Passing raw data to `register_cmap()`

Passing raw data via parameters *data* and *lut* to *`register_cmap()`* is deprecated. Instead, explicitly create a *`LinearSegmentedColormap`* and pass it via the *cmap* parameter: `register_cmap(cmap=LinearSegmentedColormap(name, data, lut))`.

`DateFormatter.illegal_s`

This attribute is unused and deprecated.

`widgets.TextBox.params_to_disable`

This attribute is deprecated.

Revert deprecation *min, *max keyword arguments to `set_x/y/zlim_3d()`

These keyword arguments were deprecated in 3.0, alongside with the respective parameters in `set_xlim()` / `set_ylim()`. The deprecations of the 2D versions were already reverted in in 3.1.

`cbook.local_over_kwdict`

This function is deprecated. Use *`cbook.normalize_kwargs`* instead.

Passing both singular and plural *colors*, *linewidths*, *linestyles* to `Axes.eventplot`

Passing e.g. both *linewidth* and *linewidths* will raise a TypeError in the future.

Setting `rcParams["text.latex.preamble"]` (default: `''`) or `rcParams["pdf.preamble"]` to non-strings

These rcParams should be set to string values. Support for None (meaning the empty string) and lists of strings (implicitly joined with newlines) is deprecated.

Parameters *norm* and *vmin*/*vmax* should not be used simultaneously

Passing parameters *norm* and *vmin*/*vmax* simultaneously to functions using colormapping such as `scatter()` and `imshow()` is deprecated. Inestead of `norm=LogNorm()`, `vmin=min_val, vmax=max_val` pass `norm=LogNorm(min_val, max_val)`. *vmin* and *vmax* should only be used without setting *norm*.

Effectless parameters of `Figure.colorbar` and `matplotlib.colorbar.Colorbar`

The *cmap* and *norm* parameters of *Figure.colorbar* and *matplotlib.colorbar.Colorbar* have no effect because they are always overridden by the mappable's colormap and norm; they are thus deprecated. Likewise, passing the *alpha*, *boundaries*, *values*, *extend*, or *filled* parameters with a *ContourSet* mappable, or the *alpha* parameter with an *Artist* mappable, is deprecated, as the mappable would likewise override them.

`args_key` and `exec_key` attributes of builtin `MovieWriters`

These attributes are deprecated.

Unused parameters

The following parameters do not have any effect and are deprecated:

- arbitrary keyword arguments to `StreamplotSet`
- parameter *quantize* of *Path.cleaned()*
- parameter *s* of *AnnotationBbox.get_fontsize()*
- parameter *label* of *Tick*

Passing *props* to `Shadow`

The parameter *props* of *Shadow* is deprecated. Use keyword arguments instead.

`Axes.update_datalim_bounds`

This method is deprecated. Use `ax.dataLim.set(Bbox.union([ax.dataLim, bounds]))` instead.

{,Symmetrical}LogScale.{,Inverted}LogTransform

LogScale.LogTransform, LogScale.InvertedLogTransform, SymmetricalScale.SymmetricalTransform and SymmetricalScale.InvertedSymmetricalTransform are deprecated. Directly access the transform classes from the *scale* module.

TexManager.cachedir, TexManager.rgba_arrayd

Use *matplotlib.get_cachedir()* instead for the former; there is no replacement for the latter.

Setting Line2D's pickradius via Line2D.set_picker

Setting a *Line2D*'s pickradius (i.e. the tolerance for pick events and containment checks) via *Line2D.set_picker* is deprecated. Use *Line2D.set_pickradius* instead.

Line2D.set_picker no longer sets the artist's custom-contain() check.

Artist.set_contains, Artist.get_contains

Setting a custom method overriding *Artist.contains* is deprecated. There is no replacement, but you may still customize pick events using *Artist.set_picker*.

Colorbar methods

The on_mappable_changed and update_bruteforce methods of *Colorbar* are deprecated; both can be replaced by calls to *update_normal*.

OldScalarFormatter, IndexFormatter and DateIndexFormatter

These formatters are deprecated. Their functionality can be implemented using e.g. *FuncFormatter*.

OldAutoLocator

This ticker is deprecated.

required, *forbidden* and *allowed* parameters of cbook.normalize_kwargs

These parameters are deprecated.

The TTFPATH and AFMPATH environment variables

Support for the (undocumented) TTFPATH and AFMPATH environment variables is deprecated. Additional fonts may be registered using matplotlib.font_manager.fontManager.addfont().

matplotlib.compat

This module is deprecated.

matplotlib.backends.qt_editor.formsubplottool

This module is deprecated. Use matplotlib.backends.backend_qt5.SubplotToolQt instead.

AVConv animation writer deprecated

The AVConvBase, AVConvWriter and AVConvFileWriter classes, and the associated animation.avconv_path and animation.avconv_args rcParams are deprecated.

Debian 8 (2015, EOL 06/2020) and Ubuntu 14.04 (EOL 04/2019) were the last versions of Debian and Ubuntu to ship avconv. It remains possible to force the use of avconv by using the ffmpeg-based writers with rcParams["animation.ffmpeg_path"] (default: 'ffmpeg') set to "avconv".

log/symlog scale base, ticks, and nonpos specification

semilogx, *semilogy*, *loglog*, *LogScale*, and *SymmetricalLogScale* used to take keyword arguments that depends on the axis orientation ("basex" vs "basey", "subsx" vs "subsy", "nonposx" vs "nonposy"); these parameter names are now deprecated in favor of "base", "subs", "nonpositive". This deprecation also affects e.g. `ax.set_yscale("log", basey=...)` which must now be spelled `ax.set_yscale("log", base=...)`.

The change from "nonpos" to "nonpositive" also affects *LogTransform*, *InvertedLogTransform*, *SymmetricalLogTransform*, etc.

To use *different* bases for the x-axis and y-axis of a *loglog* plot, use e.g. `ax.set_xscale("log", base=10); ax.set_yscale("log", base=2)`.

`DraggableBase.artist_picker`

This method is deprecated. If you previously reimplemented it in a subclass, set the artist's picker instead with *Artist.set_picker*.

clear_temp parameter and attribute of `FileMovieWriter`

The *clear_temp* parameter and attribute of *FileMovieWriter* is deprecated. In the future, files placed in a temporary directory (using `frame_prefix=None`, the default) will be cleared; files placed elsewhere will not.

Deprecated rcParams validators

The following validators, defined in *rcsetup*, are deprecated: `validate_fontset`, `validate_mathtext_default`, `validate_alignment`, `validate_svg_fontset`, `validate_pgf_texsystem`, `validate_movie_frame_fmt`, `validate_axis_locator`, `validate_movie_html_fmt`, `validate_grid_axis`, `validate_axes_titlelocation`, `validate_toolbar`, `validate_ps_papersize`, `validate_legend_loc`, `validate_bool_maybe_none`, `validate_hinting`, `validate_movie_writers`, `validate_webagg_address`, `validate_nseq_float`, `validate_nseq_int`. To test whether an rcParam value would be acceptable, one can test e.g. `rc = RcParams(); rc[k] = v` raises an exception.

Stricter rcParam validation

`rcParams["axes.axisbelow"]` (default: `'line'`) currently normalizes all strings starting with "line" (case-insensitive) to the option "line". This is deprecated; in a future version only the exact string "line" (case-sensitive) will be supported.

`add_subplot()` validates its inputs

In particular, for `add_subplot(rows, cols, index)`, all parameters must be integral. Previously strings and floats were accepted and converted to int. This will now emit a deprecation warning.

Toggling axes navigation from the keyboard using "a" and digit keys

Axes navigation can still be toggled programmatically using *Axes.set_navigate*.

The following related APIs are also deprecated: `backend_tools.ToolEnableAllNavigation`, `backend_tools.ToolEnableNavigation`, and `rcParams["keymap.all_axes"]`.

`matplotlib.test(recursionlimit=...)`

The *recursionlimit* parameter of `matplotlib.test` is deprecated.

mathtext glues

The *copy* parameter of `mathtext.Glue` is deprecated (the underlying glue spec is now immutable). `mathtext.GlueSpec` is deprecated.

Signatures of `Artist.draw` and `Axes.draw`

The *inframe* parameter to *Axes.draw* is deprecated. Use *Axes.redraw_in_frame* instead.

Not passing the *renderer* parameter to *Axes.draw* is deprecated. Use `axes.draw_artist(axes)` instead.

These changes make the signature of the `draw` (`artist.draw(renderer)`) method consistent across all artists; thus, additional parameters to *Artist.draw* are deprecated.

DraggableBase.on_motion_blit

This method is deprecated. *DraggableBase.on_motion* now handles both the blitting and the non-blitting cases.

Passing the dash offset as None

Fine control of dash patterns can be achieved by passing an `(offset, (on-length, off-length, on-length, off-length, ...))` pair as the linestyle property of *Line2D* and *LineCollection*. Previously, certain APIs would accept `offset = None` as a synonym for `offset = 0`, but this was never universally implemented, e.g. for vector output. Support for `offset = None` is deprecated, set the offset to 0 instead.

RendererCairo.fontweights, RendererCairo.fontangles

... are deprecated.

autofmt_xdate(which=None)

This is deprecated, use its more explicit synonym, `which="major"`, instead.

JPEG options

The *quality*, *optimize*, and *progressive* keyword arguments to *savefig*, which were only used when saving to JPEG, are deprecated. `rcParams["savefig.jpeg_quality"]` (default: `95`) is likewise deprecated.

Such options should now be directly passed to Pillow using `savefig(..., pil_kwargs={"quality": ..., "optimize": ..., "progressive": ...})`.

dviread.Encoding

This class was (mostly) broken and is deprecated.

Axis and Locator `pan` and `zoom`

The unused `pan` and `zoom` methods of *Axis* and *Locator* are deprecated. Panning and zooming are now implemented using the `start_pan`, `drag_pan`, and `end_pan` methods of *Axes*.

Passing None to various Axes subclass factories

Support for passing `None` as base class to *axes.subplot_class_factory*, `axes_grid1.parasite_axes.host_axes_class_factory`, `axes_grid1.parasite_axes.host_subplot_class_factory`, `axes_grid1.parasite_axes.parasite_axes_class_factory`, and `axes_grid1.parasite_axes.parasite_axes_auxtrans_class_factory` is deprecated. Explicitly pass the correct base `Axes` class instead.

axes_rgb

In *mpl_toolkits.axes_grid1.axes_rgb*, `imshow_rgb` is deprecated (use `ax.imshow(np.dstack([r, g, b]))` instead); `RGBAxesBase` is deprecated (use `RGBAxes` instead); `RGBAxes.add_RGB_to_figure` is deprecated (it was an internal helper).

Substitution.from_params

This method is deprecated. If needed, directly assign to the `params` attribute of the Substitution object.

PGF backend cleanups

The *dummy* parameter of *RendererPgf* is deprecated.

GraphicsContextPgf is deprecated (use *GraphicsContextBase* instead).

`set_factor` method of `mpl_toolkits.axisartist` locators

The `set_factor` method of *mpl_toolkits.axisartist* locators (which are different from "standard" Matplotlib tick locators) is deprecated.

`widgets.SubplotTool` callbacks and axes

The `funcleft`, `funcright`, `funcbottom`, `functop`, `funcwspace`, and `funchspace` methods of *`widgets.SubplotTool`* are deprecated.

The `axleft`, `axright`, `axbottom`, `axtop`, `axwspace`, and `axhspace` attributes of *`widgets.SubplotTool`* are deprecated. Access the `ax` attribute of the corresponding slider, if needed.

mathtext `Glue` helper classes

The `Fil`, `Fill`, `Filll`, `NegFil`, `NegFill`, `NegFilll`, and `SsGlue` classes in the *`matplotlib.mathtext`* module are deprecated. As an alternative, directly construct glue instances with `Glue("fil")`, etc.

NavigationToolbar2._init_toolbar

Overriding this method to initialize third-party toolbars is deprecated. Instead, the toolbar should be initialized in the `__init__` method of the subclass (which should call the base-class' `__init__` as appropriate). To keep back-compatibility with earlier versions of Matplotlib (which *required* `_init_toolbar` to be overridden), a fully empty implementation (`def _init_toolbar(self): pass`) may be kept and will not trigger the deprecation warning.

NavigationToolbar2QT.parent and .basedir

These attributes are deprecated. In order to access the parent window, use `toolbar.canvas.parent()`. Once the deprecation period is elapsed, it will also be accessible as `toolbar.parent()`. The base directory to the icons is `os.path.join(mpl.get_data_path(), "images")`.

NavigationToolbar2QT.ctx

This attribute is deprecated.

NavigationToolbar2Wx attributes

The `prevZoomRect`, `retinaFix`, `savedRetinaImage`, `wxoverlay`, `zoomAxes`, `zoomStartX`, and `zoomStartY` attributes are deprecated.

NavigationToolbar2.press and .release

These methods were called when pressing or releasing a mouse button, but *only* when an interactive pan or zoom was occurring (contrary to what the docs stated). They are deprecated; if you write a backend which needs to customize such events, please directly override `press_pan`/`press_zoom`/`release_pan`/`release_zoom` instead.

FigureCanvasGTK3._renderer_init

Overriding this method to initialize renderers for GTK3 canvases is deprecated. Instead, the renderer should be initialized in the `__init__` method of the subclass (which should call the base-class' `__init__` as appropriate). To keep back-compatibility with earlier versions of Matplotlib (which *required* `_renderer_init` to be overridden), a fully empty implementation (`def _renderer_init(self): pass`) may be kept and will not trigger the deprecation warning.

Path helpers in `bezier`

`bezier.make_path_regular` is deprecated. Use `Path.cleaned()` (or `Path.cleaned(curves=True)`, etc.) instead (but note that these methods add a `STOP` code at the end of the path).

`bezier.concatenate_paths` is deprecated. Use `Path.make_compound_path()` instead.

`animation.html_args` rcParam

The unused `animation.html_args` rcParam and `animation.HTMLWriter.args_key` attribute are deprecated.

`text.latex.preview` rcParam

This rcParam, which controlled the use of the preview.sty LaTeX package to align TeX string baselines, is deprecated, as Matplotlib's own dvi parser now computes baselines just as well as preview.sty.

`SubplotSpec.get_rows_columns`

This method is deprecated. Use the `GridSpec.nrows`, `GridSpec.ncols`, `SubplotSpec.rowspan`, and `SubplotSpec.colspan` properties instead.

Qt4-based backends

The qt4agg and qt4cairo backends are deprecated. Qt4 has reached its end-of-life in 2015 and there are no releases for recent versions of Python. Please consider switching to Qt5.

fontdict and *minor* parameters of `Axes.set_xticklabels` and `Axes.set_yticklabels` will become keyword-only

All parameters of `Figure.subplots` except *nrows* and *ncols* will become keyword-only

This avoids typing e.g. `subplots(1, 1, 1)` when meaning `subplot(1, 1, 1)`, but actually getting `subplots(1, 1, sharex=1)`.

`RendererWx.get_gc`

This method is deprecated. Access the `gc` attribute directly instead.

add_all parameter in `axes_grid`

The *add_all* parameter of *axes_grid1.axes_grid.Grid*, *axes_grid1.axes_grid.ImageGrid*, *axes_grid1.axes_rgb.make_rgb_axes* and *axes_grid1.axes_rgb.RGBAxes* is deprecated. Axes are now always added to the parent figure, though they can be later removed with `ax.remove()`.

BboxBase.inverse_transformed

.BboxBase.inverse_transformed is deprecated (call *BboxBase.transformed* on the *inverted()* transform instead).

orientation of eventplot() and EventCollection

Setting the *orientation* of an eventplot() or *EventCollection* to "none" or None is deprecated; set it to "horizontal" instead. Moreover, the two orientations ("horizontal" and "vertical") will become case-sensitive in the future.

minor kwarg to Axis.get_ticklocs will become keyword-only

Passing this argument positionally is deprecated.

Case-insensitive properties

Normalization of upper or mixed-case property names to lowercase in *Artist.set* and *Artist.update* is deprecated. In the future, property names will be passed as is, allowing one to pass names such as *patchA* or *UVC*.

ContourSet.ax, Quiver.ax

These attributes are deprecated in favor of ContourSet.axes and Quiver.axes, for consistency with other artists.

Locator.refresh() and associated methods

Locator.refresh() is deprecated. This method was called at certain places to let locators update their internal state, typically based on the axis limits. Locators should now always consult the axis limits when called, if needed.

The associated helper methods NavigationToolbar2.draw() and ToolViewsPositions.refresh_locators() are deprecated, and should be replaced by calls to draw_idle() on the corresponding canvas.

`ScalarMappable` checkers

The `add_checker` and `check_update` methods and `update_dict` attribute of *`ScalarMappable`* are deprecated.

`pyplot.tight_layout` and `ColorbarBase` parameters will become keyword-only

All parameters of *`pyplot.tight_layout`* and all parameters of `ColorbarBase` except for the first (*ax*) will become keyword-only, consistently with *`Figure.tight_layout`* and `Colorbar`, respectively.

`Axes.pie` radius and startangle

Passing `None` as either the `radius` or `startangle` of an *`Axes.pie`* is deprecated; use the explicit defaults of 1 and 0, respectively, instead.

`AxisArtist.dpi_transform`

... is deprecated. Scale `Figure.dpi_scale_trans` by 1/72 to achieve the same effect.

`offset_position` property of `Collection`

The `offset_position` property of *`Collection`* is deprecated. In the future, *`Collection`*s will always behave as if `offset_position` is set to "screen" (the default).

Support for passing `offset_position="data"` to the `draw_path_collection` of all renderer classes is deprecated.

`transforms.AffineDeltaTransform` can be used as a replacement. This API is experimental and may change in the future.

`testing.compare.make_external_conversion_command`

... is deprecated.

`epoch2num` and `num2epoch` are deprecated

These are unused and can be easily reproduced by other date tools. *`get_epoch`* will return Matplotlib's epoch.

`axes_grid1.CbarAxes` attributes

The `cbid` and `locator` attribute are deprecated. Use `mappable.colorbar_cid` and `colorbar.locator`, as for standard colorbars.

`qt_compat.is_pyqt5`

This function is deprecated in prevision of the future release of PyQt6. The Qt version can be checked using `QtCore.qVersion()`.

Reordering of parameters by `Artist.set`

In a future version, `Artist.set` will apply artist properties in the order in which they are given. This only affects the interaction between the *color*, *edgecolor*, *facecolor*, and, for *`Collection`*s, *alpha* properties: the *color* property now needs to be passed first in order not to override the other properties. This is consistent with e.g. *`Artist.update`*, which did not reorder the properties passed to it.

Passing multiple keys as a single comma-separated string or multiple arguments to `ToolManager.update_keymap`

This is deprecated; pass keys as a list of strings instead.

Statusbar classes and attributes

The `statusbar` attribute of *`FigureManagerBase`*, *`StatusbarBase`* and all its subclasses, and `StatusBarWx`, are deprecated, as messages are now displayed in the toolbar instead.

`ismath` parameter of `draw_tex`

The `ismath` parameter of the `draw_tex` method of all renderer classes is deprecated (as a call to `draw_tex` -- not to be confused with `draw_text`! -- means that the entire string should be passed to the `usetex` machinery anyways). Likewise, the text machinery will no longer pass the `ismath` parameter when calling `draw_tex` (this should only matter for backend implementers).

Passing `ismath="TeX!"` to *`RendererAgg.get_text_width_height_descent`* is deprecated. Pass `ismath="TeX"` instead, consistently with other low-level APIs which support the values True, False, and "TeX" for `ismath`.

`matplotlib.ttconv`

This module is deprecated.

Stricter PDF metadata keys in PGF

Saving metadata in PDF with the PGF backend currently normalizes all keys to lowercase, unlike the PDF backend, which only accepts the canonical case. This is deprecated; in a future version, only the canonically cased keys listed in the PDF specification (and the *`PdfPages`* documentation) will be accepted.

Qt modifier keys

The `MODIFIER_KEYS`, `SUPER`, `ALT`, `CTRL`, and `SHIFT` global variables of the `matplotlib.backends.backend_qt4agg`, `matplotlib.backends.backend_qt4cairo`, `matplotlib.backends.backend_qt5agg` and `matplotlib.backends.backend_qt5cairo` modules are deprecated.

`TexManager`

The `TexManager.serif`, `TexManager.sans_serif`, `TexManager.cursive` and `TexManager.monospace` attributes are deprecated.

Removals

The following deprecated APIs have been removed:

Modules

- `backends.qt_editor.formlayout` (use the formlayout module available on PyPI instead).

Classes, methods and attributes

- `artist.Artist.aname` property (no replacement)
- `axis.Axis.iter_ticks` (no replacement)
- Support for custom backends that do not provide a `backend_bases.GraphicsContextBase.set_hatch_color` method
- `backend_bases.RendererBase.strip_math()` (use `cbook.strip_math()` instead)
- `backend_wx.debug_on_error()` (no replacement)
- `backend_wx.raise_msg_to_str()` (no replacement)
- `backend_wx.fake_stderr` (no replacement)
- `backend_wx.MenuButtonWx` (no replacement)
- `backend_wx.PrintoutWx` (no replacement)
- `_backend_tk.NavigationToolbar2Tk.set_active()` (no replacement)
- `backend_ps.PsBackendHelper.gs_exe` property (no replacement)
- `backend_ps.PsBackendHelper.gs_version` property (no replacement)
- `backend_ps.PsBackendHelper.supports_ps2write` property (no replacement)
- `backend_ps.RendererPS.afmfontd` property (no replacement)
- `backend_ps.GraphicsContextPS.shouldstroke` property (no replacement)
- `backend_gtk3.FileChooserDialog` (no replacement)
- `backend_gtk3.SaveFigureGTK3.get_filechooser()` (no replacement)
- `backend_gtk3.NavigationToolbar2GTK3.get_filechooser()` (no replacement)
- `backend_gtk3cairo.FigureManagerGTK3Cairo` (use `backend_gtk3.FigureManagerGTK3` instead)
- `backend_pdf.RendererPdf.afm_font_cache` property (no replacement)
- `backend_pgf.LatexManagerFactory` (no replacement)
- `backend_qt5.NavigationToolbar2QT.buttons` property (no replacement)

- `backend_qt5.NavigationToolbar2QT.adj_window` property (no replacement)
- `bezier.find_r_to_boundary_of_closedpath()` (no replacement)
- `cbook.dedent()` (use `inspect.cleandoc` instead)
- `cbook.get_label()` (no replacement)
- `cbook.is_hashable()` (use `isinstance(..., collections.abc.Hashable)` instead)
- `cbook.iterable()` (use `numpy.iterable()` instead)
- `cbook.safezip()` (no replacement)
- `colorbar.ColorbarBase.get_cmap` (use `ScalarMappable.get_cmap` instead)
- `colorbar.ColorbarBase.set_cmap` (use `ScalarMappable.set_cmap` instead)
- `colorbar.ColorbarBase.get_clim` (use `ScalarMappable.get_clim` instead)
- `colorbar.ColorbarBase.set_clim` (use `ScalarMappable.set_clim` instead)
- `colorbar.ColorbarBase.set_norm` (use `ScalarMappable.set_norm` instead)
- `dates.seconds()` (no replacement)
- `dates.minutes()` (no replacement)
- `dates.hours()` (no replacement)
- `dates.weeks()` (no replacement)
- `dates.strpdate2num` and `dates.bytespdate2num` (use `time.strptime` or `dateutil.parser.parse` or *`dates.datestr2num`* instead)
- `docstring.Appender` (no replacement)
- `docstring.dedent()` (use `inspect.getdoc` instead)
- `docstring.copy_dedent()` (use `docstring.copy()` and `inspect.getdoc` instead)
- `font_manager.OSXInstalledFonts()` (no replacement)
- `image.BboxImage.interp_at_native` property (no replacement)
- `lines.Line2D.verticalOffset` property (no replacement)
- `matplotlib.checkdep_dvipng` (no replacement)
- `matplotlib.checkdep_ghostscript` (no replacement)
- `matplotlib.checkdep_pdftops` (no replacement)
- `matplotlib.checkdep_inkscape` (no replacement)
- `matplotlib.get_py2exe_datafiles` (no replacement)
- `matplotlib.tk_window_focus` (use `rcParams['tk.window_focus']` instead)
- `mlab.demean()` (use `mlab.detrend_mean()` instead)
- `path.get_paths_extents()` (use `path.get_path_collection_extents()` instead)

- `path.Path.has_nonfinite()` (use `not np.isfinite(self.vertices).all()` instead)
- `projections.process_projection_requirements()` (no replacement)
- `pyplot.plotfile()` (Instead, load the data using `pandas.read_csv` or `numpy.loadtxt` or similar and use regular pyplot functions to plot the loaded data.)
- `quiver.Quiver.color()` (use `Quiver.get_facecolor()` instead)
- `quiver.Quiver.keyvec` property (no replacement)
- `quiver.Quiver.keytext` property (no replacement)
- `rcsetup.validate_qt4()` (no replacement)
- `rcsetup.validate_qt5()` (no replacement)
- `rcsetup.validate_verbose()` (no replacement)
- `rcsetup.ValidateInterval` (no replacement)
- `scale.LogTransformBase` (use `scale.LogTransform` instead)
- `scale.InvertedLogTransformBase` (use `scale.InvertedLogTransform` instead)
- `scale.Log10Transform` (use `scale.LogTransform` instead)
- `scale.InvertedLog10Transform` (use `scale.InvertedLogTransform` instead)
- `scale.Log2Transform` (use `scale.LogTransform` instead)
- `scale.InvertedLog2Transform` (use `scale.InvertedLogTransform` instead)
- `scale.NaturalLogTransform` (use `scale.LogTransform` instead)
- `scale.InvertedNaturalLogTransform` (use `scale.InvertedLogTransform` instead)
- `scale.get_scale_docs()` (no replacement)
- `sphinxext.plot_directive.plot_directive()` (use the class `PlotDirective` instead)
- `sphinxext.mathmpl.math_directive()` (use the class `MathDirective` instead)
- `spines.Spine.is_frame_like()` (no replacement)
- `testing.decorators.switch_backend()` (use `@pytest.mark.backend` decorator instead)
- `text.Text.is_math_text()` (use `cbook.is_math_text()` instead)
- `text.TextWithDash()` (use `text.Annotation` instead)
- `textpath.TextPath.is_math_text()` (use `cbook.is_math_text()` instead)
- `textpath.TextPath.text_get_vertices_codes()` (use `textpath.text_to_path.get_text_path()` instead)
- `textpath.TextToPath.glyph_to_path()` (use `font.get_path()` and manual translation of the vertices instead)
- `ticker.OldScalarFormatter.pprint_val()` (no replacement)

- `ticker.ScalarFormatter.pprint_val()` (no replacement)
- `ticker.LogFormatter.pprint_val()` (no replacement)
- `ticker.decade_down()` (no replacement)
- `ticker.decade_up()` (no replacement)
- `Tick` properties `gridOn`, `tick1On`, `tick2On`, `label1On`, `label2On` (use `set_visible()` / `get_visible()` on `Tick.gridline`, `Tick.tick1line`, `Tick.tick2line`, `Tick.label1`, `Tick.label2` instead)
- `widgets.SpanSelector.buttonDown` property (no replacement)
- `mplot3d.proj3d.line2d()` (no replacement)
- `mplot3d.proj3d.line2d_dist()` (no replacement)
- `mplot3d.proj3d.line2d_seg_dist()` (no replacement)
- `mplot3d.proj3d.mod()` (use `numpy.linalg.norm` instead)
- `mplot3d.proj3d.proj_transform_vec()` (no replacement)
- `mplot3d.proj3d.proj_transform_vec_clip()` (no replacement)
- `mplot3d.proj3d.vec_pad_ones()` (no replacement)
- `mplot3d.proj3d.proj_trans_clip_points()` (no replacement)
- `mplot3d.art3d.norm_angle()` (no replacement)
- `mplot3d.art3d.norm_text_angle()` (no replacement)
- `mplot3d.art3d.path_to_3d_segment()` (no replacement)
- `mplot3d.art3d.paths_to_3d_segments()` (no replacement)
- `mplot3d.art3d.path_to_3d_segment_with_codes()` (no replacement)
- `mplot3d.art3d.paths_to_3d_segments_with_codes()` (no replacement)
- `mplot3d.art3d.get_patch_verts()` (no replacement)
- `mplot3d.art3d.get_colors()` (no replacement)
- `mplot3d.art3d.zalpha()` (no replacement)
- `mplot3d.axis3d.get_flip_min_max()` (no replacement)
- `mplot3d.axis3d.Axis.get_tick_positions()` (no replacement)
- `axisartist.axis_artist.UnimplementedException` (no replacement)
- `axisartist.axislines.SimpleChainedObjects` (use `axis_grid1.mpl_axes.SimpleChainedObjects` instead)
- `axisartist.axislines.Axes.AxisDict` (use `axis_grid1.mpl_axes.Axes.AxisDict` instead)

Arguments

- `Axes.text()` / `pyplot.text()` do not support the parameter `withdash` anymore. Use `Axes.annotate()` and `pyplot.annotate()` instead.
- The first parameter of *matplotlib.use* has been renamed from `arg` to `backend` (only relevant if you pass by keyword).
- The parameter `warn` of *matplotlib.use* has been removed. A failure to switch the backend will now always raise an `ImportError` if `force` is set; catch that error if necessary.
- All parameters of *matplotlib.use* except the first one are now keyword-only.
- The unused parameters `shape` and `imlim` of *imshow()* are now removed. All parameters beyond `extent` are now keyword-only.
- The unused parameter `interp_at_native` of *BboxImage* has been removed.
- The parameter `usetex` of *TextToPath.get_text_path* has been removed. Use `ismath='TeX'` instead.
- The parameter `block` of `show()` is now keyword-only, and arbitrary arguments or keyword arguments are no longer accepted.
- The parameter `frameon` of *Figure.savefig* has been removed. Use `facecolor="none"` to get a transparent background.
- Passing a `wx.EvtHandler` as the first argument to `backend_wx.TimerWx` is not supported anymore; the signature of `TimerWx` is now consistent with *TimerBase*.
- The `manage_xticks` parameter of *boxplot* and *bxp* has been renamed to `manage_ticks`.
- The `normed` parameter of *hist2d* has been renamed to `density`.
- The `s` parameter of *Annotation* has been renamed to `text`.
- For all functions in *bezier* that supported a `tolerence` parameter, this parameter has been renamed to `tolerance`.
- `axis("normal")` is not supported anymore. Use the equivalent `axis("auto")` instead.
- `axis()` does not accept arbitrary keyword arguments anymore.
- `Axis.set_ticklabels()` does not accept arbitrary positional arguments other than `ticklabels`.
- `mpl_toolkits.mplot3d.art3d.Poly3DCollection.set_zsort` does not accept the value `True` anymore. Pass the equivalent value 'average' instead.
- *AnchoredText* no longer accepts `horizontalalignment` or `verticalalignment` keyword arguments.
- *ConnectionPatch* no longer accepts the `arrow_transmuter` and `connector` keyword arguments, which did nothing since 3.0.

- *FancyArrowPatch* no longer accepts the `arrow_transmuter` and `connector` keyword arguments, which did nothing since 3.0.
- *TextPath* no longer accepts arbitrary positional or keyword arguments.
- *MaxNLocator.set_params()* no longer accepts arbitrary keyword arguments.
- *pie* no longer accepts and squeezes non-1D inputs; pass 1D input to the `x` argument.
- Passing (n, 1)-shaped error arrays to *Axes.errorbar()* is no longer supported; pass a 1D array instead.

rcParams

- The `text.latex.unicode` rcParam has been removed, with no replacement. Matplotlib now always supports unicode in usetex.
- The `savefig.frameon` rcParam has been removed. Set `rcParams["savefig.facecolor"]` (default: `'auto'`) to "none" to get a transparent background.
- The `pgf.debug`, `verbose.fileo` and `verbose.verbose.level` rcParams, which had no effect, have been removed.
- Support for setting `rcParams["mathtext.default"]` (default: `'it'`) to "circled" has been removed.

Environment variables

- `MATPLOTLIBDATA` (no replacement).

mathtext

- The `\stackrel` command (which behaved differently from its LaTeX version) has been removed. Use `\genfrac` instead.
- The `\mathcircled` command has been removed. Directly use Unicode characters, such as `'\N{CIRCLED LATIN CAPITAL LETTER A}'`, instead.

Development changes

Matplotlib now requires numpy>=1.15

Matplotlib now uses Pillow to save and read pngs

The builtin png encoder and decoder has been removed, and Pillow is now a dependency. Note that when reading 16-bit RGB(A) images, Pillow truncates them to 8-bit precision, whereas the old builtin decoder kept the full precision.

The deprecated wx backend (not wxagg!) now always uses wx's builtin jpeg and tiff support rather than relying on Pillow for writing these formats; this behavior is consistent with wx's png output.

16.1.3 API Changes for 3.2.0

Behavior changes

Reduced default value of `rcParams["axes.formatter.limits"]` (default: `[-5, 6]`)

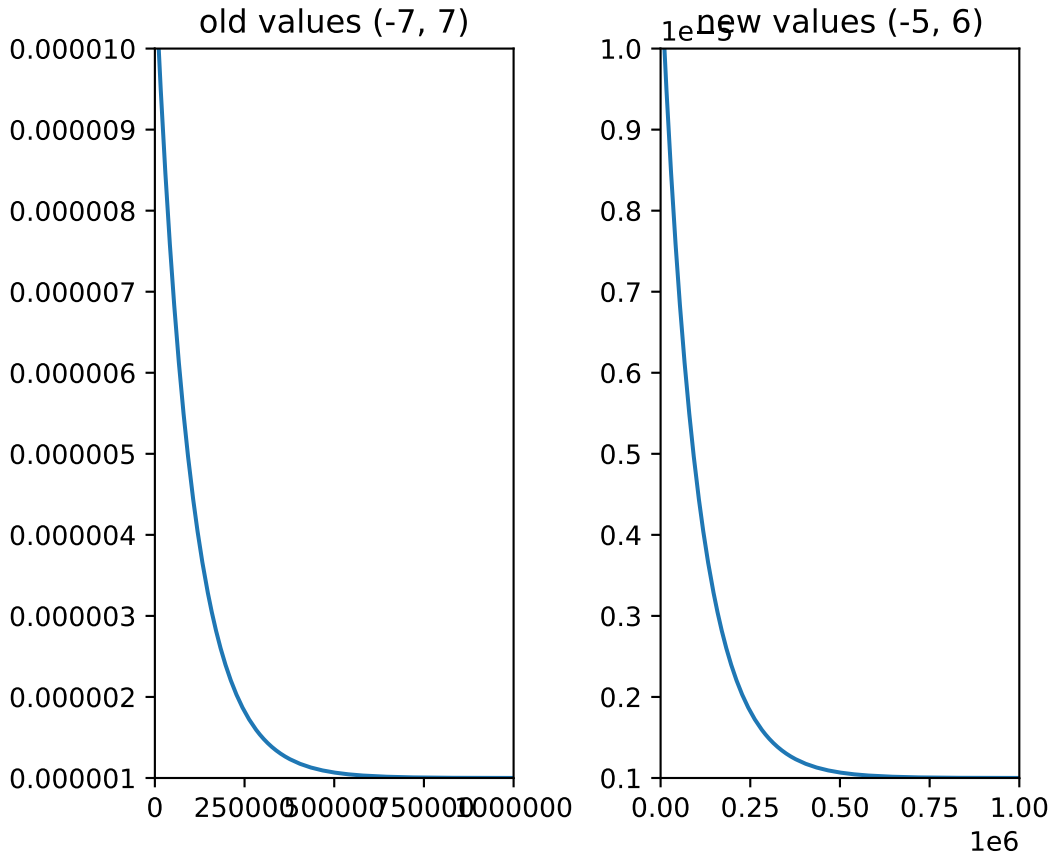
Changed the default value of `rcParams["axes.formatter.limits"]` (default: `[-5, 6]`) from -7, 7 to -5, 6 for better readability.

`matplotlib.colorbar.Colorbar` uses un-normalized axes for all mappables

Before 3.0, *`matplotlib.colorbar.Colorbar`* (*`colorbar`*) normalized all axes limits between 0 and 1 and had custom tickers to handle the labelling of the colorbar ticks. After 3.0, colorbars constructed from mappables that were *not* contours were constructed with axes that had limits between `vmin` and `vmax` of the mappable's norm, and the tickers were made children of the normal axes tickers.

This version of Matplotlib extends that to mappables made by contours, and allows the axes to run between the lowest boundary in the contour and the highest.

Code that worked around the normalization between 0 and 1 will need to be modified.



`MovieWriterRegistry`

`MovieWriterRegistry` now always checks the availability of the writer classes before returning them. If one wishes, for example, to get the first available writer, without performing the availability check on subsequent writers, it is now possible to iterate over the registry, which will yield the names of the available classes.

Autoscaling

Matplotlib used to recompute autoscaled limits after every plotting (`plot()`, `bar()`, etc.) call. It now only does so when actually rendering the canvas, or when the user queries the Axes limits. This is a major performance improvement for plots with a large number of artists.

In particular, this means that artists added manually with *`Axes.add_line`*, *`Axes.add_patch`*, etc. will be taken into account by the autoscale, even without an explicit call to *`Axes.autoscale_view`*.

In some cases, this can result in different limits being reported. If this is an issue, consider triggering a draw with `fig.canvas.draw()`.

Autoscaling has also changed for artists that are based on the *`Collection`* class. Pre-

viously, the method that calculates the automatic limits *Collection.get_datalim* tried to take into account the size of objects in the collection and make the limits large enough to not clip any of the object, i.e., for *Axes.scatter* it would make the limits large enough to not clip any markers in the scatter. This is problematic when the object size is specified in physical space, or figure-relative space, because the transform from physical units to data limits requires knowing the data limits, and becomes invalid when the new limits are applied. This is an inverse problem that is theoretically solvable (if the object is physically smaller than the axes), but the extra complexity was not deemed worth it, particularly as the most common use case is for markers in scatter that are usually small enough to be accommodated by the default data limit margins.

While the new behavior is algorithmically simpler, it is conditional on properties of the *Collection* object:

1. `offsets = None`, `transform` is a child of `Axes.transData`: use the paths for the automatic limits (i.e. for *LineCollection* in *Axes.streamplot*).
2. `offsets != None`, and `offset_transform` is child of `Axes.transData`:

a) **`transform` is child of `Axes.transData`: use the `path + offset` for** limits (i.e., for *Axes.bar*).

b) **`transform` is not a child of `Axes.transData`: just use the offsets** for the limits (i.e. for scatter)

3. otherwise return a null *Bbox*.

While this seems complicated, the logic is simply to use the information from the object that are in data space for the limits, but not information that is in physical units.

log-scale bar() / hist() autolimits

The autolimits computation in *bar* and *hist* when the axes already uses log-scale has changed to match the computation when the axes is switched to log-scale after the call to *bar* and *hist*, and when calling `bar(..., log=True)` / `hist(..., log=True)`: if there are at least two different bar heights, add the normal axes margins to them (in log-scale); if there is only a single bar height, expand the axes limits by one order of magnitude around it and then apply axes margins.

Axes labels spanning multiple rows/columns

`Axes.label_outer` now correctly keep the x labels and tick labels visible for Axes spanning multiple rows, as long as they cover the last row of the Axes grid. (This is consistent with keeping the y labels and tick labels visible for Axes spanning multiple columns as long as they cover the first column of the Axes grid.)

The `Axes.is_last_row` and `Axes.is_last_col` methods now correctly return True for Axes spanning multiple rows, as long as they cover the last row or column respectively. Again this is consistent with the behavior for axes covering the first row or column.

The `Axes.rowNum` and `Axes.colNum` attributes are deprecated, as they only refer to the first grid cell covered by the Axes. Instead, use the new `ax.get_subplotspec().rowspan` and `ax.get_subplotspec().colspan` properties, which are `range` objects indicating the whole span of rows and columns covered by the subplot.

(Note that all methods and attributes mentioned here actually only exist on the `Subplot` subclass of *Axes*, which is used for grid-positioned Axes but not for Axes positioned directly in absolute coordinates.)

The *GridSpec* class gained the `nrows` and `ncols` properties as more explicit synonyms for the parameters returned by `GridSpec.get_geometry`.

Locators

When more than *Locator.MAXTICKS* ticks are generated, the behavior of *Locator.raise_if_exceeds* changed from raising a RuntimeError to emitting a log at WARNING level.

nonsingular Locators

`Locator.nonsingular` (introduced in mpl 3.1), `DateLocator.nonsingular`, and `AutoDateLocator.nonsingular` now returns a range `v0, v1` with `v0 <= v1`. This behavior is consistent with the implementation of `nonsingular` by the `LogLocator` and `LogitLocator` subclasses.

get_data_ratio

`Axes.get_data_ratio` now takes the axes scale into account (linear, log, logit, etc.) before computing the y-to-x ratio. This change allows fixed aspects to be applied to any combination of x and y scales.

Artist sticky edges

Previously, the `sticky_edges` attribute of artists was a list of values such that if an axis limit coincides with a sticky edge, it would not be expanded by the axes margins (this is the mechanism that e.g. prevents margins from being added around images).

`sticky_edges` now have an additional effect on margins application: even if an axis limit did not coincide with a sticky edge, it cannot *cross* a sticky edge through margin application -- instead, the margins will only expand the axis limit until it bumps against the sticky edge.

This change improves the margins of axes displaying a *`streamplot`*:

- if the streamplot goes all the way to the edges of the vector field, then the axis limits are set to match exactly the vector field limits (whereas they would sometimes be off by a small floating point error previously).
- if the streamplot does not reach the edges of the vector field (e.g., due to the use of `start_points` and `maxlength`), then margins expansion will not cross the vector field limits anymore.

This change is also used internally to ensure that polar plots don't display negative *r* values unless the user really passes in a negative value.

`gid` in svg output

Previously, if a figure, axis, legend or some other artists had a custom `gid` set (e.g. via `.set_gid()`), this would not be reflected in the svg output. Instead a default gid, like `figure_1` would be shown. This is now fixed, such that e.g. `fig.set_gid("myfigure")` correctly shows up as `<g id="myfigure">` in the svg file. If you relied on the gid having the default format, you now need to make sure not to set the `gid` parameter of the artists.

Fonts

Font weight guessing now first checks for the presence of the FT_STYLE_BOLD_FLAG before trying to match substrings in the font name. In particular, this means that Times New Roman Bold is now correctly detected as bold, not normal weight.

Color-like checking

matplotlib.colors.is_color_like used to return True for all string representations of floats. However, only those with values in 0-1 are valid colors (representing grayscale values). *is_color_like* now returns False for string representations of floats outside 0-1.

Default image interpolation

Images displayed in Matplotlib previously used nearest-neighbor interpolation, leading to aliasing effects for downscaling and non-integer upscaling.

New default for `rcParams["image.interpolation"]` (default: `'antialiased'`) is the new option "antialiased". `imshow(A, interpolation='antialiased')` will apply a Hanning filter when resampling the data in A for display (or saving to file) *if* the upsample rate is less than a factor of three, and not an integer; downsampled data is always smoothed at resampling.

To get the old behavior, set `rcParams["image.interpolation"]` (default: `'antialiased'`) to the old default "nearest" (or specify the `interpolation` kwarg of *Axes.imshow*)

To always get the anti-aliasing behavior, no matter what the up/down sample rate, set `rcParams["image.interpolation"]` (default: `'antialiased'`) to "hanning" (or one of the other filters available).

Note that the "hanning" filter was chosen because it has only a modest performance penalty. Anti-aliasing can be improved with other filters.

rcParams

When using *RendererSVG* with `rcParams["svg.image_inline"] == True`, externally written images now use a single counter even if the `renderer.basename` attribute is overwritten, rather than a counter per basename.

This change will only affect you if you used `rcParams["svg.image_inline"] = True` (the default is False) *and* manually modified `renderer.basename`.

Changed the default value of `rcParams["axes.formatter.limits"]` (default: `[-5, 6]`) from -7, 7 to -5, 6 for better readability.

add_subplot()

Figure.add_subplot() and *pyplot.subplot()* do not accept a *figure* keyword argument anymore. It only used to work anyway if the passed figure was `self` or the current figure, respectively.

indicate_inset()

In <= 3.1.0, *indicate_inset* and *indicate_inset_zoom* were documented as returning a 4-tuple of *ConnectionPatch*, where in fact they returned a 4-length list.

They now correctly return a 4-tuple. *indicate_inset* would previously raise an error if the optional *inset_ax* was not supplied; it now completes successfully, and returns *None* instead of the tuple of `ConnectionPatch`.

PGF backend

The pgf backend's get_canvas_width_height now returns the canvas size in display units rather than in inches, which it previously did. The new behavior is the correct one given the uses of `get_canvas_width_height` in the rest of the codebase.

The pgf backend now includes images using `\includegraphics` instead of `\pgfimage` if the version of `graphicx` is recent enough to support the `interpolate` option (this is detected automatically).

cbook

The default value of the "obj_type" parameter to `cbook.warn_deprecated` has been changed from "attribute" (a default that was never used internally) to the empty string.

Testing

The test suite no longer turns on the Python fault handler by default. Set the standard `PYTHONFAULTHANDLER` environment variable to do so.

Backend `supports_blit`

Backends do not need to explicitly define the flag `supports_blit` anymore. This is only relevant for backend developers. Backends had to define the flag `supports_blit`. This is not needed anymore because the blitting capability is now automatically detected.

Exception changes

Various APIs that raised a `ValueError` for incorrectly typed inputs now raise `TypeError` instead: *backend_bases.GraphicsContextBase.set_clip_path*, `blocking_input.BlockingInput.__call__`, *cm.register_cmap*, *dviread.DviFont*, *rcsetup.validate_hatch*, *rcsetup.validate_animation_writer_path*, *spines.Spine*, many classes in the *matplotlib.transforms* module and *matplotlib.tri* package, and Axes methods that take a `norm` parameter.

If extra kwargs are passed to *LogScale*, `TypeError` will now be raised instead of `ValueError`.

mplot3d auto-registration

mpl_toolkits.mplot3d is always registered by default now. It is no longer necessary to import mplot3d to create 3d axes with

```
ax = fig.add_subplot(111, projection="3d")
```

`SymLogNorm` now has a *base* parameter

Previously, *SymLogNorm* had no *base* keyword argument and the base was hard-coded to `base=np.e`. This was inconsistent with the default behavior of *SymmetricalLogScale* (which defaults to `base=10`) and the use of the word "decade" in the documentation.

In preparation for changing the default base to 10, calling *SymLogNorm* without the new *base* keyword argument emits a deprecation warning.

Deprecations

`matplotlib.use`

The `warn` parameter to *matplotlib.use()* is deprecated (catch the `ImportError` emitted on backend switch failure and reemit a warning yourself if so desired).

plotfile

`.pyplot.plotfile` is deprecated in favor of separately loading and plotting the data. Use pandas or NumPy to load data, and pandas or matplotlib to plot the resulting data.

axes and axis

Setting `Axis.major.locator`, `Axis.minor.locator`, `Axis.major.formatter` or `Axis.minor.formatter` to an object that is not a subclass of *Locator* or *Formatter* (respectively) is deprecated. Note that these attributes should usually be set using *Axis.set_major_locator*, *Axis.set_minor_locator*, etc. which already raise an exception when an object of the wrong class is passed.

Passing more than one positional argument or unsupported keyword arguments to *axis()* is deprecated (such arguments used to be silently ignored).

`minor` argument will become keyword-only

Using the parameter `minor` to `get_*ticks()` / `set_*ticks()` as a positional parameter is deprecated. It will become keyword-only in future versions.

axes_grid1

The `mpl_toolkits.axes_grid1.colorbar` module and its colorbar implementation are deprecated in favor of *matplotlib.colorbar*, as the former is essentially abandoned and the latter is a more featureful replacement with a nearly compatible API (for example, the following additional keywords are supported: `panchor`, `extendfrac`, `extendrect`).

The main differences are:

- Setting the ticks on the colorbar is done by calling `colorbar.set_ticks` rather than `colorbar.cbar_axis.set_xticks` or `colorbar.cbar_axis.set_yticks`; the `locator` parameter to `colorbar()` is deprecated in favor of its synonym `ticks` (which already existed previously, and is consistent with *matplotlib.colorbar*).
- The colorbar's long axis is accessed with `colorbar.xaxis` or `colorbar.yaxis` depending on the orientation, rather than `colorbar.cbar_axis`.
- The default ticker is no longer `MaxNLocator(5)`, but a `_ColorbarAutoLocator`.
- Overdrawing multiple colorbars on top of one another in a single Axes (e.g. when using the `cax` attribute of *ImageGrid* elements) is not supported; if you previously relied on the second colorbar being drawn over the first, you can call `cax.cla()` to clear the axes before drawing the second colorbar.

During the deprecation period, the `mpl_toolkits.legacy_colorbar` rcParam can be set to True to use `mpl_toolkits.axes_grid1.colorbar` in *mpl_toolkits.axes_grid1* code with a deprecation warning (the default), or to False to use `matplotlib.colorbar`.

Passing a `pad` size of `None` (the default) as a synonym for zero to the `append_axes`, `new_horizontal` and `new_vertical` methods of *axes_grid1.axes_divider.AxesDivider* is deprecated. In a future release, the default value of `None` will mean "use `rcParams["figure.subplot.wspace"]` (default: `0.2`) or `rcParams["figure.subplot.hspace"]` (default: `0.2`)" (depending on the orientation). Explicitly pass `pad=0` to keep the old behavior.

Axes3D

`mplot3d.axis3d.get_flip_min_max` is deprecated.

`axes3d.unit_bbox` is deprecated (use `Bbox.unit` instead).

`axes3d.Axes3D.w_xaxis`, `.w_yaxis`, and `.w_zaxis` are deprecated (use `.xaxis`, `.yaxis`, and `.zaxis` instead).

matplotlib.cm

`cm.revcmap` is deprecated. Use *Colormap.reversed* to reverse a colormap.

`cm.datad` no longer contains entries for reversed colormaps in their "unconverted" form.

axisartist

`mpl_toolkits.axisartist.grid_finder.GridFinderBase` is deprecated (its only use is to be inherited by the *GridFinder* class which just provides more defaults in the constructor and directly sets the transforms, so `GridFinderBase`'s methods were just moved to *GridFinder*).

`axisartist.axis_artist.BezierPath` is deprecated (use *patches.PathPatch* to draw arbitrary Paths).

`AxisArtist.line` is now a *patches.PathPatch* instance instead of a `BezierPath` instance.

Returning a factor equal to None from axisartist Locators (which are **not** the same as "standard" tick Locators), or passing a factor equal to None to axisartist Formatters (which are **not** the same as "standard" tick Formatters) is deprecated. Pass a factor equal to 1 instead.

For the *mpl_toolkits.axisartist.axis_artist.AttributeCopier* class, the constructor and the `set_ref_artist` method, and the *default_value* parameter of `get_attribute_from_ref_artist`, are deprecated.

Deprecation of the constructor means that classes inheriting from *AttributeCopier* should no longer call its constructor.

Locators

The unused *Locator.autoscale* method is deprecated (pass the axis limits to *Locator.view_limits* instead).

Animation

The following methods and attributes of the `MovieWriterRegistry` class are deprecated: `set_dirty`, `ensure_not_dirty`, `reset_available_writers`, `avail`.

`smart_bounds()`

The "smart_bounds" functionality is deprecated. This includes `Axis.set_smart_bounds()`, `Axis.get_smart_bounds()`, `Spine.set_smart_bounds()`, and `Spine.get_smart_bounds()`.

`boxplot()`

Setting the `whis` parameter of *Axes.boxplot* and *cbook.boxplot_stats* to "range" to mean "the whole data range" is deprecated; set it to (0, 100) (which gets interpreted as percentiles) to achieve the same effect.

`fill_between()`

Passing scalars to parameter *where* in `fill_between()` and `fill_betweenx()` is deprecated. While the documentation already states that *where* must be of the same size as *x* (or *y*), scalars were accepted and broadcasted to the size of *x*. Non-matching sizes will raise a `ValueError` in the future.

`tight_layout()`

The `renderer` parameter to *Figure.tight_layout* is deprecated; this method now always uses the renderer instance cached on the *Figure*.

rcParams

The `rcsetup.validate_animation_writer_path` function is deprecated.

Setting `rcParams["savefig.format"]` (default: `'png'`) to "auto" is deprecated; use its synonym "png" instead.

Setting `rcParams["text.hinting"]` (default: `'force_autohint'`) to True or False is deprecated; use their synonyms "auto" or "none" instead.

`rcsetup.update_savefig_format` is deprecated.

`rcsetup.validate_path_exists` is deprecated (use `os.path.exists` to check whether a path exists).

`rcsetup.ValidateInterval` is deprecated.

Dates

`dates.mx2num` is deprecated.

TK

`NavigationToolbar2Tk.set_active` is deprecated, as it has no (observable) effect.

WX

`FigureFrameWx.statusbar` and `NavigationToolbar2Wx.statbar` are deprecated. The status bar can be retrieved by calling standard wx methods (`frame.GetStatusBar()` and `toolbar.GetTopLevelParent().GetStatusBar()`).

`backend_wx.ConfigureSubplotsWx.configure_subplots` and `backend_wx.ConfigureSubplotsWx.get_canvas` are deprecated.

PGF

`backend_pgf.repl_escapetext` and `backend_pgf.repl_mathdefault` are deprecated.

`RendererPgf.latexManager` is deprecated.

FigureCanvas

`FigureCanvasBase.draw_cursor` (which has never done anything and has never been overridden in any backend) is deprecated.

`FigureCanvasMac.invalidate` is deprecated in favor of its synonym, `FigureCanvasMac.draw_idle`.

The `dryrun` parameter to the various `FigureCanvasFoo.print_foo` methods is deprecated.

QuiverKey doc

`quiver.QuiverKey.quiverkey_doc` is deprecated; use `quiver.QuiverKey.__init__.__doc__` instead.

matplotlib.mlab

`mlab.apply_window` and `mlab.stride_repeat` are deprecated.

Fonts

`font_manager.JSONEncoder` is deprecated. Use *font_manager.json_dump* to dump a *FontManager* instance.

`font_manager.createFontList` is deprecated. *font_manager.FontManager.addfont* is now available to register a font at a given path.

The `as_str`, `as_rgba_str`, `as_array`, `get_width` and `get_height` methods of `matplotlib.ft2font.FT2Image` are deprecated. Convert the `FT2Image` to a NumPy array with `np.asarray` before processing it.

Colors

The function *matplotlib.colors.makeMappingArray* is not considered part of the public API any longer. Thus, it's deprecated.

Using a string of single-character colors as a color sequence (e.g. "rgb") is deprecated. Use an explicit list instead.

Scales

Passing unsupported keyword arguments to *ScaleBase*, and its subclasses *LinearScale* and *SymmetricalLogScale*, is deprecated and will raise a TypeError in 3.3.

If extra keyword arguments are passed to *LogScale*, TypeError will now be raised instead of ValueError.

Testing

The matplotlib.testing.disable_internet module is deprecated. Use (for example) pytest-remotedata instead.

Support in *matplotlib.testing* for nose-based tests is deprecated (a deprecation is emitted if using e.g. the decorators from that module while both 1) matplotlib's conftests have not been called and 2) nose is in sys.modules).

testing.is_called_from_pytest is deprecated.

During the deprecation period, to force the generation of nose base tests, import nose first.

The switch_backend_warn parameter to matplotlib.test has no effect and is deprecated.

testing.jpl_units.UnitDbl.UnitDbl.checkUnits is deprecated.

DivergingNorm renamed to TwoSlopeNorm

DivergingNorm was a misleading name; although the norm was developed with the idea that it would likely be used with diverging colormaps, the word 'diverging' does not describe or evoke the norm's mapping function. Since that function is monotonic, continuous, and piece-wise linear with two segments, the norm has been renamed to *TwoSlopeNorm*

Misc

matplotlib.get_home is deprecated (use e.g. os.path.expanduser("~")) instead.

matplotlib.compare_versions is deprecated (use comparison of distutils.version.LooseVersions instead).

matplotlib.checkdep_ps_distiller is deprecated.

matplotlib.figure.AxesStack is considered private API and will be removed from the public API in future versions.

BboxBase.is_unit is deprecated (check the Bbox extents if needed).

`Affine2DBase.matrix_from_values(...)` is deprecated. Use (for example) `Affine2D.from_values(...).get_matrix()` instead.

`style.core.is_style_file` and `style.core.iter_style_files` are deprecated.

The `datapath` rcParam

Use *`get_data_path`* instead. (The rcParam is deprecated because it cannot be meaningfully set by an end user.) The rcParam had no effect from 3.2.0, but was deprecated only in 3.2.1. In 3.2.1+ if `'datapath'` is set in a `matplotlibrc` file it will be respected, but this behavior will be removed in 3.3.

Removals

The `matplotlib.testing.determinism` module, which exposes no public API, has been deleted.

The following API elements have been removed:

- `backend_gtk3.PIXELS_PER_INCH`
- `backend_pgf.re_escapetext`, `backend_pgf.re_mathdefault`.
- the `matplotlib.backends.tkagg`, `matplotlib.backends.windowing`, `matplotlib.backends.wx_compat`, and `matplotlib.compat.subprocess` modules
- `RcParams.msg_depr`, `RcParams.msg_depr_ignore`, `RcParams.msg_depr_set`, `RcParams.msg_obsolete`, `RcParams.msg_backend_obsolete`
- `afm.parse_afm` (use `afm.AFM` instead)
- `axes.Axes.mouseover_set`
- `backend_cairo.ArrayWrapper`, `backend_cairo.RendererCairo.convert_path`
- `backend_gtk3.FileChooserDialog.sorted_filetypes` (use `sorted(self.filetypes.items())` instead)
- `backend_pgf.get_texcommand`
- `backend_pdf.PdfFile.texFontMap`
- `backend_ps.get_bbox`
- `backend_qt.FigureCanvasQt.keyAutoRepeat` (use `event.guiEvent.isAutoRepeat` instead), `backend_qt.error_msg_qt`, `backend_qt.exception_handler`
- `backend_wx.FigureCanvasWx.macros`
- `backends.pylab_setup`

- cbook.Bunch (use types.SimpleNamespace instead), cbook.Locked, cbook.unicode_safe, cbook.is_numlike (use isinstance(..., numbers.Number) instead), cbook.mkdirs (use os.makedirs(..., exist_ok=True) instead), cbook.GetRealpathAndStat (use cbook.get_realpath_and_stat instead), cbook.listFiles
- container.Container.set_remove_method
- contour.ContourLabeler.cl, contour.ContourLabeler.cl_xy, contour.ContourLabeler.cl_cvalues (use labelTexts, labelXYs, labelCValues instead)
- dates.DateFormatter.strftime, dates.DateFormatter.strftime_pre_1900
- font_manager.TempCache, font_manager.FontManager.ttffiles, font_manager.FontManager.afmfiles
- mathtext.unichr_safe (use chr instead)
- patches.YAArrow (use patches.FancyArrowPatch instead)
- sphinxext.plot_directive.remove_coding
- table.Table.get_child_artists
- testing.compare.compare_float, testing.decorators.CleanupTest, testing.decorators.ImageComparisonTest, testing.decorators.skip_if_command_unavailable, support for nose-based tests
- text.Annotation.arrow (use text.Annotation.arrow_patch instead)
- textpath.TextToPath.tex_font_map
- ticker.Base, ticker.closeto, ticker.nearest_long
- axes_grid1.axes_divider.LocatableAxesBase, axes_grid1.axes_divider.locatable_axes_factory, axes_grid1.axes_divider.Axes (use axes_grid1.mpl_axes.Axes instead), axes_grid1.axes_divider.LocatableAxes (use axes_grid1.mpl_axes.Axes instead)
- axisartist.axes_divider.Axes, axisartist.axes_divider.LocatableAxes (use axisartist.axislines.Axes instead)
- the normed kwarg to hist (use density instead)
- the verts parameter to scatter (use marker instead)
- passing (verts, 0) or (..., 3) when specifying a marker to specify a path or a circle, respectively (instead, use verts or "o", respectively)
- rcParams["examples.directory"]

The following members of matplotlib.backends.backend_pdf.PdfFile were removed:

- nextObject
- nextFont
- nextAlphaState
- nextHatch

- nextImage
- alphaStateObject

The required_interactive_framework attribute of backend modules introduced in Matplotlib 3.0 has been moved to the FigureCanvas class, in order to let it be inherited by third-party canvas subclasses and to make it easier to know what interactive framework is required by a canvas class.

backend_qt4.FigureCanvasQT5, which is an alias for backend_qt5.FigureCanvasQT (but only exists under that name in backend_qt4), has been removed.

Development changes

Windows build

Previously, when building the matplotlib._png extension, the build script would add "png" and "z" to the extensions .libraries attribute (if pkg-config information is not available, which is in particular the case on Windows).

In particular, this implies that the Windows build would look up files named png.lib and z.lib; but neither libpng upstream nor zlib upstream provides these files by default. (On Linux, this would look up libpng.so and libz.so, which are indeed standard names.)

Instead, on Windows, we now look up libpng16.lib and zlib.lib, which *are* the upstream names for the shared libraries (as of libpng 1.6.x).

For a statically-linked build, the upstream names are libpng16_static.lib and zlibstatic.lib; one still needs to manually rename them if such a build is desired.

Packaging DLLs

Previously, it was possible to package Windows DLLs into the Maptlotlib wheel (or sdist) by copying them into the source tree and setting the package_data.dlls entry in setup.cfg.

DLLs copied in the source tree are now always packaged; the package_data.dlls entry has no effect anymore. If you do not want to include the DLLs, don't copy them into the source tree.

16.1.4 API Changes for 3.1.1

Behavior changes

Locator.nonsingular return order

Locator.nonsingular (introduced in mpl 3.1) now returns a range `v0, v1` with `v0 <= v1`. This behavior is consistent with the implementation of `nonsingular` by the *LogLocator* and *LogitLocator* subclasses.

16.1.5 API Changes for 3.1.0

Behavior changes

Matplotlib.use

Switching backends via *matplotlib.use* is now allowed by default, regardless of whether *matplotlib.pyplot* has been imported. If the user tries to switch from an already-started interactive backend to a different interactive backend, an ImportError will be raised.

Invalid points in PathCollections

PathCollections created with *scatter* now keep track of invalid points. Previously, points with nonfinite (infinite or nan) coordinates would not be included in the offsets (as returned by *PathCollection.get_offsets*) of a *PathCollection* created by *scatter*, and points with nonfinite values (as specified by the *c* kwarg) would not be included in the array (as returned by *PathCollection.get_array*)

Such points are now included, but masked out by returning a masked array.

If the *plotnonfinite* kwarg to *scatter* is set, then points with nonfinite values are plotted using the bad color of the *collections.PathCollection*'s colormap (as set by *colors.Colormap.set_bad()*).

Alpha blending in imshow of RBGA input

The alpha-channel of RBGA images is now re-sampled independently of RGB channels. While this is a bug fix, it does change the output and may result in some down-stream image comparison tests to fail.

Autoscaling

On log-axes where a single value is plotted at a "full" decade (1, 10, 100, etc.), the autoscaling now expands the axis symmetrically around that point, instead of adding a decade only to the right.

Log-scaled axes

When the default *LogLocator* would generate no ticks for an axis (e.g., an axis with limits from 0.31 to 0.39) or only a single tick, it now instead falls back on the linear *AutoLocator* to pick reasonable tick positions.

`Figure.add_subplot` with no arguments

Calling *Figure.add_subplot()* with no positional arguments used to do nothing; this now is equivalent to calling `add_subplot(111)` instead.

`bxp` and rcparams

bxp now respects `rcParams["boxplot.boxprops.linewidth"]` (default: `1.0`) even when *patch_artist* is set. Previously, when the *patch_artist* parameter was set, *bxp* would ignore `rcParams["boxplot.boxprops.linewidth"]` (default: `1.0`). This was an oversight -- in particular, *boxplot* did not ignore it.

Major/minor tick collisions

Minor ticks that collide with major ticks are now hidden by default. Previously, certain locator classes (*LogLocator*, *AutoMinorLocator*) contained custom logic to avoid emitting tick locations that collided with major ticks when they were used as minor locators. This logic has now moved to the *Axis* class, and is used regardless of the locator class. You can control this behavior via the `remove_overlaping_locs` attribute on *Axis*.

If you were relying on both the major and minor tick labels to appear on the same tick, you may need to update your code. For example, the following snippet

```
import numpy as np
import matplotlib.dates as mdates
import matplotlib.pyplot as plt

t = np.arange("2018-11-03", "2018-11-06", dtype="datetime64")
x = np.random.rand(len(t))

fig, ax = plt.subplots()
ax.plot(t, x)
ax.xaxis.set(
    major_locator=mdates.DayLocator(),
    major_formatter=mdates.DateFormatter("\n%a"),
    minor_locator=mdates.HourLocator((0, 6, 12, 18)),
    minor_formatter=mdates.DateFormatter("%H:%M"),
)
# disable removing overlapping locations
ax.xaxis.remove_overlapping_locs = False
plt.show()
```

labeled days using major ticks, and hours and minutes using minor ticks and added a newline to the major ticks labels to avoid them crashing into the minor tick labels. Setting the *remove_overlapping_locs* property (also accessible via *set_remove_overlapping_locs* / *get_remove_overlapping_locs* and *setp*) disables removing overlapping tick locations.

The major tick labels could also be adjusted include hours and minutes, as the minor ticks are gone, so the `major_formatter` would be:

```
mdates.DateFormatter("%H:%M\n%a")
```

usetex support

Previously, if `rcParams["text.usetex"]` (default: `False`) was True, then constructing a *TextPath* on a non-mathtext string with `usetex=False` would rely on the mathtext parser (but not on usetex support!) to parse the string. The mathtext parser is not invoked anymore, which may cause slight changes in glyph positioning.

get_window_extents

matplotlib.axes.Axes.get_window_extent used to return a bounding box that was slightly larger than the axes, presumably to take into account the ticks that may be on a spine. However, it was not scaling the tick sizes according to the dpi of the canvas, and it did not check if the ticks were visible, or on the spine.

Now *matplotlib.axes.Axes.get_window_extent* just returns the axes extent with no padding for ticks.

This affects *matplotlib.axes.Axes.get_tightbbox* in cases where there are outward ticks with no tick labels, and it also removes the (small) pad around axes in that case.

spines.Spine.get_window_extent now takes into account ticks that are on the spine.

Sankey

Previously, *Sankey.add* would only accept a single string as the *labels* argument if its length is equal to the number of flows, in which case it would use one character of the string for each flow.

The behavior has been changed to match the documented one: when a single string is passed, it is used to label all the flows.

`FontManager` scores

font_manager.FontManager.score_weight is now more strict with its inputs. Previously, when a weight string was passed to *font_manager.FontManager.score_weight*,

- if the weight was the string representation of an integer, it would be converted to that integer,
- otherwise, if the weight was not a standard weight name, it would be silently replaced by a value of 500 ("normal" weight).

font_manager.FontManager.score_weight now raises an exception on such inputs.

Text alignment

Text alignment was previously incorrect, in particular for multiline text objects with large descenders (i.e. subscripts) and rotated text. These have been fixed and made more consistent, but could make old code that has compensated for this no longer have the correct alignment.

Upper case color strings

Support for passing single-letter colors (one of "rgbcmykw") as UPPERCASE characters is deprecated; these colors will become case-sensitive (lowercase) after the deprecation period has passed.

The goal is to decrease the number of ambiguous cases when using the `data` keyword to plotting methods; e.g. `plot("X", "Y", data={"X": ..., "Y": ...})` will not warn about "Y" possibly being a color anymore after the deprecation period has passed.

Degenerate limits

When bounds passed to *set_xlim* are degenerate (i.e. the lower and upper value are equal), the method used to "expand" the bounds now matches the expansion behavior of autoscaling when the plot contains a single x-value, and should in particular produce nicer limits for non-linear scales.

`plot` format string parsing

In certain cases, *`plot`* would previously accept format strings specifying more than one linestyle (e.g. `"---."` which specifies both `"--"` and `"-."`); only use one of them would be used. This now raises a `ValueError` instead.

HTMLWriter

The HTMLWriter constructor is more strict: it no longer normalizes unknown values of *default_mode* to 'loop', but errors out instead.

AFM parsing

In accordance with the AFM spec, the AFM parser no longer truncates the `UnderlinePosition` and `UnderlineThickness` fields to integers.

The `Notice` field (which can only be publicly accessed by the deprecated `afm.parse_afm` API) is no longer decoded to a `str`, but instead kept as `bytes`, to support non-conformant AFM files that use non-ASCII characters in that field.

`Artist.set` keyword normalisation

`Artist.set` now normalizes keywords before sorting them. Previously it sorted its keyword arguments in reverse alphabetical order (with a special-case to put `color` at the end) before applying them.

It now normalizes aliases (and, as above, emits a warning on duplicate properties) before doing the sorting (so `c` goes to the end too).

`Axes.tick_params` argument checking

Previously *`Axes.tick_params`* silently did nothing when an invalid *axis* parameter was supplied. This behavior has been changed to raise a `ValueError` instead.

`Axes.hist` output

Input that consists of multiple empty lists will now return a list of histogram values for each one of the lists. For example, an input of `[[],[]]` will return 2 lists of histogram values. Previously, a single list was returned.

backend_bases.Timer.remove_callback future signature change

Currently, `backend_bases.Timer.remove_callback(func, *args, **kwargs)` removes a callback previously added by `backend_bases.Timer.add_callback(func, *args, **kwargs)`, but if `*args, **kwargs` is not passed in (ex, `Timer.remove_callback(func)`), then the first callback with a matching `func` is removed, regardless of whether it was added with or without `*args, **kwargs`.

In a future version, `Timer.remove_callback` will always use the latter behavior (not consider `*args, **kwargs`); to specifically consider them, add the callback as a `functools.partial` object

```
cb = timer.add_callback(functools.partial(func, *args, **kwargs))
# ...
# later
timer.remove_callback(cb)
```

`backend_bases.Timer.add_callback` was modified to return *func* to simplify the above usage (previously it returned None); this also allows using it as a decorator.

The new API is modelled after `atexit.register` / `atexit.unregister`.

StemContainer performance increase

StemContainer objects can now store a *LineCollection* object instead of a list of *Line2D* objects for stem lines plotted using *stem*. This gives a very large performance boost to displaying and moving *stem* plots.

This will become the default behaviour in Matplotlib 3.3. To use it now, the *use_line_collection* keyword argument to *stem* can be set to `True`

```
ax.stem(..., use_line_collection=True)
```

Individual line segments can be extracted from the *LineCollection* using `get_segements()`. See the *LineCollection* documentation for other methods to retrieve the collection properties.

ColorbarBase inheritance

matplotlib.colorbar.ColorbarBase is no longer a subclass of *cm.ScalarMappable*. This inheritance lead to a confusing situation where the *cm.ScalarMappable* passed to *matplotlib.colorbar.Colorbar* (*colorbar*) had a `set_norm` method, as did the colorbar. The colorbar is now purely a follower to the *ScalarMappable* norm and colormap, and the old inherited methods `set_norm`, `set_cmap`, `set_clim` are deprecated, as are the getter versions of those calls. To set the norm associated with a colorbar do `colorbar.mappable.set_norm()` etc.

FreeType and libpng search paths

The `MPLBASEDIRLIST` environment variables and `basedirlist` entry in `setup.cfg` have no effect anymore. Instead, if building in situations where FreeType or libpng are not in the compiler or linker's default path, set the standard environment variables `CFLAGS`/`LDFLAGS` on Linux or OSX, or `CL`/`LINK` on Windows, to indicate the relevant paths.

See details in *Installation Guide*.

Setting artist properties twice or more in the same call

Setting the same artist property multiple time via aliases is deprecated. Previously, code such as

```
plt.plot([0, 1], c="red", color="blue")
```

would emit a warning indicating that `c` and `color` are aliases of one another, and only keep the `color` kwarg. This behavior has been deprecated; in a future version, this will raise a TypeError, similar to Python's behavior when a keyword argument is passed twice

```
plt.plot([0, 1], c="red", c="blue")
```

This warning is raised by *`normalize_kwargs`*.

Path code types

Path code types like `Path.MOVETO` are now `np.uint8` instead of `int` `Path.STOP`, `Path.MOVETO`, `Path.LINETO`, `Path.CURVE3`, `Path.CURVE4` and `Path.CLOSEPOLY` are now of the type `Path.code_type` (`np.uint8` by default) instead of plain `int`. This makes their type match the array value type of the `Path.codes` array.

LaTeX code in matplotlibrc file

Previously, the rc file keys `pgf.preamble` and `text.latex.preamble` were parsed using commmas as separators. This would break valid LaTeX code, such as:

```
\usepackage[protrusion=true, expansion=false]{microtype}
```

The parsing has been modified to pass the complete line to the LaTeX system, keeping all commas. Passing a list of strings from within a Python script still works as it used to. Passing a list containing non-strings now fails, instead of coercing the results to strings.

Axes.spy

The method *Axes.spy* now raises a TypeError for the keyword arguments *interpolation* and *linestyle* instead of silently ignoring them.

Furthermore, *Axes.spy* spy does now allow for an *extent* argument (was silently ignored so far).

A bug with `Axes.spy(..., origin='lower')` is fixed. Previously this flipped the data but not the y-axis resulting in a mismatch between axes labels and actual data indices. Now, *origin*='*lower*' flips both the data and the y-axis labels.

Boxplot tick methods

The *manage_xticks* parameter of *boxplot* and *bxp* has been renamed (with a deprecation period) to *manage_ticks*, to take into account the fact that it manages either x or y ticks depending on the *vert* parameter.

When `manage_ticks=True` (the default), these methods now attempt to take previously drawn boxplots into account when setting the axis limits, ticks, and tick labels.

MouseEvents

MouseEvents now include the event name in their `str()`. Previously they contained the prefix "MPL MouseEvent".

RGBA buffer return type

FigureCanvasAgg.buffer_rgba and *RendererAgg.buffer_rgba* now return a memoryview The `buffer_rgba` method now allows direct access to the renderer's underlying buffer (as a `(m, n, 4)`-shape memoryview) rather than copying the data to a new bytestring. This is consistent with the behavior on Py2, where a buffer object was returned.

matplotlib.font_manager.win32InstalledFonts return type

matplotlib.font_manager.win32InstalledFonts returns an empty list instead of None if no fonts are found.

`Axes.fmt_xdata` and `Axes.fmt_ydata` error handling

Previously, if the user provided a `Axes.fmt_xdata` or `Axes.fmt_ydata` function that raised a `TypeError` (or set them to a non-callable), the exception would be silently ignored and the default formatter be used instead. This is no longer the case; the exception is now propagated out.

Deprecation of redundant `Tick` attributes

The `gridOn`, `tick1On`, `tick2On`, `label1On`, and `label2On` *Tick* attributes have been deprecated. Directly get and set the visibility on the underlying artists, available as the `gridline`, `tick1line`, `tick2line`, `label1`, and `label2` attributes.

The `label` attribute, which was an alias for `label1`, has been deprecated.

Subclasses that relied on setting the above visibility attributes needs to be updated; see e.g. `examples/api/skewt.py`.

Passing a Line2D's drawstyle together with the linestyle is deprecated

Instead of `plt.plot(..., linestyle="steps--")`, use `plt.plot(..., linestyle="--", drawstyle="steps")`. `ds` is now an alias for `drawstyle`.

`pgi` support dropped

Support for `pgi` in the GTK3 backends has been dropped. `pgi` is an alternative implementation to `PyGObject`. `PyGObject` should be used instead.

rcParam changes

Removed

The following deprecated rcParams have been removed:

- `text.dvipnghack`
- `nbagg.transparent` (use `rcParams["figure.facecolor"]` (default: `'white'`) instead)
- `plugins.directory`
- `axes.hold`
- `backend.qt4` and `backend.qt5` (set the *QT_API* environment variable instead)

Deprecated

The associated validator functions `rcsetup.validate_qt4` and `validate_qt5` are deprecated.

The `verbose.fileo` and `verbose.level` rcParams have been deprecated. These have had no effect since the switch from Matplotlib's old custom Verbose logging to the stdlib's `logging` module. In addition the `rcsetup.validate_verbose` function is deprecated.

The `text.latex.unicode` rcParam now defaults to `True` and is deprecated (i.e., in future versions of Matplotlib, unicode input will always be supported). Moreover, the underlying implementation now uses `\usepackage[utf8]{inputenc}` instead of `\usepackage{ucs}\usepackage[utf8x]{inputenc}`.

Exception changes

- *`mpl_toolkits.axes_grid1.axes_size.GetExtentHelper`* now raises `ValueError` for invalid directions instead of `KeyError`.
- Previously, subprocess failures in the animation framework would raise either in a `RuntimeError` or a `ValueError` depending on when the error occurred. They now raise a `subprocess.CalledProcessError` with attributes set as documented by the exception class.
- In certain cases, Axes methods (and pyplot functions) used to raise a `RuntimeError` if they were called with a `data` kwarg and otherwise mismatched arguments. They now raise a `TypeError` instead.
- *`Axes.streamplot`* does not support irregularly gridded `x` and `y` values. So far, it used to silently plot an incorrect result. This has been changed to raise a `ValueError` instead.
- The `streamplot.Grid` class, which is internally used by streamplot code, also throws a `ValueError` when irregularly gridded values are passed in.

Removals

The following deprecated APIs have been removed:

Classes and methods

- `Verbose` (replaced by python logging library)
- `artist.Artist.hitlist` (no replacement)
- `artist.Artist.is_figure_set` (use `artist.figure is not None` instead)
- `axis.Axis.unit_data` (use `axis.Axis.units` instead)
- `backend_bases.FigureCanvasBase.onRemove` (no replacement) `backend_bases.FigureManagerBase.show_popup` (this never did anything)
- `backend_wx.SubplotToolWx` (no replacement)
- `backend_wx.Toolbar` (use `backend_wx.NavigationToolbar2Wx` instead)
- `cbook.align_iterators` (no replacement)
- `contour.ContourLabeler.get_real_label_width` (no replacement)
- `legend.Legend.draggable` (use `legend.Legend.set_draggable()` instead)
- `texmanager.TexManager.postscriptd`, `texmanager.TexManager.pscnt`, `texmanager.TexManager.make_ps`, `texmanager.TexManager.get_ps_bbox` (no replacements)

Arguments

- The *fig* kwarg to *GridSpec.get_subplot_params* and *GridSpecFromSubplotSpec.get_subplot_params* (use the argument *figure* instead)
- Passing 'box-forced' to *Axes.set_adjustable* (use 'box' instead)
- Support for the strings 'on'/'true'/'off'/'false' to mean `True` / `False` (directly use `True` / `False` instead). The following functions are affected:
  - *axes.Axes.grid*
  - *Axes3D.grid*
  - *Axis.set_tick_params*
  - *pyplot.box*
- Using *pyplot.axes* with an *axes.Axes* type argument (use *pyplot.sca* instead)

Other

The following miscellaneous API elements have been removed

- svgfont support (in `rcParams["svg.fonttype"]` (default: `'path'`))
- Logging is now done with the standard python `logging` library. `matplotlib.verbose` and the command line switches `--verbose-LEVEL` have been removed.

  To control the logging output use:

```
import logging
logger = logging.getLogger('matplotlib')
logger.setLevel(logging.INFO)
# configure log handling: Either include it into your ``logging`` hierarchy,
# e.g. by configuring a root looger using ``logging.basicConfig()``,
# or add a standalone handler to the matplotlib logger:
logger.addHandler(logging.StreamHandler())
```

- `__version__numpy__`
- `collections.CIRCLE_AREA_FACTOR`
- `font_manager.USE_FONTCONFIG`
- `font_manager.cachedir`

`matplotlib.mlab` removals

Lots of code inside the *`matplotlib.mlab`* module which was deprecated in Matplotlib 2.2 has been removed. See below for a list:

- `mlab.exp_safe` (use `numpy.exp` instead)
- `mlab.amap`
- `mlab.logspace` (use `numpy.logspace` instead)
- `mlab.rms_flat`
- `mlab.l1norm` (use `numpy.linalg.norm(a, ord=1)` instead)
- `mlab.l2norm` (use `numpy.linalg.norm(a, ord=2)` instead)
- `mlab.norm_flat` (use `numpy.linalg.norm(a.flat, ord=2)` instead)
- `mlab.frange` (use `numpy.arange` instead)
- `mlab.identity` (use `numpy.identity` instead)
- `mlab.base_repr`
- `mlab.binary_repr`
- `mlab.ispower2`
- `mlab.log2` (use `numpy.log2` instead)

- mlab.isvector
- mlab.movavg
- mlab.safe_isinf (use numpy.isinf instead)
- mlab.safe_isnan (use numpy.isnan instead)
- mlab.cohere_pairs (use scipy.signal.coherence instead)
- mlab.entropy (use scipy.stats.entropy instead)
- mlab.normpdf (use scipy.stats.norm.pdf instead)
- mlab.find (use np.nonzero(np.ravel(condition)) instead)
- mlab.longest_contiguous_ones
- mlab.longest_ones
- mlab.PCA
- mlab.prctile (use numpy.percentile instead)
- mlab.prctile_rank
- mlab.center_matrix
- mlab.rk4 (use scipy.integrate.ode instead)
- mlab.bivariate_normal
- mlab.get_xyz_where
- mlab.get_sparse_matrix
- mlab.dist (use numpy.hypot instead)
- mlab.dist_point_to_segment
- mlab.griddata (use scipy.interpolate.griddata)
- mlab.less_simple_linear_interpolation (use numpy.interp)
- mlab.slopes
- mlab.stineman_interp
- mlab.segments_intersect
- mlab.fftsurr
- mlab.offset_line
- mlab.quad2cubic
- mlab.vector_lengths
- mlab.distances_along_curve
- mlab.path_length
- mlab.cross_from_above

- mlab.cross_from_below
- mlab.contiguous_regions (use *cbook.contiguous_regions* instead)
- mlab.is_closed_polygon
- mlab.poly_between
- mlab.poly_below
- mlab.inside_poly
- mlab.csv2rec
- mlab.rec2csv (use numpy.recarray.tofile instead)
- mlab.rec2text (use numpy.recarray.tofile instead)
- mlab.rec_summarize
- mlab.rec_join
- mlab.recs_join
- mlab.rec_groupby
- mlab.rec_keep_fields
- mlab.rec_drop_fields
- mlab.rec_append_fields
- mlab.csvformat_factory
- mlab.get_formatd
- mlab.FormatDatetime (use datetime.datetime.strftime instead)
- mlab.FormatDate (use datetime.date.strftime instead)
- mlab.FormatMillions, mlab.FormatThousands, mlab.FormatPercent, mlab.FormatBool, mlab.FormatInt, mlab.FormatFloat, mlab.FormatFormatStr, mlab.FormatString, mlab.FormatObj
- mlab.donothing_callback

pylab removals

Lots of code inside the *matplotlib.mlab* module which was deprecated in Matplotlib 2.2 has been removed. This means the following functions are no longer available in the *pylab* module:

- amap
- base_repr
- binary_repr
- bivariate_normal

- `center_matrix`
- `csv2rec` (use `numpy.recarray.tofile` instead)
- `dist` (use `numpy.hypot` instead)
- `dist_point_to_segment`
- `distances_along_curve`
- `entropy` (use `scipy.stats.entropy` instead)
- `exp_safe` (use `numpy.exp` instead)
- `fftsurr`
- `find` (use `np.nonzero(np.ravel(condition))` instead)
- `frange` (use `numpy.arange` instead)
- `get_sparse_matrix`
- `get_xyz_where`
- `griddata` (use `scipy.interpolate.griddata` instead)
- `identity` (use `numpy.identity` instead)
- `inside_poly`
- `is_closed_polygon`
- `ispower2`
- `isvector`
- `l1norm` (use `numpy.linalg.norm(a, ord=1)` instead)
- `l2norm` (use `numpy.linalg.norm(a, ord=2)` instead)
- `log2` (use `numpy.log2` instead)
- `longest_contiguous_ones`
- `longest_ones`
- `movavg`
- `norm_flat` (use `numpy.linalg.norm(a.flat, ord=2)` instead)
- `normpdf` (use `scipy.stats.norm.pdf` instead)
- `path_length`
- `poly_below`
- `poly_between`
- `prctile` (use `numpy.percentile` instead)
- `prctile_rank`
- `rec2csv` (use `numpy.recarray.tofile` instead)

- rec_append_fields
- rec_drop_fields
- rec_join
- rk4 (use scipy.integrate.ode instead)
- rms_flat
- segments_intersect
- slopes
- stineman_interp
- vector_lengths

mplot3d changes

Voxel shading

Axes3D.voxels now shades the resulting voxels; for more details see What's new. The previous behavior can be achieved by passing

```
ax.voxels(..., shade=False)
```

Equal aspect axes disabled

Setting the aspect on 3D axes previously returned non-sensical results (e.g. see #1077). Calling `ax.set_aspect('equal')` or `ax.set_aspect(num)` on a 3D axes now raises a `NotImplementedError`.

Poly3DCollection.set_zsort

Poly3DCollection.set_zsort no longer silently ignores invalid inputs, or `False` (which was always broken). Passing `True` to mean `"average"` is deprecated.

Testing

The `--no-network` flag to `tests.py` has been removed (no test requires internet access anymore). If it is desired to disable internet access both for old and new versions of Matplotlib, use `tests.py -m 'not network'` (which is now a no-op).

The image comparison test decorators now skip (rather than xfail) the test for uncomparable formats. The affected decorators are *image_comparison* and *check_figures_equal*. The deprecated `ImageComparisonTest` class is likewise changed.

Dependency changes

NumPy

Matplotlib 3.1 now requires NumPy>=1.11.

ghostscript

Support for ghostscript 8.60 (released in 2007) has been removed. The oldest supported version of ghostscript is now 9.0 (released in 2010).

Mathtext changes

- In constructs such as `"$1~2$"`, mathtext now interprets the tilde as a space, consistently with TeX (this was previously a parse error).

Deprecations

- The `\stackrel` mathtext command has been deprecated (it behaved differently from LaTeX's `\stackrel`. To stack two mathtext expressions, use `\genfrac{left-delim}{right-delim}{fraction-bar-thickness}{}{top}{bottom}`.
- The `\mathcircled` mathtext command (which is not a real TeX command) is deprecated. Directly use unicode characters (e.g. `"\N{CIRCLED LATIN CAPITAL LETTER A}"` or `"\u24b6"`) instead.
- Support for setting `rcParams["mathtext.default"]` (default: `'it'`) to circled is deprecated.

Signature deprecations

The following signature related behaviours are deprecated:

- The *withdash* keyword argument to *Axes.text()*. Consider using *Axes.annotate()* instead.
- Passing (n, 1)-shaped error arrays to *Axes.errorbar()*, which was not documented and did not work for `n = 2`. Pass a 1D array instead.
- The *frameon* kwarg to *savefig* and the `rcParams["savefig.frameon"]` rcParam. To emulate `frameon = False`, set *facecolor* to fully transparent (`"none"`, or `(0, 0, 0, 0)`).
- Passing a non-1D (typically, (n, 1)-shaped) input to *Axes.pie*. Pass a 1D array instead.

- The *TextPath* constructor used to silently drop ignored arguments; this behavior is deprecated.
- The *usetex* parameter of *TextToPath.get_text_path* is deprecated and folded into the *ismath* parameter, which can now take the values `False`, `True`, and `"TeX"`, consistently with other low-level text processing functions.
- Passing `'normal'` to *axes.Axes.axis()* is deprecated, use `ax.axis('auto')` instead.
- Passing the *block* argument of *pyplot.show* positionally is deprecated; it should be passed by keyword.
- When using the nbagg backend, *pyplot.show* used to silently accept and ignore all combinations of positional and keyword arguments. This behavior is deprecated.
- The unused *shape* and *imlim* parameters to *Axes.imshow* are deprecated. To avoid triggering the deprecation warning, the *filternorm*, *filterrad*, *resample*, and *url* arguments should be passed by keyword.
- The *interp_at_native* parameter to *BboxImage*, which has had no effect since Matplotlib 2.0, is deprecated.
- All arguments to the `cbook.deprecated` decorator and `cbook.warn_deprecated` function, except the first one (the version where the deprecation occurred), are now keyword-only. The goal is to avoid accidentally setting the "message" argument when the "name" (or "alternative") argument was intended, as this has repeatedly occurred in the past.
- The arguments of `matplotlib.testing.compare.calculate_rms` have been renamed from `expectedImage, actualImage`, to `expected_image, actual_image`.
- Passing positional arguments to *Axis.set_ticklabels* beyond *ticklabels* itself has no effect, and support for them is deprecated.
- Passing `shade=None` to *plot_surface* is deprecated. This was an unintended implementation detail with the same semantics as `shade=False`. Please use the latter code instead.
- *matplotlib.ticker.MaxNLocator* and its *set_params* method will issue a warning on unknown keyword arguments instead of silently ignoring them. Future versions will raise an error.

Changes in parameter names

- The *arg* parameter to *matplotlib.use* has been renamed to *backend*.

  This will only affect cases where that parameter has been set as a keyword argument. The common usage pattern as a positional argument `matplotlib.use('Qt5Agg')` is not affected.
- The *normed* parameter to *Axes.hist2d* has been renamed to *density*.
- The *s* parameter to *Annotation* (and indirectly *Axes.annotate*) has been renamed to *text*.

- The *tolerence* parameter to `bezier.find_bezier_t_intersecting_with_closedpath`, `bezier.split_bezier_intersecting_with_closedpath`, `bezier.find_r_to_boundary_of_closedpath`, `bezier.split_path_inout` and `bezier.check_if_parallel` has been renamed to *tolerance*.

In each case, the old parameter name remains supported (it cannot be used simultaneously with the new name), but support for it will be dropped in Matplotlib 3.3.

Class/method/attribute deprecations

Support for custom backends that do not provide a *GraphicsContextBase.set_hatch_color* method is deprecated. We suggest that custom backends let their `GraphicsContext` class inherit from *GraphicsContextBase*, to at least provide stubs for all required methods.

- `spine.Spine.is_frame_like`

This has not been used in the codebase since its addition in 2009.

- `axis3d.Axis.get_tick_positions`

  This has never been used internally, there is no equivalent method exists on the 2D Axis classes, and despite the similar name, it has a completely different behavior from the 2D Axis' `axis.Axis.get_ticks_position` method.

- `.backend_pgf.LatexManagerFactory`
- `mpl_toolkits.axisartist.axislines.SimpleChainedObjects`
- `mpl_toolkits.Axes.AxisDict`

Internal Helper Functions

- `checkdep_dvipng`
- `checkdep_ghostscript`
- `checkdep_pdftops`
- `checkdep_inkscape`
- `ticker.decade_up`
- `ticker.decade_down`
- `cbook.dedent`
- `docstring.Appender`
- `docstring.dedent`
- `docstring.copy_dedent`

Use the standard library's docstring manipulation tools instead, such as `inspect.cleandoc` and `inspect.getdoc`.

- `matplotlib.scale.get_scale_docs()`
- `matplotlib.pyplot.get_scale_docs()`

These are considered internal and will be removed from the public API in a future version.

- `projections.process_projection_requirements`
- `backend_ps.PsBackendHelper`
- `backend_ps.ps_backend_helper`,
- `cbook.iterable`
- `cbook.get_label`
- `cbook.safezip` Manually check the lengths of the inputs instead, or rely on NumPy to do it.
- `cbook.is_hashable` Use `isinstance(..., collections.abc.Hashable)` instead.
- The `.backend_bases.RendererBase.strip_math`. Use *`cbook.strip_math`* instead.

Multiple internal functions that were exposed as part of the public API of *`mpl_toolkits.mplot3d`* are deprecated,

mpl_toolkits.mplot3d.art3d

- `mpl_toolkits.mplot3d.art3d.norm_angle`
- `mpl_toolkits.mplot3d.art3d.norm_text_angle`
- `mpl_toolkits.mplot3d.art3d.path_to_3d_segment`
- `mpl_toolkits.mplot3d.art3d.paths_to_3d_segments`
- `mpl_toolkits.mplot3d.art3d.path_to_3d_segment_with_codes`
- `mpl_toolkits.mplot3d.art3d.paths_to_3d_segments_with_codes`
- `mpl_toolkits.mplot3d.art3d.get_patch_verts`
- `mpl_toolkits.mplot3d.art3d.get_colors`
- `mpl_toolkits.mplot3d.art3d.zalpha`

mpl_toolkits.mplot3d.proj3d

- `mpl_toolkits.mplot3d.proj3d.line2d`
- `mpl_toolkits.mplot3d.proj3d.line2d_dist`
- `mpl_toolkits.mplot3d.proj3d.line2d_seg_dist`
- `mpl_toolkits.mplot3d.proj3d.mod`
- `mpl_toolkits.mplot3d.proj3d.proj_transform_vec`

- `mpl_toolkits.mplot3d.proj3d.proj_transform_vec_clip`
- `mpl_toolkits.mplot3d.proj3d.vec_pad_ones`
- `mpl_toolkits.mplot3d.proj3d.proj_trans_clip_points`

If your project relies on these functions, consider vendoring them.

Font Handling

- `backend_pdf.RendererPdf.afm_font_cache`
- `backend_ps.RendererPS.afmfontd`
- `font_manager.OSXInstalledFonts`
- `.TextToPath.glyph_to_path` (Instead call `font.get_path()` and manually transform the path.)

Date related functions

- `dates.seconds()`
- `dates.minutes()`
- `dates.hours()`
- `dates.weeks()`
- `dates.strpdate2num`
- `dates.bytespdate2num`

These are brittle in the presence of locale changes. Use standard datetime parsers such as `time.strptime` or `dateutil.parser.parse`, and additionally call *`matplotlib.dates.date2num`* if you need to convert to Matplotlib's internal datetime representation; or use `dates.datestr2num`.

Axes3D

- *`axes3d.Axes3D.w_xaxis`*
- *`axes3d.Axes3D.w_yaxis`*
- *`axes3d.Axes3D.w_zaxis`*

Use `axes3d.Axes3D.xaxis`, `axes3d.Axes3D.yaxis` and `axes3d.Axes3D.zaxis` instead.

Testing

- `matplotlib.testing.decorators.switch_backend` decorator

Test functions should use `pytest.mark.backend`, and the mark will be picked up by the `matplotlib.testing.conftest.mpl_test_settings` fixture.

Quiver

- `.color` attribute of *`Quiver`* objects

Instead, use (as for any *`Collection`*) the `get_facecolor` method. Note that setting to the `.color` attribute did not update the quiver artist, whereas calling `set_facecolor` does.

GUI / backend details

- `.get_py2exe_datafiles`
- `.tk_window_focus`
- `backend_gtk3.FileChooserDialog`
- `backend_gtk3.NavigationToolbar2GTK3.get_filechooser`
- `backend_gtk3.SaveFigureGTK3.get_filechooser`
- `NavigationToolbar2QT.adj_window` attribute. This is unused and always `None`.
- `backend_wx.IDLE_DELAY` global variable This is unused and only relevant to the now removed wx "idling" code (note that as it is a module-level global, no deprecation warning is emitted when accessing it).
- `mlab.demean`
- `backend_gtk3cairo.FigureCanvasGTK3Cairo`,
- `backend_wx.debug_on_error`, `backend_wx.fake_stderr`, `backend_wx.raise_msg_to_str`, `backend_wx.MenuButtonWx`, `backend_wx.PrintoutWx`,
- `matplotlib.backends.qt_editor.formlayout` module

This module is a vendored, modified version of the official formlayout module available on PyPI. Install that module separately if you need it.

- `GraphicsContextPS.shouldstroke`

Transforms / scales

- `LogTransformBase`
- `Log10Transform`
- `Log2Transform`,
- `NaturalLogTransformLog`
- `InvertedLogTransformBase`
- `InvertedLog10Transform`
- `InvertedLog2Transform`
- `InvertedNaturalLogTransform`

These classes defined in *matplotlib.scale* are deprecated. As a replacement, use the general *LogTransform* and *InvertedLogTransform* classes, whose constructors take a *base* argument.

Locators / Formatters

- `OldScalarFormatter.pprint_val`
- `ScalarFormatter.pprint_val`
- `LogFormatter.pprint_val`

These are helper methods that do not have a consistent signature across formatter classes.

Path tools

- `path.get_paths_extents`

Use *get_path_collection_extents* instead.

- `.Path.has_nonfinite` attribute

Use `not np.isfinite(path.vertices).all()` instead.

- `bezier.find_r_to_boundary_of_closedpath` function is deprecated

This has always returned None instead of the requested radius.

Text

- `text.TextWithDash`
- `Text.is_math_text`
- `TextPath.is_math_text`
- `TextPath.text_get_vertices_codes` (As an alternative, construct a new `TextPath` object.)

Unused attributes

- `NavigationToolbar2QT.buttons`
- `Line2D.verticalOffset`
- `Quiver.keytext`
- `Quiver.keyvec`
- `SpanSelector.buttonDown`

These are unused and never updated.

Sphinx extensions

- `matplotlib.sphinxext.mathmpl.math_directive`
- `matplotlib.sphinxext.plot_directive.plot_directive`

This is because the `matplotlib.sphinxext.mathmpl` and `matplotlib.sphinxext.plot_directive` interfaces have changed from the (Sphinx-)deprecated function-based interface to a class-based interface; this should not affect end users.

- `mpl_toolkits.axisartist.axis_artist.UnimplementedException`

Environmental Variables

- The `MATPLOTLIBDATA` environment variable

Axis

- `Axis.iter_ticks`

This only served as a helper to the private `Axis._update_ticks`

Undeprecations

The following API elements have bee un-deprecated:

- The *obj_type* kwarg to the `cbook.deprecated` decorator.
- *xmin*, *xmax* kwargs to *Axes.set_xlim* and *ymin*, *ymax* kwargs to *Axes.set_ylim*

New features

`Text` now has a `c` alias for the `color` property

For consistency with *Line2D*, the *Text* class has gained the `c` alias for the `color` property. For example, one can now write

```
ax.text(.5, .5, "foo", c="red")
```

`Cn` colors now support `n>=10`

It is now possible to go beyond the tenth color in the property cycle using `Cn` syntax, e.g.

```
plt.plot([1, 2], color="C11")
```

now uses the 12th color in the cycle.

Note that previously, a construct such as:

```
plt.plot([1, 2], "C11")
```

would be interpreted as a request to use color `C1` and marker `1` (an "inverted Y"). To obtain such a plot, one should now use

```
plt.plot([1, 2], "1C1")
```

(so that the first "1" gets correctly interpreted as a marker specification), or, more explicitly:

```
plt.plot([1, 2], marker="1", color="C1")
```

New `Formatter.format_ticks` method

The *Formatter* class gained a new *format_ticks* method, which takes the list of all tick locations as a single argument and returns the list of all formatted values. It is called by the axis tick handling code and, by default, first calls *set_locs* with all locations, then repeatedly calls `__call__` for each location.

Tick-handling code in the codebase that previously performed this sequence (*set_locs* followed by repeated `__call__`) have been updated to use *format_ticks*.

format_ticks is intended to be overridden by *Formatter* subclasses for which the formatting of a tick value depends on other tick values, such as *ConciseDateFormatter*.

Added support for RGB(A) images in pcolorfast

pcolorfast now accepts 3D images (RGB or RGBA) arrays if the X and Y specifications allow image or pcolorimage rendering; they remain unsupported by the more general quadmesh rendering

Invalid inputs

Passing invalid locations to *legend* and *table* used to fallback on a default location. This behavior is deprecated and will throw an exception in a future version.

offsetbox.AnchoredText is unable to handle the *horizontalalignment* or *verticalalignment* kwargs, and used to ignore them with a warning. This behavior is deprecated and will throw an exception in a future version.

Passing steps less than 1 or greater than 10 to *MaxNLocator* used to result in undefined behavior. It now throws a `ValueError`.

The signature of the (private) `Axis._update_ticks` has been changed to not take the renderer as argument anymore (that argument is unused).

16.1.6 API Changes for 3.0.1

tight_layout.auto_adjust_subplotpars can return `None` now if the new subplotparams will collapse axes to zero width or height. This prevents `tight_layout` from being executed. Similarly *tight_layout.get_tight_layout_figure* will return None.

To improve import (startup) time, private modules are now imported lazily. These modules are no longer available at these locations:

- `matplotlib.backends.backend_agg._png`
- `matplotlib.contour._contour`
- `matplotlib.image._png`

- matplotlib.mathtext._png
- matplotlib.testing.compare._png
- matplotlib.texmanager._png
- matplotlib.tri.triangulation._tri
- matplotlib.tri.triangulation._qhull
- matplotlib.tri.tricontour._tri
- matplotlib.tri.trifinder._tri

16.1.7 API Changes for 3.0.0

Drop support for python 2

Matplotlib 3 only supports python 3.5 and higher.

Changes to backend loading

Failure to load backend modules (`macosx` on non-framework builds and `gtk3` when running headless) now raises `ImportError` (instead of `RuntimeError` and `TypeError`, respectively).

Third-party backends that integrate with an interactive framework are now encouraged to define the `required_interactive_framework` global value to one of the following values: "qt5", "qt4", "gtk3", "wx", "tk", or "macosx". This information will be used to determine whether it is possible to switch from a backend to another (specifically, whether they use the same interactive framework).

`Axes.hist2d` now uses `pcolormesh` instead of `pcolorfast`

Axes.hist2d now uses *pcolormesh* instead of *pcolorfast*, which will improve the handling of log-axes. Note that the returned *image* now is of type *QuadMesh* instead of *AxesImage*.

`matplotlib.axes.Axes.get_tightbbox` now includes all artists

For Matplotlib 3.0, *all* artists are now included in the bounding box returned by *matplotlib.axes.Axes.get_tightbbox*.

matplotlib.axes.Axes.get_tightbbox adds a new kwarg `bbox_extra_artists` to manually specify the list of artists on the axes to include in the tight bounding box calculation.

Layout tools like *Figure.tight_layout*, `constrained_layout`, and `fig.savefig('fname.png', bbox_inches="tight")` use *matplotlib.axes.Axes.get_tightbbox* to determine the bounds of each axes on a figure and adjust spacing between axes.

In Matplotlib 2.2 `get_tightbbox` started to include legends made on the axes, but still excluded some other artists, like text that may overspill an axes. This has been expanded to include *all* artists.

This new default may be overridden in either of three ways:

1. Make the artist to be excluded a child of the figure, not the axes. E.g., call `fig.legend()` instead of `ax.legend()` (perhaps using *get_legend_handles_labels* to gather handles and labels from the parent axes).
2. If the artist is a child of the axes, set the artist property `artist.set_in_layout(False)`.
3. Manually specify a list of artists in the new kwarg `bbox_extra_artists`.

`Text.set_text` with string argument `None` sets string to empty

Text.set_text when passed a string value of `None` would set the string to `"None"`, so subsequent calls to *Text.get_text* would return the ambiguous `"None"` string.

This change sets text objects passed `None` to have empty strings, so that *Text.get_text* returns an empty string.

`Axes3D.get_xlim`, `get_ylim` and `get_zlim` now return a tuple

They previously returned an array. Returning a tuple is consistent with the behavior for 2D axes.

`font_manager.list_fonts` now follows the platform's casefolding semantics

i.e., it behaves case-insensitively on Windows only.

`bar` / `barh` no longer accepts `left` / `bottom` as first named argument

These arguments were renamed in 2.0 to `x` / `y` following the change of the default alignment from `edge` to `center`.

Different exception types for undocumented options

- Passing `style='comma'` to *`ticklabel_format()`* was never supported. It now raises `ValueError` like all other unsupported styles, rather than `NotImplementedError`.
- Passing the undocumented `xmin` or `xmax` arguments to *`set_xlim()`* would silently override the `left` and `right` arguments. *`set_ylim()`* and the 3D equivalents (e.g. *`set_zlim3d`*) had a corresponding problem. A `TypeError` will be raised if they would override the earlier limit arguments. In 3.0 these were kwargs were deprecated, but in 3.1 the deprecation was undone.

Improved call signature for `Axes.margins`

`Axes.margins` and *`Axes3D.margins`* no longer accept arbitrary keywords. `TypeError` will therefore be raised if unknown kwargs are passed; previously they would be silently ignored.

If too many positional arguments are passed, `TypeError` will be raised instead of `ValueError`, for consistency with other call-signature violations.

`Axes3D.margins` now raises `TypeError` instead of emitting a deprecation warning if only two positional arguments are passed. To supply only `x` and `y` margins, use keyword arguments.

Explicit arguments instead of *args, **kwargs

PEP 3102 describes keyword-only arguments, which allow Matplotlib to provide explicit call signatures - where we previously used `*args, **kwargs` and `kwargs.pop`, we can now expose named arguments. In some places, unknown kwargs were previously ignored but now raise `TypeError` because `**kwargs` has been removed.

- *`matplotlib.axes.Axes.stem()`* no longer accepts unknown keywords, and raises `TypeError` instead of emitting a deprecation.
- *`matplotlib.axes.Axes.stem()`* now raises TypeError when passed unhandled positional arguments. If two or more arguments are passed (ie X, Y, [linefmt], ...) and Y cannot be cast to an array, an error will be raised instead of treating X as Y and Y as linefmt.
- *`mpl_toolkits.axes_grid1.axes_divider.SubplotDivider`* raises `TypeError` instead of `Exception` when passed unknown kwargs.

Cleanup decorators and test classes no longer destroy warnings filter on exit

The decorators and classes in matplotlib.testing.decorators no longer destroy the warnings filter on exit. Instead, they restore the warnings filter that existed before the test started using `warnings.catch_warnings`.

Non-interactive FigureManager classes are now aliases of FigureManagerBase

The `FigureManagerPdf`, `FigureManagerPS`, and `FigureManagerSVG` classes, which were previously empty subclasses of *FigureManagerBase* (i.e., not adding or overriding any attribute or method), are now direct aliases for *FigureManagerBase*.

Change to the output of `image.thumbnail`

When called with `preview=False`, *image.thumbnail* previously returned an figure whose canvas class was set according to the output file extension. It now returns a figure whose canvas class is the base *FigureCanvasBase* (and relies on *FigureCanvasBase.print_figure*) to handle the canvas switching properly).

As a side effect of this change, *image.thumbnail* now also supports .ps, .eps, and .svgz output.

`FuncAnimation` now draws artists according to their zorder when blitting

FuncAnimation now draws artists returned by the user- function according to their zorder when using blitting, instead of using the order in which they are being passed. However, note that only zorder of passed artists will be respected, as they are drawn on top of any existing artists (see #11369).

Contour color autoscaling improvements

Selection of contour levels is now the same for contour and contourf; previously, for contour, levels outside the data range were deleted. (Exception: if no contour levels are found within the data range, the `levels` attribute is replaced with a list holding only the minimum of the data range.)

When contour is called with levels specified as a target number rather than a list, and the 'extend' kwarg is used, the levels are now chosen such that some data typically will fall in the extended range.

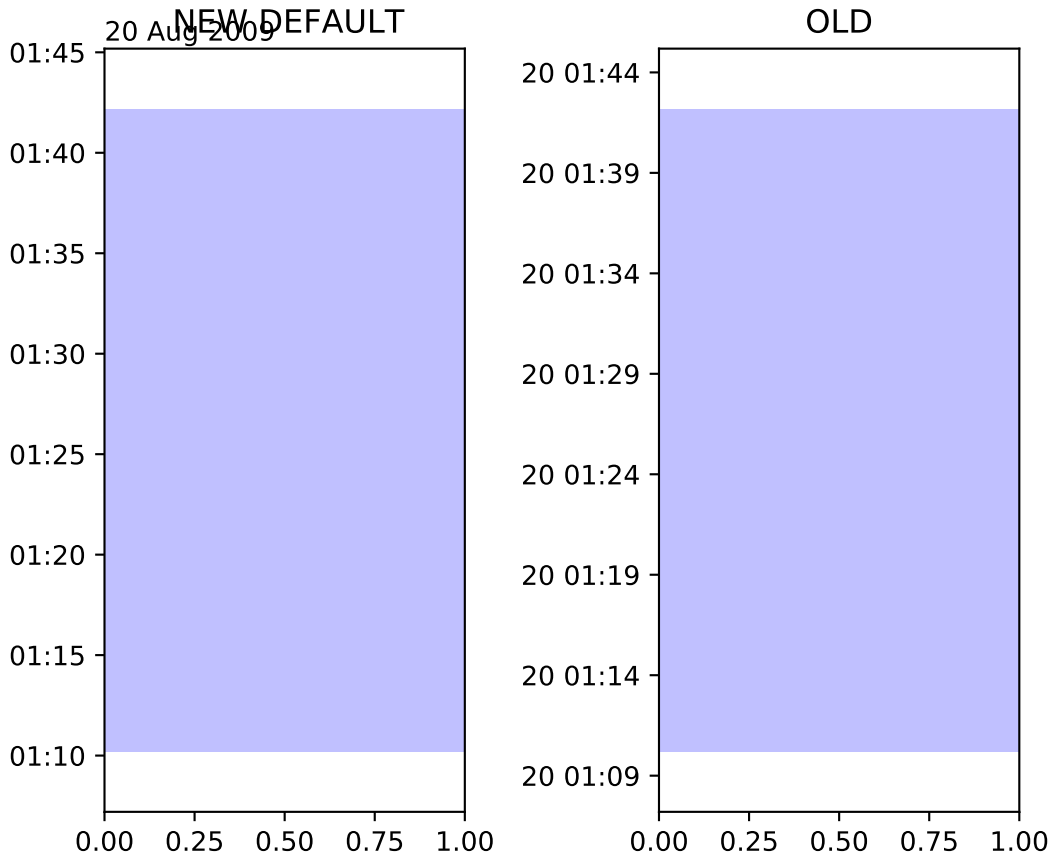
When contour is called with a *LogNorm* or a *LogLocator*, it will now select colors using the geometric mean rather than the arithmetic mean of the contour levels.

Streamplot last row and column fixed

A bug was fixed where the last row and column of data in *streamplot* were being dropped.

Changed default `AutoDateLocator` kwarg *interval_multiples* to `True`

The default value of the tick locator for dates, *dates.AutoDateLocator* kwarg *interval_multiples* was set to `False` which leads to not-nice looking automatic ticks in many instances. The much nicer `interval_multiples=True` is the new default. See below to get the old behavior back:



`Axes.get_position` now returns actual position if aspect changed

Axes.get_position used to return the original position unless a draw had been triggered or *Axes.apply_aspect* had been called, even if the kwarg *original* was set to `False`. Now *Axes.apply_aspect* is called so `ax.get_position()` will return the new modified position. To get the old behavior use `ax.get_position(original=True)`.

The ticks for colorbar now adjust for the size of the colorbar

Colorbar ticks now adjust for the size of the colorbar if the colorbar is made from a mappable that is not a contour or doesn't have a BoundaryNorm, or boundaries are not specified. If boundaries, etc are specified, the colorbar maintains the original behavior.

Colorbar for log-scaled hexbin

When using *hexbin* and plotting with a logarithmic color scale, the colorbar ticks are now correctly log scaled. Previously the tick values were linear scaled log(number of counts).

PGF backend now explicitly makes black text black

Previous behavior with the pgf backend was for text specified as black to actually be the default color of whatever was rendering the pgf file (which was of course usually black). The new behavior is that black text is black, regardless of the default color. However, this means that there is no way to fall back on the default color of the renderer.

Blacklisted rcparams no longer updated by `rcdefaults`, `rc_file_defaults`, `rc_file`

The rc modifier functions *rcdefaults*, *rc_file_defaults* and *rc_file* now ignore rcParams in the `matplotlib.style.core.STYLE_BLACKLIST` set. In particular, this prevents the `backend` and `interactive` rcParams from being incorrectly modified by these functions.

`CallbackRegistry` now stores callbacks using stdlib's `weakref.WeakMethods`

In particular, this implies that `CallbackRegistry.callbacks[signal]` is now a mapping of callback ids to `weakref.WeakMethod`s (i.e., they need to be first called with no arguments to retrieve the method itself).

Changes regarding the text.latex.unicode rcParam

The rcParam now defaults to True and is deprecated (i.e., in future versions of Matplotlib, unicode input will always be supported).

Moreover, the underlying implementation now uses `\usepackage[utf8]{inputenc}` instead of `\usepackage{ucs}\usepackage[utf8x]{inputenc}`.

Return type of ArtistInspector.get_aliases changed

`ArtistInspector.get_aliases` previously returned the set of aliases as `{fullname: {alias1: None, alias2: None, ...}}`. The dict-to-None mapping was used to simulate a set in earlier versions of Python. It has now been replaced by a set, i.e. `{fullname: {alias1, alias2, ...}}`.

This value is also stored in `ArtistInspector.aliasd`, which has likewise changed.

Removed `pytz` as a dependency

Since `dateutil` and `pytz` both provide time zones, and matplotlib already depends on `dateutil`, matplotlib will now use `dateutil` time zones internally and drop the redundant dependency on `pytz`. While `dateutil` time zones are preferred (and currently recommended in the Python documentation), the explicit use of `pytz` zones is still supported.

Deprecations

Modules

The following modules are deprecated:

- `matplotlib.compat.subprocess`. This was a python 2 workaround, but all the functionality can now be found in the python 3 standard library `subprocess`.
- `matplotlib.backends.wx_compat`. Python 3 is only compatible with wxPython 4, so support for wxPython 3 or earlier can be dropped.

Classes, methods, functions, and attributes

The following classes, methods, functions, and attributes are deprecated:

- `RcParams.msg_depr`, `RcParams.msg_depr_ignore`, `RcParams.msg_depr_set`, `RcParams.msg_obsolete`, `RcParams.msg_backend_obsolete`
- `afm.parse_afm`
- `backend_pdf.PdfFile.texFontMap`
- `backend_pgf.get_texcommand`
- `backend_ps.get_bbox`
- `backend_qt5.FigureCanvasQT.keyAutoRepeat` (directly check `event.guiEvent.isAutoRepeat()` in the event handler to decide whether to handle autorepeated key presses).
- `backend_qt5.error_msg_qt`, `backend_qt5.exception_handler`
- `backend_wx.FigureCanvasWx.macros`
- `backends.pylab_setup`
- `cbook.GetRealpathAndStat`, `cbook.Locked`
- `cbook.is_numlike` (use `isinstance(..., numbers.Number)` instead), `cbook.listFiles`, `cbook.unicode_safe`
- `container.Container.set_remove_method`,
- `contour.ContourLabeler.cl`, `.cl_xy`, and `.cl_cvalues`
- `dates.DateFormatter.strftime_pre_1900`, `dates.DateFormatter.strftime`
- `font_manager.TempCache`
- `image._ImageBase.iterpnames`, use the `interpolation_names` property instead. (this affects classes that inherit from `_ImageBase` including *FigureImage*, *BboxImage*, and *AxesImage*)
- `mathtext.unichr_safe` (use `chr` instead)
- `patches.Polygon.xy`
- `table.Table.get_child_artists` (use `get_children` instead)
- `testing.compare.ImageComparisonTest`, `testing.compare.compare_float`
- `testing.decorators.CleanupTest`, `testing.decorators.skip_if_command_unavailable`
- `FigureCanvasQT.keyAutoRepeat` (directly check `event.guiEvent.isAutoRepeat()` in the event handler to decide whether to handle autorepeated key presses)
- `FigureCanvasWx.macros`

- `_ImageBase.iterpnames`, use the `interpolation_names` property instead. (this affects classes that inherit from `_ImageBase` including *FigureImage*, *BboxImage*, and *AxesImage*)
- `patches.Polygon.xy`
- `texmanager.dvipng_hack_alpha`
- `text.Annotation.arrow`
- **`Legend.draggable()`, in favor of** *Legend.set_draggable()*

  (`Legend.draggable` may be reintroduced as a property in future releases)
- `textpath.TextToPath.tex_font_map`
- `matplotlib.cbook.deprecation.mplDeprecation` will be removed in future versions. It is just an alias for *matplotlib.cbook.deprecation.MatplotlibDeprecationWarning*. Please use `matplotlib.cbook.MatplotlibDeprecationWarning` directly if necessary.
- The `matplotlib.cbook.Bunch` class has been deprecated. Instead, use `types.SimpleNamespace` from the standard library which provides the same functionality.
- `Axes.mouseover_set` is now a frozenset, and deprecated. Directly manipulate the artist's `.mouseover` attribute to change their mouseover status.

The following keyword arguments are deprecated:

- passing `verts` to `Axes.scatter` (use `marker` instead)
- passing `obj_type` to `cbook.deprecated`

The following call signatures are deprecated:

- passing a `wx.EvtHandler` as first argument to `backend_wx.TimerWx`

rcParams

The following rcParams are deprecated:

- `examples.directory` (use `datapath` instead)
- `pgf.debug` (the pgf backend relies on logging)
- `text.latex.unicode` (always True now)

marker styles

- Using `(n, 3)` as marker style to specify a circle marker is deprecated. Use `"o"` instead.
- Using `([(x0, y0), (x1, y1), ...], 0)` as marker style to specify a custom marker path is deprecated. Use `[(x0, y0), (x1, y1), ...]` instead.

Deprecation of `LocatableAxes` in toolkits

The `LocatableAxes` classes in toolkits have been deprecated. The base *Axes* classes provide the same functionality to all subclasses, thus these mixins are no longer necessary. Related functions have also been deprecated. Specifically:

- `mpl_toolkits.axes_grid1.axes_divider.LocatableAxesBase`: no specific replacement; use any other `Axes`-derived class directly instead.
- `mpl_toolkits.axes_grid1.axes_divider.locatable_axes_factory`: no specific replacement; use any other `Axes`-derived class directly instead.
- `mpl_toolkits.axes_grid1.axes_divider.Axes`: use *mpl_toolkits.axes_grid1.mpl_axes.Axes* directly.
- `mpl_toolkits.axes_grid1.axes_divider.LocatableAxes`: use *mpl_toolkits.axes_grid1.mpl_axes.Axes* directly.
- `mpl_toolkits.axisartist.axes_divider.Axes`: use *mpl_toolkits.axisartist.axislines.Axes* directly.
- `mpl_toolkits.axisartist.axes_divider.LocatableAxes`: use *mpl_toolkits.axisartist.axislines.Axes* directly.

Removals

Hold machinery

Setting or unsetting `hold` (*deprecated in version 2.0*) has now been completely removed. Matplotlib now always behaves as if `hold=True`. To clear an axes you can manually use *cla()*, or to clear an entire figure use *clf()*.

Removal of deprecated backends

Deprecated backends have been removed:

- GTKAgg
- GTKCairo
- GTK
- GDK

Deprecated APIs

The following deprecated API elements have been removed:

- The deprecated methods `knownfailureif` and `remove_text` have been removed from *matplotlib.testing.decorators*.
- The entire contents of `testing.noseclasses` have also been removed.
- `matplotlib.checkdep_tex`, `matplotlib.checkdep_xmllint`
- `backend_bases.IdleEvent`
- `cbook.converter`, `cbook.tostr`, `cbook.todatetime`, `cbook.todate`, `cbook.tofloat`, `cbook.toint`, `cbook.unique`, `cbook.is_string_like`, `cbook.is_sequence_of_strings`, `cbook.is_scalar`, `cbook.soundex`, `cbook.dict_delall`, `cbook.get_split_ind`, `cbook.wrap`, `cbook.get_recursive_filelist`, `cbook.pieces`, `cbook.exception_to_str`, `cbook.allequal`, `cbook.alltrue`, `cbook.onetrue`, `cbook.allpairs`, `cbook.finddir`, `cbook.reverse_dict`, `cbook.restrict_dict`, `cbook.issubclass_safe`, `cbook.recursive_remove`, `cbook.unmasked_index_ranges`, `cbook.Null`, `cbook.RingBuffer`, `cbook.Sorter`, `cbook.Xlator`,
- `font_manager.weight_as_number`, `font_manager.ttfdict_to_fnames`
- `pyplot.colors`, `pyplot.spectral`
- `rcsetup.validate_negative_linestyle`, `rcsetup.validate_negative_linestyle_legacy`,
- `testing.compare.verifiers`, `testing.compare.verify`
- `testing.decorators.knownfailureif`, `testing.decorators.ImageComparisonTest.remove_text`
- `tests.assert_str_equal`, `tests.test_tinypages.file_same`
- `texmanager.dvipng_hack_alpha`,
- `_AxesBase.axesPatch`, `_AxesBase.set_color_cycle`, `_AxesBase.get_cursor_props`, `_AxesBase.set_cursor_props`
- `_ImageBase.iterpnames`
- `FigureCanvasBase.start_event_loop_default`;

- `FigureCanvasBase.stop_event_loop_default`;
- `Figure.figurePatch`,
- `FigureCanvasBase.dynamic_update`, `FigureCanvasBase.idle_event`, `FigureCanvasBase.get_linestyle`, `FigureCanvasBase.set_linestyle`
- `FigureCanvasQTAggBase`
- `FigureCanvasQTAgg.blitbox`
- `FigureCanvasTk.show` (alternative: `FigureCanvasTk.draw`)
- `FigureManagerTkAgg` (alternative: `FigureManagerTk`)
- `NavigationToolbar2TkAgg` (alternative: `NavigationToolbar2Tk`)
- `backend_wxagg.Toolbar` (alternative: `backend_wxagg.NavigationToolbar2WxAgg`)
- `RendererAgg.debug()`
- passing non-numbers to `EngFormatter.format_eng`
- passing `frac` to `PolarAxes.set_theta_grids`
- any mention of idle events

The following API elements have been removed:

- `backend_cairo.HAS_CAIRO_CFFI`
- `sphinxext.sphinx_version`

Proprietary sphinx directives

The matplotlib documentation used the proprietary sphinx directives `.. htmlonly::`, and `.. latexonly::`. These have been replaced with the standard sphinx directives `.. only:: html` and `.. only:: latex`. This change will not affect any users. Only down-stream package maintainers, who have used the proprietary directives in their docs, will have to switch to the sphinx directives.

lib/mpl_examples symlink

The symlink from lib/mpl_examples to ../examples has been removed. This is not installed as an importable package and should not affect end users, however this may require down-stream packagers to adjust. The content is still available top-level examples directory.

16.1.8 API Changes in 2.2.0

New dependency

kiwisolver is now a required dependency to support the new constrained_layout, see *Constrained Layout Guide* for more details.

Deprecations

Classes, functions, and methods

The unused and untested `Artist.onRemove` and `Artist.hitlist` methods have been deprecated.

The now unused `mlab.less_simple_linear_interpolation` function is deprecated.

The unused `ContourLabeler.get_real_label_width` method is deprecated.

The unused `FigureManagerBase.show_popup` method is deprecated. This introduced in e945059b327d42a99938b939a1be867fa023e7ba in 2005 but never built out into any of the backends.

`backend_tkagg.AxisMenu` is deprecated, as it has become unused since the removal of "classic" toolbars.

Changed function signatures

kwarg `fig` to *GridSpec.get_subplot_params* is deprecated, use `figure` instead.

Using *pyplot.axes* with an *Axes* as argument is deprecated. This sets the current axes, i.e. it has the same effect as *pyplot.sca*. For clarity `plt.sca(ax)` should be preferred over `plt.axes(ax)`.

Using strings instead of booleans to control grid and tick visibility is deprecated. Using `"on"`, `"off"`, `"true"`, or `"false"` to control grid and tick visibility has been deprecated. Instead, use normal booleans (`True`/`False`) or boolean-likes. In the future, all non-empty strings may be interpreted as `True`.

When given 2D inputs with non-matching numbers of columns, *plot* currently cycles through the columns of the narrower input, until all the columns of the wider input have been plotted. This behavior is deprecated; in the future, only broadcasting (1 column to *n* columns) will be performed.

rcparams

The `rcParams["backend.qt4"]` and `rcParams["backend.qt5"]` rcParams were deprecated in version 2.2. In order to force the use of a specific Qt binding, either import that binding first, or set the `QT_API` environment variable.

Deprecation of the `nbagg.transparent` rcParam. To control transparency of figure patches in the nbagg (or any other) backend, directly set `figure.patch.facecolor`, or the `figure.facecolor` rcParam.

Deprecated `Axis.unit_data`

Use `Axis.units` (which has long existed) instead.

Removals

Function Signatures

Contouring no longer supports `legacy` corner masking. The deprecated `ContourSet.vmin` and `ContourSet.vmax` properties have been removed.

Passing `None` instead of `"none"` as format to *`errorbar`* is no longer supported.

The `bgcolor` keyword argument to `Axes` has been removed.

Modules, methods, and functions

The `matplotlib.finance`, `mpl_toolkits.exceltools` and `mpl_toolkits.gtktools` modules have been removed. `matplotlib.finance` remains available at https://github.com/matplotlib/mpl_finance.

The `mpl_toolkits.mplot3d.art3d.iscolor` function has been removed.

The `Axes.get_axis_bgcolor`, `Axes.set_axis_bgcolor`, `Bbox.update_from_data`, `Bbox.update_datalim_numerix`, `MaxNLocator.bin_boundaries` methods have been removed.

`mencoder` can no longer be used to encode animations.

The unused `FONT_SCALE` and `fontd` attributes of the *`RendererSVG`* class have been removed.

color maps

The `spectral` colormap has been removed. The `Vega*` colormaps, which were aliases for the `tab*` colormaps, have been removed.

rcparams

The following deprecated rcParams have been removed:

- `axes.color_cycle` (see `axes.prop_cycle`),
- `legend.isaxes`,
- `svg.embed_char_paths` (see `svg.fonttype`),
- `text.fontstyle`, `text.fontangle`, `text.fontvariant`, `text.fontweight`, `text.fontsize` (renamed to `text.style`, etc.),
- `tick.size` (renamed to `tick.major.size`).

Only accept string-like for Categorical input

Do not accept mixed string / float / int input, only strings are valid categoricals.

Removal of unused imports

Many unused imports were removed from the codebase. As a result, trying to import certain classes or functions from the "wrong" module (e.g. *Figure* from *matplotlib.backends.backend_agg* instead of *matplotlib.figure*) will now raise an `ImportError`.

`Axes3D.get_xlim`, `get_ylim` and `get_zlim` now return a tuple

They previously returned an array. Returning a tuple is consistent with the behavior for 2D axes.

Exception type changes

If *MovieWriterRegistry* can't find the requested *MovieWriter*, a more helpful `RuntimeError` message is now raised instead of the previously raised `KeyError`.

auto_adjust_subplotpars now raises `ValueError` instead of `RuntimeError` when sizes of input lists don't match

`Figure.set_figwidth` and `Figure.set_figheight` default *forward* to True

matplotlib.figure.Figure.set_figwidth and *matplotlib.figure.Figure.set_figheight* had the keyword argument `forward=False` by default, but *figure.Figure.set_size_inches* now defaults to `forward=True`. This makes these functions conistent.

Do not truncate svg sizes to nearest point

There is no reason to size the SVG out put in integer points, change to out putting floats for the *height*, *width*, and *viewBox* attributes of the *svg* element.

Fontsizes less than 1 pt are clipped to be 1 pt.

FreeType doesn't allow fonts to get smaller than 1 pt, so all Agg backends were silently rounding up to 1 pt. PDF (other vector backends?) were letting us write fonts that were less than 1 pt, but they could not be placed properly because position information comes from FreeType. This change makes it so no backends can use fonts smaller than 1 pt, consistent with FreeType and ensuring more consistent results across backends.

Changes to Qt backend class MRO

To support both Agg and cairo rendering for Qt backends all of the non-Agg specific code previously in `backend_qt5agg.FigureCanvasQTAggBase` has been moved to `backend_qt5.FigureCanvasQT` so it can be shared with the cairo implementation. The `FigureCanvasQTAggBase.paintEvent`, `FigureCanvasQTAggBase.blit`, and `FigureCanvasQTAggBase.print_figure` methods have moved to `FigureCanvasQTAgg.paintEvent()`, `FigureCanvasQTAgg.blit()`, and `FigureCanvasQTAgg.print_figure()`. The first two methods assume that the instance is also a `QWidget` so to use `FigureCanvasQTAggBase` it was required to multiple inherit from a `QWidget` sub-class.

Having moved all of its methods either up or down the class hierarchy `FigureCanvasQTAggBase` has been deprecated. To do this without warning and to preserve as much API as possible, `.backend_qt5agg.FigureCanvasQTAggBase` now inherits from `backend_qt5.FigureCanvasQTAgg`.

The MRO for `FigureCanvasQTAgg` and `FigureCanvasQTAggBase` used to be

```
[matplotlib.backends.backend_qt5agg.FigureCanvasQTAgg,
 matplotlib.backends.backend_qt5agg.FigureCanvasQTAggBase,
 matplotlib.backends.backend_agg.FigureCanvasAgg,
 matplotlib.backends.backend_qt5.FigureCanvasQT,
 PyQt5.QtWidgets.QWidget,
 PyQt5.QtCore.QObject,
 sip.wrapper,
 PyQt5.QtGui.QPaintDevice,
```

(continues on next page)

(continued from previous page)

```
 sip.simplewrapper,
 matplotlib.backend_bases.FigureCanvasBase,
 object]
```

and

```
[matplotlib.backends.backend_qt5agg.FigureCanvasQTAggBase,
 matplotlib.backends.backend_agg.FigureCanvasAgg,
 matplotlib.backend_bases.FigureCanvasBase,
 object]
```

respectively. They are now

```
[matplotlib.backends.backend_qt5agg.FigureCanvasQTAgg,
 matplotlib.backends.backend_agg.FigureCanvasAgg,
 matplotlib.backends.backend_qt5.FigureCanvasQT,
 PyQt5.QtWidgets.QWidget,
 PyQt5.QtCore.QObject,
 sip.wrapper,
 PyQt5.QtGui.QPaintDevice,
 sip.simplewrapper,
 matplotlib.backend_bases.FigureCanvasBase,
 object]
```

and

```
[matplotlib.backends.backend_qt5agg.FigureCanvasQTAggBase,
 matplotlib.backends.backend_qt5agg.FigureCanvasQTAgg,
 matplotlib.backends.backend_agg.FigureCanvasAgg,
 matplotlib.backends.backend_qt5.FigureCanvasQT,
 PyQt5.QtWidgets.QWidget,
 PyQt5.QtCore.QObject,
 sip.wrapper,
 PyQt5.QtGui.QPaintDevice,
 sip.simplewrapper,
 matplotlib.backend_bases.FigureCanvasBase,
 object]
```

`axes.Axes.imshow` clips RGB values to the valid range

When *axes.Axes.imshow* is passed an RGB or RGBA value with out-of-range values, it now logs a warning and clips them to the valid range. The old behaviour, wrapping back in to the range, often hid outliers and made interpreting RGB images unreliable.

GTKAgg and GTKCairo backends deprecated

The GTKAgg and GTKCairo backends have been deprecated. These obsolete backends allow figures to be rendered via the GTK+ 2 toolkit. They are untested, known to be broken, will not work with Python 3, and their use has been discouraged for some time. Instead, use the `GTK3Agg` and `GTK3Cairo` backends for rendering to GTK+ 3 windows.

16.1.9 API Changes in 2.1.2

`Figure.legend` no longer checks for repeated lines to ignore

matplotlib.figure.Figure.legend used to check if a line had the same label as an existing legend entry. If it also had the same line color or marker color legend didn't add a new entry for that line. However, the list of conditions was incomplete, didn't handle RGB tuples, didn't handle linewidths or linestyles etc.

This logic did not exist in *axes.Axes.legend*. It was included (erroneously) in Matplotlib 2.1.1 when the legend argument parsing was unified [#9324](https://github.com/matplotlib/matplotlib/pull/9324). This change removes that check in *axes.Axes.legend* again to restore the old behavior.

This logic has also been dropped from *Figure.legend*, where it was previously undocumented. Repeated lines with the same label will now each have an entry in the legend. If you do not want the duplicate entries, don't add a label to the line, or prepend the label with an underscore.

16.1.10 API Changes in 2.1.1

Default behavior of log scales reverted to clip <= 0 values

The change it 2.1.0 to mask in logscale by default had more disruptive changes than anticipated and has been reverted, however the clipping is now done in a way that fixes the issues that motivated changing the default behavior to `'mask'`.

As a side effect of this change, error bars which go negative now work as expected on log scales.

16.1.11 API Changes in 2.1.0

Default behavior of log scales changed to mask <= 0 values

Calling *matplotlib.axes.Axes.set_xscale* or *matplotlib.axes.Axes.set_yscale* now uses 'mask' as the default method to handle invalid values (as opposed to 'clip'). This means that any values <= 0 on a log scale will not be shown.

Previously they were clipped to a very small number and shown.

`matplotlib.cbook.CallbackRegistry.process()` suppresses exceptions by default

Matplotlib uses instances of *CallbackRegistry* as a bridge between user input event from the GUI and user callbacks. Previously, any exceptions raised in a user call back would bubble out of of the `process` method, which is typically in the GUI event loop. Most GUI frameworks simple print the traceback to the screen and continue as there is not always a clear method of getting the exception back to the user. However PyQt5 now exits the process when it receives an un-handled python exception in the event loop. Thus, *process()* now suppresses and prints tracebacks to stderr by default.

What *process()* does with exceptions is now user configurable via the `exception_handler` attribute and kwarg. To restore the previous behavior pass `None`

```
cb = CallbackRegistry(exception_handler=None)
```

A function which take and `Exception` as its only argument may also be passed

```
def maybe_reraise(exc):
    if isinstance(exc, RuntimeError):
        pass
    else:
        raise exc

cb = CallbackRegistry(exception_handler=maybe_reraise)
```

Improved toggling of the axes grids

The `g` key binding now switches the states of the `x` and `y` grids independently (by cycling through all four on/off combinations).

The new `G` key binding switches the states of the minor grids.

Both bindings are disabled if only a subset of the grid lines (in either direction) is visible, to avoid making irreversible changes to the figure.

Ticklabels are turned off instead of being invisible

Internally, the *Tick*'s `~matplotlib.axis.Tick.label1On` attribute is now used to hide tick labels instead of setting the visibility on the tick label objects. This improves overall performance and fixes some issues. As a consequence, in case those labels ought to be shown, *tick_params()* needs to be used, e.g.

```
ax.tick_params(labelbottom=True)
```

Removal of warning on empty legends

pyplot.legend used to issue a warning when no labeled artist could be found. This warning has been removed.

More accurate legend autopositioning

Automatic positioning of legends now prefers using the area surrounded by a *Line2D* rather than placing the legend over the line itself.

Cleanup of stock sample data

The sample data of stocks has been cleaned up to remove redundancies and increase portability. The `AAPL.dat.gz`, `INTC.dat.gz` and `aapl.csv` files have been removed entirely and will also no longer be available from *matplotlib.cbook.get_sample_data*. If a CSV file is required, we suggest using the `msft.csv` that continues to be shipped in the sample data. If a NumPy binary file is acceptable, we suggest using one of the following two new files. The `aapl.npy.gz` and `goog.npy` files have been replaced by `aapl.npz` and `goog.npz`, wherein the first column's type has changed from `datetime.date` to `numpy.datetime64` for better portability across Python versions. Note that Matplotlib does not fully support `numpy.datetime64` as yet.

Updated qhull to 2015.2

The version of qhull shipped with Matplotlib, which is used for Delaunay triangulation, has been updated from version 2012.1 to 2015.2.

Improved Delaunay triangulations with large offsets

Delaunay triangulations now deal with large x,y offsets in a better way. This can cause minor changes to any triangulations calculated using Matplotlib, i.e. any use of *matplotlib.tri.Triangulation* that requests that a Delaunay triangulation is calculated, which includes *matplotlib.pyplot.tricontour*, *matplotlib.pyplot.tricontourf*, *matplotlib.pyplot.tripcolor*, *matplotlib.pyplot.triplot*, `matplotlib.mlab.griddata` and *mpl_toolkits.mplot3d.axes3d.Axes3D.plot_trisurf*.

Use `backports.functools_lru_cache` instead of `functools32`

It's better maintained and more widely used (by pylint, jaraco, etc).

`cbook.is_numlike` only performs an instance check

`matplotlib.cbook.is_numlike` now only checks that its argument is an instance of `(numbers.Number, np.Number)`. In particular, this means that arrays are now not numlike.

Elliptical arcs now drawn between correct angles

The *matplotlib.patches.Arc* patch is now correctly drawn between the given angles.

Previously a circular arc was drawn and then stretched into an ellipse, so the resulting arc did not lie between *theta1* and *theta2*.

`-d$backend` no longer sets the backend

It is no longer possible to set the backend by passing `-d$backend` at the command line. Use the `MPLBACKEND` environment variable instead.

Path.intersects_bbox always treats the bounding box as filled

Previously, when `Path.intersects_bbox` was called with `filled` set to `False`, it would treat both the path and the bounding box as unfilled. This behavior was not well documented and it is usually not the desired behavior, since bounding boxes are used to represent more complex shapes located inside the bounding box. This behavior has now been changed: when `filled` is `False`, the path will be treated as unfilled, but the bounding box is still treated as filled. The old behavior was arguably an implementation bug.

When `Path.intersects_bbox` is called with `filled` set to `True` (the default value), there is no change in behavior. For those rare cases where `Path.intersects_bbox` was called

with `filled` set to `False` and where the old behavior is actually desired, the suggested workaround is to call `Path.intersects_path` with a rectangle as the path:

```
from matplotlib.path import Path
from matplotlib.transforms import Bbox, BboxTransformTo
rect = Path.unit_rectangle().transformed(BboxTransformTo(bbox))
result = path.intersects_path(rect, filled=False)
```

WX no longer calls generates `IdleEvent` events or calls `idle_event`

Removed unused private method `_onIdle` from `FigureCanvasWx`.

The `IdleEvent` class and `FigureCanvasBase.idle_event` method will be removed in 2.2

Correct scaling of `magnitude_spectrum()`

The functions *matplotlib.mlab.magnitude_spectrum()* and *matplotlib.pyplot.magnitude_spectrum()* implicitly assumed the sum of windowing function values to be one. In Matplotlib and Numpy the standard windowing functions are scaled to have maximum value of one, which usually results in a sum of the order of n/2 for a n-point signal. Thus the amplitude scaling `magnitude_spectrum()` was off by that amount when using standard windowing functions (Bug 8417). Now the behavior is consistent with *matplotlib.pyplot.psd()* and `scipy.signal.welch()`. The following example demonstrates the new and old scaling:

```
import matplotlib.pyplot as plt
import numpy as np

tau, n = 10, 1024  # 10 second signal with 1024 points
T = tau/n  # sampling interval
t = np.arange(n)*T

a = 4  # amplitude
x = a*np.sin(40*np.pi*t)  # 20 Hz sine with amplitude a

# New correct behavior: Amplitude at 20 Hz is a/2
plt.magnitude_spectrum(x, Fs=1/T, sides='onesided', scale='linear')

# Original behavior: Amplitude at 20 Hz is (a/2)*(n/2) for a Hanning window
w = np.hanning(n)  # default window is a Hanning window
plt.magnitude_spectrum(x*np.sum(w), Fs=1/T, sides='onesided', scale='linear')
```

Change to signatures of `bar()` & `barh()`

For 2.0 the *default value of *align** changed to `'center'`. However this caused the signature of *bar()* and *barh()* to be misleading as the first parameters were still *left* and *bottom* respectively:

```
bar(left, height, *, align='center', **kwargs)
barh(bottom, width, *, align='center', **kwargs)
```

despite behaving as the center in both cases. The methods now take `*args, **kwargs` as input and are documented to have the primary signatures of:

```
bar(x, height, *, align='center', **kwargs)
barh(y, width, *, align='center', **kwargs)
```

Passing *left* and *bottom* as keyword arguments to *bar()* and *barh()* respectively will warn. Support will be removed in Matplotlib 3.0.

Font cache as json

The font cache is now saved as json, rather than a pickle.

Invalid (Non-finite) Axis Limit Error

When using *set_xlim()* and *set_ylim()*, passing non-finite values now results in a `ValueError`. The previous behavior resulted in the limits being erroneously reset to `(-0.001, 0.001)`.

`scatter` and `Collection` offsets are no longer implicitly flattened

Collection (and thus both 2D *scatter* and 3D *scatter*) no longer implicitly flattens its offsets. As a consequence, `scatter`'s `x` and `y` arguments can no longer be 2+-dimensional arrays.

Deprecations

`GraphicsContextBase`'s `linestyle` property.

The `GraphicsContextBase.get_linestyle` and `GraphicsContextBase.set_linestyle` methods, which had no effect, have been deprecated. All of the backends Matplotlib ships use `GraphicsContextBase.get_dashes` and `GraphicsContextBase.set_dashes` which are more general. Third-party backends should also migrate to the `*_dashes` methods.

NavigationToolbar2.dynamic_update

Use *draw_idle()* method on the Canvas instance instead.

Testing

matplotlib.testing.noseclasses is deprecated and will be removed in 2.3

EngFormatter *num* arg as string

Passing a string as *num* argument when calling an instance of *matplotlib.ticker.EngFormatter* is deprecated and will be removed in 2.3.

mpl_toolkits.axes_grid module

All functionally from mpl_toolkits.axes_grid can be found in either *mpl_toolkits.axes_grid1* or *mpl_toolkits.axisartist*. Axes classes from mpl_toolkits.axes_grid based on Axis from *mpl_toolkits.axisartist* can be found in *mpl_toolkits.axisartist*.

Axes collision in Figure.add_axes

Adding an axes instance to a figure by using the same arguments as for a previous axes instance currently reuses the earlier instance. This behavior has been deprecated in Matplotlib 2.1. In a future version, a *new* instance will always be created and returned. Meanwhile, in such a situation, a deprecation warning is raised by *AxesStack*.

This warning can be suppressed, and the future behavior ensured, by passing a *unique* label to each axes instance. See the docstring of *add_axes()* for more information.

Additional details on the rationale behind this deprecation can be found in #7377 and #9024.

Former validators for contour.negative_linestyle

The former public validation functions validate_negative_linestyle and validate_negative_linestyle_legacy will be deprecated in 2.1 and may be removed in 2.3. There are no public functions to replace them.

cbook

Many unused or near-unused *matplotlib.cbook* functions and classes have been deprecated: `converter`, `tostr`, `todatetime`, `todate`, `tofloat`, `toint`, `unique`, `is_string_like`, `is_sequence_of_strings`, `is_scalar`, `Sorter`, `Xlator`, `soundex`, `Null`, `dict_delall`, `RingBuffer`, `get_split_ind`, `wrap`, `get_recursive_filelist`, `pieces`, `exception_to_str`, `allequal`, `alltrue`, `onetrue`, `allpairs`, `finddir`, `reverse_dict`, `restrict_dict`, `issubclass_safe`, `recursive_remove`, `unmasked_index_ranges`.

Code Removal

qt4_compat.py

Moved to `qt_compat.py`. Renamed because it now handles Qt5 as well.

Previously Deprecated methods

The `GraphicsContextBase.set_graylevel`, `FigureCanvasBase.onHilite` and `mpl_toolkits.axes_grid1.mpl_axes.Axes.toggle_axisline` methods have been removed.

The `ArtistInspector.findobj` method, which was never working due to the lack of a `get_children` method, has been removed.

The deprecated `point_in_path`, `get_path_extents`, `point_in_path_collection`, `path_intersects_path`, `convert_path_to_polygons`, `cleanup_path` and `clip_path_to_rect` functions in the `matplotlib.path` module have been removed. Their functionality remains exposed as methods on the `Path` class.

The deprecated `Artist.get_axes` and `Artist.set_axes` methods have been removed

The `matplotlib.backends.backend_ps.seq_allequal` function has been removed. Use `np.array_equal` instead.

The deprecated `matplotlib.rcsetup.validate_maskedarray`, `matplotlib.rcsetup.deprecate_savefig_extension` and `matplotlib.rcsetup.validate_tkpythoninspect` functions, and associated `savefig.extension` and `tk.pythoninspect` rcparams entries have been removed.

The keyword argument *resolution* of *matplotlib.projections.polar.PolarAxes* has been removed. It has deprecation with no effect from version *0.98.x*.

`Axes.set_aspect("normal")`

Support for setting an `Axes`'s aspect to `"normal"` has been removed, in favor of the synonym `"auto"`.

`shading` kwarg to `pcolor`

The `shading` kwarg to *`pcolor`* has been removed. Set `edgecolors` appropriately instead.

Functions removed from the `lines` module

The *`matplotlib.lines`* module no longer imports the `pts_to_prestep`, `pts_to_midstep` and `pts_to_poststep` functions from *`matplotlib.cbook`*.

PDF backend functions

The methods `embedTeXFont` and `tex_font_mapping` of *`matplotlib.backends.backend_pdf.PdfFile`* have been removed. It is unlikely that external users would have called these methods, which are related to the font system internal to the PDF backend.

matplotlib.delaunay

Remove the delaunay triangulation code which is now handled by Qhull via *`matplotlib.tri`*.

16.1.12 API Changes in 2.0.1

Extensions to `matplotlib.backend_bases.GraphicsContextBase`

To better support controlling the color of hatches, the method *`matplotlib.backend_bases.GraphicsContextBase.set_hatch_color`* was added to the expected API of `GraphicsContext` classes. Calls to this method are currently wrapped with a `try:...except Attribute:` block to preserve back-compatibility with any third-party backends which do not extend *`GraphicsContextBase`*.

This value can be accessed in the backends via *`matplotlib.backend_bases.GraphicsContextBase.get_hatch_color`* (which was added in 2.0 see *Extension to matplotlib.backend_bases.GraphicsContextBase*) and should be used to color the hatches.

In the future there may also be `hatch_linewidth` and `hatch_density` related methods added. It is encouraged, but not required that third-party backends extend *`GraphicsContextBase`* to make adapting to these changes easier.

`afm.get_fontconfig_fonts` returns a list of paths and does not check for existence

`afm.get_fontconfig_fonts` used to return a set of paths encoded as a `{key: 1, ...}` dict, and checked for the existence of the paths. It now returns a list and dropped the existence check, as the same check is performed by the caller (`afm.findSystemFonts`) as well.

`bar` now returns rectangles of negative height or width if the corresponding input is negative

`pyplot.bar` used to normalize the coordinates of the rectangles that it created, to keep their height and width positives, even if the corresponding input was negative. This normalization has been removed to permit a simpler computation of the correct *`Artist.sticky_edges`* to use.

Do not clip line width when scaling dashes

The algorithm to scale dashes was changed to no longer clip the scaling factor: the dash patterns now continue to shrink at thin line widths. If the line width is smaller than the effective pixel size, this may result in dashed lines turning into solid gray-ish lines. This also required slightly tweaking the default patterns for '--', ':', and '.-' so that with the default line width the final patterns would not change.

There is no way to restore the old behavior.

Deprecate 'Vega' color maps

The "Vega" colormaps are deprecated in Matplotlib 2.0.1 and will be removed in Matplotlib 2.2. Use the "tab" colormaps instead: "tab10", "tab20", "tab20b", "tab20c".

16.1.13 API Changes in 2.0.0

Deprecation and removal

Color of Axes

The `axisbg` and `axis_bgcolor` properties on *Axes* have been deprecated in favor of `facecolor`.

GTK and GDK backends deprecated

The GDK and GTK backends have been deprecated. These obsolete backends allow figures to be rendered via the GDK API to files and GTK2 figures. They are untested and known to be broken, and their use has been discouraged for some time. Instead, use the `GTKAgg` and `GTKCairo` backends for rendering to GTK2 windows.

WX backend deprecated

The WX backend has been deprecated. It is untested, and its use has been discouraged for some time. Instead, use the `WXAgg` backend for rendering figures to WX windows.

CocoaAgg backend removed

The deprecated and not fully functional CocoaAgg backend has been removed.

`round` removed from TkAgg Backend

The TkAgg backend had its own implementation of the `round` function. This was unused internally and has been removed. Instead, use either the `round` builtin function or `numpy.around`.

'hold' functionality deprecated

The 'hold' keyword argument and all functions and methods related to it are deprecated, along with the `axes.hold` rcParams entry. The behavior will remain consistent with the default `hold=True` state that has long been in place. Instead of using a function or keyword argument (`hold=False`) to change that behavior, explicitly clear the axes or figure as needed prior to subsequent plotting commands.

`Artist.update` has return value

The methods *matplotlib.artist.Artist.set*, *matplotlib.artist.Artist.update*, and the function *matplotlib.artist.setp* now use a common codepath to look up how to update the given artist properties (either using the setter methods or an attribute/property).

The behavior of *matplotlib.artist.Artist.update* is slightly changed to return a list of the values returned from the setter methods to avoid changing the API of *matplotlib.artist.Artist.set* and *matplotlib.artist.setp*.

The keys passed into *matplotlib.artist.Artist.update* are now converted to lower case before being processed, to match the behavior of *matplotlib.artist.Artist.set*

and *matplotlib.artist.setp*. This should not break any user code because there are no set methods with capitals in their names, but this puts a constraint on naming properties in the future.

Legend initializers gain *edgecolor* and *facecolor* keyword arguments

The *Legend* background patch (or 'frame') can have its `edgecolor` and `facecolor` determined by the corresponding keyword arguments to the *matplotlib.legend.Legend* initializer, or to any of the methods or functions that call that initializer. If left to their default values of `None`, their values will be taken from `matplotlib.rcParams`. The previously-existing `framealpha` kwarg still controls the alpha transparency of the patch.

Qualitative colormaps

Colorbrewer's qualitative/discrete colormaps ("Accent", "Dark2", "Paired", "Pastel1", "Pastel2", "Set1", "Set2", "Set3") are now implemented as *ListedColormap* instead of *LinearSegmentedColormap*.

To use these for images where categories are specified as integers, for instance, use:

```
plt.imshow(x, cmap='Dark2', norm=colors.NoNorm())
```

Change in the `draw_image` backend API

The `draw_image` method implemented by backends has changed its interface.

This change is only relevant if the backend declares that it is able to transform images by returning `True` from `option_scale_image`. See the `draw_image` docstring for more information.

`matplotlib.ticker.LinearLocator` algorithm update

The *matplotlib.ticker.LinearLocator* is used to define the range and location of axis ticks when the user wants an exact number of ticks. `LinearLocator` thus differs from the default locator `MaxNLocator`, for which the user specifies a maximum number of intervals rather than a precise number of ticks.

The view range algorithm in `matplotlib.ticker.LinearLocator` has been changed so that more convenient tick locations are chosen. The new algorithm returns a plot view range that is a multiple of the user-requested number of ticks. This ensures tick marks will be located at whole integers more consistently. For example, when both y-axes of a``twinx`` plot use `matplotlib.ticker.LinearLocator` with the same number of ticks, their y-tick locations and grid lines will coincide.

`matplotlib.ticker.LogLocator` gains numticks kwarg

The maximum number of ticks generated by the *`LogLocator`* can now be controlled explicitly via setting the new 'numticks' kwarg to an integer. By default the kwarg is None which internally sets it to the 'auto' string, triggering a new algorithm for adjusting the maximum according to the axis length relative to the ticklabel font size.

`matplotlib.ticker.LogFormatter`: two new kwargs

Previously, minor ticks on log-scaled axes were not labeled by default. An algorithm has been added to the *`LogFormatter`* to control the labeling of ticks between integer powers of the base. The algorithm uses two parameters supplied in a kwarg tuple named 'minor_thresholds'. See the docstring for further explanation.

To improve support for axes using *`SymmetricalLogLocator`*, a *linthresh* keyword argument was added.

New defaults for 3D quiver function in mpl_toolkits.mplot3d.axes3d.py

Matplotlib has both a 2D and a 3D `quiver` function. These changes affect only the 3D function and make the default behavior of the 3D function match the 2D version. There are two changes:

1) The 3D quiver function previously normalized the arrows to be the same length, which makes it unusable for situations where the arrows should be different lengths and does not match the behavior of the 2D function. This normalization behavior is now controlled with the `normalize` keyword, which defaults to False.
2) The `pivot` keyword now defaults to `tail` instead of `tip`. This was done in order to match the default behavior of the 2D quiver function.

To obtain the previous behavior with the 3D quiver function, one can call the function with

```
ax.quiver(x, y, z, u, v, w, normalize=True, pivot='tip')
```

where "ax" is an `Axes3d` object created with something like

```
import mpl_toolkits.mplot3d.axes3d
ax = plt.subplot(111, projection='3d')
```

Stale figure behavior

Attempting to draw the figure will now mark it as not stale (independent if the draw succeeds). This change is to prevent repeatedly trying to re-draw a figure which is raising an error on draw. The previous behavior would only mark a figure as not stale after a full re-draw succeeded.

The spectral colormap is now nipy_spectral

The colormaps formerly known as `spectral` and `spectral_r` have been replaced by `nipy_spectral` and `nipy_spectral_r` since Matplotlib 1.3.0. Even though the colormap was deprecated in Matplotlib 1.3.0, it never raised a warning. As of Matplotlib 2.0.0, using the old names raises a deprecation warning. In the future, using the old names will raise an error.

Default install no longer includes test images

To reduce the size of wheels and source installs, the tests and baseline images are no longer included by default.

To restore installing the tests and images, use a `setup.cfg` with

```
[packages]
tests = True
toolkits_tests = True
```

in the source directory at build/install time.

16.1.14 Changes in 1.5.3

`ax.plot(..., marker=None)` gives default marker

Prior to 1.5.3 keyword arguments passed to *`plot`* were handled in two parts -- default keyword arguments generated internal to *`plot`* (such as the cycled styles) and user supplied keyword arguments. The internally generated keyword arguments were passed to the *`matplotlib.lines.Line2D`* and the user keyword arguments were passed to `ln.set(**kwargs)` to update the artist after it was created. Now both sets of keyword arguments are merged and passed to *`Line2D`*. This change was made to allow *None* to be passed in via the user keyword arguments to mean 'do the default thing' as is the convention through out Matplotlib rather than raising an exception.

Unlike most *`Line2D`* setter methods *`set_marker`* did accept `None` as a valid input which was mapped to 'no marker'. Thus, by routing this `marker=None` through `__init__` rather than `set(...)` the meaning of `ax.plot(..., marker=None)` changed from 'no markers' to 'default markers from rcparams'.

This is change is only evident if `mpl.rcParams['lines.marker']` has a value other than `'None'` (which is string `'None'` which means 'no marker').

16.1.15 Changes in 1.5.2

Default Behavior Changes

Changed default `autorange` behavior in boxplots

Prior to v1.5.2, the whiskers of boxplots would extend to the minimum and maximum values if the quartiles were all equal (i.e., Q1 = median = Q3). This behavior has been disabled by default to restore consistency with other plotting packages.

To restore the old behavior, simply set `autorange=True` when calling `plt.boxplot`.

16.1.16 Changes in 1.5.0

Code Changes

Reversed `matplotlib.cbook.ls_mapper`, added `ls_mapper_r`

Formerly, `matplotlib.cbook.ls_mapper` was a dictionary with the long-form line-style names (`"solid"`) as keys and the short forms (`"-"`) as values. This long-to-short mapping is now done by `ls_mapper_r`, and the short-to-long mapping is done by the `ls_mapper`.

Prevent moving artists between Axes, Property-ify Artist.axes, deprecate Artist.{get,set}_axes

This was done to prevent an Artist that is already associated with an Axes from being moved/added to a different Axes. This was never supported as it causes havoc with the transform stack. The apparent support for this (as it did not raise an exception) was the source of multiple bug reports and questions on SO.

For almost all use-cases, the assignment of the axes to an artist should be taken care of by the axes as part of the `Axes.add_*` method, hence the deprecation of {get,set}_axes.

Removing the `set_axes` method will also remove the 'axes' line from the ACCEPTS kwarg tables (assuming that the removal date gets here before that gets overhauled).

Tightened input validation on 'pivot' kwarg to quiver

Tightened validation so that only {'tip', 'tail', 'mid', and 'middle'} (but any capitalization) are valid values for the *pivot* keyword argument in the *Quiver* class (and hence *axes.Axes.quiver* and *pyplot.quiver* which both fully delegate to *Quiver*). Previously any input matching 'mid.*' would be interpreted as 'middle', 'tip.*' as 'tip' and any string not matching one of those patterns as 'tail'.

The value of `Quiver.pivot` is normalized to be in the set {'tip', 'tail', 'middle'} in *Quiver*.

Reordered `Axes.get_children`

The artist order returned by *axes.Axes.get_children* did not match the one used by *axes.Axes.draw*. They now use the same order, as *axes.Axes.draw* now calls *axes.Axes.get_children*.

Changed behaviour of contour plots

The default behaviour of *contour()* and *contourf()* when using a masked array is now determined by the new keyword argument *corner_mask*, or if this is not specified then the new `rcParams["contour.corner_mask"]` (default: `True`) instead. The new default behaviour is equivalent to using `corner_mask=True`; the previous behaviour can be obtained using `corner_mask=False` or by changing the rcParam. The example http://matplotlib.org/examples/pylab_examples/contour_corner_mask.html demonstrates the difference. Use of the old contouring algorithm, which is obtained with `corner_mask='legacy'`, is now deprecated.

Contour labels may now appear in different places than in earlier versions of Matplotlib.

In addition, the keyword argument *nchunk* now applies to *contour()* as well as *contourf()*, and it subdivides the domain into subdomains of exactly *nchunk* by *nchunk* quads, whereas previously it was only roughly *nchunk* by *nchunk* quads.

The C/C++ object that performs contour calculations used to be stored in the public attribute `QuadContourSet.Cntr`, but is now stored in a private attribute and should not be accessed by end users.

Added set_params function to all Locator types

This was a bug fix targeted at making the api for Locators more consistent.

In the old behavior, only locators of type MaxNLocator have set_params() defined, causing its use on any other Locator to raise an AttributeError *(aside: set_params(args) is a function that sets the parameters of a Locator instance to be as specified within args)*. The fix involves moving set_params() to the Locator class such that all subtypes will have this function defined.

Since each of the Locator subtypes have their own modifiable parameters, a universal set_params() in Locator isn't ideal. Instead, a default no-operation function that raises a warning is implemented in Locator. Subtypes extending Locator will then override with their own implementations. Subtypes that do not have a need for set_params() will fall back onto their parent's implementation, which raises a warning as intended.

In the new behavior, Locator instances will not raise an AttributeError when set_params() is called. For Locators that do not implement set_params(), the default implementation in Locator is used.

Disallow `None` as x or y value in ax.plot

Do not allow `None` as a valid input for the `x` or `y` args in *`axes.Axes.plot`*. This may break some user code, but this was never officially supported (ex documented) and allowing `None` objects through can lead to confusing exceptions downstream.

To create an empty line use

```
ln1, = ax.plot([], [], ...)
ln2, = ax.plot([], ...)
```

In either case to update the data in the *`Line2D`* object you must update both the `x` and `y` data.

Removed *args* and *kwargs* from `MicrosecondLocator.__call__`

The call signature of `__call__()` has changed from `__call__(self, *args, **kwargs)` to `__call__(self)`. This is consistent with the superclass *`Locator`* and also all the other Locators derived from this superclass.

No `ValueError` for the MicrosecondLocator and YearLocator

The *MicrosecondLocator* and *YearLocator* objects when called will return an empty list if the axes have no data or the view has no interval. Previously, they raised a `ValueError`. This is consistent with all the Date Locators.

'OffsetBox.DrawingArea' respects the 'clip' keyword argument

The call signature was `OffsetBox.DrawingArea(..., clip=True)` but nothing was done with the *clip* argument. The object did not do any clipping regardless of that parameter. Now the object can and does clip the child *Artist*s if they are set to be clipped.

You can turn off the clipping on a per-child basis using `child.set_clip_on(False)`.

Add salt to clipPath id

Add salt to the hash used to determine the id of the `clipPath` nodes. This is to avoid conflicts when two svg documents with the same clip path are included in the same document (see https://github.com/ipython/ipython/issues/8133 and https://github.com/matplotlib/matplotlib/issues/4349), however this means that the svg output is no longer deterministic if the same figure is saved twice. It is not expected that this will affect any users as the current ids are generated from an md5 hash of properties of the clip path and any user would have a very difficult time anticipating the value of the id.

Changed snap threshold for circle markers to inf

When drawing circle markers above some marker size (previously 6.0) the path used to generate the marker was snapped to pixel centers. However, this ends up distorting the marker away from a circle. By setting the snap threshold to inf snapping is never done on circles.

This change broke several tests, but is an improvement.

Preserve units with Text position

Previously the 'get_position' method on Text would strip away unit information even though the units were still present. There was no inherent need to do this, so it has been changed so that unit data (if present) will be preserved. Essentially a call to 'get_position' will return the exact value from a call to 'set_position'.

If you wish to get the old behaviour, then you can use the new method called 'get_unitless_position'.

New API for custom Axes view changes

Interactive pan and zoom were previously implemented using a Cartesian-specific algorithm that was not necessarily applicable to custom Axes. Three new private methods, `matplotlib.axes._base._AxesBase._get_view`, `matplotlib.axes._base._AxesBase._set_view`, and `matplotlib.axes._base._AxesBase._set_view_from_bbox`, allow for custom *Axes* classes to override the pan and zoom algorithms. Implementors of custom *Axes* who override these methods may provide suitable behaviour for both pan and zoom as well as the view navigation buttons on the interactive toolbars.

MathTex visual changes

The spacing commands in mathtext have been changed to more closely match vanilla TeX.

Improved spacing in mathtext

The extra space that appeared after subscripts and superscripts has been removed.

No annotation coordinates wrap

In #2351 for 1.4.0 the behavior of ['axes points', 'axes pixel', 'figure points', 'figure pixel'] as coordinates was change to no longer wrap for negative values. In 1.4.3 this change was reverted for 'axes points' and 'axes pixel' and in addition caused 'axes fraction' to wrap. For 1.5 the behavior has been reverted to as it was in 1.4.0-1.4.2, no wrapping for any type of coordinate.

Deprecation

Deprecated `GraphicsContextBase.set_graylevel`

The `GraphicsContextBase.set_graylevel` function has been deprecated in 1.5 and will be removed in 1.6. It has been unused. The *`GraphicsContextBase.set_foreground`* could be used instead.

deprecated idle_event

The `idle_event` was broken or missing in most backends and causes spurious warnings in some cases, and its use in creating animations is now obsolete due to the animations module. Therefore code involving it has been removed from all but the wx backend (where it partially works), and its use is deprecated. The *animation* module may be used instead to create animations.

`color_cycle` deprecated

In light of the new property cycling feature, the Axes method `set_color_cycle` is now deprecated. Calling this method will replace the current property cycle with one that cycles just the given colors.

Similarly, the rc parameter *axes.color_cycle* is also deprecated in lieu of the new `rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`) parameter. Having both parameters in the same rc file is not recommended as the result cannot be predicted. For compatibility, setting *axes.color_cycle* will replace the cycler in `rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`) with a color cycle. Accessing *axes.color_cycle* will return just the color portion of the property cycle, if it exists.

Timeline for removal has not been set.

Bundled jquery

The version of jquery bundled with the webagg backend has been upgraded from 1.7.1 to 1.11.3. If you are using the version of jquery bundled with webagg you will need to update your html files as such

```
-    <script src="_static/jquery/js/jquery-1.7.1.min.js"></script>
+    <script src="_static/jquery/js/jquery-1.11.3.min.js"></script>
```

Code Removed

Removed `Image` from main namespace

`Image` was imported from PIL/pillow to test if PIL is available, but there is no reason to keep `Image` in the namespace once the availability has been determined.

Removed `lod` from Artist

Removed the method `set_lod` and all references to the attribute `_lod` as they are not used anywhere else in the code base. It appears to be a feature stub that was never built out.

Removed threading related classes from cbook

The classes `Scheduler`, `Timeout`, and `Idle` were in cbook, but are not used internally. They appear to be a prototype for the idle event system which was not working and has recently been pulled out.

Removed *Lena* images from sample_data

The `lena.png` and `lena.jpg` images have been removed from Matplotlib's sample_data directory. The images are also no longer available from *matplotlib.cbook.get_sample_data*. We suggest using `matplotlib.cbook.get_sample_data('grace_hopper.png')` or `matplotlib.cbook.get_sample_data('grace_hopper.jpg')` instead.

Legend

Removed handling of *loc* as a positional argument to *Legend*

Legend handlers

Remove code to allow legend handlers to be callable. They must now implement a method `legend_artist`.

Axis

Removed method `set_scale`. This is now handled via a private method which should not be used directly by users. It is called via `Axes.set_{x,y}scale` which takes care of ensuring the related changes are also made to the Axes object.

finance.py

Removed functions with ambiguous argument order from finance.py

Annotation

Removed `textcoords` and `xytext` proprieties from Annotation objects.

sphinxext.ipython_*.py

Both `ipython_console_highlighting` and `ipython_directive` have been moved to IPython.

Change your import from `matplotlib.sphinxext.ipython_directive` to `IPython.sphinxext.ipython_directive` and from `matplotlib.sphinxext.ipython_directive` to `IPython.sphinxext.ipython_directive`

LineCollection.color

Deprecated in 2005, use `set_color`

remove `'faceted'` as a valid value for *shading* in `tri.tripcolor`

Use *edgecolor* instead. Added validation on *shading* to only be valid values.

Remove `faceted` kwarg from scatter

Remove support for the `faceted` kwarg. This was deprecated in d48b34288e9651ff95c3b8a071ef5ac5cf50bae7 (2008-04-18!) and replaced by `edgecolor`.

Remove `set_colorbar` method from `ScalarMappable`

Remove `set_colorbar` method, use *`colorbar`* attribute directly.

patheffects.svg

- remove `get_proxy_renderer` method from `AbstarctPathEffect` class
- remove `patch_alpha` and `offset_xy` from `SimplePatchShadow`

Remove `testing.image_util.py`

Contained only a no-longer used port of functionality from PIL

Remove `mlab.FIFOBuffer`

Not used internally and not part of core mission of mpl.

Remove `mlab.prepca`

Deprecated in 2009.

Remove `NavigationToolbar2QTAgg`

Added no functionality over the base `NavigationToolbar2Qt`

mpl.py

Remove the module `matplotlib.mpl`. Deprecated in 1.3 by PR #1670 and commit 78ce67d161625833cacff23cfe5d74920248c5b2

16.1.17 Changes in 1.4.x

Code changes

- A major refactoring of the axes module was made. The axes module has been split into smaller modules:
  - the `_base` module, which contains a new private `_AxesBase` class. This class contains all methods except plotting and labelling methods.
  - the *`axes`* module, which contains the *`axes.Axes`* class. This class inherits from `_AxesBase`, and contains all plotting and labelling methods.
  - the `_subplot` module, with all the classes concerning subplotting.

There are a couple of things that do not exists in the *axes* module's namespace anymore. If you use them, you need to import them from their original location:

- `math -> import math`
- `ma -> from numpy import ma`
- `cbook -> from matplotlib import cbook`
- `docstring -> from matplotlib import docstring`
- `is_sequence_of_strings -> from matplotlib.cbook import is_sequence_of_strings`
- `is_string_like -> from matplotlib.cbook import is_string_like`
- `iterable -> from matplotlib.cbook import iterable`
- `itertools -> import itertools`
- `martist -> from matplotlib import artist as martist`
- `matplotlib -> import matplotlib`
- `mcoll -> from matplotlib import collections as mcoll`
- `mcolors -> from matplotlib import colors as mcolors`
- `mcontour -> from matplotlib import contour as mcontour`
- `mpatches -> from matplotlib import patches as mpatches`
- `mpath -> from matplotlib import path as mpath`
- `mquiver -> from matplotlib import quiver as mquiver`
- `mstack -> from matplotlib import stack as mstack`
- `mstream -> from matplotlib import stream as mstream`
- `mtable -> from matplotlib import table as mtable`
- As part of the refactoring to enable Qt5 support, the module `matplotlib.backends.qt4_compat` was renamed to `matplotlib.backends.qt_compat`. `qt4_compat` is deprecated in 1.4 and will be removed in 1.5.
- The *errorbar()* method has been changed such that the upper and lower limits (*lolims*, *uplims*, *xlolims*, *xuplims*) now point in the correct direction.
- The *fmt* kwarg for *errorbar()* now supports the string 'none' to suppress drawing of a line and markers; use of the *None* object for this is deprecated. The default *fmt* value is changed to the empty string (''), so the line and markers are governed by the *plot()* defaults.
- A bug has been fixed in the path effects rendering of fonts, which now means that the font size is consistent with non-path effect fonts. See https://github.com/matplotlib/matplotlib/issues/2889 for more detail.
- The Sphinx extensions `ipython_directive` and `ipython_console_highlighting` have been moved to the IPython project itself. While they remain in Matplotlib for this release, they have been deprecated. Update your extensions in `conf.py`

to point to `IPython.sphinxext.ipython_directive` instead of `matplotlib.sphinxext.ipython_directive`.

- In `matplotlib.finance`, almost all functions have been deprecated and replaced with a pair of functions name `*_ochl` and `*_ohlc`. The former is the 'open-close-high-low' order of quotes used previously in this module, and the latter is the 'open-high-low-close' order that is standard in finance.
- For consistency the `face_alpha` keyword to *matplotlib.patheffects.SimplePatchShadow* has been deprecated in favour of the `alpha` keyword. Similarly, the keyword `offset_xy` is now named `offset` across all *AbstractPathEffect*s. `matplotlib.patheffects._Base` has been renamed to *matplotlib.patheffects.AbstractPathEffect*. `matplotlib.patheffect.ProxyRenderer` has been renamed to *matplotlib.patheffects.PathEffectRenderer* and is now a full RendererBase subclass.
- The artist used to draw the outline of a *Figure.colorbar* has been changed from a *matplotlib.lines.Line2D* to *matplotlib.patches.Polygon*, thus `colorbar.ColorbarBase.outline` is now a *matplotlib.patches.Polygon* object.
- The legend handler interface has changed from a callable, to any object which implements the `legend_artists` method (a deprecation phase will see this interface be maintained for v1.4). See *Legend guide* for further details. Further legend changes include:
  - `matplotlib.axes.Axes._get_legend_handles` now returns a generator of handles, rather than a list.
  - The *legend()* function's *loc* positional argument has been deprecated. Use the *loc* keyword argument instead.
- The `rcParams["savefig.transparent"]` (default: `False`) has been added to control default transparency when saving figures.
- Slightly refactored the *Annotation* family. The text location in *Annotation* is now entirely handled by the underlying *Text* object so `.set_position` works as expected. The attributes *xytext* and *textcoords* have been deprecated in favor of *xyann* and *anncoords* so that *Annotation* and *AnnotationBbox* can share a common sensibly named api for getting/setting the location of the text or box.
  - *xyann* -> set the location of the annotation
  - *xy* -> set where the arrow points to
  - *anncoords* -> set the units of the annotation location
  - *xycoords* -> set the units of the point location
  - `set_position()` -> *Annotation* only set location of annotation
- *matplotlib.mlab.specgram*, *matplotlib.mlab.psd*, *matplotlib.mlab.csd*, *matplotlib.mlab.cohere*, `matplotlib.mlab.cohere_pairs`, *matplotlib.pyplot.specgram*, *matplotlib.pyplot.psd*, *matplotlib.pyplot.csd*, and *matplotlib.pyplot.cohere* now raise ValueError where they previously raised AssertionError.

- For *matplotlib.mlab.psd*, *matplotlib.mlab.csd*, *matplotlib.mlab.cohere*, matplotlib.mlab.cohere_pairs, *matplotlib.pyplot.specgram*, *matplotlib.pyplot.psd*, *matplotlib.pyplot.csd*, and *matplotlib.pyplot.cohere*, in cases where a shape (n, 1) array is returned, this is now converted to a (n,) array. Previously, (n, m) arrays were averaged to an (n,) array, but (n, 1) arrays were returned unchanged. This change makes the dimensions consistent in both cases.
- Added the rcParams["axes.formatter.useoffset"] (default: True) to control the default value of *useOffset* in *ticker.ScalarFormatter*
- Added *Formatter* sub-class *StrMethodFormatter* which does the exact same thing as *FormatStrFormatter*, but for new-style formatting strings.
- Deprecated matplotlib.testing.image_util and the only function within, matplotlib.testing.image_util.autocontrast. These will be removed completely in v1.5.0.
- The fmt argument of *plot_date()* has been changed from bo to just o, so color cycling can happen by default.
- Removed the class FigureManagerQTAgg and deprecated NavigationToolbar2QTAgg which will be removed in 1.5.
- Removed formerly public (non-prefixed) attributes rect and drawRect from FigureCanvasQTAgg; they were always an implementation detail of the (preserved) drawRectangle() function.
- The function signatures of tight_bbox.adjust_bbox and tight_bbox.process_figure_for_rasterizing have been changed. A new *fixed_dpi* parameter allows for overriding the figure.dpi setting instead of trying to deduce the intended behaviour from the file format.
- Added support for horizontal/vertical axes padding to *mpl_toolkits.axes_grid1.axes_grid.ImageGrid* --- argument *axes_pad* can now be tuple-like if separate axis padding is required. The original behavior is preserved.
- Added support for skewed transforms to *matplotlib.transforms.Affine2D*, which can be created using the *skew* and *skew_deg* methods.
- Added clockwise parameter to control sectors direction in *axes.Axes.pie*
- In *matplotlib.lines.Line2D* the *markevery* functionality has been extended. Previously an integer start-index and stride-length could be specified using either a two-element-list or a two-element-tuple. Now this can only be done using a two-element-tuple. If a two-element-list is used then it will be treated as NumPy fancy indexing and only the two markers corresponding to the given indexes will be shown.
- Removed *prop* keyword argument from *mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar* call. It was passed through to the base-class __init__ and is only used for setting padding. Now *fontproperties* (which is what is really used to set the font properties of *AnchoredSizeBar*) is passed through in place of *prop*. If *fontproperties* is not passed in, but *prop* is, then *prop* is used in place of *fontproperties*. If both are passed in, *prop* is silently ignored.

- The use of the index 0 in *pyplot.subplot* and related commands is deprecated. Due to a lack of validation, calling `plt.subplots(2, 2, 0)` does not raise an exception, but puts an axes in the _last_ position. This is due to the indexing in subplot being 1-based (to mirror MATLAB) so before indexing into the *GridSpec* object used to determine where the axes should go, 1 is subtracted off. Passing in 0 results in passing -1 to *GridSpec* which results in getting the last position back. Even though this behavior is clearly wrong and not intended, we are going through a deprecation cycle in an abundance of caution that any users are exploiting this 'feature'. The use of 0 as an index will raise a warning in 1.4 and an exception in 1.5.
- Clipping is now off by default on offset boxes.
- Matplotlib now uses a less-aggressive call to `gc.collect(1)` when closing figures to avoid major delays with large numbers of user objects in memory.
- The default clip value of *all* pie artists now defaults to `False`.

Code removal

- Removed `mlab.levypdf`. The code raised a NumPy error (and has for a long time) and was not the standard form of the Levy distribution. `scipy.stats.levy` should be used instead

16.1.18 Changes in 1.3.x

Changes in 1.3.1

It is rare that we make an API change in a bugfix release, however, for 1.3.1 since 1.3.0 the following change was made:

- `text.Text.cached` (used to cache font objects) has been made into a private variable. Among the obvious encapsulation benefit, this removes this confusing-looking member from the documentation.
- The method *hist()* now always returns bin occupancies as an array of type `float`. Previously, it was sometimes an array of type `int`, depending on the call.

Code removal

- The following items that were deprecated in version 1.2 or earlier have now been removed completely.
  - The Qt 3.x backends (`qt` and `qtagg`) have been removed in favor of the Qt 4.x backends (`qt4` and `qt4agg`).
  - The FltkAgg and Emf backends have been removed.

- The `matplotlib.nxutils` module has been removed. Use the functionality on *matplotlib.path.Path.contains_point* and friends instead.
- Instead of `axes.Axes.get_frame`, use `axes.Axes.patch`.
- The following keyword arguments to the *legend* function have been renamed:
  * *pad* -> *borderpad*
  * *labelsep* -> *labelspacing*
  * *handlelen* -> *handlelength*
  * *handletextsep* -> *handletextpad*
  * *axespad* -> *borderaxespad*

  Related to this, the following rcParams have been removed:
  * `legend.pad`,
  * `legend.labelsep`,
  * `legend.handlelen`,
  * `legend.handletextsep` and
  * `legend.axespad`
- For the *hist* function, instead of *width*, use *rwidth* (relative width).
- On *patches.Circle*, the *resolution* keyword argument has been removed. For a circle made up of line segments, use *patches.CirclePolygon*.
- The printing functions in the Wx backend have been removed due to the burden of keeping them up-to-date.
- `mlab.liaupunov` has been removed.
- `mlab.save`, `mlab.load`, `pylab.save` and `pylab.load` have been removed. We recommend using `numpy.savetxt` and `numpy.loadtxt` instead.
- `widgets.HorizontalSpanSelector` has been removed. Use *widgets.SpanSelector* instead.

Code deprecation

- The CocoaAgg backend has been deprecated, with the possibility for deletion or resurrection in a future release.
- The top-level functions in *matplotlib.path* that are implemented in C++ were never meant to be public. Instead, users should use the Pythonic wrappers for them in the *path.Path* and *collections.Collection* classes. Use the following mapping to update your code:
  - `point_in_path` -> *path.Path.contains_point*
  - `get_path_extents` -> *path.Path.get_extents*

  - point_in_path_collection -> *collections.Collection.contains*
  - path_in_path -> *path.Path.contains_path*
  - path_intersects_path -> *path.Path.intersects_path*
  - convert_path_to_polygons -> *path.Path.to_polygons*
  - cleanup_path -> *path.Path.cleaned*
  - points_in_path -> *path.Path.contains_points*
  - clip_path_to_rect -> *path.Path.clip_to_bbox*

- `matplotlib.colors.normalize` and `matplotlib.colors.no_norm` have been deprecated in favour of *matplotlib.colors.Normalize* and *matplotlib.colors.NoNorm* respectively.
- The *ScalarMappable* class' `set_colorbar` method is now deprecated. Instead, the *matplotlib.cm.ScalarMappable.colorbar* attribute should be used. In previous Matplotlib versions this attribute was an undocumented tuple of `(colorbar_instance, colorbar_axes)` but is now just `colorbar_instance`. To get the colorbar axes it is possible to just use the `ax` attribute on a colorbar instance.
- The `matplotlib.mpl` module is now deprecated. Those who relied on this module should transition to simply using `import matplotlib as mpl`.

Code changes

- *Patch* now fully supports using RGBA values for its `facecolor` and `edgecolor` attributes, which enables faces and edges to have different alpha values. If the *Patch* object's `alpha` attribute is set to anything other than `None`, that value will override any alpha-channel value in both the face and edge colors. Previously, if *Patch* had `alpha=None`, the alpha component of `edgecolor` would be applied to both the edge and face.
- The optional `isRGB` argument to *set_foreground()* (and the other GraphicsContext classes that descend from it) has been renamed to `isRGBA`, and should now only be set to `True` if the `fg` color argument is known to be an RGBA tuple.
- For *Patch*, the `capstyle` used is now `butt`, to be consistent with the default for most other objects, and to avoid problems with non-solid `linestyle` appearing solid when using a large `linewidth`. Previously, *Patch* used `capstyle='projecting'`.
- *Path* objects can now be marked as *readonly* by passing `readonly=True` to its constructor. The built-in path singletons, obtained through `Path.unit*` class methods return readonly paths. If you have code that modified these, you will need to make a deepcopy first, using either:

```
import copy
path = copy.deepcopy(Path.unit_circle())
```

(continues on next page)

(continued from previous page)

```
# or

path = Path.unit_circle().deepcopy()
```

Deep copying a *Path* always creates an editable (i.e. non-readonly) *Path*.

- The list at `Path.NUM_VERTICES` was replaced by a dictionary mapping Path codes to the number of expected vertices at *NUM_VERTICES_FOR_CODE*.
- To support XKCD style plots, the `matplotlib.path.cleanup_path` method's signature was updated to require a sketch argument. Users of `matplotlib.path.cleanup_path` are encouraged to use the new *cleaned()* Path method.
- Data limits on a plot now start from a state of having "null" limits, rather than limits in the range (0, 1). This has an effect on artists that only control limits in one direction, such as *axes.Axes.axvline* and *axes.Axes.axhline*, since their limits will no longer also include the range (0, 1). This fixes some problems where the computed limits would be dependent on the order in which artists were added to the axes.
- Fixed a bug in setting the position for the right/top spine with data position type. Previously, it would draw the right or top spine at +1 data offset.
- In *FancyArrow*, the default arrow head width, `head_width`, has been made larger to produce a visible arrow head. The new value of this kwarg is `head_width = 20 * width`.
- It is now possible to provide `number of levels + 1` colors in the case of `extend='both'` for contourf (or just `number of levels` colors for an extend value `min` or `max`) such that the resulting colormap's `set_under` and `set_over` are defined appropriately. Any other number of colors will continue to behave as before (if more colors are provided than levels, the colors will be unused). A similar change has been applied to contour, where `extend='both'` would expect `number of levels + 2` colors.
- A new keyword *extendrect* in *colorbar()* and *ColorbarBase* allows one to control the shape of colorbar extensions.
- The extension of *MultiCursor* to both vertical (default) and/or horizontal cursor implied that `self.line` is replaced by `self.vline` for vertical cursors lines and `self.hline` is added for the horizontal cursors lines.
- On POSIX platforms, the *report_memory()* function raises `NotImplementedError` instead of `OSError` if the `ps` command cannot be run.
- The `matplotlib.cbook.check_output` function has been moved to `matplotlib.compat.subprocess`.

Configuration and rcParams

- On Linux, the user-specific `matplotlibrc` configuration file is now located in `~/.config/matplotlib/matplotlibrc` to conform to the XDG Base Directory Specification.
- The `font.*` rcParams now affect only text objects created after the rcParam has been set, and will not retroactively affect already existing text objects. This brings their behavior in line with most other rcParams.
- Removed call of *grid()* in `matplotlib.pyplot.plotfile`. To draw the axes grid, set the `axes.grid` rcParam to *True*, or explicitly call *grid()*.

16.1.19 Changes in 1.2.x

- The `classic` option of the rc parameter `toolbar` is deprecated and will be removed in the next release.
- The `matplotlib.cbook.isvector` method has been removed since it is no longer functional.
- The `rasterization_zorder` property on *Axes* sets a zorder below which artists are rasterized. This has defaulted to -30000.0, but it now defaults to *None*, meaning no artists will be rasterized. In order to rasterize artists below a given zorder value, *set_rasterization_zorder* must be explicitly called.
- In *scatter()*, and *scatter*, when specifying a marker using a tuple, the angle is now specified in degrees, not radians.
- Using *twinx()* or *twiny()* no longer overrides the current locaters and formatters on the axes.
- In *contourf()*, the handling of the *extend* kwarg has changed. Formerly, the extended ranges were mapped after to 0, 1 after being normed, so that they always corresponded to the extreme values of the colormap. Now they are mapped outside this range so that they correspond to the special colormap values determined by the *set_under()* and *set_over()* methods, which default to the colormap end points.
- The new rc parameter `savefig.format` replaces `cairo.format` and `savefig.extension`, and sets the default file format used by *matplotlib.figure.Figure.savefig()*.
- In *pyplot.pie()* and *axes.Axes.pie()*, one can now set the radius of the pie; setting the *radius* to 'None' (the default value), will result in a pie with a radius of 1 as before.
- Use of `matplotlib.projections.projection_factory` is now deprecated in favour of axes class identification using `matplotlib.projections.process_projection_requirements` followed by direct axes class invocation

(at the time of writing, functions which do this are: *add_axes()*, *add_subplot()* and *gca()*). Therefore:

```
key = figure._make_key(*args, **kwargs)
ispolar = kwargs.pop('polar', False)
projection = kwargs.pop('projection', None)
if ispolar:
    if projection is not None and projection != 'polar':
        raise ValueError('polar and projection args are inconsistent')
    projection = 'polar'
ax = projection_factory(projection, self, rect, **kwargs)
key = self._make_key(*args, **kwargs)

# is now

projection_class, kwargs, key = \
                  process_projection_requirements(self, *args, **kwargs)
ax = projection_class(self, rect, **kwargs)
```

This change means that third party objects can expose themselves as Matplotlib axes by providing a `_as_mpl_axes` method. See *Developer's guide for creating scales and transformations* for more detail.

- A new keyword *extendfrac* in *colorbar()* and *ColorbarBase* allows one to control the size of the triangular minimum and maximum extensions on colorbars.
- A new keyword *capthick* in *errorbar()* has been added as an intuitive alias to the *markeredgewidth* and *mew* keyword arguments, which indirectly controlled the thickness of the caps on the errorbars. For backwards compatibility, specifying either of the original keyword arguments will override any value provided by *capthick*.
- Transform subclassing behaviour is now subtly changed. If your transform implements a non-affine transformation, then it should override the `transform_non_affine` method, rather than the generic `transform` method. Previously transforms would define `transform` and then copy the method into `transform_non_affine`:

```
class MyTransform(mtrans.Transform):
    def transform(self, xy):
        ...
    transform_non_affine = transform
```

This approach will no longer function correctly and should be changed to:

```
class MyTransform(mtrans.Transform):
    def transform_non_affine(self, xy):
        ...
```

- Artists no longer have `x_isdata` or `y_isdata` attributes; instead any artist's transform can be interrogated with `artist_instance.get_transform().contains_branch(ax.transData)`

- Lines added to an axes now take into account their transform when updating the data and view limits. This means transforms can now be used as a pre-transform. For instance:

```
>>> import matplotlib.pyplot as plt
>>> import matplotlib.transforms as mtrans
>>> ax = plt.axes()
>>> ax.plot(range(10), transform=mtrans.Affine2D().scale(10) + ax.transData)
>>> print(ax.viewLim)
Bbox('array([[  0.,   0.],\n       [ 90.,  90.]])')
```

- One can now easily get a transform which goes from one transform's coordinate system to another, in an optimized way, using the new subtract method on a transform. For instance, to go from data coordinates to axes coordinates:

```
>>> import matplotlib.pyplot as plt
>>> ax = plt.axes()
>>> data2ax = ax.transData - ax.transAxes
>>> print(ax.transData.depth, ax.transAxes.depth)
3, 1
>>> print(data2ax.depth)
2
```

  for versions before 1.2 this could only be achieved in a sub-optimal way, using `ax.transData + ax.transAxes.inverted()` (depth is a new concept, but had it existed it would return 4 for this example).

- `twinx` and `twiny` now returns an instance of SubplotBase if parent axes is an instance of SubplotBase.
- All Qt3-based backends are now deprecated due to the lack of py3k bindings. Qt and QtAgg backends will continue to work in v1.2.x for py2.6 and py2.7. It is anticipated that the Qt3 support will be completely removed for the next release.
- `matplotlib.colors.ColorConverter`, *Colormap* and *Normalize* now subclasses `object`
- ContourSet instances no longer have a `transform` attribute. Instead, access the transform with the `get_transform` method.

16.1.20 Changes in 1.1.x

- Added new *matplotlib.sankey.Sankey* for generating Sankey diagrams.
- In *imshow()*, setting *interpolation* to 'nearest' will now always mean that the nearest-neighbor interpolation is performed. If you want the no-op interpolation to be performed, choose 'none'.
- There were errors in how the tri-functions were handling input parameters that had to be fixed. If your tri-plots are not working correctly anymore, or you were working around apparent mistakes, please see issue #203 in the github tracker. When in doubt, use kwargs.

- The 'symlog' scale had some bad behavior in previous versions. This has now been fixed and users should now be able to use it without frustrations. The fixes did result in some minor changes in appearance for some users who may have been depending on the bad behavior.
- There is now a common set of markers for all plotting functions. Previously, some markers existed only for *scatter()* or just for *plot()*. This is now no longer the case. This merge did result in a conflict. The string 'd' now means "thin diamond" while 'D' will mean "regular diamond".

16.1.21 Changes beyond 0.99.x

- The default behavior of *matplotlib.axes.Axes.set_xlim()*, *matplotlib.axes.Axes.set_ylim()*, and *matplotlib.axes.Axes.axis()*, and their corresponding pyplot functions, has been changed: when view limits are set explicitly with one of these methods, autoscaling is turned off for the matching axis. A new *auto* kwarg is available to control this behavior. The limit kwargs have been renamed to *left* and *right* instead of *xmin* and *xmax*, and *bottom* and *top* instead of *ymin* and *ymax*. The old names may still be used, however.
- There are five new Axes methods with corresponding pyplot functions to facilitate autoscaling, tick location, and tick label formatting, and the general appearance of ticks and tick labels:
  - *matplotlib.axes.Axes.autoscale()* turns autoscaling on or off, and applies it.
  - *matplotlib.axes.Axes.margins()* sets margins used to autoscale the `matplotlib.axes.Axes.viewLim` based on the `matplotlib.axes.Axes.dataLim`.
  - *matplotlib.axes.Axes.locator_params()* allows one to adjust axes locator parameters such as *nbins*.
  - *matplotlib.axes.Axes.ticklabel_format()* is a convenience method for controlling the *matplotlib.ticker.ScalarFormatter* that is used by default with linear axes.
  - *matplotlib.axes.Axes.tick_params()* controls direction, size, visibility, and color of ticks and their labels.
- The *matplotlib.axes.Axes.bar()* method accepts a *error_kw* kwarg; it is a dictionary of kwargs to be passed to the errorbar function.
- The *matplotlib.axes.Axes.hist()* *color* kwarg now accepts a sequence of color specs to match a sequence of datasets.
- The *EllipseCollection* has been changed in two ways:
  - There is a new *units* option, 'xy', that scales the ellipse with the data units. This matches the :class:'~matplotlib.patches.Ellipse` scaling.
  - The *height* and *width* kwargs have been changed to specify the height and width, again for consistency with *Ellipse*, and to better match their names; previously they specified the half-height and half-width.

- There is a new rc parameter `axes.color_cycle`, and the color cycle is now independent of the rc parameter `lines.color`. `matplotlib.Axes.set_default_color_cycle` is deprecated.
- You can now print several figures to one pdf file and modify the document information dictionary of a pdf file. See the docstrings of the class *matplotlib.backends.backend_pdf.PdfPages* for more information.
- Removed configobj and enthought.traits packages, which are only required by the experimental traited config and are somewhat out of date. If needed, install them independently.
- The new rc parameter `savefig.extension` sets the filename extension that is used by *matplotlib.figure.Figure.savefig()* if its *fname* argument lacks an extension.
- In an effort to simplify the backend API, all clipping rectangles and paths are now passed in using GraphicsContext objects, even on collections and images. Therefore:

```
draw_path_collection(self, master_transform, cliprect, clippath,
                     clippath_trans, paths, all_transforms, offsets,
                     offsetTrans, facecolors, edgecolors, linewidths,
                     linestyles, antialiaseds, urls)

# is now

draw_path_collection(self, gc, master_transform, paths, all_transforms,
                     offsets, offsetTrans, facecolors, edgecolors,
                     linewidths, linestyles, antialiaseds, urls)

draw_quad_mesh(self, master_transform, cliprect, clippath,
               clippath_trans, meshWidth, meshHeight, coordinates,
               offsets, offsetTrans, facecolors, antialiased,
               showedges)

# is now

draw_quad_mesh(self, gc, master_transform, meshWidth, meshHeight,
               coordinates, offsets, offsetTrans, facecolors,
               antialiased, showedges)

draw_image(self, x, y, im, bbox, clippath=None, clippath_trans=None)

# is now

draw_image(self, gc, x, y, im)
```

- There are four new Axes methods with corresponding pyplot functions that deal with unstructured triangular grids:
  - *matplotlib.axes.Axes.tricontour()* draws contour lines on a triangular grid.

- *matplotlib.axes.Axes.tricontourf()* draws filled contours on a triangular grid.
- *matplotlib.axes.Axes.tripcolor()* draws a pseudocolor plot on a triangular grid.
- *matplotlib.axes.Axes.triplot()* draws a triangular grid as lines and/or markers.

16.1.22 Changes in 0.99

- pylab no longer provides a load and save function. These are available in matplotlib.mlab, or you can use numpy.loadtxt and numpy.savetxt for text files, or np.save and np.load for binary NumPy arrays.
- User-generated colormaps can now be added to the set recognized by *matplotlib.cm.get_cmap()*. Colormaps can be made the default and applied to the current image using *matplotlib.pyplot.set_cmap()*.
- changed use_mrecords default to False in mlab.csv2rec since this is partially broken
- Axes instances no longer have a "frame" attribute. Instead, use the new "spines" attribute. Spines is a dictionary where the keys are the names of the spines (e.g., 'left','right' and so on) and the values are the artists that draw the spines. For normal (rectilinear) axes, these artists are Line2D instances. For other axes (such as polar axes), these artists may be Patch instances.
- Polar plots no longer accept a resolution kwarg. Instead, each Path must specify its own number of interpolation steps. This is unlikely to be a user-visible change -- if interpolation of data is required, that should be done before passing it to Matplotlib.

16.1.23 Changes for 0.98.x

- `psd()`, `csd()`, and `cohere()` will now automatically wrap negative frequency components to the beginning of the returned arrays. This is much more sensible behavior and makes them consistent with `specgram()`. The previous behavior was more of an oversight than a design decision.
- Added new keyword parameters *nonposx*, *nonposy* to *matplotlib.axes.Axes* methods that set log scale parameters. The default is still to mask out non-positive values, but the kwargs accept 'clip', which causes non-positive values to be replaced with a very small positive value.
- Added new *matplotlib.pyplot.fignum_exists()* and *matplotlib.pyplot.get_fignums()*; they merely expose information that had been hidden in `matplotlib._pylab_helpers`.
- Deprecated numerix package.

- Added new *matplotlib.image.imsave()* and exposed it to the *matplotlib.pyplot* interface.
- Remove support for pyExcelerator in exceltools -- use xlwt instead
- Changed the defaults of acorr and xcorr to use usevlines=True, maxlags=10 and normed=True since these are the best defaults
- Following keyword parameters for *matplotlib.legend.Legend* are now deprecated and new set of parameters are introduced. The new parameters are given as a fraction of the font-size. Also, *scatteryoffsets*, *fancybox* and *columnspacing* are added as keyword parameters.

Deprecated	New
pad	borderpad
labelsep	labelspacing
handlelen	handlelength
handlestextsep	handletextpad
axespad	borderaxespad

- Removed the configobj and experimental traits rc support
- Modified *matplotlib.mlab.psd()*, *matplotlib.mlab.csd()*, *matplotlib.mlab.cohere()*, and *matplotlib.mlab.specgram()* to scale one-sided densities by a factor of 2. Also, optionally scale the densities by the sampling frequency, which gives true values of densities that can be integrated by the returned frequency values. This also gives better MATLAB compatibility. The corresponding *matplotlib.axes.Axes* methods and *matplotlib.pyplot* functions were updated as well.
- Font lookup now uses a nearest-neighbor approach rather than an exact match. Some fonts may be different in plots, but should be closer to what was requested.
- *matplotlib.axes.Axes.set_xlim()*, *matplotlib.axes.Axes.set_ylim()* now return a copy of the `viewlim` array to avoid modify-in-place surprises.
- *matplotlib.afm.AFM.get_fullname()* and *matplotlib.afm.AFM.get_familyname()* no longer raise an exception if the AFM file does not specify these optional attributes, but returns a guess based on the required FontName attribute.
- Changed precision kwarg in *matplotlib.pyplot.spy()*; default is 0, and the string value 'present' is used for sparse arrays only to show filled locations.
- *matplotlib.collections.EllipseCollection* added.
- Added `angles` kwarg to *matplotlib.pyplot.quiver()* for more flexible specification of the arrow angles.
- Deprecated (raise NotImplementedError) all the mlab2 functions from *matplotlib.mlab* out of concern that some of them were not clean room implementations.

- Methods *matplotlib.collections.Collection.get_offsets()* and *matplotlib.collections.Collection.set_offsets()* added to *Collection* base class.
- matplotlib.figure.Figure.figurePatch renamed matplotlib.figure.Figure.patch; matplotlib.axes.Axes.axesPatch renamed matplotlib.axes.Axes.patch; matplotlib.axes.Axes.axesFrame renamed matplotlib.axes.Axes.frame. matplotlib.axes.Axes.get_frame, which returns matplotlib.axes.Axes.patch, is deprecated.
- Changes in the *matplotlib.contour.ContourLabeler* attributes (*matplotlib.pyplot.clabel()* function) so that they all have a form like .labelAttribute. The three attributes that are most likely to be used by end users, .cl, .cl_xy and .cl_cvalues have been maintained for the moment (in addition to their renamed versions), but they are deprecated and will eventually be removed.
- Moved several functions in *matplotlib.mlab* and *matplotlib.cbook* into a separate module matplotlib.numerical_methods because they were unrelated to the initial purpose of mlab or cbook and appeared more coherent elsewhere.

16.1.24 Changes for 0.98.1

- Removed broken matplotlib.axes3d support and replaced it with a non-implemented error pointing to 0.91.x

16.1.25 Changes for 0.98.0

- *matplotlib.image.imread()* now no longer always returns RGBA data---if the image is luminance or RGB, it will return a MxN or MxNx3 array if possible. Also uint8 is no longer always forced to float.
- Rewrote the *matplotlib.cm.ScalarMappable* callback infrastructure to use *matplotlib.cbook.CallbackRegistry* rather than custom callback handling. Any users of matplotlib.cm.ScalarMappable.add_observer of the *ScalarMappable* should use the matplotlib.cm.ScalarMappable.callbacksSM *CallbackRegistry* instead.
- New axes function and Axes method provide control over the plot color cycle: matplotlib.axes.set_default_color_cycle and matplotlib.axes.Axes.set_color_cycle.
- Matplotlib now requires Python 2.4, so *matplotlib.cbook* will no longer provide set, enumerate(), reversed() or izip compatibility functions.
- In Numpy 1.0, bins are specified by the left edges only. The axes method *matplotlib.axes.Axes.hist()* now uses future Numpy 1.3 semantics for histograms. Providing binedges, the last value gives the upper-right edge now, which was implicitly set to +infinity in Numpy 1.0. This also means that the last bin doesn't contain upper outliers any more by default.

- New axes method and pyplot function, *hexbin()*, is an alternative to *scatter()* for large datasets. It makes something like a *pcolor()* of a 2-D histogram, but uses hexagonal bins.
- New kwarg, `symmetric`, in *matplotlib.ticker.MaxNLocator* allows one require an axis to be centered around zero.
- Toolkits must now be imported from `mpl_toolkits` (not `matplotlib.toolkits`)

Notes about the transforms refactoring

A major new feature of the 0.98 series is a more flexible and extensible transformation infrastructure, written in Python/Numpy rather than a custom C extension.

The primary goal of this refactoring was to make it easier to extend matplotlib to support new kinds of projections. This is mostly an internal improvement, and the possible user-visible changes it allows are yet to come.

See *matplotlib.transforms* for a description of the design of the new transformation framework.

For efficiency, many of these functions return views into Numpy arrays. This means that if you hold on to a reference to them, their contents may change. If you want to store a snapshot of their current values, use the Numpy array method copy().

The view intervals are now stored only in one place -- in the *matplotlib.axes.Axes* instance, not in the locator instances as well. This means locators must get their limits from their *matplotlib.axis.Axis*, which in turn looks up its limits from the *Axes*. If a locator is used temporarily and not assigned to an Axis or Axes, (e.g., in *matplotlib.contour*), a dummy axis must be created to store its bounds. Call *matplotlib.ticker.TickHelper.create_dummy_axis()* to do so.

The functionality of `Pbox` has been merged with *Bbox*. Its methods now all return copies rather than modifying in place.

The following lists many of the simple changes necessary to update code from the old transformation framework to the new one. In particular, methods that return a copy are named with a verb in the past tense, whereas methods that alter an object in place are named with a verb in the present tense.

`matplotlib.transforms`

Old method	New method
`Bbox.get_bounds`	*transforms.Bbox.bounds*
`Bbox.width`	*transforms.Bbox.width*
`Bbox.height`	*transforms.Bbox.height*
`Bbox.intervalx().get_bounds()` `Bbox.intervalx().set_bounds()`	*transforms.Bbox.intervalx* [It is now a property.]
`Bbox.intervaly().get_bounds()` `Bbox.intervaly().set_bounds()`	*transforms.Bbox.intervaly* [It is now a property.]
`Bbox.xmin`	*transforms.Bbox.x0* or *transforms.Bbox.xmin*[1]
`Bbox.ymin`	*transforms.Bbox.y0* or *transforms.Bbox.ymin*[1]
`Bbox.xmax`	*transforms.Bbox.x1* or *transforms.Bbox.xmax*[1]
`Bbox.ymax`	*transforms.Bbox.y1* or *transforms.Bbox.ymax*[1]
`Bbox.overlaps(bboxes)`	*Bbox.count_overlaps(bboxes)*
`bbox_all(bboxes)`	*Bbox.union(bboxes)* [It is a staticmethod.]
`lbwh_to_bbox(l, b, w, h)`	*Bbox.from_bounds(x0, y0, w, h)* [It is a staticmethod.]
`inverse_transform_bbox(trans, bbox)`	*Bbox.inverse_transformed(trans)*
`Interval.contains_open(v)`	*interval_contains_open(tuple, v)*
`Interval.contains(v)`	*interval_contains(tuple, v)*
`identity_transform()`	*transforms.IdentityTransform*
`blend_xy_sep_transform(xtrans, ytrans)`	*blended_transform_factory(xtrans, ytrans)*
`scale_transform(xs, ys)`	*Affine2D().scale(xs[, ys])*
`get_bbox_transform(boxin, boxout)`	*BboxTransform(boxin, boxout)* or *BboxTransformFrom(boxin)* or *BboxTransformTo(boxout)*
`Transform.seq_xy_tup(points)`	*Transform.transform(points)*
`Transform.inverse_xy_tup(points)`	*Transform.inverted()*.transform(points)

[1] The *Bbox* is bound by the points (x0, y0) to (x1, y1) and there is no defined order to these points, that is, x0 is not necessarily the left edge of the box. To get the left edge of the *Bbox*, use the read-only property *xmin*.

matplotlib.axes

Old method	New method
`Axes.get_position()`	*matplotlib.axes.Axes.get_position()*[2]
`Axes.set_position()`	*matplotlib.axes.Axes.set_position()*[3]
`Axes.toggle_log_lineary()`	*matplotlib.axes.Axes.set_yscale()*[4]
`Subplot` class	removed

The `Polar` class has moved to *matplotlib.projections.polar*.

matplotlib.artist

Old method	New method
`Artist.set_clip_path(path)`	`Artist.set_clip_path(path, transform)`[5]

matplotlib.collections

Old method	New method
linestyle	*linestyles*[6]

matplotlib.colors

Old method	New method
`ColorConvertor.to_rgba_list(c)`	`colors.to_rgba_array(c)` [*matplotlib.colors.to_rgba_array()* returns an Nx4 NumPy array of RGBA color quadruples.]

[2] *matplotlib.axes.Axes.get_position()* used to return a list of points, now it returns a *matplotlib.transforms.Bbox* instance.

[3] *matplotlib.axes.Axes.set_position()* now accepts either four scalars or a *matplotlib.transforms.Bbox* instance.

[4] Since the recfactoring allows for more than two scale types ('log' or 'linear'), it no longer makes sense to have a toggle. `Axes.toggle_log_lineary()` has been removed.

[5] *matplotlib.artist.Artist.set_clip_path()* now accepts a *matplotlib.path.Path* instance and a *matplotlib.transforms.Transform* that will be applied to the path immediately before clipping.

[6] Linestyles are now treated like all other collection attributes, i.e. a single value or multiple values may be provided.

matplotlib.contour

Old method	New method
`Contour._segments`	`matplotlib.contour.Contour.get_paths` [Returns a list of *matplotlib.path.Path* instances.]

matplotlib.figure

Old method	New method
`Figure.dpi.get() Figure.dpi.set()`	*matplotlib.figure.Figure.dpi (a property)*

matplotlib.patches

Old method	New method
`Patch.get_verts()`	*matplotlib.patches.Patch.get_path()* [Returns a *matplotlib.path.Path* instance]

matplotlib.backend_bases

Old method	New method
`GraphicsContext.set_clip_rectangle(tuple)`	*GraphicsContext.set_clip_rectangle(bbox)*
`GraphicsContext.get_clip_path()`	*GraphicsContext.get_clip_path()*[7]
`GraphicsContext.set_clip_path()`	*GraphicsContext.set_clip_path()*[8]

RendererBase

New methods:

- *draw_path(self, gc, path, transform, rgbFace)*
- *draw_markers(self, gc, marker_path, marker_trans, path, trans, rgbFace)*

[7] *matplotlib.backend_bases.GraphicsContextBase.get_clip_path()* returns a tuple of the form (*path*, *affine_transform*), where *path* is a *matplotlib.path.Path* instance and *affine_transform* is a *matplotlib.transforms.Affine2D* instance.

[8] *matplotlib.backend_bases.GraphicsContextBase.set_clip_path()* now only accepts a *matplotlib.transforms.TransformedPath* instance.

- *draw_path_collection(self, master_transform, cliprect, clippath, clippath_trans, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds)* *[optional]*

Changed methods:

- `draw_image(self, x, y, im, bbox)` is now *draw_image(self, x, y, im, bbox, clippath, clippath_trans)*

Removed methods:

- `draw_arc`
- `draw_line_collection`
- `draw_line`
- `draw_lines`
- `draw_point`
- `draw_quad_mesh`
- `draw_poly_collection`
- `draw_polygon`
- `draw_rectangle`
- `draw_regpoly_collection`

16.1.26 Changes for 0.91.2

- For `csv2rec`, checkrows=0 is the new default indicating all rows will be checked for type inference
- A warning is issued when an image is drawn on log-scaled axes, since it will not log-scale the image data.
- Moved `rec2gtk` to `matplotlib.toolkits.gtktools`
- Moved `rec2excel` to `matplotlib.toolkits.exceltools`
- Removed, dead/experimental ExampleInfo, Namespace and Importer code from `matplotlib`

16.1.27 Changes for 0.91.0

- Changed `cbook.is_file_like` to `cbook.is_writable_file_like` and corrected behavior.
- Added *ax* keyword argument to *pyplot.colorbar()* and *Figure.colorbar()* so that one can specify the axes object from which space for the colorbar is to be taken, if one does not want to make the colorbar axes manually.
- Changed `cbook.reversed` so it yields a tuple rather than a (index, tuple). This agrees with the Python reversed builtin, and cbook only defines reversed if Python doesn't provide the builtin.
- Made skiprows=1 the default on `csv2rec`
- The gd and paint backends have been deleted.
- The errorbar method and function now accept additional kwargs so that upper and lower limits can be indicated by capping the bar with a caret instead of a straight line segment.
- The *matplotlib.dviread* file now has a parser for files like psfonts.map and pdftex.map, to map TeX font names to external files.
- The file *matplotlib.type1font* contains a new class for Type 1 fonts. Currently it simply reads pfa and pfb format files and stores the data in a way that is suitable for embedding in pdf files. In the future the class might actually parse the font to allow e.g., subsetting.
- `matplotlib.ft2font` now supports `FT_Attach_File`. In practice this can be used to read an afm file in addition to a pfa/pfb file, to get metrics and kerning information for a Type 1 font.
- The *AFM* class now supports querying CapHeight and stem widths. The get_name_char method now has an isord kwarg like get_width_char.
- Changed *pcolor()* default to `shading='flat'`; but as noted now in the docstring, it is preferable to simply use the *edgecolor* keyword argument.
- The mathtext font commands (`\cal`, `\rm`, `\it`, `\tt`) now behave as TeX does: they are in effect until the next font change command or the end of the grouping. Therefore uses of `$\cal{R}$` should be changed to `${\cal R}$`. Alternatively, you may use the new LaTeX-style font commands (`\mathcal`, `\mathrm`, `\mathit`, `\mathtt`) which do affect the following group, e.g., `$\mathcal{R}$`.
- Text creation commands have a new default linespacing and a new `linespacing` kwarg, which is a multiple of the maximum vertical extent of a line of ordinary text. The default is 1.2; `linespacing=2` would be like ordinary double spacing, for example.
- Changed default kwarg in *matplotlib.colors.Normalize* to `clip=False`; clipping silently defeats the purpose of the special over, under, and bad values in the colormap, thereby leading to unexpected behavior. The new default should reduce such surprises.

- Made the emit property of *set_xlim()* and *set_ylim()* `True` by default; removed the Axes custom callback handling into a 'callbacks' attribute which is a *CallbackRegistry* instance. This now supports the 'xlim_changed' and 'ylim_changed' Axes events.

16.1.28 Changes for 0.90.1

```
The file dviread.py has a (very limited and fragile) dvi reader
for usetex support. The API might change in the future so don't
depend on it yet.

Removed deprecated support for a float value as a gray-scale;
now it must be a string, like '0.5'.  Added alpha kwarg to
ColorConverter.to_rgba_list.

New method set_bounds(vmin, vmax) for formatters, locators sets
the viewInterval and dataInterval from floats.

Removed deprecated colorbar_classic.

Line2D.get_xdata and get_ydata valid_only=False kwarg is replaced
by orig=True.  When True, it returns the original data, otherwise
the processed data (masked, converted)

Some modifications to the units interface.
units.ConversionInterface.tickers renamed to
units.ConversionInterface.axisinfo and it now returns a
units.AxisInfo object rather than a tuple.  This will make it
easier to add axis info functionality (e.g., I added a default label
on this iteration) w/o having to change the tuple length and hence
the API of the client code every time new functionality is added.
Also, units.ConversionInterface.convert_to_value is now simply
named units.ConversionInterface.convert.

Axes.errorbar uses Axes.vlines and Axes.hlines to draw its error
limits int he vertical and horizontal direction.  As you'll see
in the changes below, these functions now return a LineCollection
rather than a list of lines.  The new return signature for
errorbar is  ylins, caplines, errorcollections where
errorcollections is a xerrcollection, yerrcollection

Axes.vlines and Axes.hlines now create and returns a LineCollection, not a list
of lines.  This is much faster.  The kwarg signature has changed,
so consult the docs

MaxNLocator accepts a new Boolean kwarg ('integer') to force
ticks to integer locations.

Commands that pass an argument to the Text constructor or to
Text.set_text() now accept any object that can be converted
with '%s'.  This affects xlabel(), title(), etc.
```

(continues on next page)

(continued from previous page)

```
Barh now takes a **kwargs dict instead of most of the old
arguments. This helps ensure that bar and barh are kept in sync,
but as a side effect you can no longer pass e.g., color as a
positional argument.

ft2font.get_charmap() now returns a dict that maps character codes
to glyph indices (until now it was reversed)

Moved data files into lib/matplotlib so that setuptools' develop
mode works. Re-organized the mpl-data layout so that this source
structure is maintained in the installation. (i.e., the 'fonts' and
'images' sub-directories are maintained in site-packages.).
Suggest removing site-packages/matplotlib/mpl-data and
~/.matplotlib/ttffont.cache before installing
```

16.1.29 Changes for 0.90.0

```
All artists now implement a "pick" method which users should not
call.  Rather, set the "picker" property of any artist you want to
pick on (the epsilon distance in points for a hit test) and
register with the "pick_event" callback.  See
examples/pick_event_demo.py for details

Bar, barh, and hist have "log" binary kwarg: log=True
sets the ordinate to a log scale.

Boxplot can handle a list of vectors instead of just
an array, so vectors can have different lengths.

Plot can handle 2-D x and/or y; it plots the columns.

Added linewidth kwarg to bar and barh.

Made the default Artist._transform None (rather than invoking
identity_transform for each artist only to have it overridden
later).  Use artist.get_transform() rather than artist._transform,
even in derived classes, so that the default transform will be
created lazily as needed

New LogNorm subclass of Normalize added to colors.py.
All Normalize subclasses have new inverse() method, and
the __call__() method has a new clip kwarg.

Changed class names in colors.py to match convention:
normalize -> Normalize, no_norm -> NoNorm.  Old names
are still available for now.

Removed obsolete pcolor_classic command and method.
```

(continues on next page)

(continued from previous page)

```
Removed lineprops and markerprops from the Annotation code and
replaced them with an arrow configurable with kwarg arrowprops.
See examples/annotation_demo.py - JDH
```

16.1.30 Changes for 0.87.7

```
Completely reworked the annotations API because I found the old
API cumbersome.  The new design is much more legible and easy to
read.  See matplotlib.text.Annotation and
examples/annotation_demo.py

markeredgecolor and markerfacecolor cannot be configured in
matplotlibrc any more. Instead, markers are generally colored
automatically based on the color of the line, unless marker colors
are explicitly set as kwargs - NN

Changed default comment character for load to '#' - JDH

math_parse_s_ft2font_svg from mathtext.py & mathtext2.py now returns
width, height, svg_elements. svg_elements is an instance of Bunch (
cmbook.py) and has the attributes svg_glyphs and svg_lines, which are both
lists.

Renderer.draw_arc now takes an additional parameter, rotation.
It specifies to draw the artist rotated in degrees anti-
clockwise.  It was added for rotated ellipses.

Renamed Figure.set_figsize_inches to Figure.set_size_inches to
better match the get method, Figure.get_size_inches.

Removed the copy_bbox_transform from transforms.py; added
shallowcopy methods to all transforms.  All transforms already
had deepcopy methods.

FigureManager.resize(width, height): resize the window
specified in pixels

barh: x and y args have been renamed to width and bottom
respectively, and their order has been swapped to maintain
a (position, value) order.

bar and barh: now accept kwarg 'edgecolor'.

bar and barh: The left, height, width and bottom args can
now all be scalars or sequences; see docstring.

barh: now defaults to edge aligned instead of center
aligned bars
```

(continues on next page)

(continued from previous page)

```
bar, barh and hist: Added a keyword arg 'align' that
controls between edge or center bar alignment.

Collections: PolyCollection and LineCollection now accept
vertices or segments either in the original form [(x,y),
(x,y), ...] or as a 2D numerix array, with X as the first column
and Y as the second. Contour and quiver output the numerix
form.  The transforms methods Bbox.update() and
Transformation.seq_xy_tups() now accept either form.

Collections: LineCollection is now a ScalarMappable like
PolyCollection, etc.

Specifying a grayscale color as a float is deprecated; use
a string instead, e.g., 0.75 -> '0.75'.

Collections: initializers now accept any mpl color arg, or
sequence of such args; previously only a sequence of rgba
tuples was accepted.

Colorbar: completely new version and api; see docstring.  The
original version is still accessible as colorbar_classic, but
is deprecated.

Contourf: "extend" kwarg replaces "clip_ends"; see docstring.
Masked array support added to pcolormesh.

Modified aspect-ratio handling:
    Removed aspect kwarg from imshow
    Axes methods:
        set_aspect(self, aspect, adjustable=None, anchor=None)
        set_adjustable(self, adjustable)
        set_anchor(self, anchor)
    Pylab interface:
        axis('image')

 Backend developers: ft2font's load_char now takes a flags
 argument, which you can OR together from the LOAD_XXX
 constants.
```

16.1.31 Changes for 0.86

```
Matplotlib data is installed into the matplotlib module.
This is similar to package_data.  This should get rid of
having to check for many possibilities in _get_data_path().
The MATPLOTLIBDATA env key is still checked first to allow
for flexibility.
```

(continues on next page)

(continued from previous page)

```
1) Separated the color table data from cm.py out into
a new file, _cm.py, to make it easier to find the actual
code in cm.py and to add new colormaps. Everything
from _cm.py is imported by cm.py, so the split should be
transparent.
2) Enabled automatic generation of a colormap from
a list of colors in contour; see modified
examples/contour_demo.py.
3) Support for imshow of a masked array, with the
ability to specify colors (or no color at all) for
masked regions, and for regions that are above or
below the normally mapped region.  See
examples/image_masked.py.
4) In support of the above, added two new classes,
ListedColormap, and no_norm, to colors.py, and modified
the Colormap class to include common functionality. Added
a clip kwarg to the normalize class.
```

16.1.32 Changes for 0.85

```
Made xtick and ytick separate props in rc

made pos=None the default for tick formatters rather than 0 to
indicate "not supplied"

Removed "feature" of minor ticks which prevents them from
overlapping major ticks.  Often you want major and minor ticks at
the same place, and can offset the major ticks with the pad.  This
could be made configurable

Changed the internal structure of contour.py to a more OO style.
Calls to contour or contourf in axes.py or pylab.py now return
a ContourSet object which contains references to the
LineCollections or PolyCollections created by the call,
as well as the configuration variables that were used.
The ContourSet object is a "mappable" if a colormap was used.

Added a clip_ends kwarg to contourf. From the docstring:
         * clip_ends = True
           If False, the limits for color scaling are set to the
           minimum and maximum contour levels.
           True (default) clips the scaling limits.  Example:
           if the contour boundaries are V = [-100, 2, 1, 0, 1, 2, 100],
           then the scaling limits will be [-100, 100] if clip_ends
           is False, and [-3, 3] if clip_ends is True.
Added kwargs linewidths, antialiased, and nchunk to contourf.  These
are experimental; see the docstring.

Changed Figure.colorbar():
```

(continues on next page)

(continued from previous page)

```
    kw argument order changed;
    if mappable arg is a non-filled ContourSet, colorbar() shows
            lines instead hof polygons.
    if mappable arg is a filled ContourSet with clip_ends=True,
            the endpoints are not labelled, so as to give the
            correct impression of open-endedness.

Changed LineCollection.get_linewidths to get_linewidth, for
consistency.
```

16.1.33 Changes for 0.84

```
Unified argument handling between hlines and vlines.  Both now
take optionally a fmt argument (as in plot) and a keyword args
that can be passed onto Line2D.

Removed all references to "data clipping" in rc and lines.py since
these were not used and not optimized.  I'm sure they'll be
resurrected later with a better implementation when needed.

'set' removed - no more deprecation warnings.  Use 'setp' instead.

Backend developers: Added flipud method to image and removed it
from to_str.  Removed origin kwarg from backend.draw_image.
origin is handled entirely by the frontend now.
```

16.1.34 Changes for 0.83

```
- Made HOME/.matplotlib the new config dir where the matplotlibrc
  file, the ttf.cache, and the tex.cache live.  The new default
  filenames in .matplotlib have no leading dot and are not hidden.
  e.g., the new names are matplotlibrc, tex.cache, and ttffont.cache.
  This is how ipython does it so it must be right.

  If old files are found, a warning is issued and they are moved to
  the new location.

- backends/__init__.py no longer imports new_figure_manager,
  draw_if_interactive and show from the default backend, but puts
  these imports into a call to pylab_setup.  Also, the Toolbar is no
  longer imported from WX/WXAgg.  New usage:

    from backends import pylab_setup
    new_figure_manager, draw_if_interactive, show = pylab_setup()

- Moved Figure.get_width_height() to FigureCanvasBase. It now
  returns int instead of float.
```

16.1.35 Changes for 0.82

```
- toolbar import change in GTKAgg, GTKCairo and WXAgg

- Added subplot config tool to GTK* backends -- note you must now
  import the NavigationToolbar2 from your backend of choice rather
  than from backend_gtk because it needs to know about the backend
  specific canvas -- see examples/embedding_in_gtk2.py.  Ditto for
  wx backend -- see examples/embedding_in_wxagg.py

- hist bin change

    Sean Richards notes there was a problem in the way we created
    the binning for histogram, which made the last bin
    underrepresented.  From his post:

      I see that hist uses the linspace function to create the bins
      and then uses searchsorted to put the values in their correct
      bin. That's all good but I am confused over the use of linspace
      for the bin creation. I wouldn't have thought that it does
      what is needed, to quote the docstring it creates a "Linear
      spaced array from min to max". For it to work correctly
      shouldn't the values in the bins array be the same bound for
      each bin? (i.e. each value should be the lower bound of a
      bin). To provide the correct bins for hist would it not be
      something like

      def bins(xmin, xmax, N):
        if N==1: return xmax
        dx = (xmax-xmin)/N # instead of N-1
        return xmin + dx*arange(N)

     This suggestion is implemented in 0.81.  My test script with these
     changes does not reveal any bias in the binning

      from matplotlib.numerix.mlab import randn, rand, zeros, Float
      from matplotlib.mlab import hist, mean

      Nbins = 50
      Ntests = 200
      results = zeros((Ntests,Nbins), typecode=Float)
      for i in range(Ntests):
          print 'computing', i
          x = rand(10000)
          n, bins = hist(x, Nbins)
          results[i] = n
      print mean(results)
```

16.1.36 Changes for 0.81

```
- pylab and artist "set" functions renamed to setp to avoid clash
  with python2.4 built-in set.  Current version will issue a
  deprecation warning which will be removed in future versions

- imshow interpolation arguments changes for advanced interpolation
  schemes.  See help imshow, particularly the interpolation,
  filternorm and filterrad kwargs

- Support for masked arrays has been added to the plot command and
  to the Line2D object.  Only the valid points are plotted.  A
  "valid_only" kwarg was added to the get_xdata() and get_ydata()
  methods of Line2D; by default it is False, so that the original
  data arrays are returned. Setting it to True returns the plottable
  points.

- contour changes:

  Masked arrays: contour and contourf now accept masked arrays as
    the variable to be contoured.  Masking works correctly for
    contour, but a bug remains to be fixed before it will work for
    contourf.  The "badmask" kwarg has been removed from both
    functions.

   Level argument changes:

     Old version: a list of levels as one of the positional
     arguments specified the lower bound of each filled region; the
     upper bound of the last region was taken as a very large
     number.  Hence, it was not possible to specify that z values
     between 0 and 1, for example, be filled, and that values
     outside that range remain unfilled.

     New version: a list of N levels is taken as specifying the
     boundaries of N-1 z ranges.  Now the user has more control over
     what is colored and what is not.  Repeated calls to contourf
     (with different colormaps or color specifications, for example)
     can be used to color different ranges of z.  Values of z
     outside an expected range are left uncolored.

     Example:
       Old: contourf(z, [0, 1, 2]) would yield 3 regions: 0-1, 1-2, and >2.
       New: it would yield 2 regions: 0-1, 1-2.  If the same 3 regions were
       desired, the equivalent list of levels would be [0, 1, 2,
       1e38].
```

16.1.37 Changes for 0.80

```
- xlim/ylim/axis always return the new limits regardless of
  arguments.  They now take kwargs which allow you to selectively
  change the upper or lower limits while leaving unnamed limits
  unchanged.  See help(xlim) for example
```

16.1.38 Changes for 0.73

```
- Removed deprecated ColormapJet and friends

- Removed all error handling from the verbose object

- figure num of zero is now allowed
```

16.1.39 Changes for 0.72

```
- Line2D, Text, and Patch copy_properties renamed update_from and
  moved into artist base class

- LineCollecitons.color renamed to LineCollections.set_color for
  consistency with set/get introspection mechanism,

- pylab figure now defaults to num=None, which creates a new figure
  with a guaranteed unique number

- contour method syntax changed - now it is MATLAB compatible

    unchanged: contour(Z)
    old: contour(Z, x=Y, y=Y)
    new: contour(X, Y, Z)

  see http://matplotlib.sf.net/matplotlib.pylab.html#-contour

 - Increased the default resolution for save command.

 - Renamed the base attribute of the ticker classes to _base to avoid conflict
   with the base method.  Sitt for subs

 - subs=none now does autosubbing in the tick locator.

 - New subplots that overlap old will delete the old axes.  If you
   do not want this behavior, use fig.add_subplot or the axes
   command
```

16.1.40 Changes for 0.71

```
Significant numerix namespace changes, introduced to resolve
namespace clashes between python built-ins and mlab names.
Refactored numerix to maintain separate modules, rather than
folding all these names into a single namespace.  See the following
mailing list threads for more information and background

  http://sourceforge.net/mailarchive/forum.php?thread_id=6398890&forum_id=36187
  http://sourceforge.net/mailarchive/forum.php?thread_id=6323208&forum_id=36187

OLD usage

  from matplotlib.numerix import array, mean, fft

NEW usage

  from matplotlib.numerix import array
  from matplotlib.numerix.mlab import mean
  from matplotlib.numerix.fft import fft

numerix dir structure mirrors numarray (though it is an incomplete
implementation)

  numerix
  numerix/mlab
  numerix/linear_algebra
  numerix/fft
  numerix/random_array

but of course you can use 'numerix : Numeric' and still get the
symbols.

pylab still imports most of the symbols from Numerix, MLab, fft,
etc, but is more cautious.  For names that clash with python names
(min, max, sum), pylab keeps the builtins and provides the numeric
versions with an a* prefix, e.g., (amin, amax, asum)
```

16.1.41 Changes for 0.70

```
MplEvent factored into a base class Event and derived classes
MouseEvent and KeyEvent

Removed definct set_measurement in wx toolbar
```

16.1.42 Changes for 0.65.1

```
removed add_axes and add_subplot from backend_bases.  Use
figure.add_axes and add_subplot instead.  The figure now manages the
current axes with gca and sca for get and set current axes.  If you
have code you are porting which called, e.g., figmanager.add_axes, you
can now simply do figmanager.canvas.figure.add_axes.
```

16.1.43 Changes for 0.65

```
mpl_connect and mpl_disconnect in the MATLAB interface renamed to
connect and disconnect

Did away with the text methods for angle since they were ambiguous.
fontangle could mean fontstyle (obligue, etc) or the rotation of the
text.  Use style and rotation instead.
```

16.1.44 Changes for 0.63

```
Dates are now represented internally as float days since 0001-01-01,
UTC.

All date tickers and formatters are now in matplotlib.dates, rather
than matplotlib.tickers

converters have been abolished from all functions and classes.
num2date and date2num are now the converter functions for all date
plots

Most of the date tick locators have a different meaning in their
constructors.  In the prior implementation, the first argument was a
base and multiples of the base were ticked.  e.g.,

  HourLocator(5)  # old: tick every 5 minutes

In the new implementation, the explicit points you want to tick are
provided as a number or sequence

```

(continues on next page)

(continued from previous page)

```
   HourLocator(range(0,5,61))  # new: tick every 5 minutes

This gives much greater flexibility.  I have tried to make the
default constructors (no args) behave similarly, where possible.

Note that YearLocator still works under the base/multiple scheme.
The difference between the YearLocator and the other locators is
that years are not recurrent.

Financial functions:

  matplotlib.finance.quotes_historical_yahoo(ticker, date1, date2)

   date1, date2 are now datetime instances.  Return value is a list
   of quotes where the quote time is a float - days since gregorian
   start, as returned by date2num

   See examples/finance_demo.py for example usage of new API
```

16.1.45 Changes for 0.61

```
canvas.connect is now deprecated for event handling.  use
mpl_connect and mpl_disconnect instead.  The callback signature is
func(event) rather than func(widget, event)
```

16.1.46 Changes for 0.60

```
ColormapJet and Grayscale are deprecated.  For backwards
compatibility, they can be obtained either by doing

  from matplotlib.cm import ColormapJet

or

  from matplotlib.matlab import *

They are replaced by cm.jet and cm.grey
```

16.1.47 Changes for 0.54.3

```
removed the set_default_font / get_default_font scheme from the
font_manager to unify customization of font defaults with the rest of
the rc scheme.  See examples/font_properties_demo.py and help(rc) in
matplotlib.matlab.
```

16.1.48 Changes for 0.54

MATLAB interface

dpi

Several of the backends used a PIXELS_PER_INCH hack that I added to try and make images render consistently across backends. This just complicated matters. So you may find that some font sizes and line widths appear different than before. Apologies for the inconvenience. You should set the dpi to an accurate value for your screen to get true sizes.

pcolor and scatter

There are two changes to the MATLAB interface API, both involving the patch drawing commands. For efficiency, pcolor and scatter have been rewritten to use polygon collections, which are a new set of objects from matplotlib.collections designed to enable efficient handling of large collections of objects. These new collections make it possible to build large scatter plots or pcolor plots with no loops at the python level, and are significantly faster than their predecessors. The original pcolor and scatter functions are retained as pcolor_classic and scatter_classic.

The return value from pcolor is a PolyCollection. Most of the properties that are available on rectangles or other patches are also available on PolyCollections, e.g., you can say:

```
c = scatter(blah, blah)
c.set_linewidth(1.0)
c.set_facecolor('r')
c.set_alpha(0.5)
```

or:

```
c = scatter(blah, blah)
set(c, 'linewidth', 1.0, 'facecolor', 'r', 'alpha', 0.5)
```

Because the collection is a single object, you no longer need to loop over the return value of scatter or pcolor to set properties for the entire list.

If you want the different elements of a collection to vary on a property, e.g., to have different line widths, see matplotlib.collections for a discussion on how to set the properties as a sequence.

For scatter, the size argument is now in points^2 (the area of the symbol in points) as in MATLAB and is not in data coords as before. Using sizes in data coords caused several problems. So you will need to adjust your size arguments accordingly or use scatter_classic.

mathtext spacing

For reasons not clear to me (and which I'll eventually fix) spacing no longer works in font groups. However, I added three new spacing commands which compensate for this '' (regular space), '/' (small space) and 'hspace{frac}' where frac is a fraction of fontsize in points. You will need to quote spaces in font strings, is:

```
title(r'$\rm{Histogram\ of\ IQ:}\ \mu=100,\ \sigma=15$')
```

Object interface - Application programmers

Autoscaling

The x and y axis instances no longer have autoscale view. These are handled by axes.autoscale_view

Axes creation

You should not instantiate your own Axes any more using the OO API. Rather, create a Figure as before and in place of:

```
f = Figure(figsize=(5,4), dpi=100)
a = Subplot(f, 111)
f.add_axis(a)
```

use:

```
f = Figure(figsize=(5,4), dpi=100)
a = f.add_subplot(111)
```

That is, add_axis no longer exists and is replaced by:

```
add_axes(rect, axisbg=defaultcolor, frameon=True)
add_subplot(num, axisbg=defaultcolor, frameon=True)
```

Artist methods

If you define your own Artists, you need to rename the _draw method to draw

Bounding boxes

matplotlib.transforms.Bound2D is replaced by matplotlib.transforms.Bbox. If you want to construct a bbox from left, bottom, width, height (the signature for Bound2D), use matplotlib.transforms.lbwh_to_bbox, as in

bbox = clickBBox = lbwh_to_bbox(left, bottom, width, height)

The Bbox has a different API than the Bound2D. e.g., if you want to get the width and height of the bbox

OLD::

width = fig.bbox.x.interval() height = fig.bbox.y.interval()

New::

width = fig.bbox.width() height = fig.bbox.height()

Object constructors

You no longer pass the bbox, dpi, or transforms to the various Artist constructors. The old way or creating lines and rectangles was cumbersome because you had to pass so many attributes to the Line2D and Rectangle classes not related directly to the geometry and properties of the object. Now default values are added to the object when you call axes.add_line or axes.add_patch, so they are hidden from the user.

If you want to define a custom transformation on these objects, call o.set_transform(trans) where trans is a Transformation instance.

In prior versions of you wanted to add a custom line in data coords, you would have to do

l = Line2D(dpi, bbox, x, y,

color = color, transx = transx, transy = transy,)

now all you need is

l = Line2D(x, y, color=color)

and the axes will set the transformation for you (unless you have set your own already, in which case it will eave it unchanged)

Transformations

The entire transformation architecture has been rewritten. Previously the x and y transformations where stored in the xaxis and yaxis instances. The problem with this approach is it only allows for separable transforms (where the x and y transformations don't depend on one another). But for cases like polar, they do. Now transformations operate on x,y together. There is a new base class matplotlib.transforms.Transformation and two concrete implementations, matplotlib.transforms.SeparableTransformation and matplotlib.transforms.Affine. The SeparableTransformation is constructed with the bounding box of the input (this determines the rectangular coordinate system of the input, i.e., the x and y view limits), the bounding box of the display, and possibly nonlinear transformations of x and y. The 2 most frequently used transformations, data coordinates -> display and axes coordinates -> display are available as ax.transData and ax.transAxes. See alignment_demo.py which uses axes coords.

Also, the transformations should be much faster now, for two reasons

- they are written entirely in extension code
- because they operate on x and y together, they can do the entire transformation in one loop. Earlier I did something along the lines of:

```
xt = sx*func(x) + tx
yt = sy*func(y) + ty
```

  Although this was done in numerix, it still involves 6 length(x) for-loops (the multiply, add, and function evaluation each for x and y). Now all of that is done in a single pass.

If you are using transformations and bounding boxes to get the cursor position in data coordinates, the method calls are a little different now. See the updated examples/coords_demo.py which shows you how to do this.

Likewise, if you are using the artist bounding boxes to pick items on the canvas with the GUI, the bbox methods are somewhat different. You will need to see the updated examples/object_picker.py.

See unit/transforms_unit.py for many examples using the new transformations.

16.1.49 Changes for 0.50

```
* refactored Figure class so it is no longer backend dependent.
  FigureCanvasBackend takes over the backend specific duties of the
  Figure.  matplotlib.backend_bases.FigureBase moved to
  matplotlib.figure.Figure.

* backends must implement FigureCanvasBackend (the thing that
  controls the figure and handles the events if any) and
  FigureManagerBackend (wraps the canvas and the window for MATLAB
  interface).  FigureCanvasBase implements a backend switching
  mechanism

* Figure is now an Artist (like everything else in the figure) and
  is totally backend independent

* GDFONTPATH renamed to TTFPATH

* backend faceColor argument changed to rgbFace

* colormap stuff moved to colors.py

* arg_to_rgb in backend_bases moved to class ColorConverter in
  colors.py

* GD users must upgrade to gd-2.0.22 and gdmodule-0.52 since new gd
  features (clipping, antialiased lines) are now used.

* Renderer must implement points_to_pixels

Migrating code:

MATLAB interface:

  The only API change for those using the MATLAB interface is in how
  you call figure redraws for dynamically updating figures.  In the
  old API, you did

    fig.draw()

  In the new API, you do

    manager = get_current_fig_manager()
    manager.canvas.draw()

  See the examples system_monitor.py, dynamic_demo.py, and anim.py

API

  There is one important API change for application developers.
  Figure instances used subclass GUI widgets that enabled them to be
  placed directly into figures.  e.g., FigureGTK subclassed
```

(continues on next page)

(continued from previous page)

```
  gtk.DrawingArea.  Now the Figure class is independent of the
  backend, and FigureCanvas takes over the functionality formerly
  handled by Figure.  In order to include figures into your apps,
  you now need to do, for example

    # gtk example
    fig = Figure(figsize=(5,4), dpi=100)
    canvas = FigureCanvasGTK(fig)  # a gtk.DrawingArea
    canvas.show()
    vbox.pack_start(canvas)

  If you use the NavigationToolbar, this in now initialized with a
  FigureCanvas, not a Figure.  The examples embedding_in_gtk.py,
  embedding_in_gtk2.py, and mpl_with_glade.py all reflect the new
  API so use these as a guide.

  All prior calls to

   figure.draw()  and
   figure.print_figure(args)

  should now be

   canvas.draw()  and
   canvas.print_figure(args)

  Apologies for the inconvenience.  This refactorization brings
  significant more freedom in developing matplotlib and should bring
  better plotting capabilities, so I hope the inconvenience is worth
  it.
```

16.1.50 Changes for 0.42

```
* Refactoring AxisText to be backend independent.  Text drawing and
  get_window_extent functionality will be moved to the Renderer.

* backend_bases.AxisTextBase is now text.Text module

* All the erase and reset functionality removed from AxisText - not
  needed with double buffered drawing.  Ditto with state change.
  Text instances have a get_prop_tup method that returns a hashable
  tuple of text properties which you can use to see if text props
  have changed, e.g., by caching a font or layout instance in a dict
  with the prop tup as a key -- see RendererGTK.get_pango_layout in
  backend_gtk for an example.

* Text._get_xy_display renamed Text.get_xy_display

* Artist set_renderer and wash_brushes methods removed
```

(continues on next page)

(continued from previous page)

```
* Moved Legend class from matplotlib.axes into matplotlib.legend

* Moved Tick, XTick, YTick, Axis, XAxis, YAxis from matplotlib.axes
  to matplotlib.axis

* moved process_text_args to matplotlib.text

* After getting Text handled in a backend independent fashion, the
  import process is much cleaner since there are no longer cyclic
  dependencies

* matplotlib.matlab._get_current_fig_manager renamed to
  matplotlib.matlab.get_current_fig_manager to allow user access to
  the GUI window attribute, e.g., figManager.window for GTK and
  figManager.frame for wx
```

16.1.51 Changes for 0.40

```
- Artist
    * __init__ takes a DPI instance and a Bound2D instance which is
      the bounding box of the artist in display coords
    * get_window_extent returns a Bound2D instance
    * set_size is removed; replaced by bbox and dpi
    * the clip_gc method is removed.  Artists now clip themselves with
      their box
    * added _clipOn boolean attribute.  If True, gc clip to bbox.

- AxisTextBase
    * Initialized with a transx, transy which are Transform instances
    * set_drawing_area removed
    * get_left_right and get_top_bottom are replaced by get_window_extent

- Line2D Patches now take transx, transy
    * Initialized with a transx, transy which are Transform instances

- Patches
   * Initialized with a transx, transy which are Transform instances

- FigureBase attributes dpi is a DPI instance rather than scalar and
  new attribute bbox is a Bound2D in display coords, and I got rid
  of the left, width, height, etc... attributes.  These are now
  accessible as, for example, bbox.x.min is left, bbox.x.interval()
  is width, bbox.y.max is top, etc...

- GcfBase attribute pagesize renamed to figsize

- Axes
    * removed figbg attribute
```

(continues on next page)

(continued from previous page)

```
    * added fig instance to __init__
    * resizing is handled by figure call to resize.

- Subplot
    * added fig instance to __init__

- Renderer methods for patches now take gcEdge and gcFace instances.
  gcFace=None takes the place of filled=False

- True and False symbols provided by cbook in a python2.3 compatible
  way

- new module transforms supplies Bound1D, Bound2D and Transform
  instances and more

- Changes to the MATLAB helpers API

  * _matlab_helpers.GcfBase is renamed by Gcf.  Backends no longer
    need to derive from this class.  Instead, they provide a factory
    function new_figure_manager(num, figsize, dpi).  The destroy
    method of the GcfDerived from the backends is moved to the derived
    FigureManager.

  * FigureManagerBase moved to backend_bases

  * Gcf.get_all_figwins renamed to Gcf.get_all_fig_managers

Jeremy:

  Make sure to self._reset = False in AxisTextWX._set_font.  This was
  something missing in my backend code.
```

Changes for the latest version are listed below. For new features that were added to Matplotlib, see *What's new?*

16.2 API Changes for 3.3.1

16.2.1 Deprecations

Reverted deprecation of `num2epoch` and `epoch2num`

These two functions were deprecated in 3.3.0, and did not return an accurate Matplotlib datenum relative to the new Matplotlib epoch handling (*`get_epoch`* and `rcParams["date.epoch"]` (default: `'1970-01-01T00:00:00'`)). This version reverts the deprecation.

Functions `epoch2num` and `dates.julian2num` use `date.epoch` rcParam

Now *`epoch2num`* and (undocumented) `julian2num` return floating point days since *`get_epoch`* as set by `rcParams["date.epoch"]` (default: `'1970-01-01T00:00:00'`), instead of floating point days since the old epoch of "0000-12-31T00:00:00". If needed, you can translate from the new to old values as `old = new + mdates.date2num(np.datetime64('0000-12-31'))`

16.3 API Changes for 3.3.0

16.3.1 Behaviour changes

`Formatter.fix_minus`

`Formatter.fix_minus` now performs hyphen-to-unicode-minus replacement whenever `rcParams["axes.unicode_minus"]` (default: `True`) is True; i.e. its behavior matches the one of `ScalarFormatter.fix_minus` (*`ScalarFormatter`* now just inherits that implementation).

This replacement is now used by the `format_data_short` method of the various builtin formatter classes, which affects the cursor value in the GUI toolbars.

`FigureCanvasBase` now always has a `manager` attribute, which may be None

Previously, it did not necessarily have such an attribute. A check for `hasattr(figure.canvas, "manager")` should now be replaced by `figure.canvas.manager is not None` (or `getattr(figure.canvas, "manager", None) is not None` for back-compatibility).

`cbook.CallbackRegistry` now propagates exceptions when no GUI event loop is running

cbook.CallbackRegistry now defaults to propagating exceptions thrown by callbacks when no interactive GUI event loop is running. If a GUI event loop *is* running, *cbook.CallbackRegistry* still defaults to just printing a traceback, as unhandled exceptions can make the program completely `abort()` in that case.

`Axes.locator_params()` validates `axis` parameter

axes.Axes.locator_params used to accept any value for `axis` and silently did nothing, when passed an unsupported value. It now raises a `ValueError`.

`Axis.set_tick_params()` validates `which` parameter

Axis.set_tick_params (and the higher level *axes.Axes.tick_params* and *pyplot.tick_params*) used to accept any value for `which` and silently did nothing, when passed an unsupported value. It now raises a `ValueError`.

`Axis.set_ticklabels()` must match `FixedLocator.locs`

If an axis is using a *ticker.FixedLocator*, typically set by a call to *Axis.set_ticks*, then the number of ticklabels supplied must match the number of locations available (`FixedFormattor.locs`). If not, a `ValueError` is raised.

`backend_pgf.LatexManager.latex`

`backend_pgf.LatexManager.latex` is now created with `encoding="utf-8"`, so its `stdin`, `stdout`, and `stderr` attributes are utf8-encoded.

`pyplot.xticks()` and `pyplot.yticks()`

Previously, passing labels without passing the ticks to either *pyplot.xticks* and *pyplot.yticks* would result in

> TypeError: object of type 'NoneType' has no len()

It now raises a `TypeError` with a proper description of the error.

Setting the same property under multiple aliases now raises a TypeError

Previously, calling e.g. `plot(..., color=somecolor, c=othercolor)` would emit a warning because `color` and `c` actually map to the same Artist property. This now raises a TypeError.

`FileMovieWriter` temporary frames directory

`FileMovieWriter` now defaults to writing temporary frames in a temporary directory, which is always cleared at exit. In order to keep the individual frames saved on the filesystem, pass an explicit *frame_prefix*.

`Axes.plot` no longer accepts *x* and *y* being both 2D and with different numbers of columns

Previously, calling *`Axes.plot`* e.g. with *x* of shape `(n, 3)` and *y* of shape `(n, 2)` would plot the first column of *x* against the first column of *y*, the second column of *x* against the second column of *y*, **and** the first column of *x* against the third column of *y*. This now raises an error instead.

`Text.update_from` now copies usetex state from the source Text

`stem` now defaults to `use_line_collection=True`

This creates the stem plot as a *`LineCollection`* rather than individual *`Line2D`* objects, greatly improving performance.

rcParams color validator is now stricter

Previously, rcParams entries whose values were color-like accepted "spurious" extra letters or characters in the "middle" of the string, e.g. `"(0, 1a, '0.5')"` would be interpreted as `(0, 1, 0.5)`. These extra characters (including the internal quotes) now cause a ValueError to be raised.

`SymLogNorm` now has a *base* parameter

Previously, *`SymLogNorm`* had no *base* keyword argument, and defaulted to `base=np.e` whereas the documentation said it was `base=10`. In preparation to make the default 10, calling *`SymLogNorm`* without the new *base* keyword argument emits a deprecation warning.

`errorbar` now color cycles when only errorbar color is set

Previously setting the *ecolor* would turn off automatic color cycling for the plot, leading to the the lines and markers defaulting to whatever the first color in the color cycle was in the case of multiple plot calls.

`rcsetup.validate_color_for_prop_cycle` now always raises TypeError for bytes input

It previously raised `TypeError`, **except** when the input was of the form `b"C[number]"` in which case it raised a ValueError.

`FigureCanvasPS.print_ps` and `FigureCanvasPS.print_eps` no longer apply edgecolor and facecolor

These methods now assume that the figure edge and facecolor have been correctly applied by *`FigureCanvasBase.print_figure`*, as they are normally called through it.

This behavior is consistent with other figure saving methods (*`FigureCanvasAgg.print_png`*, *`FigureCanvasPdf.print_pdf`*, *`FigureCanvasSVG.print_svg`*).

`pyplot.subplot()` now raises TypeError when given an incorrect number of arguments

This is consistent with other signature mismatch errors. Previously a ValueError was raised.

Shortcut for closing all figures

Shortcuts for closing all figures now also work for the classic toolbar. There is no default shortcut any more because unintentionally closing all figures by a key press might happen too easily. You can configure the shortcut yourself using `rcParams["keymap.quit_all"]` (default: `[]`).

Autoscale for arrow

Calling ax.arrow() will now autoscale the axes.

`set_tick_params(label1On=False)` now also makes the offset text (if any) invisible

... because the offset text can rarely be interpreted without tick labels anyways.

`Axes.annotate` and `pyplot.annotate` parameter name changed

The parameter `s` to *Axes.annotate* and *pyplot.annotate* is renamed to `text`, matching *Annotation*.

The old parameter name remains supported, but support for it will be dropped in a future Matplotlib release.

`font_manager.json_dump` now locks the font manager dump file

... to prevent multiple processes from writing to it at the same time.

`pyplot.rgrids` and `pyplot.thetagrids` now act as setters also when called with only kwargs

Previously, keyword arguments were silently ignored when no positional arguments were given.

`Axis.get_minorticklabels` and `Axis.get_majorticklabels` now returns plain list

Previously, *Axis.get_minorticklabels* and *Axis.get_majorticklabels* returns silent_list. Their return type is now changed to normal list. *get_xminorticklabels*, *get_yminorticklabels*, *get_zminorticklabels*, *Axis.get_ticklabels*, *get_xmajorticklabels*, *get_ymajorticklabels* and *get_zmajorticklabels* methods will be affected by this change.

Default slider formatter

The default method used to format *Slider* values has been changed to use a *ScalarFormatter* adapted the slider values limits. This should ensure that values are displayed with an appropriate number of significant digits even if they are much smaller or much bigger than 1. To restore the old behavior, explicitly pass a "%1.2f" as the *valfmt* parameter to *Slider*.

Add *normalize* keyword argument to `Axes.pie`

`pie()` used to draw a partial pie if the sum of the values was < 1. This behavior is deprecated and will change to always normalizing the values to a full pie by default. If you want to draw a partial pie, please pass `normalize=False` explicitly.

`table.CustomCell` is now an alias for `table.Cell`

All the functionality of `CustomCell` has been moved to its base class *Cell*.

wx Timer interval

Setting the timer interval on a not-yet-started `TimerWx` won't start it anymore.

"step"-type histograms default to the zorder of `Line2D`

This ensures that they go above gridlines by default. The old `zorder` can be kept by passing it as a keyword argument to *Axes.hist*.

`Legend` and `OffsetBox` visibility

Legend and *OffsetBox* subclasses (*PaddedBox*, *AnchoredOffsetbox*, and *AnnotationBbox*) no longer directly keep track of the visibility of their underlying *Patch* artist, but instead pass that flag down to the *Patch*.

`Legend` and `Table` no longer allow invalid locations

This affects legends produced on an Axes (*Axes.legend* and *pyplot.legend*) and on a Figure (*Figure.legend* and *pyplot.figlegend*). Figure legends also no longer accept the unsupported `'best'` location. Previously, invalid Axes locations would use `'best'` and invalid Figure locations would used `'upper right'`.

Passing Line2D's *drawstyle* together with *linestyle* is removed

Instead of `plt.plot(..., linestyle="steps--")`, use `plt.plot(..., linestyle="--", drawstyle="steps")`. `ds` is also an alias for `drawstyle`.

Upper case color strings

Support for passing single-letter colors (one of "rgbcmykw") as UPPERCASE characters is removed; these colors are now case-sensitive (lowercase).

tight/constrained_layout no longer worry about titles that are too wide

tight_layout and *constrained_layout* shrink axes to accommodate "decorations" on the axes. However, if an xlabel or title is too long in the x direction, making the axes smaller in the x-direction doesn't help. The behavior of both has been changed to ignore the width of the title and xlabel and the height of the ylabel in the layout logic.

This also means there is a new keyword argument for *axes.Axes.get_tightbbox* and *axis.Axis.get_tightbbox*: `for_layout_only`, which defaults to *False*, but if *True* returns a bounding box using the rules above.

`rcParams["savefig.facecolor"]` (default: `'auto'`) and `rcParams["savefig.edgecolor"]` (default: `'auto'`) now default to "auto"

This newly allowed value for `rcParams["savefig.facecolor"]` (default: `'auto'`) and `rcParams["savefig.edgecolor"]` (default: `'auto'`), as well as the *facecolor* and *edgecolor* parameters to *Figure.savefig*, means "use whatever facecolor and edgecolor the figure current has".

When using a single dataset, `Axes.hist` no longer wraps the added artist in a `silent_list`

When *Axes.hist* is called with a single dataset, it adds to the axes either a *BarContainer* object (when `histtype="bar"` or `"barstacked"`), or a *Polygon* object (when `histype="step"` or `"stepfilled"`) -- the latter being wrapped in a list-of-one-element. Previously, either artist would be wrapped in a *silent_list*. This is no longer the case: the *BarContainer* is now returned as is (this is an API breaking change if you were directly relying on the concrete `list` API; however, *BarContainer* inherits from `tuple` so most common operations remain available), and the list-of-one *Polygon* is returned as is. This makes the `repr` of the returned artist more accurate: it is now

```
<BarContainer object of of 10 artists>  # "bar", "barstacked"
[<matplotlib.patches.Polygon object at 0xdeadbeef>]  # "step", "stepfilled"
```

instead of

```
<a list of 10 Patch objects>  # "bar", "barstacked"
<a list of 1 Patch objects>  # "step", "stepfilled"
```

When *Axes.hist* is called with multiple artists, it still wraps its return value in a *silent_list*, but uses more accurate type information

```
<a list of 3 BarContainer objects>  # "bar", "barstacked"
<a list of 3 List[Polygon] objects>  # "step", "stepfilled"
```

instead of

```
<a list of 3 Lists of Patches objects>  # "bar", "barstacked"
<a list of 3 Lists of Patches objects>  # "step", "stepfilled"
```

Qt and wx backends no longer create a status bar by default

The coordinates information is now displayed in the toolbar, consistently with the other backends. This is intended to simplify embedding of Matplotlib in larger GUIs, where Matplotlib may control the toolbar but not the status bar.

`rcParams["text.hinting"]` (default: `'force_autohint'`) now supports names mapping to FreeType flags

`rcParams["text.hinting"]` (default: `'force_autohint'`) now supports the values "default", "no_autohint", "force_autohint", and "no_hinting", which directly map to the FreeType flags FT_LOAD_DEFAULT, etc. The old synonyms (respectively "either", "native", "auto", and "none") are still supported, but their use is discouraged. To get normalized values, use *backend_agg.get_hinting_flag*, which returns integer flag values.

`cbook.get_sample_data` auto-loads numpy arrays

When *cbook.get_sample_data* is used to load a npy or npz file and the keyword-only parameter `np_load` is True, the file is automatically loaded using `numpy.load`. `np_load` defaults to False for backwards compatibility, but will become True in a later release.

`get_text_width_height_descent` now checks `ismath` rather than `rcParams["text.usetex"]` (default: `False`)

... to determine whether a string should be passed to the usetex machinery or not. This allows single strings to be marked as not-usetex even when the rcParam is True.

`Axes.vlines`, `Axes.hlines`, `pyplot.vlines` and `pyplot.hlines` *colors* parameter default change

The *colors* parameter will now default to `rcParams["lines.color"]` (default: `'C0'`), while previously it defaulted to 'k'.

Aggressively autoscale clim in `ScalerMappable` classes

Previously some plotting methods would defer autoscaling until the first draw if only one of the *vmin* or *vmax* keyword arguments were passed (*`Axes.scatter`*, *`Axes.hexbin`*, *`Axes.imshow`*, *`Axes.pcolorfast`*) but would scale based on the passed data if neither was passed (independent of the *norm* keyword arguments). Other methods (*`Axes.pcolor`*, *`Axes.pcolormesh`*) always autoscaled base on the initial data.

All of the plotting methods now resolve the unset *vmin* or *vmax* at the initial call time using the data passed in.

If you were relying on exactly one of the *vmin* or *vmax* remaining unset between the time when the method is called and the first time the figure is rendered you get back the old behavior by manually setting the relevant limit back to `None`

```
cm_obj.norm.vmin = None
# or
cm_obj.norm.vmax = None
```

which will be resolved during the draw process.

16.3.2 Deprecations

`figure.add_axes()` without arguments

Calling `fig.add_axes()` with no arguments currently does nothing. This call will raise an error in the future. Adding a free-floating axes needs a position rectangle. If you want a figure-filling single axes, use `add_subplot()` instead.

`backend_wx.DEBUG_MSG`

`backend_wx.DEBUG_MSG` is deprecated. The wx backends now use regular logging.

`Colorbar.config_axis()`

`Colorbar.config_axis()` is considered internal. Its use is deprecated.

`NonUniformImage.is_grayscale` and `PcolorImage.is_grayscale`

These attributes are deprecated, for consistency with `AxesImage.is_grayscale`, which was removed back in Matplotlib 2.0.0. (Note that previously, these attributes were only available *after rendering the image*).

`den` parameter and attribute to `mpl_toolkits.axisartist.angle_helper`

For all locator classes defined in *mpl_toolkits.axisartist.angle_helper*, the `den` parameter has been renamed to `nbins`, and the `den` attribute deprecated in favor of its (pre-existing) synonym `nbins`, for consistency with locator classes defined in *matplotlib.ticker*.

`backend_pgf.LatexManager.latex_stdin_utf8`

`backend_pgf.LatexManager.latex` is now created with `encoding="utf-8"`, so its `stdin` attribute is already utf8-encoded; the `latex_stdin_utf8` attribute is thus deprecated.

Flags containing "U" passed to `cbook.to_filehandle` and `cbook.open_file_cm`

Please remove "U" from flags passed to *cbook.to_filehandle* and *cbook.open_file_cm*. This is consistent with their removal from `open` in Python 3.9.

PDF and PS character tracking internals

The `used_characters` attribute and `track_characters` and `merge_used_characters` methods of *RendererPdf*, *PdfFile*, and *RendererPS* are deprecated.

Case-insensitive capstyles and joinstyles

Please pass capstyles ("miter", "round", "bevel") and joinstyles ("butt", "round", "projecting") as lowercase.

Passing raw data to `register_cmap()`

Passing raw data via parameters *data* and *lut* to *`register_cmap()`* is deprecated. Instead, explicitly create a *`LinearSegmentedColormap`* and pass it via the *cmap* parameter: `register_cmap(cmap=LinearSegmentedColormap(name, data, lut))`.

`DateFormatter.illegal_s`

This attribute is unused and deprecated.

`widgets.TextBox.params_to_disable`

This attribute is deprecated.

Revert deprecation *min, *max keyword arguments to `set_x/y/zlim_3d()`

These keyword arguments were deprecated in 3.0, alongside with the respective parameters in `set_xlim()` / `set_ylim()`. The deprecations of the 2D versions were already reverted in in 3.1.

`cbook.local_over_kwdict`

This function is deprecated. Use *`cbook.normalize_kwargs`* instead.

Passing both singular and plural *colors*, *linewidths*, *linestyles* to `Axes.eventplot`

Passing e.g. both *linewidth* and *linewidths* will raise a TypeError in the future.

Setting `rcParams["text.latex.preamble"]` (default: `''`) or `rcParams["pdf.preamble"]` to non-strings

These rcParams should be set to string values. Support for None (meaning the empty string) and lists of strings (implicitly joined with newlines) is deprecated.

Parameters *norm* and *vmin*/*vmax* should not be used simultaneously

Passing parameters *norm* and *vmin*/*vmax* simultaneously to functions using colormapping such as `scatter()` and `imshow()` is deprecated. Inestead of `norm=LogNorm(), vmin=min_val, vmax=max_val` pass `norm=LogNorm(min_val, max_val)`. *vmin* and *vmax* should only be used without setting *norm*.

Effectless parameters of `Figure.colorbar` and `matplotlib.colorbar.Colorbar`

The *cmap* and *norm* parameters of *Figure.colorbar* and *matplotlib.colorbar.Colorbar* have no effect because they are always overridden by the mappable's colormap and norm; they are thus deprecated. Likewise, passing the *alpha*, *boundaries*, *values*, *extend*, or *filled* parameters with a *ContourSet* mappable, or the *alpha* parameter with an *Artist* mappable, is deprecated, as the mappable would likewise override them.

`args_key` and `exec_key` attributes of builtin `MovieWriters`

These attributes are deprecated.

Unused parameters

The following parameters do not have any effect and are deprecated:

- arbitrary keyword arguments to `StreamplotSet`
- parameter *quantize* of *Path.cleaned()*
- parameter *s* of *AnnotationBbox.get_fontsize()*
- parameter *label* of *Tick*

Passing *props* to `Shadow`

The parameter *props* of *Shadow* is deprecated. Use keyword arguments instead.

`Axes.update_datalim_bounds`

This method is deprecated. Use `ax.dataLim.set(Bbox.union([ax.dataLim, bounds]))` instead.

{,Symmetrical}LogScale.{,Inverted}LogTransform

LogScale.LogTransform, LogScale.InvertedLogTransform, SymmetricalScale.SymmetricalTransform and SymmetricalScale.InvertedSymmetricalTransform are deprecated. Directly access the transform classes from the *scale* module.

TexManager.cachedir, TexManager.rgba_arrayd

Use *matplotlib.get_cachedir()* instead for the former; there is no replacement for the latter.

Setting Line2D's pickradius via Line2D.set_picker

Setting a *Line2D*'s pickradius (i.e. the tolerance for pick events and containment checks) via *Line2D.set_picker* is deprecated. Use *Line2D.set_pickradius* instead.

Line2D.set_picker no longer sets the artist's custom-contain() check.

Artist.set_contains, Artist.get_contains

Setting a custom method overriding *Artist.contains* is deprecated. There is no replacement, but you may still customize pick events using *Artist.set_picker*.

Colorbar methods

The on_mappable_changed and update_bruteforce methods of *Colorbar* are deprecated; both can be replaced by calls to *update_normal*.

OldScalarFormatter, IndexFormatter and DateIndexFormatter

These formatters are deprecated. Their functionality can be implemented using e.g. *FuncFormatter*.

OldAutoLocator

This ticker is deprecated.

required, *forbidden* and *allowed* parameters of `cbook.normalize_kwargs`

These parameters are deprecated.

The `TTFPATH` and `AFMPATH` environment variables

Support for the (undocumented) `TTFPATH` and `AFMPATH` environment variables is deprecated. Additional fonts may be registered using `matplotlib.font_manager.fontManager.addfont()`.

`matplotlib.compat`

This module is deprecated.

`matplotlib.backends.qt_editor.formsubplottool`

This module is deprecated. Use `matplotlib.backends.backend_qt5.SubplotToolQt` instead.

AVConv animation writer deprecated

The `AVConvBase`, `AVConvWriter` and `AVConvFileWriter` classes, and the associated `animation.avconv_path` and `animation.avconv_args` rcParams are deprecated.

Debian 8 (2015, EOL 06/2020) and Ubuntu 14.04 (EOL 04/2019) were the last versions of Debian and Ubuntu to ship avconv. It remains possible to force the use of avconv by using the ffmpeg-based writers with `rcParams["animation.ffmpeg_path"]` (default: `'ffmpeg'`) set to "avconv".

log/symlog scale base, ticks, and nonpos specification

semilogx, *semilogy*, *loglog*, *LogScale*, and *SymmetricalLogScale* used to take keyword arguments that depends on the axis orientation ("basex" vs "basey", "subsx" vs "subsy", "nonposx" vs "nonposy"); these parameter names are now deprecated in favor of "base", "subs", "nonpositive". This deprecation also affects e.g. `ax.set_yscale("log", basey=...)` which must now be spelled `ax.set_yscale("log", base=...)`.

The change from "nonpos" to "nonpositive" also affects *LogTransform*, *InvertedLogTransform*, *SymmetricalLogTransform*, etc.

To use *different* bases for the x-axis and y-axis of a *loglog* plot, use e.g. `ax.set_xscale("log", base=10); ax.set_yscale("log", base=2)`.

DraggableBase.artist_picker

This method is deprecated. If you previously reimplemented it in a subclass, set the artist's picker instead with *Artist.set_picker*.

clear_temp parameter and attribute of FileMovieWriter

The *clear_temp* parameter and attribute of *FileMovieWriter* is deprecated. In the future, files placed in a temporary directory (using `frame_prefix=None`, the default) will be cleared; files placed elsewhere will not.

Deprecated rcParams validators

The following validators, defined in *rcsetup*, are deprecated: `validate_fontset`, `validate_mathtext_default`, `validate_alignment`, `validate_svg_fontset`, `validate_pgf_texsystem`, `validate_movie_frame_fmt`, `validate_axis_locator`, `validate_movie_html_fmt`, `validate_grid_axis`, `validate_axes_titlelocation`, `validate_toolbar`, `validate_ps_papersize`, `validate_legend_loc`, `validate_bool_maybe_none`, `validate_hinting`, `validate_movie_writers`, `validate_webagg_address`, `validate_nseq_float`, `validate_nseq_int`. To test whether an rcParam value would be acceptable, one can test e.g. `rc = RcParams(); rc[k] = v` raises an exception.

Stricter rcParam validation

`rcParams["axes.axisbelow"]` (default: `'line'`) currently normalizes all strings starting with "line" (case-insensitive) to the option "line". This is deprecated; in a future version only the exact string "line" (case-sensitive) will be supported.

add_subplot() validates its inputs

In particular, for `add_subplot(rows, cols, index)`, all parameters must be integral. Previously strings and floats were accepted and converted to int. This will now emit a deprecation warning.

Toggling axes navigation from the keyboard using "a" and digit keys

Axes navigation can still be toggled programmatically using *Axes.set_navigate*.

The following related APIs are also deprecated: `backend_tools.ToolEnableAllNavigation`, `backend_tools.ToolEnableNavigation`, and `rcParams["keymap.all_axes"]`.

`matplotlib.test(recursionlimit=...)`

The *recursionlimit* parameter of `matplotlib.test` is deprecated.

mathtext glues

The *copy* parameter of `mathtext.Glue` is deprecated (the underlying glue spec is now immutable). `mathtext.GlueSpec` is deprecated.

Signatures of `Artist.draw` and `Axes.draw`

The *inframe* parameter to *Axes.draw* is deprecated. Use *Axes.redraw_in_frame* instead.

Not passing the *renderer* parameter to *Axes.draw* is deprecated. Use `axes.draw_artist(axes)` instead.

These changes make the signature of the `draw` (`artist.draw(renderer)`) method consistent across all artists; thus, additional parameters to *Artist.draw* are deprecated.

`DraggableBase.on_motion_blit`

This method is deprecated. *DraggableBase.on_motion* now handles both the blitting and the non-blitting cases.

Passing the dash offset as None

Fine control of dash patterns can be achieved by passing an `(offset, (on-length, off-length, on-length, off-length, ...))` pair as the linestyle property of *Line2D* and *LineCollection*. Previously, certain APIs would accept `offset = None` as a synonym for `offset = 0`, but this was never universally implemented, e.g. for vector output. Support for `offset = None` is deprecated, set the offset to 0 instead.

RendererCairo.fontweights, RendererCairo.fontangles

... are deprecated.

autofmt_xdate(which=None)

This is deprecated, use its more explicit synonym, `which="major"`, instead.

JPEG options

The *quality*, *optimize*, and *progressive* keyword arguments to *savefig*, which were only used when saving to JPEG, are deprecated. `rcParams["savefig.jpeg_quality"]` (default: `95`) is likewise deprecated.

Such options should now be directly passed to Pillow using `savefig(..., pil_kwargs={"quality": ..., "optimize": ..., "progressive": ...})`.

dviread.Encoding

This class was (mostly) broken and is deprecated.

Axis and Locator pan and zoom

The unused `pan` and `zoom` methods of *Axis* and *Locator* are deprecated. Panning and zooming are now implemented using the `start_pan`, `drag_pan`, and `end_pan` methods of *Axes*.

Passing None to various Axes subclass factories

Support for passing `None` as base class to *axes.subplot_class_factory*, `axes_grid1.parasite_axes.host_axes_class_factory`, `axes_grid1.parasite_axes.host_subplot_class_factory`, `axes_grid1.parasite_axes.parasite_axes_class_factory`, and `axes_grid1.parasite_axes.parasite_axes_auxtrans_class_factory` is deprecated. Explicitly pass the correct base `Axes` class instead.

axes_rgb

In *mpl_toolkits.axes_grid1.axes_rgb*, `imshow_rgb` is deprecated (use `ax.imshow(np.dstack([r, g, b]))` instead); `RGBAxesBase` is deprecated (use `RGBAxes` instead); `RGBAxes.add_RGB_to_figure` is deprecated (it was an internal helper).

Substitution.from_params

This method is deprecated. If needed, directly assign to the `params` attribute of the Substitution object.

PGF backend cleanups

The *dummy* parameter of *RendererPgf* is deprecated.

GraphicsContextPgf is deprecated (use *GraphicsContextBase* instead).

set_factor method of mpl_toolkits.axisartist locators

The `set_factor` method of *mpl_toolkits.axisartist* locators (which are different from "standard" Matplotlib tick locators) is deprecated.

widgets.SubplotTool callbacks and axes

The `funcleft`, `funcright`, `funcbottom`, `functop`, `funcwspace`, and `funchspace` methods of *widgets.SubplotTool* are deprecated.

The `axleft`, `axright`, `axbottom`, `axtop`, `axwspace`, and `axhspace` attributes of *widgets.SubplotTool* are deprecated. Access the `ax` attribute of the corresponding slider, if needed.

mathtext Glue helper classes

The `Fil`, `Fill`, `Filll`, `NegFil`, `NegFill`, `NegFilll`, and `SsGlue` classes in the *matplotlib.mathtext* module are deprecated. As an alternative, directly construct glue instances with `Glue("fil")`, etc.

NavigationToolbar2._init_toolbar

Overriding this method to initialize third-party toolbars is deprecated. Instead, the toolbar should be initialized in the `__init__` method of the subclass (which should call the base-class' `__init__` as appropriate). To keep back-compatibility with earlier versions of Matplotlib (which *required* `_init_toolbar` to be overridden), a fully empty implementation (`def _init_toolbar(self): pass`) may be kept and will not trigger the deprecation warning.

NavigationToolbar2QT.parent and .basedir

These attributes are deprecated. In order to access the parent window, use `toolbar.canvas.parent()`. Once the deprecation period is elapsed, it will also be accessible as `toolbar.parent()`. The base directory to the icons is `os.path.join(mpl.get_data_path(), "images")`.

NavigationToolbar2QT.ctx

This attribute is deprecated.

NavigationToolbar2Wx attributes

The `prevZoomRect`, `retinaFix`, `savedRetinaImage`, `wxoverlay`, `zoomAxes`, `zoomStartX`, and `zoomStartY` attributes are deprecated.

NavigationToolbar2.press and .release

These methods were called when pressing or releasing a mouse button, but *only* when an interactive pan or zoom was occurring (contrary to what the docs stated). They are deprecated; if you write a backend which needs to customize such events, please directly override `press_pan`/`press_zoom`/`release_pan`/`release_zoom` instead.

FigureCanvasGTK3._renderer_init

Overriding this method to initialize renderers for GTK3 canvases is deprecated. Instead, the renderer should be initialized in the `__init__` method of the subclass (which should call the base-class' `__init__` as appropriate). To keep back-compatibility with earlier versions of Matplotlib (which *required* `_renderer_init` to be overridden), a fully empty implementation (`def _renderer_init(self): pass`) may be kept and will not trigger the deprecation warning.

Path helpers in `bezier`

`bezier.make_path_regular` is deprecated. Use `Path.cleaned()` (or `Path.cleaned(curves=True)`, etc.) instead (but note that these methods add a `STOP` code at the end of the path).

`bezier.concatenate_paths` is deprecated. Use `Path.make_compound_path()` instead.

`animation.html_args` rcParam

The unused `animation.html_args` rcParam and `animation.HTMLWriter.args_key` attribute are deprecated.

`text.latex.preview` rcParam

This rcParam, which controlled the use of the preview.sty LaTeX package to align TeX string baselines, is deprecated, as Matplotlib's own dvi parser now computes baselines just as well as preview.sty.

`SubplotSpec.get_rows_columns`

This method is deprecated. Use the `GridSpec.nrows`, `GridSpec.ncols`, `SubplotSpec.rowspan`, and `SubplotSpec.colspan` properties instead.

Qt4-based backends

The qt4agg and qt4cairo backends are deprecated. Qt4 has reached its end-of-life in 2015 and there are no releases for recent versions of Python. Please consider switching to Qt5.

fontdict and *minor* parameters of `Axes.set_xticklabels` and `Axes.set_yticklabels` will become keyword-only

All parameters of `Figure.subplots` except *nrows* and *ncols* will become keyword-only

This avoids typing e.g. `subplots(1, 1, 1)` when meaning `subplot(1, 1, 1)`, but actually getting `subplots(1, 1, sharex=1)`.

RendererWx.get_gc

This method is deprecated. Access the `gc` attribute directly instead.

add_all parameter in axes_grid

The *add_all* parameter of *axes_grid1.axes_grid.Grid*, *axes_grid1.axes_grid.ImageGrid*, *axes_grid1.axes_rgb.make_rgb_axes* and *axes_grid1.axes_rgb.RGBAxes* is deprecated. Axes are now always added to the parent figure, though they can be later removed with `ax.remove()`.

BboxBase.inverse_transformed

`.BboxBase.inverse_transformed` is deprecated (call *BboxBase.transformed* on the *inverted()* transform instead).

orientation of eventplot() and EventCollection

Setting the *orientation* of an `eventplot()` or *EventCollection* to "none" or None is deprecated; set it to "horizontal" instead. Moreover, the two orientations ("horizontal" and "vertical") will become case-sensitive in the future.

minor kwarg to Axis.get_ticklocs will become keyword-only

Passing this argument positionally is deprecated.

Case-insensitive properties

Normalization of upper or mixed-case property names to lowercase in *Artist.set* and *Artist.update* is deprecated. In the future, property names will be passed as is, allowing one to pass names such as *patchA* or *UVC*.

ContourSet.ax, Quiver.ax

These attributes are deprecated in favor of `ContourSet.axes` and `Quiver.axes`, for consistency with other artists.

`Locator.refresh()` and associated methods

`Locator.refresh()` is deprecated. This method was called at certain places to let locators update their internal state, typically based on the axis limits. Locators should now always consult the axis limits when called, if needed.

The associated helper methods `NavigationToolbar2.draw()` and `ToolViewsPositions.refresh_locators()` are deprecated, and should be replaced by calls to `draw_idle()` on the corresponding canvas.

`ScalarMappable` checkers

The `add_checker` and `check_update` methods and `update_dict` attribute of *`ScalarMappable`* are deprecated.

`pyplot.tight_layout` and `ColorbarBase` parameters will become keyword-only

All parameters of *`pyplot.tight_layout`* and all parameters of `ColorbarBase` except for the first (*ax*) will become keyword-only, consistently with *`Figure.tight_layout`* and `Colorbar`, respectively.

`Axes.pie` radius and startangle

Passing `None` as either the `radius` or `startangle` of an *`Axes.pie`* is deprecated; use the explicit defaults of 1 and 0, respectively, instead.

`AxisArtist.dpi_transform`

... is deprecated. Scale `Figure.dpi_scale_trans` by 1/72 to achieve the same effect.

`offset_position` property of `Collection`

The `offset_position` property of *`Collection`* is deprecated. In the future, *`Collection`*s will always behave as if `offset_position` is set to "screen" (the default).

Support for passing `offset_position="data"` to the `draw_path_collection` of all renderer classes is deprecated.

`transforms.AffineDeltaTransform` can be used as a replacement. This API is experimental and may change in the future.

testing.compare.make_external_conversion_command

... is deprecated.

epoch2num and num2epoch are deprecated

These are unused and can be easily reproduced by other date tools. *get_epoch* will return Matplotlib's epoch.

axes_grid1.CbarAxes attributes

The `cbid` and `locator` attribute are deprecated. Use `mappable.colorbar_cid` and `colorbar.locator`, as for standard colorbars.

qt_compat.is_pyqt5

This function is deprecated in prevision of the future release of PyQt6. The Qt version can be checked using `QtCore.qVersion()`.

Reordering of parameters by Artist.set

In a future version, `Artist.set` will apply artist properties in the order in which they are given. This only affects the interaction between the *color*, *edgecolor*, *facecolor*, and, for *Collection*s, *alpha* properties: the *color* property now needs to be passed first in order not to override the other properties. This is consistent with e.g. *Artist.update*, which did not reorder the properties passed to it.

Passing multiple keys as a single comma-separated string or multiple arguments to ToolManager.update_keymap

This is deprecated; pass keys as a list of strings instead.

Statusbar classes and attributes

The `statusbar` attribute of *FigureManagerBase*, *StatusbarBase* and all its subclasses, and `StatusBarWx`, are deprecated, as messages are now displayed in the toolbar instead.

`ismath` parameter of `draw_tex`

The `ismath` parameter of the `draw_tex` method of all renderer classes is deprecated (as a call to `draw_tex` -- not to be confused with `draw_text`! -- means that the entire string should be passed to the `usetex` machinery anyways). Likewise, the text machinery will no longer pass the `ismath` parameter when calling `draw_tex` (this should only matter for backend implementers).

Passing `ismath="TeX!"` to *`RendererAgg.get_text_width_height_descent`* is deprecated. Pass `ismath="TeX"` instead, consistently with other low-level APIs which support the values True, False, and "TeX" for `ismath`.

`matplotlib.ttconv`

This module is deprecated.

Stricter PDF metadata keys in PGF

Saving metadata in PDF with the PGF backend currently normalizes all keys to lowercase, unlike the PDF backend, which only accepts the canonical case. This is deprecated; in a future version, only the canonically cased keys listed in the PDF specification (and the *`PdfPages`* documentation) will be accepted.

Qt modifier keys

The `MODIFIER_KEYS`, `SUPER`, `ALT`, `CTRL`, and `SHIFT` global variables of the `matplotlib.backends.backend_qt4agg`, `matplotlib.backends.backend_qt4cairo`, `matplotlib.backends.backend_qt5agg` and `matplotlib.backends.backend_qt5cairo` modules are deprecated.

`TexManager`

The `TexManager.serif`, `TexManager.sans_serif`, `TexManager.cursive` and `TexManager.monospace` attributes are deprecated.

16.3.3 Removals

The following deprecated APIs have been removed:

Modules

- `backends.qt_editor.formlayout` (use the formlayout module available on PyPI instead).

Classes, methods and attributes

- `artist.Artist.aname` property (no replacement)
- `axis.Axis.iter_ticks` (no replacement)
- Support for custom backends that do not provide a `backend_bases.GraphicsContextBase.set_hatch_color` method
- `backend_bases.RendererBase.strip_math()` (use `cbook.strip_math()` instead)
- `backend_wx.debug_on_error()` (no replacement)
- `backend_wx.raise_msg_to_str()` (no replacement)
- `backend_wx.fake_stderr` (no replacement)
- `backend_wx.MenuButtonWx` (no replacement)
- `backend_wx.PrintoutWx` (no replacement)
- `_backend_tk.NavigationToolbar2Tk.set_active()` (no replacement)
- `backend_ps.PsBackendHelper.gs_exe` property (no replacement)
- `backend_ps.PsBackendHelper.gs_version` property (no replacement)
- `backend_ps.PsBackendHelper.supports_ps2write` property (no replacement)
- `backend_ps.RendererPS.afmfontd` property (no replacement)
- `backend_ps.GraphicsContextPS.shouldstroke` property (no replacement)
- `backend_gtk3.FileChooserDialog` (no replacement)
- `backend_gtk3.SaveFigureGTK3.get_filechooser()` (no replacement)
- `backend_gtk3.NavigationToolbar2GTK3.get_filechooser()` (no replacement)
- `backend_gtk3cairo.FigureManagerGTK3Cairo` (use `backend_gtk3.FigureManagerGTK3` instead)
- `backend_pdf.RendererPdf.afm_font_cache` property (no replacement)
- `backend_pgf.LatexManagerFactory` (no replacement)
- `backend_qt5.NavigationToolbar2QT.buttons` property (no replacement)
- `backend_qt5.NavigationToolbar2QT.adj_window` property (no replacement)
- `bezier.find_r_to_boundary_of_closedpath()` (no replacement)
- `cbook.dedent()` (use `inspect.cleandoc` instead)

- `cbook.get_label()` (no replacement)
- `cbook.is_hashable()` (use `isinstance(..., collections.abc.Hashable)` instead)
- `cbook.iterable()` (use `numpy.iterable()` instead)
- `cbook.safezip()` (no replacement)
- `colorbar.ColorbarBase.get_cmap` (use `ScalarMappable.get_cmap` instead)
- `colorbar.ColorbarBase.set_cmap` (use `ScalarMappable.set_cmap` instead)
- `colorbar.ColorbarBase.get_clim` (use `ScalarMappable.get_clim` instead)
- `colorbar.ColorbarBase.set_clim` (use `ScalarMappable.set_clim` instead)
- `colorbar.ColorbarBase.set_norm` (use `ScalarMappable.set_norm` instead)
- `dates.seconds()` (no replacement)
- `dates.minutes()` (no replacement)
- `dates.hours()` (no replacement)
- `dates.weeks()` (no replacement)
- `dates.strpdate2num` and `dates.bytespdate2num` (use `time.strptime` or `dateutil.parser.parse` or *`dates.datestr2num`* instead)
- `docstring.Appender` (no replacement)
- `docstring.dedent()` (use `inspect.getdoc` instead)
- `docstring.copy_dedent()` (use `docstring.copy()` and `inspect.getdoc` instead)
- `font_manager.OSXInstalledFonts()` (no replacement)
- `image.BboxImage.interp_at_native` property (no replacement)
- `lines.Line2D.verticalOffset` property (no replacement)
- `matplotlib.checkdep_dvipng` (no replacement)
- `matplotlib.checkdep_ghostscript` (no replacement)
- `matplotlib.checkdep_pdftops` (no replacement)
- `matplotlib.checkdep_inkscape` (no replacement)
- `matplotlib.get_py2exe_datafiles` (no replacement)
- `matplotlib.tk_window_focus` (use `rcParams['tk.window_focus']` instead)
- `mlab.demean()` (use `mlab.detrend_mean()` instead)
- `path.get_paths_extents()` (use `path.get_path_collection_extents()` instead)
- `path.Path.has_nonfinite()` (use `not np.isfinite(self.vertices).all()` instead)
- `projections.process_projection_requirements()` (no replacement)
- `pyplot.plotfile()` (Instead, load the data using `pandas.read_csv` or `numpy.loadtxt` or similar and use regular pyplot functions to plot the loaded data.)

- `quiver.Quiver.color()` (use `Quiver.get_facecolor()` instead)
- `quiver.Quiver.keyvec` property (no replacement)
- `quiver.Quiver.keytext` property (no replacement)
- `rcsetup.validate_qt4()` (no replacement)
- `rcsetup.validate_qt5()` (no replacement)
- `rcsetup.validate_verbose()` (no replacement)
- `rcsetup.ValidateInterval` (no replacement)
- `scale.LogTransformBase` (use `scale.LogTransform` instead)
- `scale.InvertedLogTransformBase` (use `scale.InvertedLogTransform` instead)
- `scale.Log10Transform` (use `scale.LogTransform` instead)
- `scale.InvertedLog10Transform` (use `scale.InvertedLogTransform` instead)
- `scale.Log2Transform` (use `scale.LogTransform` instead)
- `scale.InvertedLog2Transform` (use `scale.InvertedLogTransform` instead)
- `scale.NaturalLogTransform` (use `scale.LogTransform` instead)
- `scale.InvertedNaturalLogTransform` (use `scale.InvertedLogTransform` instead)
- `scale.get_scale_docs()` (no replacement)
- `sphinxext.plot_directive.plot_directive()` (use the class `PlotDirective` instead)
- `sphinxext.mathmpl.math_directive()` (use the class `MathDirective` instead)
- `spines.Spine.is_frame_like()` (no replacement)
- `testing.decorators.switch_backend()` (use `@pytest.mark.backend` decorator instead)
- `text.Text.is_math_text()` (use `cbook.is_math_text()` instead)
- `text.TextWithDash()` (use `text.Annotation` instead)
- `textpath.TextPath.is_math_text()` (use `cbook.is_math_text()` instead)
- `textpath.TextPath.text_get_vertices_codes()` (use `textpath.text_to_path.get_text_path()` instead)
- `textpath.TextToPath.glyph_to_path()` (use `font.get_path()` and manual translation of the vertices instead)
- `ticker.OldScalarFormatter.pprint_val()` (no replacement)
- `ticker.ScalarFormatter.pprint_val()` (no replacement)
- `ticker.LogFormatter.pprint_val()` (no replacement)
- `ticker.decade_down()` (no replacement)
- `ticker.decade_up()` (no replacement)

- `Tick` properties `gridOn`, `tick1On`, `tick2On`, `label1On`, `label2On` (use `set_visible()` / `get_visible()` on `Tick.gridline`, `Tick.tick1line`, `Tick.tick2line`, `Tick.label1`, `Tick.label2` instead)
- `widgets.SpanSelector.buttonDown` property (no replacement)
- `mplot3d.proj3d.line2d()` (no replacement)
- `mplot3d.proj3d.line2d_dist()` (no replacement)
- `mplot3d.proj3d.line2d_seg_dist()` (no replacement)
- `mplot3d.proj3d.mod()` (use `numpy.linalg.norm` instead)
- `mplot3d.proj3d.proj_transform_vec()` (no replacement)
- `mplot3d.proj3d.proj_transform_vec_clip()` (no replacement)
- `mplot3d.proj3d.vec_pad_ones()` (no replacement)
- `mplot3d.proj3d.proj_trans_clip_points()` (no replacement)
- `mplot3d.art3d.norm_angle()` (no replacement)
- `mplot3d.art3d.norm_text_angle()` (no replacement)
- `mplot3d.art3d.path_to_3d_segment()` (no replacement)
- `mplot3d.art3d.paths_to_3d_segments()` (no replacement)
- `mplot3d.art3d.path_to_3d_segment_with_codes()` (no replacement)
- `mplot3d.art3d.paths_to_3d_segments_with_codes()` (no replacement)
- `mplot3d.art3d.get_patch_verts()` (no replacement)
- `mplot3d.art3d.get_colors()` (no replacement)
- `mplot3d.art3d.zalpha()` (no replacement)
- `mplot3d.axis3d.get_flip_min_max()` (no replacement)
- `mplot3d.axis3d.Axis.get_tick_positions()` (no replacement)
- `axisartist.axis_artist.UnimplementedException` (no replacement)
- `axisartist.axislines.SimpleChainedObjects` (use `axis_grid1.mpl_axes.SimpleChainedObjects` instead)
- `axisartist.axislines.Axes.AxisDict` (use `axis_grid1.mpl_axes.Axes.AxisDict` instead)

Arguments

- `Axes.text()` / `pyplot.text()` do not support the parameter `withdash` anymore. Use `Axes.annotate()` and `pyplot.annotate()` instead.
- The first parameter of *matplotlib.use* has been renamed from `arg` to `backend` (only relevant if you pass by keyword).
- The parameter `warn` of *matplotlib.use* has been removed. A failure to switch the backend will now always raise an `ImportError` if `force` is set; catch that error if necessary.
- All parameters of *matplotlib.use* except the first one are now keyword-only.
- The unused parameters `shape` and `imlim` of *imshow()* are now removed. All parameters beyond `extent` are now keyword-only.
- The unused parameter `interp_at_native` of *BboxImage* has been removed.
- The parameter `usetex` of *TextToPath.get_text_path* has been removed. Use `ismath='TeX'` instead.
- The parameter `block` of `show()` is now keyword-only, and arbitrary arguments or keyword arguments are no longer accepted.
- The parameter `frameon` of *Figure.savefig* has been removed. Use `facecolor="none"` to get a transparent background.
- Passing a `wx.EvtHandler` as the first argument to `backend_wx.TimerWx` is not supported anymore; the signature of `TimerWx` is now consistent with *TimerBase*.
- The `manage_xticks` parameter of *boxplot* and *bxp* has been renamed to `manage_ticks`.
- The `normed` parameter of *hist2d* has been renamed to `density`.
- The `s` parameter of *Annotation* has been renamed to `text`.
- For all functions in *bezier* that supported a `tolerence` parameter, this parameter has been renamed to `tolerance`.
- `axis("normal")` is not supported anymore. Use the equivalent `axis("auto")` instead.
- `axis()` does not accept arbitrary keyword arguments anymore.
- `Axis.set_ticklabels()` does not accept arbitrary positional arguments other than `ticklabels`.
- `mpl_toolkits.mplot3d.art3d.Poly3DCollection.set_zsort` does not accept the value `True` anymore. Pass the equivalent value 'average' instead.
- *AnchoredText* no longer accepts `horizontalalignment` or `verticalalignment` keyword arguments.
- *ConnectionPatch* no longer accepts the `arrow_transmuter` and `connector` keyword arguments, which did nothing since 3.0.

- *FancyArrowPatch* no longer accepts the `arrow_transmuter` and `connector` keyword arguments, which did nothing since 3.0.
- *TextPath* no longer accepts arbitrary positional or keyword arguments.
- *MaxNLocator.set_params()* no longer accepts arbitrary keyword arguments.
- *pie* no longer accepts and squeezes non-1D inputs; pass 1D input to the `x` argument.
- Passing (n, 1)-shaped error arrays to *Axes.errorbar()* is no longer supported; pass a 1D array instead.

rcParams

- The `text.latex.unicode` rcParam has been removed, with no replacement. Matplotlib now always supports unicode in usetex.
- The `savefig.frameon` rcParam has been removed. Set `rcParams["savefig.facecolor"]` (default: `'auto'`) to "none" to get a transparent background.
- The `pgf.debug`, `verbose.fileo` and `verbose.verbose.level` rcParams, which had no effect, have been removed.
- Support for setting `rcParams["mathtext.default"]` (default: `'it'`) to "circled" has been removed.

Environment variables

- `MATPLOTLIBDATA` (no replacement).

mathtext

- The `\stackrel` command (which behaved differently from its LaTeX version) has been removed. Use `\genfrac` instead.
- The `\mathcircled` command has been removed. Directly use Unicode characters, such as `'\N{CIRCLED LATIN CAPITAL LETTER A}'`, instead.

16.3.4 Development changes

Matplotlib now requires numpy>=1.15

Matplotlib now uses Pillow to save and read pngs

The builtin png encoder and decoder has been removed, and Pillow is now a dependency. Note that when reading 16-bit RGB(A) images, Pillow truncates them to 8-bit precision, whereas the old builtin decoder kept the full precision.

The deprecated wx backend (not wxagg!) now always uses wx's builtin jpeg and tiff support rather than relying on Pillow for writing these formats; this behavior is consistent with wx's png output.

See also the *API Changes*.

CHAPTER

SEVENTEEN

USAGE PATTERNS

Below we describe several common approaches to plotting with Matplotlib.

17.1 The pyplot API

matplotlib.pyplot is a collection of command style functions that make Matplotlib work like MATLAB. Each pyplot function makes some change to a figure: e.g., creates a figure, creates a plotting area in a figure, plots some lines in a plotting area, decorates the plot with labels, etc.

pyplot is mainly intended for interactive plots and simple cases of programmatic plot generation.

Further reading:

- The *matplotlib.pyplot* function reference
- *Pyplot tutorial*
- Pyplot examples

17.2 The object-oriented API

At its core, Matplotlib is object-oriented. We recommend directly working with the objects, if you need more control and customization of your plots.

In many cases you will create a *Figure* and one or more *Axes* using *pyplot.subplots* and from then on only work on these objects. However, it's also possible to create *Figure*s explicitly (e.g. when including them in GUI applications).

Further reading:

- *matplotlib.axes.Axes* and *matplotlib.figure.Figure* for an overview of plotting functions.
- Most of the examples use the object-oriented approach (except for the pyplot section)

17.3 The pylab API (disapproved)

Warning: Since heavily importing into the global namespace may result in unexpected behavior, the use of pylab is strongly discouraged. Use *matplotlib.pyplot* instead.

pylab is a module that includes *matplotlib.pyplot*, numpy, numpy.fft, numpy.linalg, numpy.random, and some additional functions, all within a single namespace. Its original purpose was to mimic a MATLAB-like way of working by importing all functions into the global namespace. This is considered bad style nowadays.

CHAPTER

EIGHTEEN

MODULES

Matplotlib consists of the following submodules:

18.1 matplotlib

18.1.1 Backend management

matplotlib.use(*backend*, *, *force=True*)

Select the backend used for rendering and GUI integration.

Parameters

backend

[str] The backend to switch to. This can either be one of the standard backend names, which are case-insensitive:

- interactive backends: GTK3Agg, GTK3Cairo, MacOSX, nbAgg, Qt4Agg, Qt4Cairo, Qt5Agg, Qt5Cairo, TkAgg, TkCairo, WebAgg, WX, WXAgg, WXCairo
- non-interactive backends: agg, cairo, pdf, pgf, ps, svg, template

or a string of the form: `module://my.module.name`.

force

[bool, default: True] If True (the default), raise an `ImportError` if the backend cannot be set up (either because it fails to import, or because an incompatible GUI interactive framework is already running); if False, ignore the failure.

See also:

Backends

matplotlib.get_backend

matplotlib.**get_backend**()
Return the name of the current backend.

See also:

matplotlib.use

matplotlib.**interactive**(*b*)
Set whether to redraw after every plotting command (e.g. *pyplot.xlabel*).

matplotlib.**is_interactive**()
Return whether to redraw after every plotting command.

18.1.2 Default values and styling

matplotlib.**rcParams**
An instance of *RcParams* for handling default Matplotlib values.

class matplotlib.**RcParams**(**args*, ***kwargs*)
A dictionary object including validation.

Validating functions are defined and associated with rc parameters in *matplotlib.rcsetup*.

See also:

The matplotlibrc file

find_all(*self*, *pattern*)
Return the subset of this RcParams dictionary whose keys match, using `re.search()`, the given `pattern`.

Note: Changes to the returned dictionary are *not* propagated to the parent RcParams dictionary.

---

matplotlib.**rc_context**(*rc=None*, *fname=None*)
Return a context manager for temporarily changing rcParams.

Parameters

rc

[dict] The rcParams to temporarily set.

fname

[str or path-like] A file with Matplotlib rc settings. If both *fname* and *rc* are given, settings from *rc* take precedence.

See also:

The matplotlibrc file

Examples

Passing explicit values via a dict:

```
with mpl.rc_context({'interactive': False}):
    fig, ax = plt.subplots()
    ax.plot(range(3), range(3))
    fig.savefig('example.png')
    plt.close(fig)
```

Loading settings from a file:

```
with mpl.rc_context(fname='print.rc'):
    plt.plot(x, y)  # uses 'print.rc'
```

matplotlib.**rc**(*group*, ***kwargs*)

Set the current *rcParams*. *group* is the grouping for the rc, e.g., for `lines.linewidth` the group is `lines`, for `axes.facecolor`, the group is `axes`, and so on. Group may also be a list or tuple of group names, e.g., (*xtick*, *ytick*). *kwargs* is a dictionary attribute name/value pairs, e.g.,:

```
rc('lines', linewidth=2, color='r')
```

sets the current *rcParams* and is equivalent to:

```
rcParams['lines.linewidth'] = 2
rcParams['lines.color'] = 'r'
```

The following aliases are available to save typing for interactive users:

Alias	Property
'lw'	'linewidth'
'ls'	'linestyle'
'c'	'color'
'fc'	'facecolor'
'ec'	'edgecolor'
'mew'	'markeredgewidth'
'aa'	'antialiased'

Thus you could abbreviate the above call as:

```
rc('lines', lw=2, c='r')
```

Note you can use python's kwargs dictionary facility to store dictionaries of default parameters. e.g., you can customize the font rc as follows:

```
font = {'family' : 'monospace',
        'weight' : 'bold',
        'size'   : 'larger'}
rc('font', **font)  # pass in the font dict as kwargs
```

This enables you to easily switch between several configurations. Use `matplotlib.style.use('default')` or *rcdefaults()* to restore the default *rcParams* after changes.

Notes

Similar functionality is available by using the normal dict interface, i.e. `rcParams.update({"lines.linewidth": 2, ...})` (but `rcParams.update` does not support abbreviations or grouping).

matplotlib.**rcdefaults**()

Restore the *rcParams* from Matplotlib's internal default style.

Style-blacklisted *rcParams* (defined in `matplotlib.style.core.STYLE_BLACKLIST`) are not updated.

See also:

matplotlib.rc_file_defaults

Restore the *rcParams* from the rc file originally loaded by Matplotlib.

matplotlib.style.use

Use a specific style file. Call `style.use('default')` to restore the default style.

matplotlib.**rc_file_defaults**()

Restore the *rcParams* from the original rc file loaded by Matplotlib.

Style-blacklisted *rcParams* (defined in `matplotlib.style.core.STYLE_BLACKLIST`) are not updated.

matplotlib.**rc_file**(*fname*, ***, *use_default_template=True*)

Update *rcParams* from file.

Style-blacklisted *rcParams* (defined in `matplotlib.style.core.STYLE_BLACKLIST`) are not updated.

Parameters

fname

[str or path-like] A file with Matplotlib rc settings.

use_default_template

[bool] If True, initialize with default parameters before updating with those in the given file. If False, the current configuration persists and only the parameters specified in the file are updated.

matplotlib.**rc_params**(*fail_on_error=False*)

Construct a *RcParams* instance from the default Matplotlib rc file.

matplotlib.**rc_params_from_file**(*fname*, *fail_on_error=False*, *use_default_template=True*)

Construct a *RcParams* from file *fname*.

Parameters

fname

[str or path-like] A file with Matplotlib rc settings.

fail_on_error

[bool] If True, raise an error when the parser fails to convert a parameter.

use_default_template

[bool] If True, initialize with default parameters before updating with those in the given file. If False, the configuration class only contains the parameters specified in the file. (Useful for updating dicts.)

matplotlib.**get_configdir**()

Return the string path of the the configuration directory.

The directory is chosen as follows:

1. If the MPLCONFIGDIR environment variable is supplied, choose that.
2. On Linux, follow the XDG specification and look first in `$XDG_CONFIG_HOME`, if defined, or `$HOME/.config`. On other platforms, choose `$HOME/.matplotlib`.
3. If the chosen directory exists and is writable, use that as the configuration directory.
4. Else, create a temporary directory, and use it as the configuration directory.

matplotlib.**matplotlib_fname**()

Get the location of the config file.

The file location is determined in the following order

- `$PWD/matplotlibrc`
- `$MATPLOTLIBRC` if it is not a directory
- `$MATPLOTLIBRC/matplotlibrc`
- `$MPLCONFIGDIR/matplotlibrc`

- **On Linux,**
  - `$XDG_CONFIG_HOME/matplotlib/matplotlibrc` (if `$XDG_CONFIG_HOME` is defined)
  - or `$HOME/.config/matplotlib/matplotlibrc` (if `$XDG_CONFIG_HOME` is not defined)
- On other platforms, - `$HOME/.matplotlib/matplotlibrc` if `$HOME` is defined
- Lastly, it looks in `$MATPLOTLIBDATA/matplotlibrc`, which should always exist.

matplotlib.**get_data_path**(*, *_from_rc=None*)

Return the path to Matplotlib data.

18.1.3 Logging

matplotlib.**set_loglevel**(*level*)

Set Matplotlib's root logger and root logger handler level, creating the handler if it does not exist yet.

Typically, one should call `set_loglevel("info")` or `set_loglevel("debug")` to get additional debugging information.

Parameters

level

[{"notset", "debug", "info", "warning", "error", "critical"}] The log level of the handler.

Notes

The first time this function is called, an additional handler is attached to Matplotlib's root handler; this handler is reused every time and this function simply manipulates the logger and handler's level.

18.1.4 Miscellaneous

matplotlib.**get_cachedir**()

Return the string path of the cache directory.

The procedure used to find the directory is the same as for _get_config_dir, except using `$XDG_CACHE_HOME`/`$HOME/.cache` instead.

18.2 matplotlib.afm

A python interface to Adobe Font Metrics Files.

Although a number of other python implementations exist, and may be more complete than this, it was decided not to go with them because they were either:

1) copyrighted or used a non-BSD compatible license
2) had too many dependencies and a free standing lib was needed
3) did more than needed and it was easier to write afresh rather than figure out how to get just what was needed.

It is pretty easy to use, and has no external dependencies:

```
>>> import matplotlib as mpl
>>> from pathlib import Path
>>> afm_path = Path(mpl.get_data_path(), 'fonts', 'afm', 'ptmr8a.afm')
>>>
>>> from matplotlib.afm import AFM
>>> with afm_path.open('rb') as fh:
...     afm = AFM(fh)
>>> afm.string_width_height('What the heck?')
(6220.0, 694)
>>> afm.get_fontname()
'Times-Roman'
>>> afm.get_kern_dist('A', 'f')
0
>>> afm.get_kern_dist('A', 'y')
-92.0
>>> afm.get_bbox_char('!')
[130, -9, 238, 676]
```

As in the Adobe Font Metrics File Format Specification, all dimensions are given in units of 1/1000 of the scale factor (point size) of the font being used.

class matplotlib.afm.**AFM**(*fh*)

Bases: object

Parse the AFM file in file object *fh*.

property family_name

The font family name, e.g., 'Times'.

get_angle(*self*)

Return the fontangle as float.

get_bbox_char(*self*, *c*, *isord=False*)

get_capheight(*self*)

Return the cap height as float.

get_familyname(*self*)

Return the font family name, e.g., 'Times'.

`get_fontname`(*self*)
Return the font name, e.g., 'Times-Roman'.

`get_fullname`(*self*)
Return the font full name, e.g., 'Times-Roman'.

`get_height_char`(*self*, *c*, *isord=False*)
Get the bounding box (ink) height of character *c* (space is 0).

`get_horizontal_stem_width`(*self*)
Return the standard horizontal stem width as float, or *None* if not specified in AFM file.

`get_kern_dist`(*self*, *c1*, *c2*)
Return the kerning pair distance (possibly 0) for chars *c1* and *c2*.

`get_kern_dist_from_name`(*self*, *name1*, *name2*)
Return the kerning pair distance (possibly 0) for chars *name1* and *name2*.

`get_name_char`(*self*, *c*, *isord=False*)
Get the name of the character, i.e., ';' is 'semicolon'.

`get_str_bbox`(*self*, *s*)
Return the string bounding box.

`get_str_bbox_and_descent`(*self*, *s*)
Return the string bounding box and the maximal descent.

`get_underline_thickness`(*self*)
Return the underline thickness as float.

`get_vertical_stem_width`(*self*)
Return the standard vertical stem width as float, or *None* if not specified in AFM file.

`get_weight`(*self*)
Return the font weight, e.g., 'Bold' or 'Roman'.

`get_width_char`(*self*, *c*, *isord=False*)
Get the width of the character from the character metric WX field.

`get_width_from_char_name`(*self*, *name*)
Get the width of the character from a type1 character name.

`get_xheight`(*self*)
Return the xheight as float.

`string_width_height`(*self*, *s*)
Return the string width (including kerning) and string height as a (*w*, *h*) tuple.

`class matplotlib.afm.CharMetrics`(*width*, *name*, *bbox*)
Bases: `tuple`

Represents the character metrics of a single character.

Notes

The fields do currently only describe a subset of character metrics information defined in the AFM standard.

Create new instance of CharMetrics(width, name, bbox)

bbox
The bbox of the character (B) as a tuple (*llx*, *lly*, *urx*, *ury*).

name
The character name (N).

width
The character width (WX).

class matplotlib.afm.CompositePart(*name*, *dx*, *dy*)
Bases: tuple

Represents the information on a composite element of a composite char.

Create new instance of CompositePart(name, dx, dy)

dx
x-displacement of the part from the origin.

dy
y-displacement of the part from the origin.

name
Name of the part, e.g. 'acute'.

18.3 matplotlib.animation

Table of Contents

18.3.1 Animation

The easiest way to make a live animation in matplotlib is to use one of the *Animation* classes.

Animation	A base class for Animations.
FuncAnimation	Makes an animation by repeatedly calling a function *func*.
ArtistAnimation	Animation using a fixed set of *Artist* objects.

matplotlib.animation.Animation

class matplotlib.animation.**Animation**(*fig*, *event_source=None*, *blit=False*)

A base class for Animations.

This class is not usable as is, and should be subclassed to provide needed behavior.

Parameters

fig

[*Figure*] The figure object used to get needed events, such as draw or resize.

event_source

[object, optional] A class that can run a callback when desired events are generated, as well as be stopped and started.

Examples include timers (see *TimedAnimation*) and file system notifications.

blit

[bool, default: False] Whether blitting is used to optimize drawing.

See also:

FuncAnimation, *ArtistAnimation*

__init__(*self*, *fig*, *event_source=None*, *blit=False*)

Initialize self. See help(type(self)) for accurate signature.

Methods

__init__(self, fig[, event_source, blit])	Initialize self.
new_frame_seq(self)	Return a new sequence of frame information.
new_saved_frame_seq(self)	Return a new sequence of saved/cached frame information.
save(self, filename[, writer, fps, dpi, ...])	Save the animation as a movie file by drawing every frame.
to_html5_video(self[, embed_limit])	Convert the animation to an HTML5 `<video>` tag.
to_jshtml(self[, fps, embed_frames, ...])	Generate HTML representation of the animation

new_frame_seq(*self*)
Return a new sequence of frame information.

new_saved_frame_seq(*self*)
Return a new sequence of saved/cached frame information.

save(*self*, *filename*, *writer=None*, *fps=None*, *dpi=None*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*, *extra_anim=None*, *savefig_kwargs=None*, *, *progress_callback=None*)
Save the animation as a movie file by drawing every frame.

Parameters

filename

[str] The output filename, e.g., `mymovie.mp4`.

writer

[*MovieWriter* or str, default: `rcParams["animation.writer"]` (default: `'ffmpeg'`)] A *MovieWriter* instance to use or a key that identifies a class to use, such as 'ffmpeg'.

fps

[int, optional] Movie frame rate (per second). If not set, the frame rate from the animation's frame interval.

dpi

[float, default: `rcParams["savefig.dpi"]` (default: `'figure'`)] Controls the dots per inch for the movie frames. Together with the figure's size in inches, this controls the size of the movie.

codec

[str, default: `rcParams["animation.codec"]` (default: `'h264'`).] The video codec to use. Not all codecs are supported by a given *MovieWriter*.

bitrate

[int, default: `rcParams["animation.bitrate"]` (default: -1)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use `rcParams["animation.[name-of-encoder]_args"]` for the builtin writers.

metadata

[Dict[str, str], default {}] Dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

extra_anim

[list, default: []] Additional *Animation* objects that should be included in the saved movie file. These need to be from the same *matplotlib.figure.Figure* instance. Also, animation frames will just be simply combined, so there should be a 1:1 correspondence between the frames from the different animations.

savefig_kwargs

[dict, default: {}] Keyword arguments passed to each *savefig* call used to save the individual frames.

progress_callback

[function, optional] A callback function that will be called for every frame to notify the saving progress. It must have the signature

```
def func(current_frame: int, total_frames: int) -> Any
```

where *current_frame* is the current frame number and *total_frames* is the total number of frames to be saved. *total_frames* is set to None, if the total number of frames can not be determined. Return values may exist but are ignored.

Example code to write the progress to stdout:

```
progress_callback =                     lambda i, n: print(f
↪'Saving frame {i} of {n}')
```

Notes

fps, *codec*, *bitrate*, *extra_args* and *metadata* are used to construct a *MovieWriter* instance and can only be passed if *writer* is a string. If they are passed as non-*None* and *writer* is a *MovieWriter*, a RuntimeError will be raised.

`to_html5_video`(*self*, *embed_limit=None*)
Convert the animation to an HTML5 `<video>` tag.

This saves the animation as an h264 video, encoded in base64 directly into the HTML5 video tag. This respects `rcParams["animation.writer"]` (default: `'ffmpeg'`) and `rcParams["animation.bitrate"]` (default: `-1`). This also makes use of the `interval` to control the speed, and uses the `repeat` parameter to decide whether to loop.

Parameters

embed_limit

[float, optional] Limit, in MB, of the returned animation. No animation is created if the limit is exceeded. Defaults to `rcParams["animation.embed_limit"]` (default: `20.0`) = 20.0.

Returns

str

An HTML5 video tag with the animation embedded as base64 encoded h264 video. If the *embed_limit* is exceeded, this returns the string "Video too large to embed."

`to_jshtml`(*self*, *fps=None*, *embed_frames=True*, *default_mode=None*)
Generate HTML representation of the animation

matplotlib.animation.FuncAnimation

class matplotlib.animation.**FuncAnimation**(*fig*, *func*, *frames=None*, *init_func=None*, *fargs=None*, *save_count=None*, ***, *cache_frame_data=True*, ***kwargs*)
Makes an animation by repeatedly calling a function *func*.

Parameters

fig

[*Figure*] The figure object used to get needed events, such as draw or resize.

func

[callable] The function to call at each frame. The first argument will be the next value in *frames*. Any additional positional arguments can be supplied via the *fargs* parameter.

The required signature is:

```
def func(frame, *fargs) -> iterable_of_artists
```

If `blit == True`, *func* must return an iterable of all artists that were modified or created. This information is used by the blitting algorithm to determine which parts of the figure have to be updated. The return value is unused if `blit == False` and may be omitted in that case.

frames

[iterable, int, generator function, or None, optional] Source of data to pass *func* and each frame of the animation

- If an iterable, then simply use the values provided. If the iterable has a length, it will override the *save_count* kwarg.
- If an integer, then equivalent to passing `range(frames)`
- If a generator function, then must have the signature:

```
def gen_function() -> obj
```

- If *None*, then equivalent to passing `itertools.count`.

In all of these cases, the values in *frames* is simply passed through to the user-supplied *func* and thus can be of any type.

init_func

[callable, optional] A function used to draw a clear frame. If not given, the results of drawing from the first item in the frames sequence will be used. This function will be called once before the first frame.

The required signature is:

```
def init_func() -> iterable_of_artists
```

If `blit == True`, *init_func* must return an iterable of artists to be re-drawn. This information is used by the blitting algorithm to determine which parts of the figure have to be updated. The return value is unused if `blit == False` and may be omitted in that case.

fargs

[tuple or None, optional] Additional arguments to pass to each call to *func*.

save_count

[int, default: 100] Fallback for the number of values from *frames* to cache. This is only used if the number of frames cannot be inferred from *frames*, i.e. when it's an iterator without length or a generator.

interval

[int, default: 200] Delay between frames in milliseconds.

repeat_delay

[int, default: 0] The delay in milliseconds between consecutive animation runs, if *repeat* is True.

repeat

[bool, default: True] Whether the animation repeats when the sequence of frames is completed.

blit

[bool, default: False] Whether blitting is used to optimize drawing. Note: when using blitting, any animated artists will be drawn according to their zorder; however, they will be drawn on top of any previous artists, regardless of their zorder.

cache_frame_data

[bool, default: True] Whether frame data is cached. Disabling cache might be helpful when frames contain large objects.

`__init__`(*self*, *fig*, *func*, *frames=None*, *init_func=None*, *fargs=None*, *save_count=None*, *, *cache_frame_data=True*, **kwargs*)
Initialize self. See help(type(self)) for accurate signature.

Methods

__init__(self, fig, func[, frames, ...])	Initialize self.
new_frame_seq(self)	Return a new sequence of frame information.
new_saved_frame_seq(self)	Return a new sequence of saved/cached frame information.
save(self, filename[, writer, fps, dpi, ...])	Save the animation as a movie file by drawing every frame.
to_html5_video(self[, embed_limit])	Convert the animation to an HTML5 <video> tag.

continues on next page

Table 3 – continued from previous page

`to_jshtml`(self[, fps, embed_frames, ...])	Generate HTML representation of the animation

`new_frame_seq`(*self*)
Return a new sequence of frame information.

`new_saved_frame_seq`(*self*)
Return a new sequence of saved/cached frame information.

matplotlib.animation.ArtistAnimation

`class matplotlib.animation.ArtistAnimation`(*fig*, *artists*, **args*, ***kwargs*)
Animation using a fixed set of *Artist* objects.

Before creating an instance, all plotting should have taken place and the relevant artists saved.

Parameters

fig

[*Figure*] The figure object used to get needed events, such as draw or resize.

artists

[list] Each list entry is a collection of artists that are made visible on the corresponding frame. Other artists are made invisible.

interval

[int, default: 200] Delay between frames in milliseconds.

repeat_delay

[int, default: 0] The delay in milliseconds between consecutive animation runs, if *repeat* is True.

repeat

[bool, default: True] Whether the animation repeats when the sequence of frames is completed.

blit

[bool, default: False] Whether blitting is used to optimize drawing.

`__init__`(*self*, *fig*, *artists*, **args*, ***kwargs*)
Initialize self. See help(type(self)) for accurate signature.

Methods

__init__(self, fig, artists, *args, **kwargs)	Initialize self.
new_frame_seq(self)	Return a new sequence of frame information.
new_saved_frame_seq(self)	Return a new sequence of saved/cached frame information.
save(self, filename[, writer, fps, dpi, ...])	Save the animation as a movie file by drawing every frame.
to_html5_video(self[, embed_limit])	Convert the animation to an HTML5 <video> tag.
to_jshtml(self[, fps, embed_frames, ...])	Generate HTML representation of the animation

In both cases it is critical to keep a reference to the instance object. The animation is advanced by a timer (typically from the host GUI framework) which the *Animation* object holds the only reference to. If you do not hold a reference to the *Animation* object, it (and hence the timers), will be garbage collected which will stop the animation.

To save an animation to disk use *Animation.save* or *Animation.to_html5_video*

See *Helper Classes* below for details about what movie formats are supported.

FuncAnimation

The inner workings of *FuncAnimation* is more-or-less:

```
for d in frames:
   artists = func(d, *fargs)
   fig.canvas.draw_idle()
   fig.canvas.start_event_loop(interval)
```

with details to handle 'blitting' (to dramatically improve the live performance), to be non-blocking, not repeatedly start/stop the GUI event loop, handle repeats, multiple animated axes, and easily save the animation to a movie file.

'Blitting' is a standard technique in computer graphics. The general gist is to take an existing bit map (in our case a mostly rasterized figure) and then 'blit' one more artist on top. Thus, by managing a saved 'clean' bitmap, we can only re-draw the few artists that are changing at each frame and possibly save significant amounts of time. When we use blitting (by passing `blit=True`), the core loop of *FuncAnimation* gets a bit more complicated:

```
ax = fig.gca()

def update_blit(artists):
```

(continues on next page)

(continued from previous page)

```
    fig.canvas.restore_region(bg_cache)
    for a in artists:
        a.axes.draw_artist(a)

    ax.figure.canvas.blit(ax.bbox)

artists = init_func()

for a in artists:
   a.set_animated(True)

fig.canvas.draw()
bg_cache = fig.canvas.copy_from_bbox(ax.bbox)

for f in frames:
    artists = func(f, *fargs)
    update_blit(artists)
    fig.canvas.start_event_loop(interval)
```

This is of course leaving out many details (such as updating the background when the figure is resized or fully re-drawn). However, this hopefully minimalist example gives a sense of how `init_func` and `func` are used inside of *FuncAnimation* and the theory of how 'blitting' works.

The expected signature on `func` and `init_func` is very simple to keep *FuncAnimation* out of your book keeping and plotting logic, but this means that the callable objects you pass in must know what artists they should be working on. There are several approaches to handling this, of varying complexity and encapsulation. The simplest approach, which works quite well in the case of a script, is to define the artist at a global scope and let Python sort things out. For example

```
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.animation import FuncAnimation

fig, ax = plt.subplots()
xdata, ydata = [], []
ln, = plt.plot([], [], 'ro')

def init():
    ax.set_xlim(0, 2*np.pi)
    ax.set_ylim(-1, 1)
    return ln,

def update(frame):
    xdata.append(frame)
    ydata.append(np.sin(frame))
    ln.set_data(xdata, ydata)
    return ln,

ani = FuncAnimation(fig, update, frames=np.linspace(0, 2*np.pi, 128),
```

(continues on next page)

(continued from previous page)

```
                    init_func=init, blit=True)
plt.show()
```

The second method is to use `functools.partial` to 'bind' artists to function. A third method is to use closures to build up the required artists and functions. A fourth method is to create a class.

Examples

Decay

This example showcases: - using a generator to drive an animation, - changing axes limits during an animation.

```
import itertools

import numpy as np
import matplotlib.pyplot as plt
import matplotlib.animation as animation

def data_gen():
    for cnt in itertools.count():
        t = cnt / 10
        yield t, np.sin(2*np.pi*t) * np.exp(-t/10.)

def init():
    ax.set_ylim(-1.1, 1.1)
    ax.set_xlim(0, 10)
    del xdata[:]
    del ydata[:]
    line.set_data(xdata, ydata)
    return line,

fig, ax = plt.subplots()
line, = ax.plot([], [], lw=2)
ax.grid()
xdata, ydata = [], []

def run(data):
    # update the data
    t, y = data
    xdata.append(t)
    ydata.append(y)
    xmin, xmax = ax.get_xlim()

    if t >= xmax:
```

(continues on next page)

(continued from previous page)

```
        ax.set_xlim(xmin, 2*xmax)
        ax.figure.canvas.draw()
    line.set_data(xdata, ydata)

    return line,

ani = animation.FuncAnimation(fig, run, data_gen, interval=10, init_func=init)
plt.show()
```

Total running time of the script: (0 minutes 9.620 seconds)

The Bayes update

This animation displays the posterior estimate updates as it is refitted when new data arrives. The vertical line represents the theoretical value to which the plotted distribution should converge.

```
import math

import numpy as np
import matplotlib.pyplot as plt
from matplotlib.animation import FuncAnimation

def beta_pdf(x, a, b):
    return (x**(a-1) * (1-x)**(b-1) * math.gamma(a + b)
            / (math.gamma(a) * math.gamma(b)))

class UpdateDist:
    def __init__(self, ax, prob=0.5):
        self.success = 0

The double pendulum problem

This animation illustrates the double pendulum problem.

Double pendulum formula translated from the C code at http://www.physics.usyd.edu.au/~wheat/dpend_html/solve_dpend.c

```
from numpy import sin, cos
import numpy as np
import matplotlib.pyplot as plt
import scipy.integrate as integrate
import matplotlib.animation as animation

G = 9.8  # acceleration due to gravity, in m/s^2
L1 = 1.0  # length of pendulum 1 in m
L2 = 1.0  # length of pendulum 2 in m
M1 = 1.0  # mass of pendulum 1 in kg
M2 = 1.0  # mass of pendulum 2 in kg
t_stop = 5  # how many seconds to simulate

def derivs(state, t):

    dydx = np.zeros_like(state)
    dydx[0] = state[1]

    delta = state[2] - state[0]
```

(continues on next page)

(continued from previous page)

```
    den1 = (M1+M2) * L1 - M2 * L1 * cos(delta) * cos(delta)
    dydx[1] = ((M2 * L1 * state[1] * state[1] * sin(delta) * cos(delta)
                + M2 * G * sin(state[2]) * cos(delta)
                + M2 * L2 * state[3] * state[3] * sin(delta)
                - (M1+M2) * G * sin(state[0]))
               / den1)

    dydx[2] = state[3]

    den2 = (L2/L1) * den1
    dydx[3] = ((- M2 * L2 * state[3] * state[3] * sin(delta) * cos(delta)
                + (M1+M2) * G * sin(state[0]) * cos(delta)
                - (M1+M2) * L1 * state[1] * state[1] * sin(delta)
                - (M1+M2) * G * sin(state[2]))
               / den2)

    return dydx

# create a time array from 0..100 sampled at 0.05 second steps

plt.show()
```

Total running time of the script: (0 minutes 9.800 seconds)

Animated histogram

Use a path patch to draw a bunch of rectangles for an animated histogram.

```
import numpy as np

import matplotlib.pyplot as plt
import matplotlib.patches as patches
import matplotlib.path as path
import matplotlib.animation as animation

# Fixing random state for reproducibility
np.random.seed(19680801)

# histogram our data with numpy
data = np.random.randn(1000)
n, bins = np.histogram(data, 100)

# get the corners of the rectangles for the histogram
left = bins[:-1]
right = bins[1:]
bottom = np.zeros(len(left))
top = bottom + n
nrects = len(left)
```

Here comes the tricky part -- we have to set up the vertex and path codes arrays using *Path.MOVETO*, *Path.LINETO* and *Path.CLOSEPOLY* for each rect.

- We need 1 `MOVETO` per rectangle, which sets the initial point.
- We need 3 `LINETO`'s, which tell Matplotlib to draw lines from vertex 1 to vertex 2, v2 to v3, and v3 to v4.
- We then need one `CLOSEPOLY` which tells Matplotlib to draw a line from the v4 to our initial vertex (the `MOVETO` vertex), in order to close the polygon.

Note: The vertex for `CLOSEPOLY` is ignored, but we still need a placeholder in the `verts` array to keep the codes aligned with the vertices.

```
nverts = nrects * (1 + 3 + 1)
verts = np.zeros((nverts, 2))
codes = np.full(nverts, path.Path.LINETO)
codes[0::5] = path.Path.MOVETO
codes[4::5] = path.Path.CLOSEPOLY
verts[0::5, 0] = left
verts[0::5, 1] = bottom
verts[1::5, 0] = left
verts[1::5, 1] = top
verts[2::5, 0] = right
verts[2::5, 1] = top
verts[3::5, 0] = right
verts[3::5, 1] = bottom
```

To animate the histogram, we need an `animate` function, which generates a random set of numbers and updates the locations of the vertices for the histogram (in this case, only the heights of each rectangle). `patch` will eventually be a *Patch* object.

```
patch = None

def animate(i):
    # simulate new data coming in
    data = np.random.randn(1000)
    n, bins = np.histogram(data, 100)
    top = bottom + n
    verts[1::5, 1] = top
    verts[2::5, 1] = top
    return [patch, ]
```

And now we build the *Path* and *Patch* instances for the histogram using our vertices and codes. We add the patch to the *Axes* instance, and setup the *FuncAnimation* with our `animate` function.

```
fig, ax = plt.subplots()
barpath = path.Path(verts, codes)
patch = patches.PathPatch(
    barpath, facecolor='green', edgecolor='yellow', alpha=0.5)
ax.add_patch(patch)

ax.set_xlim(left[0], right[-1])
ax.set_ylim(bottom.min(), top.max())

ani = animation.FuncAnimation(fig, animate, 50, repeat=False, blit=True)
plt.show()
```

Total running time of the script: (0 minutes 4.742 seconds)

Rain simulation

Simulates rain drops on a surface by animating the scale and opacity of 50 scatter points.

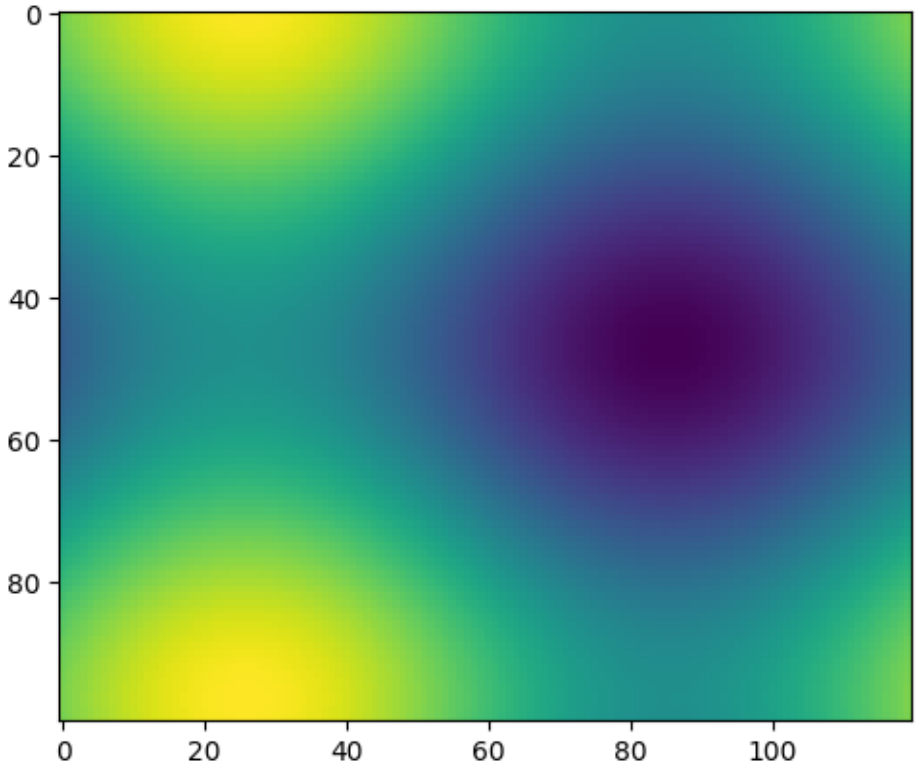
`ArtistAnimation`

Examples

Animated image using a precomputed list of images



```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.animation as animation

fig, ax = plt.subplots()

def f(x, y):
    return np.sin(x) + np.cos(y)

x = np.linspace(0, 2 * np.pi, 120)
y = np.linspace(0, 2 * np.pi, 100).reshape(-1, 1)

# ims is a list of lists, each row is a list of artists to draw in the
# current frame; here we are just animating one artist, the image, in
# each frame
ims = []
for i in range(60):
    x += np.pi / 15.
    y += np.pi / 20.
```

(continues on next page)

(continued from previous page)

```
    im = ax.imshow(f(x, y), animated=True)
    if i == 0:
        ax.imshow(f(x, y))  # show an initial one first
    ims.append([im])

ani = animation.ArtistAnimation(fig, ims, interval=50, blit=True,
                                repeat_delay=1000)

# To save the animation, use e.g.
#
# ani.save("movie.mp4")
#
# or
#
# writer = animation.FFMpegWriter(
#     fps=15, metadata=dict(artist='Me'), bitrate=1800)
# ani.save("movie.mp4", writer=writer)

plt.show()
```

18.3.2 Writer Classes

The provided writers fall into a few broad categories.

The Pillow writer relies on the Pillow library to write the animation, keeping all data in memory.

PillowWriter

matplotlib.animation.PillowWriter

class matplotlib.animation.**PillowWriter**(*fps=5*, *metadata=None*, *codec=None*, *bitrate=None*)

__init__(*self*, *fps=5*, *metadata=None*, *codec=None*, *bitrate=None*)
Initialize self. See help(type(self)) for accurate signature.

Methods

__init__(self[, fps, metadata, codec, bitrate])	Initialize self.
finish(self)	Finish any processing for writing the movie.
grab_frame(self, **savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
isAvailable()	
saving(self, fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
setup(self, fig, outfile[, dpi])	Setup for writing the movie file.

Attributes

frame_size	A tuple `(width, height)` in pixels of a movie frame.

`finish`(*self*)
: Finish any processing for writing the movie.

`grab_frame`(*self*, ***savefig_kwargs*)
: Grab the image information from the figure and save as a movie frame.

  All keyword arguments in *savefig_kwargs* are passed on to the *savefig* call that saves the figure.

`classmethod isAvailable`()

`setup`(*self*, *fig*, *outfile*, *dpi=None*)
: Setup for writing the movie file.

  Parameters

  fig

  [*Figure*] The figure object that contains the information for frames.

  outfile

  [str] The filename of the resulting movie file.

  dpi

  [float, default: `fig.dpi`] The DPI (or resolution) for the file. This controls the size in pixels of the resulting movie file.

The HTML writer generates JavaScript-based animations.

HTMLWriter	Writer for JavaScript-based HTML movies.

matplotlib.animation.HTMLWriter

class matplotlib.animation.**HTMLWriter**(*fps=30*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*, *embed_frames=False*, *default_mode='loop'*, *embed_limit=None*)

Writer for JavaScript-based HTML movies.

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: `rcParams["animation.codec"]` (default: `'h264'`)] The codec to use.

bitrate

[int, default: `rcParams["animation.bitrate"]` (default: `-1`)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use `rcParams["animation.[name-of-encoder]_args"]` for the builtin writers.

metadata

[Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

__init__(*self*, *fps=30*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*, *embed_frames=False*, *default_mode='loop'*, *embed_limit=None*)

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: `rcParams["animation.codec"]` (default: `'h264'`)] The codec to use.

bitrate

[int, default: `rcParams["animation.bitrate"]` (default: `-1`)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use `rcParams["animation.[name-of-encoder]_args"]` for the builtin writers.

metadata

[Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

__init__(self[, fps, codec, bitrate, ...])	**Parameters**
bin_path()	Return the binary path to the commandline tool used by a specific subclass.
cleanup(self)	Clean-up and collect the process used to write the movie file.
finish(self)	Finish any processing for writing the movie.
grab_frame(self, **savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
isAvailable()	Return whether a MovieWriter subclass is actually available.
saving(self, fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
setup(self, fig, outfile, dpi[, frame_dir])	Setup for writing the movie file.

Attributes

args_key	
clear_temp	
exec_key	
frame_format	Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.
frame_size	A tuple `(width, height)` in pixels of a movie frame.
supported_formats	

property args_key

finish(*self*)
Finish any processing for writing the movie.

grab_frame(*self*, ***savefig_kwargs*)
Grab the image information from the figure and save as a movie frame.

All keyword arguments in *savefig_kwargs* are passed on to the *savefig* call that saves the figure.

classmethod isAvailable()
Return whether a MovieWriter subclass is actually available.

setup(*self*, *fig*, *outfile*, *dpi*, *frame_dir=None*)
Setup for writing the movie file.

Parameters

fig

[*Figure*] The figure to grab the rendered frames from.

outfile

[str] The filename of the resulting movie file.

dpi

[float, optional] The dpi of the output file. This, with the figure size, controls the size in pixels of the resulting movie file. Default is `fig.dpi`.

frame_prefix

[str, optional] The filename prefix to use for temporary files. If None (the default), files are written to a temporary directory which is deleted by `cleanup` (regardless of the value of *clear_temp*).

clear_temp

[bool, optional] If the temporary files should be deleted after stitching the final result. Setting this to `False` can be useful for debugging. Defaults to `True`.

```
supported_formats = ['png', 'jpeg', 'tiff', 'svg']
```

The pipe-based writers stream the captured frames over a pipe to an external process. The pipe-based variants tend to be more performant, but may not work on all systems.

FFMpegWriter	Pipe-based ffmpeg writer.
ImageMagickWriter	Pipe-based animated gif.
AVConvWriter	Pipe-based avconv writer.

matplotlib.animation.FFMpegWriter

class matplotlib.animation.**FFMpegWriter**(*fps=5*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*)

Pipe-based ffmpeg writer.

Frames are streamed directly to ffmpeg via a pipe and written in a single pass.

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: `rcParams["animation.codec"]` (default: `'h264'`)] The codec to use.

bitrate

[int, default: `rcParams["animation.bitrate"]` (default: `-1`)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use `rcParams["animation.[name-of-encoder]_args"]` for the builtin writers.

metadata

[Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

__init__(*self*, *fps=5*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*)

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: `rcParams["animation.codec"]` (default: `'h264'`)] The codec to use.

bitrate

[int, default: `rcParams["animation.bitrate"]` (default: `-1`)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use `rcParams["animation.[name-of-encoder]_args"]` for the builtin writers.

metadata

[Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

__init__(self[, fps, codec, bitrate, ...])	**Parameters**
bin_path()	Return the binary path to the commandline tool used by a specific subclass.
cleanup(self)	Clean-up and collect the process used to write the movie file.
finish(self)	Finish any processing for writing the movie.
grab_frame(self, **savefig_kwargs)	Grab the image information from the figure and save as a movie frame.

continues on next page

Table 12 – continued from previous page

isAvailable()	Return whether a MovieWriter subclass is actually available.
saving(self, fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
setup(self, fig, outfile[, dpi])	Setup for writing the movie file.

Attributes

args_key	
exec_key	
frame_size	A tuple (width, height) in pixels of a movie frame.
output_args	

matplotlib.animation.ImageMagickWriter

class matplotlib.animation.**ImageMagickWriter**(*fps=5*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*)

Pipe-based animated gif.

Frames are streamed directly to ImageMagick via a pipe and written in a single pass.

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: rcParams["animation.codec"] (default: 'h264')] The codec to use.

bitrate

[int, default: rcParams["animation.bitrate"] (default: -1)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use rcParams["animation.[name-of-encoder]_args"] for the builtin writers.

metadata

[Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

`__init__`(*self*, *fps=5*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*)

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: `rcParams["animation.codec"]` (default: `'h264'`)] The codec to use.

bitrate

[int, default: `rcParams["animation.bitrate"]` (default: `-1`)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use `rcParams["animation.[name-of-encoder]_args"]` for the builtin writers.

metadata

[Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

`__init__`(self[, fps, codec, bitrate, ...])	**Parameters**
`bin_path`()	Return the binary path to the commandline tool used by a specific subclass.

continues on next page

Table 14 – continued from previous page

`cleanup`(self)	Clean-up and collect the process used to write the movie file.
`finish`(self)	Finish any processing for writing the movie.
`grab_frame`(self, **savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
`isAvailable`()	Return whether a MovieWriter subclass is actually available.
`saving`(self, fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
`setup`(self, fig, outfile[, dpi])	Setup for writing the movie file.

Attributes

`args_key`	
`delay`	
`exec_key`	
`frame_size`	A tuple `(width, height)` in pixels of a movie frame.
`output_args`	

matplotlib.animation.AVConvWriter

class matplotlib.animation.**AVConvWriter**(**args*, ***kwargs*)

Pipe-based avconv writer.

Frames are streamed directly to avconv via a pipe and written in a single pass.

__init__(*self*, */*, **args*, ***kwargs*)

Initialize self. See help(type(self)) for accurate signature.

Methods

__init__(self, /, *args, **kwargs)	Initialize self.
`bin_path`()	Return the binary path to the commandline tool used by a specific subclass.
`cleanup`(self)	Clean-up and collect the process used to write the movie file.
`finish`(self)	Finish any processing for writing the movie.

continues on next page

Table 16 – continued from previous page

grab_frame(self, **savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
isAvailable()	Return whether a MovieWriter subclass is actually available.
saving(self, fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
setup(self, fig, outfile[, dpi])	Setup for writing the movie file.

Attributes

args_key	
exec_key	
frame_size	A tuple (width, height) in pixels of a movie frame.
output_args	

The file-based writers save temporary files for each frame which are stitched into a single file at the end. Although slower, these writers can be easier to debug.

FFMpegFileWriter	File-based ffmpeg writer.
ImageMagickFileWriter	File-based animated gif writer.
AVConvFileWriter	File-based avconv writer.

matplotlib.animation.FFMpegFileWriter

class matplotlib.animation.**FFMpegFileWriter**(**args*, ***kwargs*)

File-based ffmpeg writer.

Frames are written to temporary files on disk and then stitched together at the end.

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: rcParams["animation.codec"] (default: 'h264')] The codec to use.

bitrate

[int, default: rcParams["animation.bitrate"] (default: -1)] The bitrate of the movie, in kilobits per second. Higher values means

higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use `rcParams["animation.[name-of-encoder]_args"]` for the builtin writers.

metadata

[Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

`__init__`(*self*, **args*, ***kwargs*)

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: `rcParams["animation.codec"]` (default: `'h264'`)] The codec to use.

bitrate

[int, default: `rcParams["animation.bitrate"]` (default: `-1`)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use `rcParams["animation.[name-of-encoder]_args"]` for the builtin writers.

metadata

[Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

__init__(self, *args, **kwargs) **Parameters**	
bin_path()	Return the binary path to the commandline tool used by a specific subclass.
cleanup(self)	Clean-up and collect the process used to write the movie file.
finish(self)	Finish any processing for writing the movie.
grab_frame(self, **savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
isAvailable()	Return whether a MovieWriter subclass is actually available.
saving(self, fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
setup(self, fig, outfile[, dpi, ...])	Setup for writing the movie file.

Attributes

args_key	
clear_temp	
exec_key	
frame_format	Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.
frame_size	A tuple `(width, height)` in pixels of a movie frame.
output_args	
supported_formats	

```
supported_formats = ['png', 'jpeg', 'ppm', 'tiff', 'sgi', 'bmp', 'pbm', 'raw', 'rgba']
```

matplotlib.animation.ImageMagickFileWriter

class matplotlib.animation.**ImageMagickFileWriter**(**args*, ***kwargs*)

File-based animated gif writer.

Frames are written to temporary files on disk and then stitched together at the end.

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: `rcParams["animation.codec"]` (default: `'h264'`)] The codec to use.

bitrate

[int, default: `rcParams["animation.bitrate"]` (default: `-1`)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use `rcParams["animation.[name-of-encoder]_args"]` for the builtin writers.

metadata

[Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

__init__(*self*, **args*, ***kwargs*)

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: `rcParams["animation.codec"]` (default: `'h264'`)] The codec to use.

bitrate

[int, default: rcParams["animation.bitrate"] (default: -1)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use rcParams["animation.[name-of-encoder]_args"] for the builtin writers.

metadata

[Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

__init__(self, *args, **kwargs)	**Parameters**
bin_path()	Return the binary path to the commandline tool used by a specific subclass.
cleanup(self)	Clean-up and collect the process used to write the movie file.
finish(self)	Finish any processing for writing the movie.
grab_frame(self, **savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
isAvailable()	Return whether a MovieWriter subclass is actually available.
saving(self, fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
setup(self, fig, outfile[, dpi, ...])	Setup for writing the movie file.

Attributes

args_key	
clear_temp	
delay	
exec_key	
frame_format	Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.
frame_size	A tuple (width, height) in pixels of a movie frame.
output_args	
supported_formats	

supported_formats = ['png', 'jpeg', 'ppm', 'tiff', 'sgi', 'bmp', 'pbm', 'raw', 'rgba']

matplotlib.animation.AVConvFileWriter

class matplotlib.animation.**AVConvFileWriter**(**args*, ***kwargs*)

File-based avconv writer.

Frames are written to temporary files on disk and then stitched together at the end.

__init__(*self*, */*, **args*, ***kwargs*)

Initialize self. See help(type(self)) for accurate signature.

Methods

__init__(self, /, *args, **kwargs)	Initialize self.
bin_path()	Return the binary path to the commandline tool used by a specific subclass.
cleanup(self)	Clean-up and collect the process used to write the movie file.
finish(self)	Finish any processing for writing the movie.
grab_frame(self, **savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
isAvailable()	Return whether a MovieWriter subclass is actually available.
saving(self, fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
setup(self, fig, outfile[, dpi, ...])	Setup for writing the movie file.

Attributes

args_key	
clear_temp	
exec_key	
frame_format	Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.
frame_size	A tuple `(width, height)` in pixels of a movie frame.
output_args	
supported_formats	

Fundamentally, a *MovieWriter* provides a way to grab sequential frames from the same underlying *Figure* object. The base class *MovieWriter* implements 3 methods and a context manager. The only difference between the pipe-based and file-based writers is in the arguments to their respective `setup` methods.

The `setup()` method is used to prepare the writer (possibly opening a pipe), successive calls to `grab_frame()` capture a single frame at a time and `finish()` finalizes the movie and writes the output file to disk. For example

```
moviewriter = MovieWriter(...)
moviewriter.setup(fig, 'my_movie.ext', dpi=100)
for j in range(n):
    update_figure(j)
    moviewriter.grab_frame()
moviewriter.finish()
```

If using the writer classes directly (not through *Animation.save*), it is strongly encouraged to use the `saving` context manager

```
with moviewriter.saving(fig, 'myfile.mp4', dpi=100):
    for j in range(n):
        update_figure(j)
        moviewriter.grab_frame()
```

to ensures that setup and cleanup are performed as necessary.

Examples

Frame grabbing

Use a MovieWriter directly to grab individual frames and write them to a file. This avoids any event loop integration, and thus works even with the Agg backend. This is not recommended for use in an interactive setting.

```
import numpy as np
import matplotlib
matplotlib.use("Agg")
import matplotlib.pyplot as plt
from matplotlib.animation import FFMpegWriter

# Fixing random state for reproducibility
np.random.seed(19680801)

metadata = dict(title='Movie Test', artist='Matplotlib',
                comment='Movie support!')
writer = FFMpegWriter(fps=15, metadata=metadata)

fig = plt.figure()
l, = plt.plot([], [], 'k-o')

plt.xlim(-5, 5)
plt.ylim(-5, 5)

x0, y0 = 0, 0

with writer.saving(fig, "writer_test.mp4", 100):
    for i in range(100):
        x0 += 0.1 * np.random.randn()
        y0 += 0.1 * np.random.randn()
        l.set_data(x0, y0)
        writer.grab_frame()
```

18.3.3 Helper Classes

Animation Base Classes

Animation	A base class for Animations.
TimedAnimation	*Animation* subclass for time-based animation.

matplotlib.animation.TimedAnimation

class matplotlib.animation.**TimedAnimation**(*fig*, *interval=200*, *repeat_delay=0*, *repeat=True*, *event_source=None*, **args*, ***kwargs*)

Animation subclass for time-based animation.

A new frame is drawn every *interval* milliseconds.

Parameters

fig

[*Figure*] The figure object used to get needed events, such as draw or resize.

interval

[int, default: 200] Delay between frames in milliseconds.

repeat_delay

[int, default: 0] The delay in milliseconds between consecutive animation runs, if *repeat* is True.

repeat

[bool, default: True] Whether the animation repeats when the sequence of frames is completed.

blit

[bool, default: False] Whether blitting is used to optimize drawing.

`__init__`(*self*, *fig*, *interval=200*, *repeat_delay=0*, *repeat=True*, *event_source=None*, **args*, ***kwargs*)
Initialize self. See help(type(self)) for accurate signature.

Methods

__init__(self, fig[, interval, ...])	Initialize self.
new_frame_seq(self)	Return a new sequence of frame information.
new_saved_frame_seq(self)	Return a new sequence of saved/cached frame information.
save(self, filename[, writer, fps, dpi, ...])	Save the animation as a movie file by drawing every frame.
to_html5_video(self[, embed_limit])	Convert the animation to an HTML5 <video> tag.
to_jshtml(self[, fps, embed_frames, ...])	Generate HTML representation of the animation

Writer Registry

A module-level registry is provided to map between the name of the writer and the class to allow a string to be passed to *Animation.save* instead of a writer instance.

MovieWriterRegistry	Registry of available writer classes by human readable name.

matplotlib.animation.MovieWriterRegistry

class matplotlib.animation.**MovieWriterRegistry**

Registry of available writer classes by human readable name.

__init__(*self*)

Initialize self. See help(type(self)) for accurate signature.

Methods

__init__(self)	Initialize self.
ensure_not_dirty(self)	[*Deprecated*] If dirty, reasks the writers if they are available
is_available(self, name)	Check if given writer is available by name.
list(self)	Get a list of available MovieWriters.
register(self, name)	Decorator for registering a class under a name.
reset_available_writers(self)	[*Deprecated*] Reset the available state of all registered writers
set_dirty(self)	[*Deprecated*] Sets a flag to re-setup the writers.

Attributes

avail

property avail

ensure_not_dirty(*self*)

[*Deprecated*] If dirty, reasks the writers if they are available

Notes

Deprecated since version 3.2.

`is_available`(*self*, *name*)
Check if given writer is available by name.

Parameters

name

[str]

Returns

bool

`list`(*self*)
Get a list of available MovieWriters.

`register`(*self*, *name*)
Decorator for registering a class under a name.

Example use:

```
@registry.register(name)
class Foo:
    pass
```

`reset_available_writers`(*self*)
[*Deprecated*] Reset the available state of all registered writers

Notes

Deprecated since version 3.2.

`set_dirty`(*self*)
[*Deprecated*] Sets a flag to re-setup the writers.

Notes

Deprecated since version 3.2.

Writer Base Classes

To reduce code duplication base classes

AbstractMovieWriter	Abstract base class for writing movies.
MovieWriter	Base class for writing movies.
FileMovieWriter	*MovieWriter* for writing to individual files and stitching at the end.

matplotlib.animation.AbstractMovieWriter

class matplotlib.animation.**AbstractMovieWriter**(*fps=5*, *metadata=None*, *codec=None*, *bitrate=None*)

Abstract base class for writing movies. Fundamentally, what a MovieWriter does is provide is a way to grab frames by calling grab_frame().

setup() is called to start the process and finish() is called afterwards.

This class is set up to provide for writing movie frame data to a pipe. saving() is provided as a context manager to facilitate this process as:

```
with moviewriter.saving(fig, outfile='myfile.mp4', dpi=100):
    # Iterate over frames
    moviewriter.grab_frame(**savefig_kwargs)
```

The use of the context manager ensures that setup() and finish() are performed as necessary.

An instance of a concrete subclass of this class can be given as the `writer` argument of *Animation.save()*.

__init__(*self*, *fps=5*, *metadata=None*, *codec=None*, *bitrate=None*)

Initialize self. See help(type(self)) for accurate signature.

Methods

__init__(self[, fps, metadata, codec, bitrate])	Initialize self.
finish(self)	Finish any processing for writing the movie.
grab_frame(self, **savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
saving(self, fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
setup(self, fig, outfile[, dpi])	Setup for writing the movie file.

Attributes

frame_size	A tuple `(width, height)` in pixels of a movie frame.

`abstract finish(self)`
Finish any processing for writing the movie.

`property frame_size`
A tuple `(width, height)` in pixels of a movie frame.

`abstract grab_frame(self, **savefig_kwargs)`
Grab the image information from the figure and save as a movie frame.

All keyword arguments in *savefig_kwargs* are passed on to the *savefig* call that saves the figure.

`saving(self, fig, outfile, dpi, *args, **kwargs)`
Context manager to facilitate writing the movie file.

`*args, **kw` are any parameters that should be passed to *setup*.

`abstract setup(self, fig, outfile, dpi=None)`
Setup for writing the movie file.

Parameters

fig

[*Figure*] The figure object that contains the information for frames.

outfile

[str] The filename of the resulting movie file.

dpi

[float, default: `fig.dpi`] The DPI (or resolution) for the file. This controls the size in pixels of the resulting movie file.

matplotlib.animation.MovieWriter

`class matplotlib.animation.MovieWriter(fps=5, codec=None, bitrate=None, extra_args=None, metadata=None)`
Base class for writing movies.

This is a base class for MovieWriter subclasses that write a movie frame data to a pipe. You cannot instantiate this class directly. See examples for how to use its subclasses.

Attributes

frame_format

[str] The format used in writing frame data, defaults to 'rgba'.

fig

[*Figure*] The figure to capture data from. This must be provided by the sub-classes.

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: `rcParams["animation.codec"]` (default: `'h264'`)] The codec to use.

bitrate

[int, default: `rcParams["animation.bitrate"]` (default: `-1`)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use `rcParams["animation.[name-of-encoder]_args"]` for the builtin writers.

metadata

[Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

`__init__`(*self*, *fps=5*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*)

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: `rcParams["animation.codec"]` (default: `'h264'`)] The codec to use.

bitrate

[int, default: `rcParams["animation.bitrate"]` (default: `-1`)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use `rcParams["animation.[name-of-encoder]_args"]` for the builtin writers.

metadata

[Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

__init__(self[, fps, codec, bitrate, ...])	**Parameters**
bin_path()	Return the binary path to the commandline tool used by a specific subclass.
cleanup(self)	Clean-up and collect the process used to write the movie file.
finish(self)	Finish any processing for writing the movie.
grab_frame(self, **savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
isAvailable()	Return whether a MovieWriter subclass is actually available.
saving(self, fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
setup(self, fig, outfile[, dpi])	Setup for writing the movie file.

Attributes

args_key	
exec_key	
frame_size	A tuple (width, height) in pixels of a movie frame.

property args_key

classmethod bin_path()
Return the binary path to the commandline tool used by a specific subclass. This is a class method so that the tool can be looked for before making a particular MovieWriter subclass available.

cleanup(*self*)
Clean-up and collect the process used to write the movie file.

property exec_key

finish(*self*)
Finish any processing for writing the movie.

grab_frame(*self*, ***savefig_kwargs*)
Grab the image information from the figure and save as a movie frame.

All keyword arguments in *savefig_kwargs* are passed on to the *savefig* call that saves the figure.

classmethod isAvailable()
Return whether a MovieWriter subclass is actually available.

setup(*self*, *fig*, *outfile*, *dpi=None*)
Setup for writing the movie file.

Parameters

fig

[*Figure*] The figure object that contains the information for frames.

outfile

[str] The filename of the resulting movie file.

dpi

[float, default: fig.dpi] The DPI (or resolution) for the file. This controls the size in pixels of the resulting movie file.

matplotlib.animation.FileMovieWriter

class matplotlib.animation.**FileMovieWriter**(**args*, ***kwargs*)

MovieWriter for writing to individual files and stitching at the end.

This must be sub-classed to be useful.

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: `rcParams["animation.codec"]` (default: `'h264'`)] The codec to use.

bitrate

[int, default: `rcParams["animation.bitrate"]` (default: `-1`)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use `rcParams["animation.[name-of-encoder]_args"]` for the builtin writers.

metadata

[Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

__init__(*self*, **args*, ***kwargs*)

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: `rcParams["animation.codec"]` (default: `'h264'`)] The codec to use.

bitrate

[int, default: `rcParams["animation.bitrate"]` (default: `-1`)] The bitrate of the movie, in kilobits per second. Higher values

means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use `rcParams["animation.[name-of-encoder]_args"]` for the builtin writers.

metadata

[Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

__init__(self, *args, **kwargs) **Parameters**	
`bin_path`()	Return the binary path to the commandline tool used by a specific subclass.
cleanup(self)	Clean-up and collect the process used to write the movie file.
finish(self)	Finish any processing for writing the movie.
grab_frame(self, **savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
`isAvailable`()	Return whether a MovieWriter subclass is actually available.
`saving`(self, fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
setup(self, fig, outfile[, dpi, ...])	Setup for writing the movie file.

Attributes

`args_key`
clear_temp
`exec_key`

continues on next page

Table 36 – continued from previous page

frame_format	Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.
`frame_size`	A tuple `(width, height)` in pixels of a movie frame.

`cleanup`(*self*)
Clean-up and collect the process used to write the movie file.

`property clear_temp`

`finish`(*self*)
Finish any processing for writing the movie.

`property frame_format`
Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.

`grab_frame`(*self*, ***savefig_kwargs*)
Grab the image information from the figure and save as a movie frame.

All keyword arguments in *savefig_kwargs* are passed on to the *savefig* call that saves the figure.

`setup`(*self*, *fig*, *outfile*, *dpi=None*, *frame_prefix=None*, *clear_temp=<deprecated parameter>*)
Setup for writing the movie file.

Parameters

fig

[*Figure*] The figure to grab the rendered frames from.

outfile

[str] The filename of the resulting movie file.

dpi

[float, optional] The dpi of the output file. This, with the figure size, controls the size in pixels of the resulting movie file. Default is `fig.dpi`.

frame_prefix

[str, optional] The filename prefix to use for temporary files. If None (the default), files are written to a temporary directory which is deleted by *cleanup* (regardless of the value of *clear_temp*).

clear_temp

[bool, optional] If the temporary files should be deleted after stitching the final result. Setting this to `False` can be useful for debugging. Defaults to `True`.

and mixins

AVConvBase	[*Deprecated*] Mixin class for avconv output.
FFMpegBase	Mixin class for FFMpeg output.
ImageMagickBase	Mixin class for ImageMagick output.

matplotlib.animation.AVConvBase

class matplotlib.animation.**AVConvBase**(**args*, ***kwargs*)

[*Deprecated*] Mixin class for avconv output.

To be useful this must be multiply-inherited from with a `MovieWriterBase` subclass.

Notes

Deprecated since version 3.3.

__init__(*self*, */*, **args*, ***kwargs*)

Initialize self. See help(type(self)) for accurate signature.

Methods

__init__(self, /, *args, **kwargs)	Initialize self.
isAvailable()	Return whether a MovieWriter subclass is actually available.

Attributes

output_args

classmethod isAvailable()

Return whether a MovieWriter subclass is actually available.

matplotlib.animation.FFMpegBase

class matplotlib.animation.FFMpegBase

Mixin class for FFMpeg output.

To be useful this must be multiply-inherited from with a `MovieWriterBase` subclass.

__init__(*self*, /, **args*, ***kwargs*)

Initialize self. See help(type(self)) for accurate signature.

Methods

__init__(self, /, *args, **kwargs)	Initialize self.
isAvailable()	

Attributes

output_args

classmethod isAvailable()

property output_args

matplotlib.animation.ImageMagickBase

class matplotlib.animation.ImageMagickBase

Mixin class for ImageMagick output.

To be useful this must be multiply-inherited from with a `MovieWriterBase` subclass.

__init__(*self*, /, **args*, ***kwargs*)

Initialize self. See help(type(self)) for accurate signature.

Methods

__init__(self, /, *args, **kwargs)	Initialize self.
bin_path()	
isAvailable()	

Attributes

delay
output_args

classmethod bin_path()

property delay

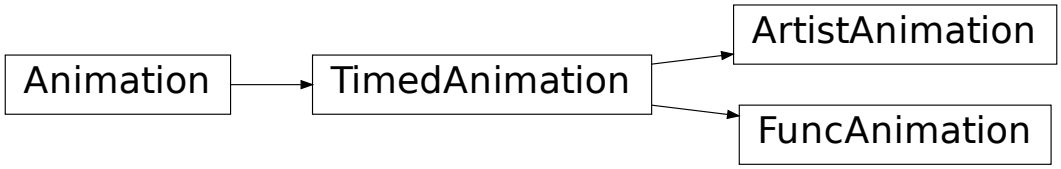
classmethod isAvailable()

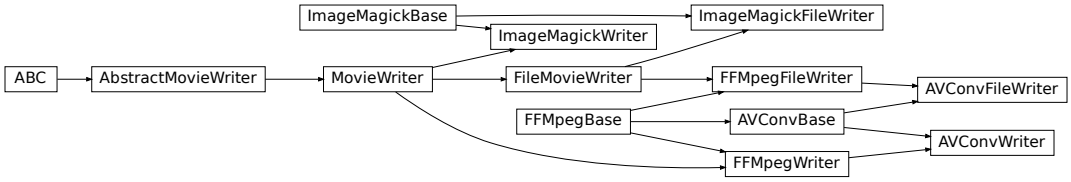
property output_args

are provided.

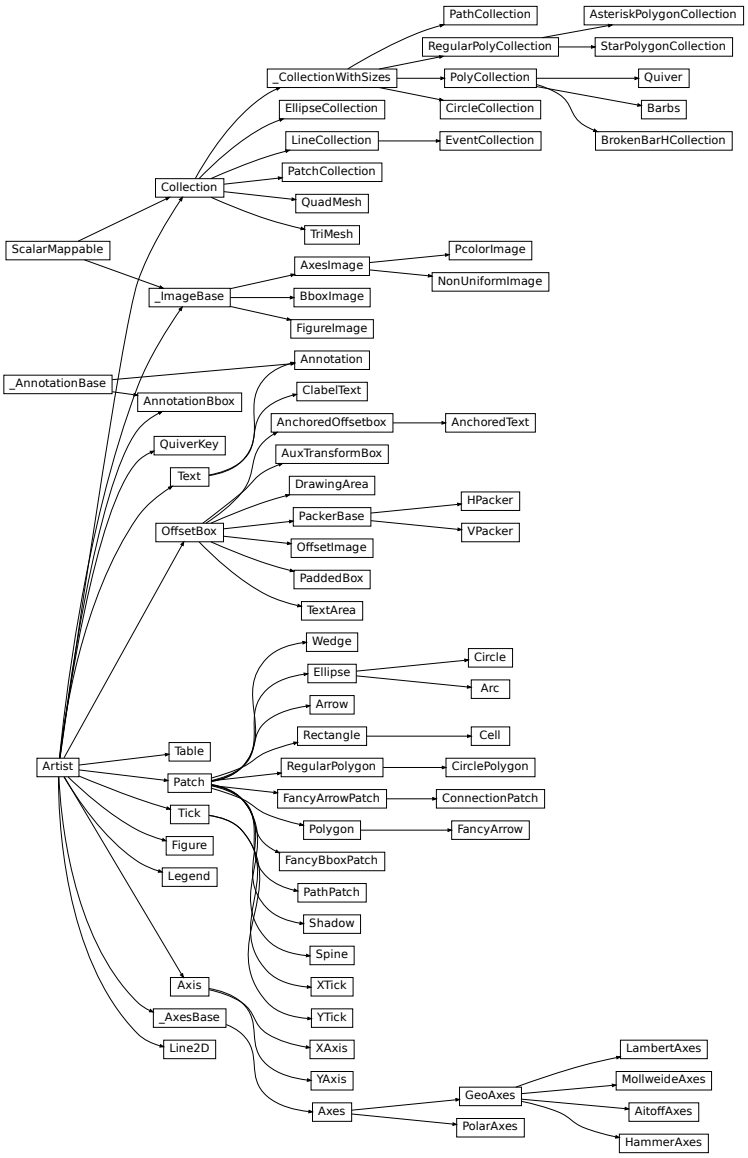
See the source code for how to easily implement new *MovieWriter* classes.

18.3.4 Inheritance Diagrams





18.4 matplotlib.artist



18.4.1 `Artist` class

class matplotlib.artist.**Artist**

Abstract base class for objects that render into a FigureCanvas.

Typically, all visible elements in a figure are subclasses of Artist.

Interactive

Artist.add_callback	Add a callback function that will be called whenever one of the *Artist*'s properties changes.
Artist.remove_callback	Remove a callback based on its observer id.
Artist.pchanged	Call all of the registered callbacks.
Artist.get_cursor_data	Return the cursor data for a given event.
Artist.format_cursor_data	Return a string representation of *data*.
Artist.mouseover	If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.
Artist.contains	Test whether the artist contains the mouse event.
Artist.set_contains	[*Deprecated*] Define a custom contains test for the artist.
Artist.get_contains	[*Deprecated*] Return the custom contains function of the artist if set, or *None*.
Artist.pick	Process a pick event.
Artist.pickable	Return whether the artist is pickable.
Artist.set_picker	Define the picking behavior of the artist.
Artist.get_picker	Return the picking behavior of the artist.

matplotlib.artist.Artist.add_callback

Artist.add_callback(*self*, *func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

matplotlib.artist.Artist.remove_callback

Artist.**remove_callback**(*self*, *oid*)

Remove a callback based on its observer id.

See also:

add_callback

matplotlib.artist.Artist.pchanged

Artist.**pchanged**(*self*)

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback

remove_callback

matplotlib.artist.Artist.get_cursor_data

Artist.get_cursor_data(*self*, *event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*matplotlib.backend_bases.MouseEvent*]

See also:

format_cursor_data

matplotlib.artist.Artist.format_cursor_data

Artist.format_cursor_data(*self*, *data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

matplotlib.artist.Artist.mouseover

property Artist.mouseover

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also *get_cursor_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

matplotlib.artist.Artist.contains

Artist.contains(*self*, *mouseevent*)

Test whether the artist contains the mouse event.

Parameters

mouseevent

[*matplotlib.backend_bases.MouseEvent*]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

matplotlib.artist.Artist.set_contains

Artist.set_contains(*self*, *picker*)

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

Parameters

picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist

- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

matplotlib.artist.Artist.get_contains

`Artist.get_contains(`*self*`)`

[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

See also:

set_contains

Notes

Deprecated since version 3.3.

matplotlib.artist.Artist.pick

`Artist.pick(`*self, mouseevent*`)`

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

matplotlib.artist.Artist.pickable

`Artist.pickable(`*self*`)`

Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

matplotlib.artist.Artist.set_picker

Artist.set_picker(*self*, *picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set_pickradius* instead.

matplotlib.artist.Artist.get_picker

Artist.get_picker(*self*)

Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, *pickable*, *pick*

Clipping

Artist.set_clip_on	Set whether the artist uses clipping.
Artist.get_clip_on	Return whether the artist uses clipping.
Artist.set_clip_box	Set the artist's clip *Bbox*.
Artist.get_clip_box	Return the clipbox.
Artist.set_clip_path	Set the artist's clip path.
Artist.get_clip_path	Return the clip path.

matplotlib.artist.Artist.set_clip_on

Artist.set_clip_on(*self*, *b*)

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

Parameters

b

[bool]

matplotlib.artist.Artist.get_clip_on

Artist.get_clip_on(*self*)

Return whether the artist uses clipping.

matplotlib.artist.Artist.set_clip_box

Artist.set_clip_box(*self*, *clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*Bbox*]

matplotlib.artist.Artist.get_clip_box

Artist.get_clip_box(*self*)

Return the clipbox.

matplotlib.artist.Artist.set_clip_path

Artist.set_clip_path(*self*, *path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

matplotlib.artist.Artist.get_clip_path

`Artist.get_clip_path`(*self*)

Return the clip path.

Bulk Properties

Artist.update	Update this artist's properties from the dict *props*.
Artist.update_from	Copy properties from *other* to *self*.
Artist.properties	Return a dictionary of all the properties of the artist.
Artist.set	A property batch setter.

matplotlib.artist.Artist.update

`Artist.update`(*self*, *props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

matplotlib.artist.Artist.update_from

Artist.update_from(*self*, *other*)
Copy properties from *other* to *self*.

matplotlib.artist.Artist.properties

Artist.properties(*self*)
Return a dictionary of all the properties of the artist.

matplotlib.artist.Artist.set

Artist.set(*self*, ***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

Drawing

Artist.draw	Draw the Artist (and its children) using the given renderer.
Artist.set_animated	Set the artist's animation state.
Artist.get_animated	Return whether the artist is animated.
Artist.set_alpha	Set the alpha value used for blending - not supported on all backends.
Artist.get_alpha	Return the alpha value used for blending - not supported on all backends.
Artist.set_snap	Set the snapping behavior.
Artist.get_snap	Return the snap setting.
Artist.set_visible	Set the artist's visibility.
Artist.get_visible	Return the visibility.
Artist.zorder	
Artist.set_zorder	Set the zorder for the artist.
Artist.get_zorder	Return the artist's zorder.
Artist.set_agg_filter	Set the agg filter.
Artist.set_sketch_params	Sets the sketch parameters.
Artist.get_sketch_params	Return the sketch parameters for the artist.
Artist.set_rasterized	Force rasterized (bitmap) drawing in vector backend output.
Artist.get_rasterized	Return whether the artist is to be rasterized.
Artist.set_path_effects	Set the path effects.
Artist.get_path_effects	

continues on next page

Table 47 – continued from previous page

Artist.get_agg_filter	Return filter function to be used for agg filter.
Artist.get_window_extent	Get the axes bounding box in display space.
Artist.get_transformed_clip_path_and_affine	Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

matplotlib.artist.Artist.draw

Artist.**draw**(*self*, *renderer*, **args*, ***kwargs*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

matplotlib.artist.Artist.set_animated

Artist.**set_animated**(*self*, *b*)

Set the artist's animation state.

Parameters

b

[bool]

matplotlib.artist.Artist.get_animated

Artist.get_animated(*self*)
Return whether the artist is animated.

matplotlib.artist.Artist.set_alpha

Artist.set_alpha(*self*, *alpha*)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[float or None]

matplotlib.artist.Artist.get_alpha

Artist.get_alpha(*self*)
Return the alpha value used for blending - not supported on all backends.

matplotlib.artist.Artist.set_snap

Artist.set_snap(*self*, *snap*)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

matplotlib.artist.Artist.get_snap

Artist.get_snap(*self*)
Return the snap setting.

See *set_snap* for details.

matplotlib.artist.Artist.set_visible

Artist.set_visible(*self*, *b*)
Set the artist's visibility.

Parameters

b

[bool]

matplotlib.artist.Artist.get_visible

Artist.get_visible(*self*)
Return the visibility.

matplotlib.artist.Artist.zorder

Artist.zorder = 0

matplotlib.artist.Artist.set_zorder

Artist.set_zorder(*self*, *level*)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

matplotlib.artist.Artist.get_zorder

Artist.get_zorder(*self*)
Return the artist's zorder.

matplotlib.artist.Artist.set_agg_filter

Artist.set_agg_filter(*self*, *filter_func*)
Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

matplotlib.artist.Artist.set_sketch_params

Artist.set_sketch_params(*self*, *scale=None*, *length=None*, *randomness=None*)
Sets the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

matplotlib.artist.Artist.get_sketch_params

Artist.get_sketch_params(*self*)

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

matplotlib.artist.Artist.set_rasterized

Artist.set_rasterized(*self*, *rasterized*)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

Parameters

rasterized

[bool or None]

matplotlib.artist.Artist.get_rasterized

Artist.get_rasterized(*self*)

Return whether the artist is to be rasterized.

matplotlib.artist.Artist.set_path_effects

Artist.set_path_effects(*self*, *path_effects*)

Set the path effects.

Parameters

path_effects

[*AbstractPathEffect*]

matplotlib.artist.Artist.get_path_effects

Artist.get_path_effects(*self*)

matplotlib.artist.Artist.get_agg_filter

Artist.get_agg_filter(*self*)
Return filter function to be used for agg filter.

matplotlib.artist.Artist.get_window_extent

Artist.get_window_extent(*self*, *renderer*)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

matplotlib.artist.Artist.get_transformed_clip_path_and_affine

Artist.get_transformed_clip_path_and_affine(*self*)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

Figure and Axes

Artist.remove	Remove the artist from the figure if possible.
Artist.axes	The *Axes* instance the artist resides in, or *None*.
Artist.set_figure	Set the *Figure* instance the artist belongs to.
Artist.get_figure	Return the *Figure* instance the artist belongs to.

matplotlib.artist.Artist.remove

Artist.**remove**(*self*)

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

matplotlib.artist.Artist.axes

property Artist.**axes**

The *Axes* instance the artist resides in, or *None*.

matplotlib.artist.Artist.set_figure

Artist.**set_figure**(*self*, *fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

matplotlib.artist.Artist.get_figure

Artist.**get_figure**(*self*)

Return the *Figure* instance the artist belongs to.

Children

Artist.get_children	Return a list of the child *Artist*s of this *Artist*.
Artist.findobj	Find artist objects.

matplotlib.artist.Artist.get_children

Artist.get_children(*self*)
Return a list of the child *Artist*s of this *Artist*.

matplotlib.artist.Artist.findobj

Artist.findobj(*self, match=None, include_self=True*)
Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

Transform

Artist.set_transform	Set the artist transform.
Artist.get_transform	Return the *Transform* instance used by this artist.
Artist.is_transform_set	Return whether the Artist has an explicitly set transform.

matplotlib.artist.Artist.set_transform

Artist.set_transform(*self*, *t*)
Set the artist transform.

Parameters

t

[*Transform*]

matplotlib.artist.Artist.get_transform

Artist.get_transform(*self*)
Return the *Transform* instance used by this artist.

matplotlib.artist.Artist.is_transform_set

Artist.is_transform_set(*self*)
Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

Units

Artist.convert_xunits	Convert *x* using the unit type of the xaxis.
Artist.convert_yunits	Convert *y* using the unit type of the yaxis.
Artist.have_units	Return *True* if units are set on any axis.

matplotlib.artist.Artist.convert_xunits

Artist.convert_xunits(*self*, *x*)
Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

matplotlib.artist.Artist.convert_yunits

Artist.**convert_yunits**(*self*, *y*)

Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

matplotlib.artist.Artist.have_units

Artist.**have_units**(*self*)

Return *True* if units are set on any axis.

Metadata

Artist.set_gid	Set the (group) id for the artist.
Artist.get_gid	Return the group id.
Artist.set_label	Set a label that will be displayed in the legend.
Artist.get_label	Return the label used for this artist in the legend.
Artist.set_url	Set the url for the artist.
Artist.get_url	Return the url.

matplotlib.artist.Artist.set_gid

Artist.**set_gid**(*self*, *gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

matplotlib.artist.Artist.get_gid

Artist.get_gid(*self*)
Return the group id.

matplotlib.artist.Artist.set_label

Artist.set_label(*self*, *s*)
Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

matplotlib.artist.Artist.get_label

Artist.get_label(*self*)
Return the label used for this artist in the legend.

matplotlib.artist.Artist.set_url

Artist.set_url(*self*, *url*)
Set the url for the artist.

Parameters

url

[str]

matplotlib.artist.Artist.get_url

Artist.get_url(*self*)
Return the url.

Miscellaneous

Artist.sticky_edges	x and y sticky edge lists for autoscaling.
Artist.set_in_layout	Set if artist is to be included in layout calculations, E.g.
Artist.get_in_layout	Return boolean flag, True if artist is included in layout calculations.
Artist.stale	Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

matplotlib.artist.Artist.sticky_edges

property Artist.**sticky_edges**

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

matplotlib.artist.Artist.set_in_layout

Artist.**set_in_layout**(*self*, *in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

matplotlib.artist.Artist.get_in_layout

Artist.get_in_layout(*self*)

Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

matplotlib.artist.Artist.stale

property Artist.stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

18.4.2 Functions

`allow_rasterization`	Decorator for Artist.draw method.
`get`	Return the value of an object's *property*, or print all of them.
`getp`	Return the value of an object's *property*, or print all of them.
`setp`	Set a property on an artist object.
`kwdoc`	Inspect an *`Artist`* class (using *`ArtistInspector`*) and return information about its settable properties and their current values.
`ArtistInspector`	A helper class to inspect an *`Artist`* and return information about its settable properties and their current values.

matplotlib.artist.allow_rasterization

matplotlib.artist.allow_rasterization(*draw*)

Decorator for Artist.draw method. Provides routines that run before and after the draw call. The before and after functions are useful for changing artist-dependent renderer attributes or making other setup function calls, such as starting and flushing a mixed-mode renderer.

matplotlib.artist.get

matplotlib.artist.get(*obj*, *property=None*)

Return the value of an object's *property*, or print all of them.

Parameters

obj

[*Artist*] The queried artist; e.g., a *Line2D*, a *Text*, or an *Axes*.

property

[str or None, default: None] If *property* is 'somename', this function returns `obj.get_somename()`.

If is is None (or unset), it *prints* all gettable properties from *obj*. Many properties have aliases for shorter typing, e.g. 'lw' is an alias for 'linewidth'. In the output, aliases and full property names will be listed as:

property or alias = value

e.g.:

linewidth or lw = 2

matplotlib.artist.getp

matplotlib.artist.getp(*obj*, *property=None*)

Return the value of an object's *property*, or print all of them.

Parameters

obj

[*Artist*] The queried artist; e.g., a *Line2D*, a *Text*, or an *Axes*.

property

[str or None, default: None] If *property* is 'somename', this function returns `obj.get_somename()`.

If is is None (or unset), it *prints* all gettable properties from *obj*. Many properties have aliases for shorter typing, e.g. 'lw' is an alias for 'linewidth'. In the output, aliases and full property names will be listed as:

property or alias = value

e.g.:

linewidth or lw = 2

matplotlib.artist.setp

matplotlib.artist.**setp**(*obj*, **args*, *file=None*, ***kwargs*)

Set a property on an artist object.

matplotlib supports the use of *setp()* ("set property") and *getp()* to set and get object properties, as well as to do introspection on the object. For example, to set the linestyle of a line to be dashed, you can do:

```
>>> line, = plot([1, 2, 3])
>>> setp(line, linestyle='--')
```

If you want to know the valid types of arguments, you can provide the name of the property you want to set without a value:

```
>>> setp(line, 'linestyle')
    linestyle: {'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
```

If you want to see all the properties that can be set, and their possible values, you can do:

```
>>> setp(line)
    ... long output listing omitted
```

By default *setp* prints to `sys.stdout`, but this can be modified using the *file* keyword-only argument:

```
>>> with fopen('output.log') as f:
>>>     setp(line, file=f)
```

setp() operates on a single instance or a iterable of instances. If you are in query mode introspecting the possible values, only the first instance in the sequence is used. When actually setting values, all the instances will be set. e.g., suppose you have a list of two lines, the following will make both lines thicker and red:

```
>>> x = arange(0, 1, 0.01)
>>> y1 = sin(2*pi*x)
>>> y2 = sin(4*pi*x)
>>> lines = plot(x, y1, x, y2)
>>> setp(lines, linewidth=2, color='r')
```

setp() works with the MATLAB style string/value pairs or with python kwargs. For example, the following are equivalent:

```
>>> setp(lines, 'linewidth', 2, 'color', 'r')  # MATLAB style
>>> setp(lines, linewidth=2, color='r')        # python style
```

matplotlib.artist.kwdoc

matplotlib.artist.**kwdoc**(*artist*)

Inspect an *Artist* class (using *ArtistInspector*) and return information about its settable properties and their current values.

Parameters

artist

[*Artist* or an iterable of *Artist*s]

Returns

str

The settable properties of *artist*, as plain text if `rcParams["docstring.hardcopy"]` (default: `False`) is False and as a rst table (intended for use in Sphinx) if it is True.

matplotlib.artist.ArtistInspector

class matplotlib.artist.**ArtistInspector**(*o*)

A helper class to inspect an *Artist* and return information about its settable properties and their current values.

Initialize the artist inspector with an *Artist* or an iterable of *Artist*s. If an iterable is used, we assume it is a homogeneous sequence (all *Artist*s are of the same type) and it is your responsibility to make sure this is so.

__init__(*self*, *o*)

Initialize the artist inspector with an *Artist* or an iterable of *Artist*s. If an iterable is used, we assume it is a homogeneous sequence (all *Artist*s are of the same type) and it is your responsibility to make sure this is so.

Methods

__init__(self, o)	Initialize the artist inspector with an *Artist* or an iterable of *Artist*s.
aliased_name(self, s)	Return 'PROPNAME or alias' if *s* has an alias, else return 'PROPNAME'.
aliased_name_rest(self, s, target)	Return 'PROPNAME or alias' if *s* has an alias, else return 'PROPNAME', formatted for reST.

continues on next page

Table 55 – continued from previous page

get_aliases(self)	Get a dict mapping property fullnames to sets of aliases for each alias in the *ArtistInspector*.
get_setters(self)	Get the attribute strings with setters for object.
get_valid_values(self, attr)	Get the legal arguments for the setter associated with *attr*.
is_alias(self, o)	Return whether method object *o* is an alias for another method.
pprint_getters(self)	Return the getters and actual values as list of strings.
pprint_setters(self[, prop, leadingspace])	If *prop* is *None*, return a list of strings of all settable properties and their valid values.
pprint_setters_rest(self[, prop, leadingspace])	If *prop* is *None*, return a list of reST-formatted strings of all settable properties and their valid values.
properties(self)	Return a dictionary mapping property name -> value.

aliased_name(*self*, *s*)
Return 'PROPNAME or alias' if *s* has an alias, else return 'PROPNAME'.

e.g., for the line markerfacecolor property, which has an alias, return 'markerfacecolor or mfc' and for the transform property, which does not, return 'transform'.

aliased_name_rest(*self*, *s*, *target*)
Return 'PROPNAME or alias' if *s* has an alias, else return 'PROPNAME', formatted for reST.

e.g., for the line markerfacecolor property, which has an alias, return 'markerfacecolor or mfc' and for the transform property, which does not, return 'transform'.

get_aliases(*self*)
Get a dict mapping property fullnames to sets of aliases for each alias in the *ArtistInspector*.

e.g., for lines:

```
{'markerfacecolor': {'mfc'},
 'linewidth'      : {'lw'},
}
```

get_setters(*self*)
Get the attribute strings with setters for object.

For example, for a line, return `['markerfacecolor', 'linewidth', ....]`.

`get_valid_values`(*self*, *attr*)
: Get the legal arguments for the setter associated with *attr*.

  This is done by querying the docstring of the setter for a line that begins with "ACCEPTS:" or ".. ACCEPTS:", and then by looking for a numpydoc-style documentation for the setter's first argument.

`is_alias`(*self*, *o*)
: Return whether method object *o* is an alias for another method.

`pprint_getters`(*self*)
: Return the getters and actual values as list of strings.

`pprint_setters`(*self*, *prop=None*, *leadingspace=2*)
: If *prop* is *None*, return a list of strings of all settable properties and their valid values.

  If *prop* is not *None*, it is a valid property name and that property will be returned as a string of property : valid values.

`pprint_setters_rest`(*self*, *prop=None*, *leadingspace=4*)
: If *prop* is *None*, return a list of reST-formatted strings of all settable properties and their valid values.

  If *prop* is not *None*, it is a valid property name and that property will be returned as a string of "property : valid" values.

`properties`(*self*)
: Return a dictionary mapping property name -> value.

18.5 `matplotlib.axes`

Table of Contents

18.5.1 Inheritance

18.5.2 The Axes class

class matplotlib.axes.**Axes**(*fig*, *rect*, *facecolor=None*, *frameon=True*, *sharex=None*, *sharey=None*, *label=''*, *xscale=None*, *yscale=None*, *box_aspect=None*, ***kwargs*)

Bases: matplotlib.axes._base._AxesBase

The *Axes* contains most of the figure elements: *Axis*, *Tick*, *Line2D*, *Text*, *Polygon*, etc., and sets the coordinate system.

The *Axes* instance supports callbacks through a callbacks attribute which is a *CallbackRegistry* instance. The events you can connect to are 'xlim_changed' and 'ylim_changed' and the callback will be called with func(*ax*) where *ax* is the *Axes* instance.

Attributes

dataLim

[*Bbox*] The bounding box enclosing all data displayed in the Axes.

viewLim

[*Bbox*] The view limits in data coordinates.

Build an axes in a figure.

Parameters

fig

[*Figure*] The axes is build in the *Figure* *fig*.

rect

[[left, bottom, width, height]] The axes is build in the rectangle *rect*. *rect* is in *Figure* coordinates.

sharex, sharey

[*Axes*, optional] The x or y *axis* is shared with the x or y axis in the input *Axes*.

frameon

[bool, default: True] Whether the axes frame is visible.

box_aspect

[None, or a number, optional] Sets the aspect of the axes box. See *set_box_aspect* for details.

****kwargs**

Other optional keyword arguments:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and r
alpha	float or None
anchor	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
animated	bool
aspect	{'auto'} or num
autoscale_on	bool
autoscalex_on	bool
autoscaley_on	bool
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	None, or a number
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
contains	unknown
facecolor or fc	color
figure	*Figure*
frame_on	bool
gid	str
in_layout	bool
label	object
navigate	bool
navigate_mode	unknown
path_effects	*AbstractPathEffect*
picker	None or bool or callable
position	[left, bottom, width, height] or *Bbox*
prop_cycle	unknown
rasterization_zorder	float or None
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
title	str
transform	*Transform*
url	str
visible	bool
xbound	unknown
xlabel	str
xlim	(bottom: float, top: float)
xmargin	float greater than -0.5
xscale	{"linear", "log", "symlog", "logit", ...}
xticklabels	unknown
xticks	unknown

Table 56 – continued from previous page

Property	Description
ybound	unknown
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	{"linear", "log", "symlog", "logit", ...}
yticklabels	unknown
yticks	unknown
zorder	float

Returns

Axes

The new *Axes* object.

18.5.3 Subplots

SubplotBase	Base class for subplots, which are *Axes* instances with additional methods to facilitate generating and manipulating a set of *Axes* within a figure.
subplot_class_factory	Make a new class that inherits from *SubplotBase* and the given axes_class (which is assumed to be a subclass of *axes.Axes*).

matplotlib.axes.SubplotBase

class matplotlib.axes.**SubplotBase**(*fig*, **args*, ***kwargs*)

Bases: object

Base class for subplots, which are *Axes* instances with additional methods to facilitate generating and manipulating a set of *Axes* within a figure.

Parameters

fig

[*matplotlib.figure.Figure*]

***args**

[tuple (*nrows*, *ncols*, *index*) or int] The array of subplots in the figure has dimensions `(nrows, ncols)`, and *index* is the index of

the subplot being created. *index* starts at 1 in the upper left corner and increases to the right.

If *nrows*, *ncols*, and *index* are all single digit numbers, then *args* can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

****kwargs**

Keyword arguments are passed to the Axes (sub)class constructor.

`__dict__ = mappingproxy({'__module__': 'matplotlib.axes._subplots', '__doc__': '\n Base c`

`__init__`(*self*, *fig*, **args*, ***kwargs*)

Parameters

fig

[*matplotlib.figure.Figure*]

***args**

[tuple (*nrows*, *ncols*, *index*) or int] The array of subplots in the figure has dimensions `(nrows, ncols)`, and *index* is the index of the subplot being created. *index* starts at 1 in the upper left corner and increases to the right.

If *nrows*, *ncols*, and *index* are all single digit numbers, then *args* can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

****kwargs**

Keyword arguments are passed to the Axes (sub)class constructor.

`__module__ = 'matplotlib.axes._subplots'`

`__reduce__`(*self*)
Helper for pickle.

`__repr__`(*self*)
Return repr(self).

`__weakref__`
list of weak references to the object (if defined)

`change_geometry`(*self*, *numrows*, *numcols*, *num*)
Change subplot geometry, e.g., from (1, 1, 1) to (2, 2, 3).

`property colNum`

`get_geometry`(*self*)
Get the subplot geometry, e.g., (2, 2, 3).

`get_gridspec`(*self*)
Return the *GridSpec* instance associated with the subplot.

`get_subplotspec`(*self*)
Return the *SubplotSpec* instance associated with the subplot.

`is_first_col`(*self*)

`is_first_row`(*self*)

`is_last_col`(*self*)

`is_last_row`(*self*)

`label_outer`(*self*)
Only show "outer" labels and tick labels.

x-labels are only kept for subplots on the last row; y-labels only for subplots on the first column.

`property rowNum`

`set_subplotspec`(*self*, *subplotspec*)
Set the *SubplotSpec*. instance associated with the subplot.

`update_params`(*self*)
Update the subplot position from `self.figure.subplotpars`.

- sphx_glr_gallery_axisartist_simple_axisline3.py

matplotlib.axes.subplot_class_factory

matplotlib.axes.**subplot_class_factory**(*axes_class=None*)

Make a new class that inherits from *SubplotBase* and the given axes_class (which is assumed to be a subclass of *axes.Axes*). This is perhaps a little bit roundabout to make a new class on the fly like this, but it means that a new Subplot class does not have to be created for every type of Axes.

Examples using `matplotlib.axes.subplot_class_factory`

- sphx_glr_gallery_text_labels_and_annotations_usetex_baseline_test.py

18.5.4 Plotting

Basic

Axes.plot	Plot y versus x as lines and/or markers.
Axes.errorbar	Plot y versus x as lines and/or markers with attached errorbars.
Axes.scatter	A scatter plot of *y* vs.
Axes.plot_date	Plot data that contains dates.
Axes.step	Make a step plot.
Axes.loglog	Make a plot with log scaling on both the x and y axis.
Axes.semilogx	Make a plot with log scaling on the x axis.
Axes.semilogy	Make a plot with log scaling on the y axis.
Axes.fill_between	Fill the area between two horizontal curves.

continues on next page

Table 58 – continued from previous page

Axes.fill_betweenx	Fill the area between two vertical curves.
Axes.bar	Make a bar plot.
Axes.barh	Make a horizontal bar plot.
Axes.stem	Create a stem plot.
Axes.eventplot	Plot identical parallel lines at the given positions.
Axes.pie	Plot a pie chart.
Axes.stackplot	Draw a stacked area plot.
Axes.broken_barh	Plot a horizontal sequence of rectangles.
Axes.vlines	Plot vertical lines.
Axes.hlines	Plot horizontal lines at each *y* from *xmin* to *xmax*.
Axes.fill	Plot filled polygons.

matplotlib.axes.Axes.plot

Axes.**plot**(*self*, **args*, *scalex=True*, *scaley=True*, *data=None*, ***kwargs*)

Plot y versus x as lines and/or markers.

Call signatures:

```
plot([x], y, [fmt], *, data=None, **kwargs)
plot([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

The coordinates of the points or line nodes are given by *x*, *y*.

The optional parameter *fmt* is a convenient way for defining basic formatting like color, marker and linestyle. It's a shortcut string notation described in the *Notes* section below.

```
>>> plot(x, y)        # plot x and y using default line style and color
>>> plot(x, y, 'bo')  # plot x and y using blue circle markers
>>> plot(y)           # plot y using x as index array 0..N-1
>>> plot(y, 'r+')     # ditto, but with red plusses
```

You can use *Line2D* properties as keyword arguments for more control on the appearance. Line properties and *fmt* can be mixed. The following two calls yield identical results:

```
>>> plot(x, y, 'go--', linewidth=2, markersize=12)
>>> plot(x, y, color='green', marker='o', linestyle='dashed',
...      linewidth=2, markersize=12)
```

When conflicting with *fmt*, keyword arguments take precedence.

Plotting labelled data

There's a convenient way for plotting objects with labelled data (i.e. data that can be accessed by index `obj['y']`). Instead of giving the data in *x* and *y*, you can provide the object in the *data* parameter and just give the labels for *x* and *y*:

```
>>> plot('xlabel', 'ylabel', data=obj)
```

All indexable objects are supported. This could e.g. be a `dict`, a `pandas.DataFrame` or a structured numpy array.

Plotting multiple sets of data

There are various ways to plot multiple sets of data.

- The most straight forward way is just to call *plot* multiple times. Example:

  ```
  >>> plot(x1, y1, 'bo')
  >>> plot(x2, y2, 'go')
  ```

- Alternatively, if your data is already a 2d array, you can pass it directly to *x*, *y*. A separate data set will be drawn for every column.

  Example: an array `a` where the first column represents the *x* values and the other columns are the *y* columns:

  ```
  >>> plot(a[0], a[1:])
  ```

- The third way is to specify multiple sets of *[x], y, [fmt]* groups:

  ```
  >>> plot(x1, y1, 'g^', x2, y2, 'g-')
  ```

  In this case, any additional keyword argument applies to all datasets. Also this syntax cannot be combined with the *data* parameter.

By default, each line is assigned a different style specified by a 'style cycle'. The *fmt* and line property parameters are only necessary if you want explicit deviations from these defaults. Alternatively, you can also change the style cycle using `rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`).

Parameters

x, y

[array-like or scalar] The horizontal / vertical coordinates of the data points. *x* values are optional and default to `range(len(y))`.

Commonly, these parameters are 1D arrays.

They can also be scalars, or two-dimensional (in that case, the columns represent separate data sets).

These arguments cannot be passed as keywords.

fmt

[str, optional] A format string, e.g. 'ro' for red circles. See the *Notes* section for a full description of the format strings.

Format strings are just an abbreviation for quickly setting basic line properties. All of these and more can also be controlled by keyword arguments.

This argument cannot be passed as keyword.

data

[indexable object, optional] An object with labelled data. If given, provide the label names to plot in *x* and *y*.

Note: Technically there's a slight ambiguity in calls where the second label is a valid *fmt*. `plot('n', 'o', data=obj)` could be `plt(x, y)` or `plt(y, fmt)`. In such cases, the former interpretation is chosen, but a warning is issued. You may suppress the warning by adding an empty format string `plot('n', 'o', '', data=obj)`.

Returns

list of *Line2D*

A list of lines representing the plotted data.

Other Parameters

scalex, scaley

[bool, default: True] These parameters determine if the view limits are adapted to the data limits. The values are passed on to *autoscale_view*.

****kwargs**

[*Line2D* properties, optional] *kwargs* are used to specify properties like a line label (for auto legends), linewidth, antialiasing, marker face color. Example:

```
>>> plot([1, 2, 3], [1, 2, 3], 'go-', label='line 1', linewidth=2)
>>> plot([1, 2, 3], [1, 4, 9], 'rs', label='line 2')
```

If you make multiple lines with one plot call, the kwargs apply to all those lines.

Here is a list of available *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also:

scatter

XY scatter plot with markers of varying size and/or color (sometimes also called bubble chart).

Notes

Format Strings

A format string consists of a part for color, marker and line:

```
fmt = '[marker][line][color]'
```

Each of them is optional. If not provided, the value from the style cycle is used. Exception: If `line` is given, but no `marker`, the data will be a line without markers.

Other combinations such as `[color][marker][line]` are also supported, but note that their parsing may be ambiguous.

Markers

character	description
`'.'`	point marker
`','`	pixel marker
`'o'`	circle marker
`'v'`	triangle_down marker
`'^'`	triangle_up marker
`'<'`	triangle_left marker
`'>'`	triangle_right marker
`'1'`	tri_down marker
`'2'`	tri_up marker
`'3'`	tri_left marker
`'4'`	tri_right marker
`'s'`	square marker
`'p'`	pentagon marker
`'*'`	star marker
`'h'`	hexagon1 marker
`'H'`	hexagon2 marker
`'+'`	plus marker
`'x'`	x marker
`'D'`	diamond marker
`'d'`	thin_diamond marker
`'|'`	vline marker
`'_'`	hline marker

Line Styles

character	description
'-'	solid line style
'--'	dashed line style
'-.'	dash-dot line style
':'	dotted line style

Example format strings:

```
'b'    # blue markers with default shape
'or'   # red circles
'-g'   # green solid line
'--'   # dashed line with default color
'^k:'  # black triangle_up markers connected by a dotted line
```

Colors

The supported color abbreviations are the single letter codes

character	color
'b'	blue
'g'	green
'r'	red
'c'	cyan
'm'	magenta
'y'	yellow
'k'	black
'w'	white

and the 'CN' colors that index into the default property cycle.

If the color is the only part of the format string, you can additionally use any *matplotlib.colors* spec, e.g. full names ('green') or hex strings ('#008000').

matplotlib.axes.Axes.errorbar

Axes.errorbar(*self*, *x*, *y*, *yerr=None*, *xerr=None*, *fmt=''*, *ecolor=None*, *elinewidth=None*, *capsize=None*, *barsabove=False*, *lolims=False*, *uplims=False*, *xlolims=False*, *xuplims=False*, *errorevery=1*, *capthick=None*, ***, *data=None*, ***kwargs*)

Plot y versus x as lines and/or markers with attached errorbars.

x, *y* define the data locations, *xerr*, *yerr* define the errorbar sizes. By default, this draws the data markers/lines as well the errorbars. Use fmt='none' to draw errorbars without any data markers.

Parameters

x, y

[float or array-like] The data positions.

xerr, yerr

[float or array-like, shape(N,) or shape(2, N), optional] The errorbar sizes:

- scalar: Symmetric +/- values for all data points.
- shape(N,): Symmetric +/-values for each data point.
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- *None*: No errorbar.

Note that all error arrays should have *positive* values.

See /gallery/statistics/errorbar_features for an example on the usage of `xerr` and `yerr`.

fmt

[str, default: ''] The format for the data points / data lines. See *plot* for details.

Use 'none' (case insensitive) to plot errorbars without any data markers.

ecolor

[color, default: None] The color of the errorbar lines. If None, use the color of the line connecting the markers.

elinewidth

[float, default: None] The linewidth of the errorbar lines. If None, the linewidth of the current style is used.

capsize

[float, default: `rcParams["errorbar.capsize"]` (default: `0.0`)] The length of the error bar caps in points.

capthick

[float, default: None] An alias to the keyword argument *markeredgewidth* (a.k.a. *mew*). This setting is a more sensible name for the property that controls the thickness of the error bar cap in points. For backwards compatibility, if *mew* or *markeredgewidth* are given, then they will over-ride *capthick*. This may change in future releases.

barsabove

[bool, default: False] If True, will plot the errorbars above the plot symbols. Default is below.

lolims, uplims, xlolims, xuplims

[bool, default: False] These arguments can be used to indicate that a value gives only upper/lower limits. In that case a caret symbol is used to indicate this. *lims*-arguments may be scalars, or array-likes of the same length as *xerr* and *yerr*. To use limits with inverted axes, *set_xlim* or *set_ylim* must be called before *errorbar()*. Note the tricky parameter names: setting e.g. *lolims* to True means that the y-value is a *lower* limit of the True value, so, only an *upward*-pointing arrow will be drawn!

errorevery

[int or (int, int), default: 1] draws error bars on a subset of the data. *errorevery* =N draws error bars on the points (x[::N], y[::N]). *errorevery* =(start, N) draws error bars on the points (x[start::N], y[start::N]). e.g. errorevery=(6, 3) adds error bars to the data at (x[6], x[9], x[12], x[15], ...). Used to avoid overlapping error bars when two series share x-axis values.

Returns

ErrorbarContainer

The container contains:

- plotline: *Line2D* instance of x, y plot markers and/or line.
- caplines: A tuple of *Line2D* instances of the error bar caps.
- barlinecols: A tuple of *LineCollection* with the horizontal and vertical error ranges.

Other Parameters

****kwargs**

All other keyword arguments are passed on to the *plot* call drawing the markers. For example, this code makes big red squares with thick green edges:

```
x, y, yerr = rand(3, 10)
errorbar(x, y, yerr, marker='s', mfc='red',
         mec='green', ms=20, mew=4)
```

where *mfc*, *mec*, *ms* and *mew* are aliases for the longer property names, *markerfacecolor*, *markeredgecolor*, *markersize* and *markeredgewidth*.

Valid kwargs for the marker properties are *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown

Table 60 – continued from previous page

Property	Description
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*, *xerr*, *yerr*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.errorbar`

- sphx_glr_gallery_axes_grid1_parasite_simple2.py
- sphx_glr_gallery_scales_log_demo.py

matplotlib.axes.Axes.scatter

Axes.scatter(*self*, *x*, *y*, *s=None*, *c=None*, *marker=None*, *cmap=None*, *norm=None*, *vmin=None*, *vmax=None*, *alpha=None*, *linewidths=None*, *verts=<deprecated parameter>*, *edgecolors=None*, ***, *plotnonfinite=False*, *data=None*, ***kwargs*)

A scatter plot of *y* vs. *x* with varying marker size and/or color.

Parameters

x, y

[float or array-like, shape (n,)] The data positions.

s

[float or array-like, shape (n,), optional] The marker size in points**2. Default is `rcParams['lines.markersize'] ** 2`.

c

[array-like or list of colors or color, optional] The marker colors. Possible values:

- A scalar or sequence of n numbers to be mapped to colors using *cmap* and *norm*.
- A 2-D array in which the rows are RGB or RGBA.
- A sequence of colors of length n.
- A single color format string.

Note that *c* should not be a single numeric RGB or RGBA sequence because that is indistinguishable from an array of values to be colormapped. If you want to specify the same RGB or RGBA value for all points, use a 2-D array with a single row. Otherwise, value- matching will have precedence in case of a size matching with *x* and *y*.

If you wish to specify a single color for all points prefer the *color* keyword argument.

Defaults to `None`. In that case the marker color is determined by the value of *color*, *facecolor* or *facecolors*. In case those are not specified or `None`, the marker color is determined by the next color of the `Axes`' current "shape and fill" color cycle. This cycle defaults to `rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`).

marker

[*MarkerStyle*, default: `rcParams["scatter.marker"]` (default: `'o'`)] The marker style. *marker* can be either an instance of the class

or the text shorthand for a particular marker. See *matplotlib.markers* for more information about marker styles.

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] A *Colormap* instance or registered colormap name. *cmap* is only used if *c* is an array of floats.

norm

[*Normalize*, default: None] If *c* is an array of floats, *norm* is used to scale the color data, *c*, in the range 0 to 1, in order to map into the colormap *cmap*. If *None*, use the default *colors.Normalize*.

vmin, vmax

[float, default: None] *vmin* and *vmax* are used in conjunction with the default norm to map the color array *c* to the colormap *cmap*. If None, the respective min and max of the color array is used. It is deprecated to use *vmin*/*vmax* when *norm* is given.

alpha

[float, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

linewidths

[float or array-like, default: `rcParams["lines.linewidth"]` (default: `1.5`)] The linewidth of the marker edges. Note: The default *edgecolors* is 'face'. You may want to change this as well.

edgecolors

[{'face', 'none', *None*} or color or sequence of color, default: `rcParams["scatter.edgecolors"]` (default: `'face'`)] The edge color of the marker. Possible values:

- 'face': The edge color will always be the same as the face color.
- 'none': No patch boundary will be drawn.
- A color or sequence of colors.

For non-filled markers, the *edgecolors* kwarg is ignored and forced to 'face' internally.

plotnonfinite

[bool, default: False] Set to plot points with nonfinite *c*, in conjunction with *set_bad*.

Returns

PathCollection

Other Parameters

****kwargs**

[*Collection* properties]

See also:

plot

To plot scatter plots when markers are identical in size and color.

Notes

- The *plot* function will be faster for scatterplots where markers don't vary in size or color.
- Any or all of *x*, *y*, *s*, and *c* may be masked arrays, in which case all masks will be combined and only unmasked points will be plotted.
- Fundamentally, scatter works with 1-D arrays; *x*, *y*, *s*, and *c* may be input as N-D arrays, but within scatter they will be flattened. The exception is *c*, which will be flattened only if its size matches the size of *x* and *y*.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*, *s*, *linewidths*, *edgecolors*, *c*, *facecolor*, *facecolors*, *color*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

matplotlib.axes.Axes.plot_date

`Axes.plot_date`(*self*, *x*, *y*, *fmt='o'*, *tz=None*, *xdate=True*, *ydate=False*, ***, *data=None*, ***kwargs*)

Plot data that contains dates.

Similar to *plot*, this plots *y* vs. *x* as lines or markers. However, the axis labels are formatted as dates depending on *xdate* and *ydate*.

Parameters

x, y

[array-like] The coordinates of the data points. If *xdate* or *ydate* is *True*, the respective values *x* or *y* are interpreted as *Matplotlib dates*.

fmt

[str, optional] The plot format string. For details, see the corresponding parameter in *plot*.

tz

[timezone string or `datetime.tzinfo`, default: `rcParams["timezone"]` (default: `'UTC'`)] The time zone to use in labeling dates.

xdate

[bool, default: True] If *True*, the *x*-axis will be interpreted as Matplotlib dates.

ydate

[bool, default: False] If *True*, the *y*-axis will be interpreted as Matplotlib dates.

Returns

lines

A list of *Line2D* objects representing the plotted data.

Other Parameters

****kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}

Table 61 – continued from previous page

Property	Description
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)

solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also:

matplotlib.dates

Helper functions on dates.

matplotlib.dates.date2num

Convert dates to num.

matplotlib.dates.num2date

Convert num to dates.

matplotlib.dates.drange

Create an equally spaced sequence of dates.

Notes

If you are using custom date tickers and formatters, it may be necessary to set the formatters/locators after the call to *plot_date*. *plot_date* will set the default tick locator to *AutoDateLocator* (if the tick locator is not already set to a *DateLocator* instance) and the default tick formatter to *AutoDateFormatter* (if the tick formatter is not already set to a *DateFormatter* instance).

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.plot_date`

- sphx_glr_gallery_ticks_and_spines_date_demo_convert.py

matplotlib.axes.Axes.step

`Axes.step`(*self*, *x*, *y*, **args*, *where='pre'*, *data=None*, ***kwargs*)

Make a step plot.

Call signatures:

```
step(x, y, [fmt], *, data=None, where='pre', **kwargs)
step(x, y, [fmt], x2, y2, [fmt2], ..., *, where='pre', **kwargs)
```

This is just a thin wrapper around *plot* which changes some formatting options. Most of the concepts and parameters of plot can be used here as well.

Parameters

x

[array-like] 1-D sequence of x positions. It is assumed, but not checked, that it is uniformly increasing.

y

[array-like] 1-D sequence of y levels.

fmt

[str, optional] A format string, e.g. 'g' for a green line. See *plot* for a more detailed description.

Note: While full format strings are accepted, it is recommended to only specify the color. Line styles are currently ignored (use the keyword argument *linestyle* instead). Markers are accepted and plotted on the given positions, however, this is a rarely needed feature for step plots.

data

[indexable object, optional] An object with labelled data. If given, provide the label names to plot in *x* and *y*.

where

[{'pre', 'post', 'mid'}, default: 'pre'] Define where the steps should be placed:

- 'pre': The y value is continued constantly to the left from every *x* position, i.e. the interval `(x[i-1], x[i]]` has the value `y[i]`.
- 'post': The y value is continued constantly to the right from every *x* position, i.e. the interval `[x[i], x[i+1])` has the value `y[i]`.
- 'mid': Steps occur half-way between the *x* positions.

Returns

lines

A list of *Line2D* objects representing the plotted data.

Other Parameters

****kwargs**

Additional parameters are the same as those for *plot*.

Notes

Examples using `matplotlib.axes.Axes.step`

- sphx_glr_gallery_lines_bars_and_markers_step_demo.py

matplotlib.axes.Axes.loglog

Axes.**loglog**(*self*, **args*, ***kwargs*)

Make a plot with log scaling on both the x and y axis.

Call signatures:

```
loglog([x], y, [fmt], data=None, **kwargs)
loglog([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around *plot* which additionally changes both the x-axis and the y-axis to log scaling. All of the concepts and parameters of plot can be used here as well.

The additional parameters *base*, *subs* and *nonpositive* control the x/y-axis properties. They are just forwarded to *Axes.set_xscale* and *Axes.set_yscale*. To use different properties on the x-axis and the y-axis, use e.g. `ax.set_xscale("log", base=10); ax.set_yscale("log", base=2)`.

Parameters

base

[float, default: 10] Base of the logarithm.

subs

[sequence, optional] The location of the minor ticks. If *None*, reasonable locations are automatically chosen depending on the number of decades in the plot. See *Axes.set_xscale*/*Axes.set_yscale* for details.

nonpositive

[{'mask', 'clip'}, default: 'mask'] Non-positive values can be masked as invalid, or clipped to a very small positive number.

Returns

lines

A list of *Line2D* objects representing the plotted data.

Other Parameters

****kwargs**

All parameters supported by *plot*.

Examples using `matplotlib.axes.Axes.loglog`

- sphx_glr_gallery_subplots_axes_and_figures_secondary_axis.py
- sphx_glr_gallery_scales_log_demo.py

matplotlib.axes.Axes.semilogx

Axes.**semilogx**(*self*, **args*, ***kwargs*)

Make a plot with log scaling on the x axis.

Call signatures:

```
semilogx([x], y, [fmt], data=None, **kwargs)
semilogx([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around *plot* which additionally changes the x-axis to log scaling. All of the concepts and parameters of plot can be used here as well.

The additional parameters *base*, *subs*, and *nonpositive* control the x-axis properties. They are just forwarded to *Axes.set_xscale*.

Parameters

base

[float, default: 10] Base of the x logarithm.

subs

[array-like, optional] The location of the minor xticks. If *None*, reasonable locations are automatically chosen depending on the number of decades in the plot. See *Axes.set_xscale* for details.

nonpositive

[{'mask', 'clip'}, default: 'mask'] Non-positive values in x can be masked as invalid, or clipped to a very small positive number.

Returns

lines

A list of *Line2D* objects representing the plotted data.

Other Parameters

****kwargs**

All parameters supported by *plot*.

Examples using `matplotlib.axes.Axes.semilogx`

- sphx_glr_gallery_scales_log_demo.py
- sphx_glr_gallery_scales_log_test.py
- *Transformations Tutorial*

matplotlib.axes.Axes.semilogy

`Axes.semilogy(self, *args, **kwargs)`

Make a plot with log scaling on the y axis.

Call signatures:

```
semilogy([x], y, [fmt], data=None, **kwargs)
semilogy([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around *plot* which additionally changes the y-axis to log scaling. All of the concepts and parameters of plot can be used here as well.

The additional parameters *base*, *subs*, and *nonpositive* control the y-axis properties. They are just forwarded to *Axes.set_yscale*.

Parameters

base

[float, default: 10] Base of the y logarithm.

subs

[array-like, optional] The location of the minor yticks. If *None*, reasonable locations are automatically chosen depending on the number of decades in the plot. See *Axes.set_yscale* for details.

nonpositive

[{'mask', 'clip'}, default: 'mask'] Non-positive values in y can be masked as invalid, or clipped to a very small positive number.

Returns

lines

A list of *Line2D* objects representing the plotted data.

Other Parameters

****kwargs**

All parameters supported by *plot*.

Examples using `matplotlib.axes.Axes.semilogy`

- sphx_glr_gallery_scales_log_demo.py
- sphx_glr_gallery_specialty_plots_skewt.py

matplotlib.axes.Axes.fill_between

`Axes.fill_between`(*self*, *x*, *y1*, *y2=0*, *where=None*, *interpolate=False*, *step=None*, ***, *data=None*, ***kwargs*)

Fill the area between two horizontal curves.

The curves are defined by the points (*x*, *y1*) and (*x*, *y2*). This creates one or multiple polygons describing the filled area.

You may exclude some horizontal sections from filling using *where*.

By default, the edges connect the given points directly. Use *step* if the filling should be a step function, i.e. constant in between *x*.

Parameters

x

[array (length N)] The x coordinates of the nodes defining the curves.

y1

[array (length N) or scalar] The y coordinates of the nodes defining the first curve.

y2

[array (length N) or scalar, default: 0] The y coordinates of the nodes defining the second curve.

where

[array of bool (length N), optional] Define *where* to exclude some horizontal regions from being filled. The filled regions are defined by the coordinates `x[where]`. More precisely, fill between `x[i]` and `x[i+1]` if `where[i] and where[i+1]`. Note that this definition implies that an isolated *True* value between two *False* values in *where* will not result in filling. Both sides of the *True* position remain unfilled due to the adjacent *False* values.

interpolate

[bool, default: False] This option is only relevant if *where* is used and the two curves are crossing each other.

Semantically, *where* is often used for *y1* > *y2* or similar. By default, the nodes of the polygon defining the filled region will only

be placed at the positions in the *x* array. Such a polygon cannot describe the above semantics close to the intersection. The x-sections containing the intersection are simply clipped.

Setting *interpolate* to *True* will calculate the actual intersection point and extend the filled region up to this point.

step

[{'pre', 'post', 'mid'}, optional] Define *step* if the filling should be a step function, i.e. constant in between *x*. The value determines where the step will occur:

- 'pre': The y value is continued constantly to the left from every *x* position, i.e. the interval `(x[i-1], x[i]]` has the value `y[i]`.
- 'post': The y value is continued constantly to the right from every *x* position, i.e. the interval `[x[i], x[i+1])` has the value `y[i]`.
- 'mid': Steps occur half-way between the *x* positions.

Returns

PolyCollection

A *PolyCollection* containing the plotted polygons.

Other Parameters

****kwargs**

All other keyword arguments are passed on to *PolyCollection*. They control the *Polygon* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	ndarray
capstyle	{'butt', 'round', 'projecting'}
clim	(vmin: float, vmax: float)
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of rgba tuples
contains	unknown
edgecolor or ec or edgecolors	color or list of colors or 'face'

Table 62 – continued from previous page

Property	Description

See also:

fill_between

Fill between two sets of y-values.

fill_betweenx

Fill between two sets of x-values.

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y1*, *y2*, *where*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.fill_between`

- sphx_glr_gallery_lines_bars_and_markers_fill_between_demo.py
- sphx_glr_gallery_lines_bars_and_markers_filled_step.py
- sphx_glr_gallery_pyplots_whats_new_98_4_fill_between.py
- sphx_glr_gallery_recipes_fill_between_alpha.py

matplotlib.axes.Axes.fill_betweenx

`Axes.fill_betweenx`(*self*, *y*, *x1*, *x2=0*, *where=None*, *step=None*, *interpolate=False*, *, *data=None*, ***kwargs*)

Fill the area between two vertical curves.

The curves are defined by the points (*y*, *x1*) and (*y*, *x2*). This creates one or multiple polygons describing the filled area.

You may exclude some vertical sections from filling using *where*.

By default, the edges connect the given points directly. Use *step* if the filling should be a step function, i.e. constant in between *y*.

Parameters

y

[array (length N)] The y coordinates of the nodes defining the curves.

x1

[array (length N) or scalar] The x coordinates of the nodes defining the first curve.

x2

[array (length N) or scalar, default: 0] The x coordinates of the nodes defining the second curve.

where

[array of bool (length N), optional] Define *where* to exclude some vertical regions from being filled. The filled regions are defined by the coordinates `y[where]`. More precisely, fill between `y[i]` and `y[i+1]` if `where[i] and where[i+1]`. Note that this definition implies that an isolated *True* value between two *False* values in *where* will not result in filling. Both sides of the *True* position remain unfilled due to the adjacent *False* values.

interpolate

[bool, default: False] This option is only relevant if *where* is used and the two curves are crossing each other.

Semantically, *where* is often used for *x1 > x2* or similar. By default, the nodes of the polygon defining the filled region will only be placed at the positions in the *y* array. Such a polygon cannot describe the above semantics close to the intersection. The y-sections containing the intersection are simply clipped.

Setting *interpolate* to *True* will calculate the actual intersection point and extend the filled region up to this point.

step

[{'pre', 'post', 'mid'}, optional] Define *step* if the filling should be a step function, i.e. constant in between *y*. The value determines where the step will occur:

- 'pre': The y value is continued constantly to the left from every *x* position, i.e. the interval `(x[i-1], x[i]]` has the value `y[i]`.
- 'post': The y value is continued constantly to the right from every *x* position, i.e. the interval `[x[i], x[i+1])` has the value `y[i]`.
- 'mid': Steps occur half-way between the *x* positions.

Returns

PolyCollection

A *PolyCollection* containing the plotted polygons.

Other Parameters

****kwargs**

All other keyword arguments are passed on to *PolyCollection*. They control the *Polygon* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool

See also:

fill_between

Fill between two sets of y-values.

fill_betweenx

Fill between two sets of x-values.

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *y*, *x1*, *x2*, *where*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.fill_betweenx`

- sphx_glr_gallery_lines_bars_and_markers_fill_betweenx_demo.py
- sphx_glr_gallery_lines_bars_and_markers_filled_step.py

matplotlib.axes.Axes.bar

`Axes.bar`(*self*, *x*, *height*, *width=0.8*, *bottom=None*, *, *align='center'*, *data=None*, ***kwargs*)

Make a bar plot.

The bars are positioned at *x* with the given *align*ment. Their dimensions are given by *height* and *width*. The vertical baseline is *bottom* (default 0).

Many parameters can take either a single value applying to all bars or a sequence of values, one for each bar.

Parameters

x

[float or array-like] The x coordinates of the bars. See also *align* for the alignment of the bars to the coordinates.

height

[float or array-like] The height(s) of the bars.

width

[float or array-like, default: 0.8] The width(s) of the bars.

bottom

[float or array-like, default: 0] The y coordinate(s) of the bars bases.

align

[{'center', 'edge'}, default: 'center'] Alignment of the bars to the *x* coordinates:

- 'center': Center the base on the *x* positions.
- 'edge': Align the left edges of the bars with the *x* positions.

To align the bars on the right edge pass a negative *width* and `align='edge'`.

Returns

BarContainer

Container with all the bars and optionally errorbars.

Other Parameters

color

[color or list of color, optional] The colors of the bar faces.

edgecolor

[color or list of color, optional] The colors of the bar edges.

linewidth

[float or array-like, optional] Width of the bar edge(s). If 0, don't draw edges.

tick_label

[str or list of str, optional] The tick labels of the bars. Default: None (Use default numeric labels.)

xerr, yerr

[float or array-like of shape(N,) or shape(2, N), optional] If not *None*, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:

- scalar: symmetric +/- values for all bars
- shape(N,): symmetric +/- values for each bar
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- *None*: No errorbar. (Default)

See /gallery/statistics/errorbar_features for an example on the usage of `xerr` and `yerr`.

ecolor

[color or list of color, default: 'black'] The line color of the errorbars.

capsize

[float, default: `rcParams["errorbar.capsize"]` (default: `0.0`)] The length of the error bar caps in points.

error_kw

[dict, optional] Dictionary of kwargs to be passed to the *errorbar* method. Values of *ecolor* or *capsize* defined here take precedence over the independent kwargs.

log

[bool, default: False] If *True*, set the y-axis to be log scale.

****kwargs**

[*Rectangle* properties]

matplotlib.axes.Axes.barh

`Axes.barh`(*self*, *y*, *width*, *height=0.8*, *left=None*, *, *align='center'*, **kwargs*)

Make a horizontal bar plot.

The bars are positioned at *y* with the given *align*ment. Their dimensions are given by *width* and *height*. The horizontal baseline is *left* (default 0).

Many parameters can take either a single value applying to all bars or a sequence of values, one for each bar.

Parameters

y

[float or array-like] The y coordinates of the bars. See also *align* for the alignment of the bars to the coordinates.

width

[float or array-like] The width(s) of the bars.

height

[float or array-like, default: 0.8] The heights of the bars.

left

[float or array-like, default: 0] The x coordinates of the left sides of the bars.

align

[{'center', 'edge'}, default: 'center'] Alignment of the base to the *y* coordinates*:

- 'center': Center the bars on the *y* positions.
- 'edge': Align the bottom edges of the bars with the *y* positions.

To align the bars on the top edge pass a negative *height* and `align='edge'`.

Returns

BarContainer

Container with all the bars and optionally errorbars.

Other Parameters

color

[color or list of color, optional] The colors of the bar faces.

edgecolor

[color or list of color, optional] The colors of the bar edges.

linewidth

[float or array-like, optional] Width of the bar edge(s). If 0, don't draw edges.

tick_label

[str or list of str, optional] The tick labels of the bars. Default: None (Use default numeric labels.)

xerr, yerr

[float or array-like of shape(N,) or shape(2, N), optional] If not `None`, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:

- scalar: symmetric +/- values for all bars
- shape(N,): symmetric +/- values for each bar
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- *None*: No errorbar. (default)

See /gallery/statistics/errorbar_features for an example on the usage of `xerr` and `yerr`.

ecolor

[color or list of color, default: 'black'] The line color of the errorbars.

capsize

[float, default: `rcParams["errorbar.capsize"]` (default: `0.0`)] The length of the error bar caps in points.

error_kw

[dict, optional] Dictionary of kwargs to be passed to the *errorbar* method. Values of *ecolor* or *capsize* defined here take precedence over the independent kwargs.

log

[bool, default: False] If `True`, set the x-axis to be log scale.

****kwargs**

- sphx_glr_gallery_statistics_multiple_histograms_side_by_side.py
- *The Lifecycle of a Plot*

matplotlib.axes.Axes.stem

Axes.**stem**(*self*, **args*, *linefmt=None*, *markerfmt=None*, *basefmt=None*, *bottom=0*, *label=None*, *use_line_collection=True*, *data=None*)

Create a stem plot.

A stem plot plots vertical lines at each *x* location from the baseline to *y*, and places a marker there.

Call signature:

```
stem([x,] y, linefmt=None, markerfmt=None, basefmt=None)
```

The x-positions are optional. The formats may be provided either as positional or as keyword-arguments.

Parameters

x

[array-like, optional] The x-positions of the stems. Default: (0, 1, ..., len(y) - 1).

y

[array-like] The y-values of the stem heads.

linefmt

[str, optional] A string defining the properties of the vertical lines. Usually, this will be a color or a color and a linestyle:

Character	Line Style
'-'	solid line
'--'	dashed line
'-.'	dash-dot line
':'	dotted line

Default: 'C0-', i.e. solid line with the first color of the color cycle.

Note: While it is technically possible to specify valid formats other than color or color and linestyle (e.g. 'rx' or '-.'), this is beyond the intention of the method and will most likely not result in a reasonable plot.

markerfmt

[str, optional] A string defining the properties of the markers at the stem heads. Default: 'C0o', i.e. filled circles with the first color of the color cycle.

basefmt

[str, default: 'C3-' ('C2-' in classic mode)] A format string defining the properties of the baseline.

bottom

[float, default: 0] The y-position of the baseline.

label

[str, default: None] The label to use for the stems in legends.

use_line_collection

[bool, default: True] If `True`, store and plot the stem lines as a *LineCollection* instead of individual lines, which significantly increases performance. If `False`, defaults to the old behavior of using a list of *Line2D* objects. This parameter may be deprecated in the future.

Returns

StemContainer

The container may be treated like a tuple (*markerline*, *stemlines*, *baseline*)

Notes

See also:

The MATLAB function stem which inspired this method.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.stem`

- sphx_glr_gallery_lines_bars_and_markers_stem_plot.py
- sphx_glr_gallery_text_labels_and_annotations_legend_demo.py

matplotlib.axes.Axes.eventplot

Axes.eventplot(*self*, *positions*, *orientation='horizontal'*, *lineoffsets=1*, *linelengths=1*, *linewidths=None*, *colors=None*, *linestyles='solid'*, ***, *data=None*, ***kwargs*)

Plot identical parallel lines at the given positions.

This type of plot is commonly used in neuroscience for representing neural events, where it is usually called a spike raster, dot raster, or raster plot.

However, it is useful in any situation where you wish to show the timing or position of multiple sets of discrete events, such as the arrival times of people to a business on each day of the month or the date of hurricanes each year of the last century.

Parameters

positions

[array-like or list of array-like] A 1D array-like defines the positions of one sequence of events.

Multiple groups of events may be passed as a list of array-likes. Each group can be styled independently by passing lists of values to *lineoffsets*, *linelengths*, *linewidths*, *colors* and *linestyles*.

Note that *positions* can be a 2D array, but in practice different event groups usually have different counts so that one will use a list of different-length arrays rather than a 2D array.

orientation

[{'horizontal', 'vertical'}, default: 'horizontal'] The direction of the event sequence:

- 'horizontal': the events are arranged horizontally. The indicator lines are vertical.
- 'vertical': the events are arranged vertically. The indicator lines are horizontal.

lineoffsets

[float or array-like, default: 1] The offset of the center of the lines from the origin, in the direction orthogonal to *orientation*.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

linelengths

[float or array-like, default: 1] The total height of the lines (i.e. the lines stretches from `lineoffset - linelength/2` to `lineoffset + linelength/2`).

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

linewidths

[float or array-like, default: `rcParams["lines.linewidth"]` (default: `1.5`)] The line width(s) of the event lines, in points.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

colors

[color or list of colors, default: `rcParams["lines.color"]` (default: `'C0'`)] The color(s) of the event lines.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

linestyles

[str or tuple or list of such values, default: 'solid'] Default is 'solid'. Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

```
(offset, onoffseq),
```

where *onoffseq* is an even length tuple of on and off ink in points.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

****kwargs**

Other keyword arguments are line collection properties. See *LineCollection* for a list of the valid properties.

Returns

list of *EventCollection*

The *EventCollection* that were added.

Notes

For *linelengths*, *linewidths*, *colors*, and *linestyles*, if only a single value is given, that value is applied to all lines. If an array-like is given, it must have the same length as *positions*, and each value will be applied to the corresponding row of the array.

Examples

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *positions*, *lineoffsets*, *linelengths*, *linewidths*, *colors*, *linestyles*.

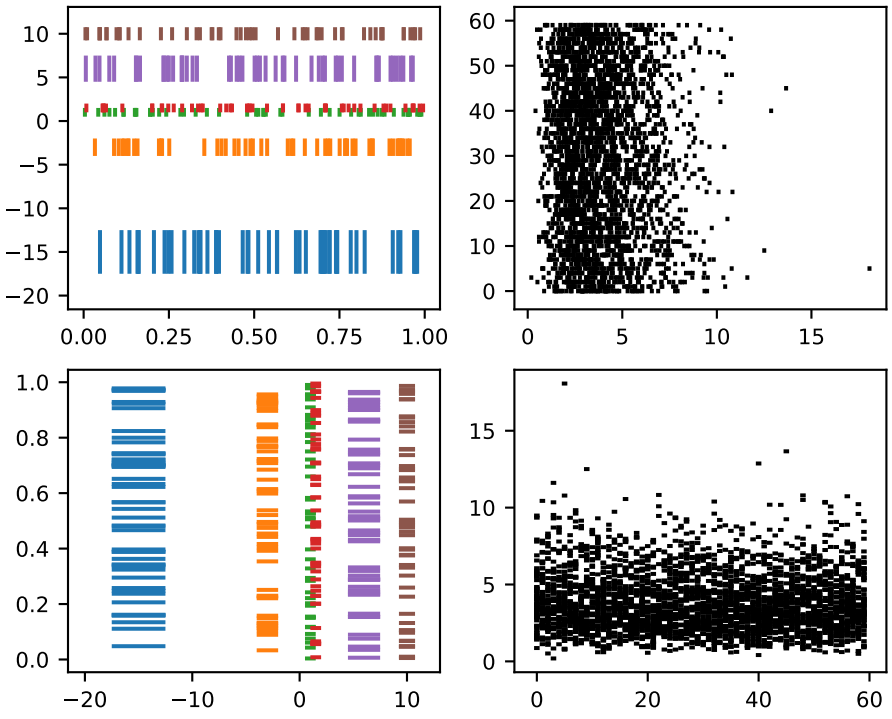
Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.eventplot`

matplotlib.axes.Axes.pie

`Axes.pie`(*self*, *x*, *explode=None*, *labels=None*, *colors=None*, *autopct=None*, *pctdistance=0.6*, *shadow=False*, *labeldistance=1.1*, *startangle=0*, *radius=1*, *counterclock=True*, *wedgeprops=None*, *textprops=None*, *center=0, 0*, *frame=False*, *rotatelabels=False*, ***, *normalize=None*, *data=None*)

Plot a pie chart.



Make a pie chart of array *x*. The fractional area of each wedge is given by `x/sum(x)`. If `sum(x) < 1`, then the values of *x* give the fractional area directly and the array will not be normalized. The resulting pie will have an empty wedge of size `1 - sum(x)`.

The wedges are plotted counterclockwise, by default starting from the x-axis.

Parameters

x

[1D array-like] The wedge sizes.

explode

[array-like, default: None] If not *None*, is a `len(x)` array which specifies the fraction of the radius with which to offset each wedge.

labels

[list, default: None] A sequence of strings providing the labels for each wedge

colors

[array-like, default: None] A sequence of colors through which the pie chart will cycle. If *None*, will use the colors in the currently active cycle.

autopct

[None or str or callable, default: None] If not *None*, is a string or function used to label the wedges with their numeric value. The label will be placed inside the wedge. If it is a format string, the label will be `fmt % pct`. If it is a function, it will be called.

pctdistance

[float, default: 0.6] The ratio between the center of each pie slice and the start of the text generated by *autopct*. Ignored if *autopct* is *None*.

shadow

[bool, default: False] Draw a shadow beneath the pie.

normalize: None or bool, default: None

When *True*, always make a full pie by normalizing x so that `sum(x) == 1`. *False* makes a partial pie if `sum(x) <= 1` and raises a `ValueError` for `sum(x) > 1`.

When *None*, defaults to *True* if `sum(x) >= 1` and *False* if `sum(x) < 1`.

Please note that the previous default value of *None* is now deprecated, and the default will change to *True* in the next release. Please pass `normalize=False` explicitly if you want to draw a partial pie.

labeldistance

[float or None, default: 1.1] The radial distance at which the pie labels are drawn. If set to `None`, label are not drawn, but are stored for use in `legend()`

startangle

[float, default: 0 degrees] The angle by which the start of the pie is rotated, counterclockwise from the x-axis.

radius

[float, default: 1] The radius of the pie.

counterclock

[bool, default: True] Specify fractions direction, clockwise or counterclockwise.

wedgeprops

[dict, default: None] Dict of arguments passed to the wedge objects making the pie. For example, you can pass in `wedgeprops = {'linewidth': 3}` to set the width of the wedge border lines equal to 3. For more details, look at the doc/arguments of the wedge object. By default `clip_on=False`.

textprops

[dict, default: None] Dict of arguments to pass to the text objects.

center

[(float, float), default: (0, 0)] The coordinates of the center of the chart.

frame

[bool, default: False] Plot axes frame with the chart if true.

rotatelabels

[bool, default: False] Rotate each label to the angle of the corresponding slice if true.

Returns

patches

[list] A sequence of *matplotlib.patches.Wedge* instances

texts

[list] A list of the label *Text* instances.

autotexts

[list] A list of *Text* instances for the numeric labels. This will only be returned if the parameter *autopct* is not *None*.

Notes

The pie chart will probably look best if the figure and axes are square, or the Axes aspect is equal. This method sets the aspect ratio of the axis to "equal". The axes aspect ratio can be controlled with *Axes.set_aspect*.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *explode*, *labels*, *colors*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.pie`

- sphx_glr_gallery_pie_and_polar_charts_pie_features.py
- sphx_glr_gallery_pie_and_polar_charts_pie_demo2.py
- sphx_glr_gallery_pie_and_polar_charts_bar_of_pie.py
- sphx_glr_gallery_pie_and_polar_charts_nested_pie.py
- sphx_glr_gallery_pie_and_polar_charts_pie_and_donut_labels.py
- sphx_glr_gallery_misc_svg_filter_pie.py

matplotlib.axes.Axes.stackplot

Axes.stackplot(*axes*, *x*, **args*, *labels=()*, *colors=None*, *baseline='zero'*, *data=None*, ***kwargs*)

Draw a stacked area plot.

Parameters

x

[1d array of dimension N]

y

[2d array (dimension MxN), or sequence of 1d arrays (each dimension 1xN)] The data is assumed to be unstacked. Each of the following calls is legal:

```
stackplot(x, y)               # where y is MxN
stackplot(x, y1, y2, y3, y4)  # where y1, y2, y3, y4, are all 1xNm
```

baseline

[{'zero', 'sym', 'wiggle', 'weighted_wiggle'}] Method used to calculate the baseline:

- `'zero'`: Constant zero baseline, i.e. a simple stacked plot.
- `'sym'`: Symmetric around zero and is sometimes called 'ThemeRiver'.
- `'wiggle'`: Minimizes the sum of the squared slopes.

- `'weighted_wiggle'`: Does the same but weights to account for size of each layer. It is also called 'Streamgraph'-layout. More details can be found at http://leebyron.com/streamgraph/.

labels

[Length N sequence of strings] Labels to assign to each data series.

colors

[Length N sequence of colors] A list or tuple of colors. These will be cycled through and used to colour the stacked areas.

****kwargs**

All other keyword arguments are passed to *Axes.fill_between*.

Returns

list of *PolyCollection*

A list of *PolyCollection* instances, one for each element in the stacked area plot.

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.stackplot`

- sphx_glr_gallery_lines_bars_and_markers_stackplot_demo.py

matplotlib.axes.Axes.broken_barh

Axes.**broken_barh**(*self*, *xranges*, *yrange*, *, *data=None*, **kwargs*)

Plot a horizontal sequence of rectangles.

A rectangle is drawn for each element of *xranges*. All rectangles have the same vertical position and size defined by *yrange*.

This is a convenience function for instantiating a *BrokenBarHCollection*, adding it to the axes and autoscaling the view.

Parameters

xranges

[sequence of tuples (*xmin*, *xwidth*)] The x-positions and extends of the rectangles. For each tuple (*xmin*, *xwidth*) a rectangle is drawn from *xmin* to *xmin* + *xwidth*.

yrange

[(*ymin*, *yheight*)] The y-position and extend for all the rectangles.

Returns

BrokenBarHCollection

Other Parameters

**kwargs

[*BrokenBarHCollection* properties] Each *kwarg* can be either a single argument applying to all rectangles, e.g.:

```
facecolors='black'
```

or a sequence of arguments over which is cycled, e.g.:

```
facecolors=('black', 'blue')
```

would create interleaving black and blue rectangles.

Supported keywords:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	ndarray

Table 66 – continued from previous page

Property	Description
capstyle	{'butt', 'round', 'projecting'}
clim	(vmin: float, vmax: float)
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of rgba tuples
contains	unknown
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
norm	*Normalize* or None
offset_position	unknown
offsets	array-like (N, 2) or (2,)
path_effects	*AbstractPathEffect*
picker	None or bool or callable
pickradius	unknown
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.broken_barh`

- sphx_glr_gallery_lines_bars_and_markers_broken_barh.py

matplotlib.axes.Axes.vlines

`Axes.vlines`(*self*, *x*, *ymin*, *ymax*, *colors=None*, *linestyles='solid'*, *label=''*, ***, *data=None*, ***kwargs*)

Plot vertical lines.

Plot vertical lines at each *x* from *ymin* to *ymax*.

Parameters

x

[float or array-like] x-indexes where to plot the lines.

ymin, ymax

[float or array-like] Respective beginning and end of each line. If scalars are provided, all lines will have same length.

colors

[list of colors, default: `rcParams["lines.color"]` (default: `'C0'`)]

linestyles

[{'solid', 'dashed', 'dashdot', 'dotted'}, optional]

label

[str, default: '']

Returns

LineCollection

Other Parameters

****kwargs**

[*LineCollection* properties.]

See also:

hlines

horizontal lines

axvline

vertical line across the axes

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *ymin*, *ymax*, *colors*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.vlines`

- sphx_glr_gallery_lines_bars_and_markers_timeline.py
- sphx_glr_gallery_lines_bars_and_markers_vline_hline_demo.py
- sphx_glr_gallery_statistics_customized_violin.py

matplotlib.axes.Axes.hlines

`Axes.hlines`(*self*, *y*, *xmin*, *xmax*, *colors=None*, *linestyles='solid'*, *label=''*, ***, *data=None*, ***kwargs*)

Plot horizontal lines at each *y* from *xmin* to *xmax*.

Parameters

y

[float or array-like] y-indexes where to plot the lines.

xmin, xmax

[float or array-like] Respective beginning and end of each line. If scalars are provided, all lines will have same length.

colors

[list of colors, default: `rcParams["lines.color"]` (default: `'C0'`)]

linestyles

[{'solid', 'dashed', 'dashdot', 'dotted'}, optional]

label

[str, default: '']

Returns

LineCollection

Other Parameters

****kwargs**

[*LineCollection* properties.]

See also:

vlines

vertical lines

axhline

horizontal line across the axes

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *y*, *xmin*, *xmax*, *colors*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.hlines`

- sphx_glr_gallery_lines_bars_and_markers_vline_hline_demo.py

matplotlib.axes.Axes.fill

`Axes.fill`(*self*, **args*, *data=None*, ***kwargs*)

Plot filled polygons.

Parameters

***args**

[sequence of x, y, [color]] Each polygon is defined by the lists of *x* and *y* positions of its nodes, optionally followed by a *color* specifier. See *matplotlib.colors* for supported color specifiers. The standard color cycle is used for polygons without a color specifier.

You can plot multiple polygons by providing multiple *x*, *y*, *[color]* groups.

For example, each of the following is legal:

```
ax.fill(x, y)                    # a polygon with default color
ax.fill(x, y, "b")               # a blue polygon
ax.fill(x, y, x2, y2)            # two polygons
ax.fill(x, y, "b", x2, y2, "r")  # a blue and a red polygon
```

data

[indexable object, optional] An object with labelled data. If given, provide the label names to plot in *x* and *y*, e.g.:

```
ax.fill("time", "signal",
        data={"time": [0, 1, 2], "signal": [0, 1, 0]})
```

Returns

list of *Polygon*

Other Parameters

****kwargs**

[*Polygon* properties]

Notes

Use *fill_between()* if you would like to fill the region between two curves.

Examples using `matplotlib.axes.Axes.fill`

- sphx_glr_gallery_lines_bars_and_markers_fill.py
- sphx_glr_gallery_shapes_and_collections_hatch_demo.py
- sphx_glr_gallery_specialty_plots_radar_chart.py
- sphx_glr_gallery_units_ellipse_with_units.py

Spans

Axes.axhline	Add a horizontal line across the axis.
Axes.axhspan	Add a horizontal span (rectangle) across the axis.
Axes.axvline	Add a vertical line across the axes.
Axes.axvspan	Add a vertical span (rectangle) across the axes.
Axes.axline	Add an infinitely long straight line.

matplotlib.axes.Axes.axhline

Axes.**axhline**(*self*, *y=0*, *xmin=0*, *xmax=1*, ***kwargs*)

Add a horizontal line across the axis.

Parameters

y

[float, default: 0] y position in data coordinates of the horizontal line.

xmin

[float, default: 0] Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.

xmax

[float, default: 1] Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.

Returns

Line2D

Other Parameters

****kwargs**

Valid keyword arguments are *Line2D* properties, with the exception of 'transform':

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool

Table 68 – continued from previous page

Property	Description
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also:

hlines

Add horizontal lines in data coordinates.

axhspan

Add a horizontal span (rectangle) across the axis.

axline

Add a line with an arbitrary slope.

Examples

- draw a thick red hline at 'y' = 0 that spans the xrange:

```
>>> axhline(linewidth=4, color='r')
```

- draw a default hline at 'y' = 1 that spans the xrange:

```
>>> axhline(y=1)
```

- draw a default hline at 'y' = .5 that spans the middle half of the xrange:

```
>>> axhline(y=.5, xmin=0.25, xmax=0.75)
```

Examples using `matplotlib.axes.Axes.axhline`

matplotlib.axes.Axes.axhspan

Axes.**axhspan**(*self*, *ymin*, *ymax*, *xmin=0*, *xmax=1*, ***kwargs*)

Add a horizontal span (rectangle) across the axis.

The rectangle spans from *ymin* to *ymax* vertically, and, by default, the whole x-axis horizontally. The x-span can be set using *xmin* (default: 0) and *xmax* (default: 1) which are in axis units; e.g. `xmin = 0.5` always refers to the middle of the x-axis regardless of the limits set by *set_xlim*.

Parameters

ymin

[float] Lower y-coordinate of the span, in data units.

ymax

[float] Upper y-coordinate of the span, in data units.

xmin

[float, default: 0] Lower x-coordinate of the span, in x-axis (0-1) units.

xmax

[float, default: 1] Upper x-coordinate of the span, in x-axis (0-1) units.

Returns

Polygon

Horizontal span (rectangle) from (xmin, ymin) to (xmax, ymax).

Other Parameters

****kwargs**

[*Polygon* properties]

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None

matplotlib.axes.Axes.axvline

`Axes.axvline`(*self*, *x=0*, *ymin=0*, *ymax=1*, ***kwargs*)

Add a vertical line across the axes.

Parameters

x

[float, default: 0] x position in data coordinates of the vertical line.

ymin

[float, default: 0] Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

ymax

[float, default: 1] Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

Returns

Line2D

Other Parameters

- *The Lifecycle of a Plot*
- *Transformations Tutorial*

matplotlib.axes.Axes.axvspan

Axes.**axvspan**(*self*, *xmin*, *xmax*, *ymin=0*, *ymax=1*, ***kwargs*)

Add a vertical span (rectangle) across the axes.

The rectangle spans from *xmin* to *xmax* horizontally, and, by default, the whole y-axis vertically. The y-span can be set using *ymin* (default: 0) and *ymax* (default: 1) which are in axis units; e.g. `ymin = 0.5` always refers to the middle of the y-axis regardless of the limits set by *set_ylim*.

Parameters

xmin

[float] Lower x-coordinate of the span, in data units.

xmax

[float] Upper x-coordinate of the span, in data units.

ymin

[float, default: 0] Lower y-coordinate of the span, in y-axis units (0-1).

ymax

[float, default: 1] Upper y-coordinate of the span, in y-axis units (0-1).

Returns

Polygon

Vertical span (rectangle) from (xmin, ymin) to (xmax, ymax).

Other Parameters

****kwargs**

[*Polygon* properties]

%(Polygon)s

See also:

axhspan

Add a horizontal span across the axes.

Examples

Draw a vertical, green, translucent rectangle from x = 1.25 to x = 1.55 that spans the yrange of the axes.

```
>>> axvspan(1.25, 1.55, facecolor='g', alpha=0.5)
```

Examples using `matplotlib.axes.Axes.axvspan`

- sphx_glr_gallery_subplots_axes_and_figures_axhspan_demo.py
- *Transformations Tutorial*

matplotlib.axes.Axes.axline

`Axes.axline`(*self*, *xy1*, *xy2=None*, ***, *slope=None*, ***kwargs*)

Add an infinitely long straight line.

The line can be defined either by two points *xy1* and *xy2*, or by one point *xy1* and a *slope*.

This draws a straight line "on the screen", regardless of the x and y scales, and is thus also suitable for drawing exponential decays in semilog plots, power laws in loglog plots, etc. However, *slope* should only be used with linear scales; It has no clear meaning for all other scales, and thus the behavior is undefined. Please specify the line using the points *xy1*, *xy2* for non-linear scales.

Parameters

xy1, xy2

[(float, float)] Points for the line to pass through. Either *xy2* or *slope* has to be given.

slope

[float, optional] The slope of the line. Either *xy2* or *slope* has to be given.

Returns

Line2D

Other Parameters

****kwargs**

Valid kwargs are *Line2D* properties, with the exception of 'transform':

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color

Table 71 – continued from previous page

Property	Description
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}

axhline

for horizontal lines

axvline

for vertical lines

Examples

Draw a thick red line passing through (0, 0) and (1, 1):

```
>>> axline((0, 0), (1, 1), linewidth=4, color='r')
```

Examples using `matplotlib.axes.Axes.axline`

- sphx_glr_gallery_subplots_axes_and_figures_axhspan_demo.py
- sphx_glr_gallery_pyplots_axline.py

Spectral

Axes.acorr	Plot the autocorrelation of *x*.
Axes.angle_spectrum	Plot the angle spectrum.
Axes.cohere	Plot the coherence between *x* and *y*.
Axes.csd	Plot the cross-spectral density.
Axes.magnitude_spectrum	Plot the magnitude spectrum.
Axes.phase_spectrum	Plot the phase spectrum.
Axes.psd	Plot the power spectral density.
Axes.specgram	Plot a spectrogram.
Axes.xcorr	Plot the cross correlation between *x* and *y*.

matplotlib.axes.Axes.acorr

`Axes.acorr`(*self*, *x*, *, *data=None*, ***kwargs*)

Plot the autocorrelation of *x*.

Parameters

x

[array-like]

detrend

[callable, default: *mlab.detrend_none* (no detrending)] A detrending function applied to *x*. It must have the signature

```
detrend(x: np.ndarray) -> np.ndarray
```

normed

[bool, default: True] If `True`, input vectors are normalised to unit length.

usevlines

[bool, default: True] Determines the plot style.

If `True`, vertical lines are plotted from 0 to the acorr value using *Axes.vlines*. Additionally, a horizontal line is plotted at y=0 using *Axes.axhline*.

If `False`, markers are plotted at the acorr values using *Axes.plot*.

maxlags

[int, default: 10] Number of lags to show. If `None`, will return all `2 * len(x) - 1` lags.

Returns

lags

[array (length `2*maxlags+1`)] The lag vector.

c

[array (length `2*maxlags+1`)] The auto correlation vector.

line

[*LineCollection* or *Line2D*] *Artist* added to the axes of the correlation:

- *LineCollection* if *usevlines* is True.
- *Line2D* if *usevlines* is False.

b

[*Line2D* or None] Horizontal line at 0 if *usevlines* is True None *usevlines* is False.

Other Parameters

linestyle

[*Line2D* property, optional] The linestyle for plotting the data points. Only used if *usevlines* is `False`.

marker

[str, default: 'o'] The marker for plotting the data points. Only used if *usevlines* is `False`.

****kwargs**

Additional parameters are passed to *Axes.vlines* and *Axes.axhline* if *usevlines* is `True`; otherwise they are passed to *Axes.plot*.

Notes

The cross correlation is performed with `numpy.correlate` with `mode = "full"`.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.acorr`

- sphx_glr_gallery_lines_bars_and_markers_xcorr_acorr_demo.py

matplotlib.axes.Axes.angle_spectrum

Axes.**angle_spectrum**(*self*, *x*, *Fs=None*, *Fc=None*, *window=None*, *pad_to=None*, *sides=None*, *, *data=None*, ***kwargs*)

Plot the angle spectrum.

Compute the angle spectrum (wrapped phase spectrum) of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data.

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

spectrum

[1-D array] The values for the angle spectrum in radians (real valued).

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

line

[*Line2D*] The line created by this function.

Other Parameters

****kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object

Table 73 – continued from previous page

Property	Description
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also:

magnitude_spectrum

Plots the magnitudes of the corresponding frequencies.

phase_spectrum

Plots the unwrapped version of this function.

specgram

Can plot the angle spectrum of segments within the signal in a colormap.

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.angle_spectrum`

matplotlib.axes.Axes.cohere

`Axes.cohere`(*self*, *x*, *y*, *NFFT=256*, *Fs=2*, *Fc=0*, *detrend=<function detrend_none at 0x7f5434697820>*, *window=<function window_hanning at 0x7f5434697160>*, *noverlap=0*, *pad_to=None*, *sides='default'*, *scale_by_freq=None*, ***, *data=None*, ***kwargs*)

Plot the coherence between *x* and *y*.

Plot the coherence between *x* and *y*. Coherence is the normalized cross spectral density:

$$C_{xy} = \frac{|P_{xy}|^2}{P_{xx}P_{yy}}$$

Parameters

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The *mlab* module defines *detrend_none*, *detrend_mean*, and *detrend_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend_none*. 'mean' calls *detrend_mean*. 'linear' calls *detrend_linear*.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int, default: 0 (no overlap)] The number of points of overlap between blocks.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

Cxy

[1-D array] The coherence vector.

freqs

[1-D array] The frequencies for the elements in *Cxy*.

Other Parameters

****kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description

Bendat & Piersol -- Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

Examples using `matplotlib.axes.Axes.cohere`

matplotlib.axes.Axes.csd

Axes.csd(*self*, *x*, *y*, *NFFT=None*, *Fs=None*, *Fc=None*, *detrend=None*, *window=None*, *noverlap=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*, *return_line=None*, *, *data=None*, **kwargs*)

Plot the cross-spectral density.

The cross spectral density P_{xy} by Welch's average periodogram method. The vectors *x* and *y* are divided into *NFFT* length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The product of the direct FFTs of *x* and *y* are averaged over each segment to compute P_{xy}, with a scaling to correct for power loss due to windowing.

If len(*x*) < *NFFT* or len(*y*) < *NFFT*, they will be zero padded to *NFFT*.

Parameters

x, y

[1-D arrays or sequences] Arrays or sequences containing the data.

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The *mlab* module defines *detrend_none*, *detrend_mean*, and *detrend_linear*, but you can use a custom function as well. You can also use a

string to choose one of the functions: 'none' calls *detrend_none*. 'mean' calls *detrend_mean*. 'linear' calls *detrend_linear*.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int, default: 0 (no overlap)] The number of points of overlap between segments.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

return_line

[bool, default: False] Whether to include the line object plotted in the returned values.

Returns

Pxy

[1-D array] The values for the cross spectrum P_{xy} before scaling (complex valued).

freqs

[1-D array] The frequencies corresponding to the elements in *Pxy*.

line

[*Line2D*] The line created by this function. Only returned if *return_line* is True.

Other Parameters

psd

is equivalent to setting `y = x`.

Notes

For plotting, the power is plotted as $10\log_{10}(P_{xy})$ for decibels, though P_{xy} itself is returned.

References

Bendat & Piersol -- Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.csd`

- sphx_glr_gallery_lines_bars_and_markers_csd_demo.py

matplotlib.axes.Axes.magnitude_spectrum

Axes.**magnitude_spectrum**(*self*, *x*, *Fs=None*, *Fc=None*, *window=None*, *pad_to=None*, *sides=None*, *scale=None*, *, *data=None*, ***kwargs*)

Plot the magnitude spectrum.

Compute the magnitude spectrum of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data.

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

scale

[{'default', 'linear', 'dB'}] The scaling of the values in the *spec*. 'linear' is no scaling. 'dB' returns the values in dB scale, i.e., the dB amplitude (20 * log10). 'default' is 'linear'.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

spectrum

[1-D array] The values for the magnitude spectrum before scaling (real valued).

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

line

[*Line2D*] The line created by this function.

Other Parameters

**kwargs

Plots the phase (unwrapped angle) of the corresponding frequencies.

specgram

Can plot the magnitude spectrum of segments within the signal in a colormap.

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.magnitude_spectrum`

matplotlib.axes.Axes.phase_spectrum

Axes.**phase_spectrum**(*self*, *x*, *Fs=None*, *Fc=None*, *window=None*, *pad_to=None*, *sides=None*, *, *data=None*, **kwargs*)

Plot the phase spectrum.

Compute the phase spectrum (unwrapped angle spectrum) of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

spectrum

[1-D array] The values for the phase spectrum in radians (real valued).

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

line

[*Line2D*] The line created by this function.

Other Parameters

****kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}

Table 77 – continued from previous page

Property	Description
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also:

magnitude_spectrum

Plots the magnitudes of the corresponding frequencies.

angle_spectrum

Plots the wrapped version of this function.

specgram

Can plot the phase spectrum of segments within the signal in a colormap.

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.phase_spectrum`

matplotlib.axes.Axes.psd

`Axes.psd`(*self*, *x*, *NFFT=None*, *Fs=None*, *Fc=None*, *detrend=None*, *window=None*, *noverlap=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*, *return_line=None*, ***, *data=None*, ***kwargs*)

Plot the power spectral density.

The power spectral density P_{xx} by Welch's average periodogram method. The vector *x* is divided into *NFFT* length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length

of the overlap between segments. The $|\mathrm{fft}(i)|^2$ of each segment i are averaged to compute P_{xx}, with a scaling to correct for power loss due to windowing.

If len(*x*) < *NFFT*, it will be zero padded to *NFFT*.

Parameters

x

[1-D array or sequence] Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the

mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The *mlab* module defines *detrend_none*, *detrend_mean*, and *detrend_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend_none*. 'mean' calls *detrend_mean*. 'linear' calls *detrend_linear*.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int, default: 0 (no overlap)] The number of points of overlap between segments.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

return_line

[bool, default: False] Whether to include the line object plotted in the returned values.

Returns

Pxx

[1-D array] The values for the power spectrum P_{xx} before scaling (real valued).

freqs

[1-D array] The frequencies corresponding to the elements in *Pxx*.

line

[*Line2D*] The line created by this function. Only returned if *return_line* is True.

Other Parameters

****kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also:

specgram

Differs in the default overlap; in not returning the mean of the segment periodograms; in returning the times of the segments; and in plotting a colormap instead of a line.

magnitude_spectrum

Plots the magnitude spectrum.

csd

Plots the spectral density between two signals.

Notes

For plotting, the power is plotted as $10 \log_{10}(P_{xx})$ for decibels, though *Pxx* itself is returned.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.psd`

- sphx_glr_gallery_lines_bars_and_markers_psd_demo.py

matplotlib.axes.Axes.specgram

Axes.**specgram**(*self*, *x*, *NFFT=None*, *Fs=None*, *Fc=None*, *detrend=None*, *window=None*, *noverlap=None*, *cmap=None*, *xextent=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*, *mode=None*, *scale=None*, *vmin=None*, *vmax=None*, ***, *data=None*, ***kwargs*)

Plot a spectrogram.

Compute and plot a spectrogram of data in *x*. Data are split into *NFFT* length segments and the spectrum of each section is computed. The windowing function *window* is applied to each segment, and the amount of overlap of each segment is specified with *noverlap*. The spectrogram is plotted as a colormap (using imshow).

Parameters

x

[1-D array or sequence] Array or sequence containing the data.

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib is it a function. The *mlab* module defines *detrend_none*, *detrend_mean*, and *detrend_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend_none*. 'mean' calls *detrend_mean*. 'linear' calls *detrend_linear*.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

mode

[{'default', 'psd', 'magnitude', 'angle', 'phase'}] What sort of spectrum to use. Default is 'psd', which takes the power spectral density. 'magnitude' returns the magnitude spectrum. 'angle' returns the phase spectrum without unwrapping. 'phase' returns the phase spectrum with unwrapping.

noverlap

[int] The number of points of overlap between blocks. The default value is 128.

scale

[{'default', 'linear', 'dB'}] The scaling of the values in the *spec*. 'linear' is no scaling. 'dB' returns the values in dB scale. When *mode* is 'psd', this is dB power (10 * log10). Otherwise this is dB amplitude (20 * log10). 'default' is 'dB' if *mode* is 'psd' or 'magnitude' and 'linear' otherwise. This must be 'linear' if *mode* is 'angle' or 'phase'.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

cmap

[*Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)]

xextent

[*None* or (xmin, xmax)] The image extent along the x-axis. The default sets *xmin* to the left border of the first bin (*spectrum* column) and *xmax* to the right border of the last bin. Note that

for *noverlap>0* the width of the bins is smaller than those of the segments.

****kwargs**

Additional keyword arguments are passed on to *imshow* which makes the specgram image.

Returns

spectrum

[2-D array] Columns are the periodograms of successive segments.

freqs

[1-D array] The frequencies corresponding to the rows in *spectrum*.

t

[1-D array] The times corresponding to midpoints of segments (i.e., the columns in *spectrum*).

im

[*AxesImage*] The image created by imshow containing the spectrogram.

See also:

psd

Differs in the default overlap; in returning the mean of the segment periodograms; in not returning times; and in generating a line plot instead of colormap.

magnitude_spectrum

A single spectrum, similar to having a single segment when *mode* is 'magnitude'. Plots a line instead of a colormap.

angle_spectrum

A single spectrum, similar to having a single segment when *mode* is 'angle'. Plots a line instead of a colormap.

phase_spectrum

A single spectrum, similar to having a single segment when *mode* is 'phase'. Plots a line instead of a colormap.

Notes

The parameters *detrend* and *scale_by_freq* do only apply when *mode* is set to 'psd'.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.specgram`

- sphx_glr_gallery_images_contours_and_fields_specgram_demo.py

matplotlib.axes.Axes.xcorr

Axes.xcorr(*self*, *x*, *y*, *normed=True*, *detrend=<function detrend_none at 0x7f5434697820>*, *usevlines=True*, *maxlags=10*, ***, *data=None*, ***kwargs*)

Plot the cross correlation between *x* and *y*.

The correlation with lag k is defined as $\sum_n x[n+k] \cdot y^*[n]$, where y^* is the complex conjugate of y.

Parameters

x, y

[array-like of length n]

detrend

[callable, default: *mlab.detrend_none* (no detrending)] A detrending function applied to *x* and *y*. It must have the signature

```
detrend(x: np.ndarray) -> np.ndarray
```

normed

[bool, default: True] If `True`, input vectors are normalised to unit length.

usevlines

[bool, default: True] Determines the plot style.

If `True`, vertical lines are plotted from 0 to the xcorr value using *Axes.vlines*. Additionally, a horizontal line is plotted at y=0 using *Axes.axhline*.

If `False`, markers are plotted at the xcorr values using *Axes.plot*.

maxlags

[int, default: 10] Number of lags to show. If None, will return all `2 * len(x) - 1` lags.

Returns

lags

[array (length `2*maxlags+1`)] The lag vector.

c

[array (length `2*maxlags+1`)] The auto correlation vector.

line

[*LineCollection* or *Line2D*] *Artist* added to the axes of the correlation:

- *LineCollection* if *usevlines* is True.
- *Line2D* if *usevlines* is False.

b

[*Line2D* or None] Horizontal line at 0 if *usevlines* is True None *usevlines* is False.

Other Parameters

linestyle

[*Line2D* property, optional] The linestyle for plotting the data points. Only used if *usevlines* is `False`.

marker

[str, default: 'o'] The marker for plotting the data points. Only used if *usevlines* is `False`.

****kwargs**

Additional parameters are passed to *Axes.vlines* and *Axes.axhline* if *usevlines* is `True`; otherwise they are passed to *Axes.plot*.

Notes

The cross correlation is performed with `numpy.correlate` with `mode = "full"`.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.xcorr`

- sphx_glr_gallery_lines_bars_and_markers_xcorr_acorr_demo.py

Statistics

Axes.boxplot	Make a box and whisker plot.
Axes.violinplot	Make a violin plot.
Axes.violin	Drawing function for violin plots.
Axes.bxp	Drawing function for box and whisker plots.

matplotlib.axes.Axes.boxplot

`Axes.boxplot`(*self*, *x*, *notch=None*, *sym=None*, *vert=None*, *whis=None*, *positions=None*, *widths=None*, *patch_artist=None*, *bootstrap=None*, *usermedians=None*, *conf_intervals=None*, *meanline=None*, *showmeans=None*, *showcaps=None*, *showbox=None*, *showfliers=None*, *boxprops=None*, *labels=None*, *flierprops=None*, *medianprops=None*, *meanprops=None*, *capprops=None*, *whiskerprops=None*, *manage_ticks=True*, *autorange=False*, *zorder=None*, *, *data=None*)

Make a box and whisker plot.

Make a box and whisker plot for each column of *x* or each vector in sequence *x*. The box extends from the lower to upper quartile values of the data, with a line at the median. The whiskers extend from the box to show the range of the data. Flier points are those past the end of the whiskers.

Parameters

x

[Array or a sequence of vectors.] The input data.

notch

[bool, default: False] Whether to draw a noteched box plot (`True`), or a rectangular box plot (`False`). The notches represent the confidence interval (CI) around the median. The documentation for *bootstrap* describes how the locations of the notches are computed.

Note: In cases where the values of the CI are less than the lower quartile or greater than the upper quartile, the notches will extend beyond the box, giving it a distinctive "flipped" appearance. This is expected behavior and consistent with other statistical visualization packages.

---

sym

[str, optional] The default symbol for flier points. An empty string ('') hides the fliers. If `None`, then the fliers default to 'b+'. More control is provided by the *flierprops* parameter.

vert

[bool, default: True] If `True`, draws vertical boxes. If `False`, draw horizontal boxes.

whis

[float or (float, float), default: 1.5] The position of the whiskers.

If a float, the lower whisker is at the lowest datum above `Q1 - whis*(Q3-Q1)`, and the upper whisker at the highest datum below `Q3 + whis*(Q3-Q1)`, where Q1 and Q3 are the first and third quartiles. The default value of `whis = 1.5` corresponds to Tukey's original definition of boxplots.

If a pair of floats, they indicate the percentiles at which to draw the whiskers (e.g., (5, 95)). In particular, setting this to (0, 100) results in whiskers covering the whole range of the data. "range" is a deprecated synonym for (0, 100).

In the edge case where `Q1 == Q3`, *whis* is automatically set to (0, 100) (cover the whole range of the data) if *autorange* is True.

Beyond the whiskers, data are considered outliers and are plotted as individual points.

bootstrap

[int, optional] Specifies whether to bootstrap the confidence intervals around the median for notched boxplots. If *bootstrap* is

None, no bootstrapping is performed, and notches are calculated using a Gaussian-based asymptotic approximation (see McGill, R., Tukey, J.W., and Larsen, W.A., 1978, and Kendall and Stuart, 1967). Otherwise, bootstrap specifies the number of times to bootstrap the median to determine its 95% confidence intervals. Values between 1000 and 10000 are recommended.

usermedians

[array-like, optional] A 1D array-like of length `len(x)`. Each entry that is not `None` forces the value of the median for the corresponding dataset. For entries that are `None`, the medians are computed by Matplotlib as normal.

conf_intervals

[array-like, optional] A 2D array-like of shape `(len(x), 2)`. Each entry that is not None forces the location of the corresponding notch (which is only drawn if *notch* is `True`). For entries that are `None`, the notches are computed by the method specified by the other parameters (e.g., *bootstrap*).

positions

[array-like, optional] Sets the positions of the boxes. The ticks and limits are automatically set to match the positions. Defaults to `range(1, N+1)` where N is the number of boxes to be drawn.

widths

[float or array-like] Sets the width of each box either with a scalar or a sequence. The default is 0.5, or `0.15*(distance between extreme positions)`, if that is smaller.

patch_artist

[bool, default: False] If `False` produces boxes with the Line2D artist. Otherwise, boxes and drawn with Patch artists.

labels

[sequence, optional] Labels for each dataset (one per dataset).

manage_ticks

[bool, default: True] If True, the tick locations and labels will be adjusted to match the boxplot positions.

autorange

[bool, default: False] When `True` and the data are distributed such that the 25th and 75th percentiles are equal, *whis* is set to (0, 100) such that the whisker ends are at the minimum and maximum of the data.

meanline

[bool, default: False] If `True` (and *showmeans* is `True`), will try to render the mean as a line spanning the full width of the box according to *meanprops* (see below). Not recommended if *shownotches* is also True. Otherwise, means will be shown as points.

zorder

[float, default: `Line2D.zorder = 2`] Sets the zorder of the boxplot.

Returns

dict

A dictionary mapping each component of the boxplot to a list of the *Line2D* instances created. That dictionary has the following keys (assuming vertical boxplots):

- `boxes`: the main body of the boxplot showing the quartiles and the median's confidence intervals if enabled.
- `medians`: horizontal lines at the median of each box.
- `whiskers`: the vertical lines extending to the most extreme, non-outlier data points.
- `caps`: the horizontal lines at the ends of the whiskers.
- `fliers`: points representing data that extend beyond the whiskers (fliers).
- `means`: points or lines representing the means.

Other Parameters

showcaps

[bool, default: True] Show the caps on the ends of whiskers.

showbox

[bool, default: True] Show the central box.

showfliers

[bool, default: True] Show the outliers beyond the caps.

showmeans

[bool, default: False] Show the arithmetic means.

capprops

[dict, default: None] The style of the caps.

boxprops

[dict, default: None] The style of the box.

whiskerprops

[dict, default: None] The style of the whiskers.

flierprops

[dict, default: None] The style of the fliers.

medianprops

[dict, default: None] The style of the median.

meanprops

[dict, default: None] The style of the mean.

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.boxplot`

- sphx_glr_gallery_statistics_boxplot_color.py
- sphx_glr_gallery_statistics_boxplot_demo.py
- sphx_glr_gallery_pyplots_boxplot_demo_pyplot.py

matplotlib.axes.Axes.violinplot

`Axes.violinplot`(*self*, *dataset*, *positions=None*, *vert=True*, *widths=0.5*, *showmeans=False*, *showextrema=True*, *showmedians=False*, *quantiles=None*, *points=100*, *bw_method=None*, ***, *data=None*)

Make a violin plot.

Make a violin plot for each column of *dataset* or each vector in sequence *dataset*. Each filled area extends to represent the entire data range, with optional lines at the mean, the median, the minimum, the maximum, and user-specified quantiles.

Parameters

dataset

[Array or a sequence of vectors.] The input data.

positions

[array-like, default: [1, 2, ..., n]] Sets the positions of the violins. The ticks and limits are automatically set to match the positions.

vert

[bool, default: True.] If true, creates a vertical violin plot. Otherwise, creates a horizontal violin plot.

widths

[array-like, default: 0.5] Either a scalar or a vector that sets the maximal width of each violin. The default is 0.5, which uses about half of the available horizontal space.

showmeans

[bool, default: False] If `True`, will toggle rendering of the means.

showextrema

[bool, default: True] If `True`, will toggle rendering of the extrema.

showmedians

[bool, default: False] If `True`, will toggle rendering of the medians.

quantiles

[array-like, default: None] If not None, set a list of floats in interval [0, 1] for each violin, which stands for the quantiles that will be rendered for that violin.

points

[int, default: 100] Defines the number of points to evaluate each of the gaussian kernel density estimations at.

bw_method

[str, scalar or callable, optional] The method used to calculate the estimator bandwidth. This can be 'scott', 'silverman', a scalar constant or a callable. If a scalar, this will be used directly as `kde.factor`. If a callable, it should take a `GaussianKDE` instance as its only parameter and return a scalar. If None (default), 'scott' is used.

Returns

dict

A dictionary mapping each component of the violinplot to a list of the corresponding collection instances created. The dictionary has the following keys:

- `bodies`: A list of the *PolyCollection* instances containing the filled area of each violin.
- `cmeans`: A *LineCollection* instance that marks the mean values of each of the violin's distribution.
- `cmins`: A *LineCollection* instance that marks the bottom of each violin's distribution.
- `cmaxes`: A *LineCollection* instance that marks the top of each violin's distribution.
- `cbars`: A *LineCollection* instance that marks the centers of each violin's distribution.
- `cmedians`: A *LineCollection* instance that marks the median values of each of the violin's distribution.
- `cquantiles`: A *LineCollection* instance created to identify the quantile values of each of the violin's distribution.

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *dataset*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.violinplot`

- sphx_glr_gallery_statistics_customized_violin.py

matplotlib.axes.Axes.violin

Axes.violin(*self*, *vpstats*, *positions=None*, *vert=True*, *widths=0.5*, *showmeans=False*, *showextrema=True*, *showmedians=False*)

Drawing function for violin plots.

Draw a violin plot for each column of *vpstats*. Each filled area extends to represent the entire data range, with optional lines at the mean, the median, the minimum, the maximum, and the quantiles values.

Parameters

vpstats

[list of dicts] A list of dictionaries containing stats for each violin plot. Required keys are:

- `coords`: A list of scalars containing the coordinates that the violin's kernel density estimate were evaluated at.
- `vals`: A list of scalars containing the values of the kernel density estimate at each of the coordinates given in *coords*.
- `mean`: The mean value for this violin's dataset.
- `median`: The median value for this violin's dataset.
- `min`: The minimum value for this violin's dataset.
- `max`: The maximum value for this violin's dataset.

Optional keys are:

- `quantiles`: A list of scalars containing the quantile values for this violin's dataset.

positions

[array-like, default: [1, 2, ..., n]] Sets the positions of the violins. The ticks and limits are automatically set to match the positions.

vert

[bool, default: True.] If true, plots the violins vertically. Otherwise, plots the violins horizontally.

widths

[array-like, default: 0.5] Either a scalar or a vector that sets the maximal width of each violin. The default is 0.5, which uses about half of the available horizontal space.

showmeans

[bool, default: False] If true, will toggle rendering of the means.

showextrema

[bool, default: True] If true, will toggle rendering of the extrema.

showmedians

[bool, default: False] If true, will toggle rendering of the medians.

Returns

dict

A dictionary mapping each component of the violinplot to a list of the corresponding collection instances created. The dictionary has the following keys:

- `bodies`: A list of the *PolyCollection* instances containing the filled area of each violin.
- `cmeans`: A *LineCollection* instance that marks the mean values of each of the violin's distribution.
- `cmins`: A *LineCollection* instance that marks the bottom of each violin's distribution.
- `cmaxes`: A *LineCollection* instance that marks the top of each violin's distribution.
- `cbars`: A *LineCollection* instance that marks the centers of each violin's distribution.
- `cmedians`: A *LineCollection* instance that marks the median values of each of the violin's distribution.
- `cquantiles`: A *LineCollection* instance created to identify the quantiles values of each of the violin's distribution.

Examples using `matplotlib.axes.Axes.violin`

matplotlib.axes.Axes.bxp

`Axes.bxp`(*self*, *bxpstats*, *positions=None*, *widths=None*, *vert=True*, *patch_artist=False*, *shownotches=False*, *showmeans=False*, *showcaps=True*, *showbox=True*, *showfliers=True*, *boxprops=None*, *whiskerprops=None*, *flierprops=None*, *medianprops=None*, *capprops=None*, *meanprops=None*, *meanline=False*, *manage_ticks=True*, *zorder=None*)

Drawing function for box and whisker plots.

Make a box and whisker plot for each column of *x* or each vector in sequence *x*. The box extends from the lower to upper quartile values of the data, with a line

at the median. The whiskers extend from the box to show the range of the data. Flier points are those past the end of the whiskers.

Parameters

bxpstats

[list of dicts] A list of dictionaries containing stats for each boxplot. Required keys are:

- `med`: The median (scalar float).
- `q1`: The first quartile (25th percentile) (scalar float).
- `q3`: The third quartile (75th percentile) (scalar float).
- `whislo`: Lower bound of the lower whisker (scalar float).
- `whishi`: Upper bound of the upper whisker (scalar float).

Optional keys are:

- `mean`: The mean (scalar float). Needed if `showmeans=True`.
- `fliers`: Data beyond the whiskers (sequence of floats). Needed if `showfliers=True`.
- `cilo` & `cihi`: Lower and upper confidence intervals about the median. Needed if `shownotches=True`.
- `label`: Name of the dataset (string). If available, this will be used a tick label for the boxplot

positions

[array-like, default: [1, 2, ..., n]] Sets the positions of the boxes. The ticks and limits are automatically set to match the positions.

widths

[array-like, default: None] Either a scalar or a vector and sets the width of each box. The default is `0.15*(distance between extreme positions)`, clipped to no less than 0.15 and no more than 0.5.

vert

[bool, default: True] If `True` (default), makes the boxes vertical. If `False`, makes horizontal boxes.

patch_artist

[bool, default: False] If `False` produces boxes with the *Line2D* artist. If `True` produces boxes with the *Patch* artist.

shownotches

[bool, default: False] If `False` (default), produces a rectangular box plot. If `True`, will produce a notched box plot

showmeans

[bool, default: False] If `True`, will toggle on the rendering of the means

showcaps

[bool, default: True] If `True`, will toggle on the rendering of the caps

showbox

[bool, default: True] If `True`, will toggle on the rendering of the box

showfliers

[bool, default: True] If `True`, will toggle on the rendering of the fliers

boxprops

[dict or None (default)] If provided, will set the plotting style of the boxes

whiskerprops

[dict or None (default)] If provided, will set the plotting style of the whiskers

capprops

[dict or None (default)] If provided, will set the plotting style of the caps

flierprops

[dict or None (default)] If provided will set the plotting style of the fliers

medianprops

[dict or None (default)] If provided, will set the plotting style of the medians

meanprops

[dict or None (default)] If provided, will set the plotting style of the means

meanline

[bool, default: False] If `True` (and *showmeans* is `True`), will try to render the mean as a line spanning the full width of the box according to *meanprops*. Not recommended if *shownotches* is also True. Otherwise, means will be shown as points.

manage_ticks

[bool, default: True] If True, the tick locations and labels will be adjusted to match the boxplot positions.

zorder

[float, default: `Line2D.zorder = 2`] The zorder of the resulting boxplot.

Returns

dict

A dictionary mapping each component of the boxplot to a list of the *Line2D* instances created. That dictionary has the following keys (assuming vertical boxplots):

- `boxes`: the main body of the boxplot showing the quartiles and the median's confidence intervals if enabled.
- `medians`: horizontal lines at the median of each box.
- `whiskers`: the vertical lines extending to the most extreme, non-outlier data points.
- `caps`: the horizontal lines at the ends of the whiskers.
- `fliers`: points representing data that extend beyond the whiskers (fliers).
- `means`: points or lines representing the means.

Examples

Examples using `matplotlib.axes.Axes.bxp`

Binned

Axes.hexbin	Make a 2D hexagonal binning plot of points x, y.
Axes.hist	Plot a histogram.
Axes.hist2d	Make a 2D histogram plot.

matplotlib.axes.Axes.hexbin

Axes.hexbin(*self*, *x*, *y*, *C=None*, *gridsize=100*, *bins=None*, *xscale='linear'*, *yscale='linear'*, *extent=None*, *cmap=None*, *norm=None*, *vmin=None*, *vmax=None*, *alpha=None*, *linewidths=None*, *edgecolors='face'*, *reduce_C_function=<function mean at 0x7f5439899310>*, *mincnt=None*, *marginals=False*, ***, *data=None*, ***kwargs*)

Make a 2D hexagonal binning plot of points *x*, *y*.

If *C* is *None*, the value of the hexagon is determined by the number of points in the hexagon. Otherwise, *C* specifies values at the coordinate (x[i], y[i]). For each hexagon, these values are reduced using *reduce_C_function*.

Parameters

x, y

[array-like] The data positions. *x* and *y* must be of the same length.

C

[array-like, optional] If given, these values are accumulated in the bins. Otherwise, every point has a value of 1. Must be of the same length as *x* and *y*.

gridsize

[int or (int, int), default: 100] If a single int, the number of hexagons in the *x*-direction. The number of hexagons in the *y*-direction is chosen such that the hexagons are approximately regular.

Alternatively, if a tuple (*nx*, *ny*), the number of hexagons in the *x*-direction and the *y*-direction.

bins

['log' or int or sequence, default: None] Discretization of the hexagon values.

- If *None*, no binning is applied; the color of each hexagon directly corresponds to its count value.
- If 'log', use a logarithmic scale for the color map. Internally, $log_{10}(i+1)$ is used to determine the hexagon color. This is equivalent to `norm=LogNorm()`.
- If an integer, divide the counts in the specified number of bins, and color the hexagons accordingly.
- If a sequence of values, the values of the lower bound of the bins to be used.

xscale

[{'linear', 'log'}, default: 'linear'] Use a linear or log10 scale on the horizontal axis.

yscale

[{'linear', 'log'}, default: 'linear'] Use a linear or log10 scale on the vertical axis.

mincnt

[int > 0, default: *None*] If not *None*, only display cells with more than *mincnt* number of points in the cell.

marginals

[bool, default: *False*] If marginals is *True*, plot the marginal density as colormapped rectangles along the bottom of the x-axis and left of the y-axis.

extent

[float, default: *None*] The limits of the bins. The default assigns the limits based on *gridsize*, *x*, *y*, *xscale* and *yscale*.

If *xscale* or *yscale* is set to 'log', the limits are expected to be the exponent for a power of 10. E.g. for x-limits of 1 and 50 in 'linear' scale and y-limits of 10 and 1000 in 'log' scale, enter (1, 50, 1, 3).

Order of scalars is (left, right, bottom, top).

Returns

PolyCollection

A *PolyCollection* defining the hexagonal bins.

- *PolyCollection.get_offsets* contains a Mx2 array containing the x, y positions of the M hexagon centers.
- *PolyCollection.get_array* contains the values of the M hexagons.

If *marginals* is *True*, horizontal bar and vertical bar (both PolyCollections) will be attached to the return collection as attributes *hbar* and *vbar*.

Other Parameters

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] The Colormap instance or registered colormap name used to map the bin values to colors.

norm

[*Normalize*, optional] The Normalize instance scales the bin values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

vmin, vmax

[float, default: None] The colorbar range. If *None*, suitable min/max values are automatically chosen by the *Normalize* instance (defaults to the respective min/max values of the bins in case of the default linear scaling). It is deprecated to use *vmin*/*vmax* when *norm* is given.

alpha

[float between 0 and 1, optional] The alpha blending value, between 0 (transparent) and 1 (opaque).

linewidths

[float, default: *None*] If *None*, defaults to 1.0.

edgecolors

[{'face', 'none', *None*} or color, default: 'face'] The color of the hexagon edges. Possible values are:

- 'face': Draw the edges in the same color as the fill color.
- 'none': No edges are drawn. This can sometimes lead to unsightly unpainted pixels between the hexagons.
- *None*: Draw outlines in the default color.
- An explicit color.

reduce_C_function

[callable, default: `numpy.mean`] The function to aggregate *C* within the bins. It is ignored if *C* is not given. This must have the signature:

```
def reduce_C_function(C: array) -> float
```

Commonly used functions are:

- `numpy.mean`: average of the points
- `numpy.sum`: integral of the point values
- `numpy.max`: value taken from the largest point

****kwargs**

[*PolyCollection* properties] All other keyword arguments are passed on to *PolyCollection*:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	ndarray
capstyle	{'butt', 'round', 'projecting'}
clim	(vmin: float, vmax: float)
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of rgba tuples
contains	unknown
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
norm	*Normalize* or None
offset_position	unknown
offsets	array-like (N, 2) or (2,)
path_effects	*AbstractPathEffect*
picker	None or bool or callable
pickradius	unknown
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.hexbin`

- sphx_glr_gallery_statistics_hexbin_demo.py

matplotlib.axes.Axes.hist

`Axes.hist`(*self*, *x*, *bins=None*, *range=None*, *density=False*, *weights=None*, *cumulative=False*, *bottom=None*, *histtype='bar'*, *align='mid'*, *orientation='vertical'*, *rwidth=None*, *log=False*, *color=None*, *label=None*, *stacked=False*, *, *data=None*, **kwargs*)

Plot a histogram.

Compute and draw the histogram of *x*. The return value is a tuple (*n*, *bins*, *patches*) or ([*n0*, *n1*, ...], *bins*, [*patches0*, *patches1*, ...]) if the input contains multiple data. See the documentation of the *weights* parameter to draw a histogram of already-binned data.

Multiple data can be provided via *x* as a list of datasets of potentially different length ([*x0*, *x1*, ...]), or as a 2-D ndarray in which each column is a dataset. Note that the ndarray form is transposed relative to the list form.

Masked arrays are not supported.

The *bins*, *range*, *weights*, and *density* parameters behave as in `numpy.histogram`.

Parameters

x

[(n,) array or sequence of (n,) arrays] Input values, this takes either a single array or a sequence of arrays which are not required to be of the same length.

bins

[int or sequence or str, default: `rcParams["hist.bins"]` (default: `10`)] If *bins* is an integer, it defines the number of equal-width bins in the range.

If *bins* is a sequence, it defines the bin edges, including the left edge of the first bin and the right edge of the last bin; in this case, bins may be unequally spaced. All but the last (righthand-most) bin is half-open. In other words, if *bins* is:

```
[1, 2, 3, 4]
```

then the first bin is `[1, 2)` (including 1, but excluding 2) and the second `[2, 3)`. The last bin, however, is `[3, 4]`, which *includes* 4.

If *bins* is a string, it is one of the binning strategies supported by `numpy.histogram_bin_edges`: 'auto', 'fd', 'doane', 'scott', 'stone', 'rice', 'sturges', or 'sqrt'.

range

[tuple or None, default: None] The lower and upper range of the bins. Lower and upper outliers are ignored. If not provided, *range* is `(x.min(), x.max())`. Range has no effect if *bins* is a sequence.

If *bins* is a sequence or *range* is specified, autoscaling is based on the specified bin range instead of the range of x.

density

[bool, default: False] If `True`, draw and return a probability density: each bin will display the bin's raw count divided by the total number of counts *and the bin width* (`density = counts / (sum(counts) * np.diff(bins))`), so that the area under the histogram integrates to 1 (`np.sum(density * np.diff(bins)) == 1`).

If *stacked* is also `True`, the sum of the histograms is normalized to 1.

weights

[(n,) array-like or None, default: None] An array of weights, of the same shape as *x*. Each value in *x* only contributes its associated weight towards the bin count (instead of 1). If *density* is `True`, the weights are normalized, so that the integral of the density over the range remains 1.

This parameter can be used to draw a histogram of data that has already been binned, e.g. using `numpy.histogram` (by treating each bin as a single point with a weight equal to its count)

```
counts, bins = np.histogram(data)
plt.hist(bins[:-1], bins, weights=counts)
```

(or you may alternatively use *bar()*).

cumulative

[bool or -1, default: False] If `True`, then a histogram is computed where each bin gives the counts in that bin plus all bins for smaller values. The last bin gives the total number of datapoints.

If *density* is also `True` then the histogram is normalized such that the last bin equals 1.

If *cumulative* is a number less than 0 (e.g., -1), the direction of accumulation is reversed. In this case, if *density* is also `True`, then the histogram is normalized such that the first bin equals 1.

bottom

[array-like, scalar, or None, default: None] Location of the bottom of each bin, ie. bins are drawn from `bottom` to `bottom + hist(x, bins)` If a scalar, the bottom of each bin is shifted by the same amount. If an array, each bin is shifted independently and the length of bottom must match the number of bins. If None, defaults to 0.

histtype

[{'bar', 'barstacked', 'step', 'stepfilled'}, default: 'bar'] The type of histogram to draw.

- 'bar' is a traditional bar-type histogram. If multiple data are given the bars are arranged side by side.
- 'barstacked' is a bar-type histogram where multiple data are stacked on top of each other.
- 'step' generates a lineplot that is by default unfilled.
- 'stepfilled' generates a lineplot that is by default filled.

align

[{'left', 'mid', 'right'}, default: 'mid'] The horizontal alignment of the histogram bars.

- 'left': bars are centered on the left bin edges.
- 'mid': bars are centered between the bin edges.
- 'right': bars are centered on the right bin edges.

orientation

[{'vertical', 'horizontal'}, default: 'vertical'] If 'horizontal', *barh* will be used for bar-type histograms and the *bottom* kwarg will be the left edges.

rwidth

[float or None, default: None] The relative width of the bars as a fraction of the bin width. If `None`, automatically compute the width.

Ignored if *histtype* is 'step' or 'stepfilled'.

log

[bool, default: False] If `True`, the histogram axis will be set to a log scale. If *log* is `True` and *x* is a 1D array, empty bins will be filtered out and only the non-empty `(n, bins, patches)` will be returned.

color

[color or array-like of colors or None, default: None] Color or sequence of colors, one per dataset. Default (`None`) uses the standard line color sequence.

label

[str or None, default: None] String, or sequence of strings to match multiple datasets. Bar charts yield multiple patches per dataset, but only the first gets the label, so that *legend* will work as expected.

stacked

[bool, default: False] If `True`, multiple data are stacked on top of each other If `False` multiple data are arranged side by side if histtype is 'bar' or on top of each other if histtype is 'step'

Returns

n

[array or list of arrays] The values of the histogram bins. See *density* and *weights* for a description of the possible semantics. If input *x* is an array, then this is an array of length *nbins*. If input is a sequence of arrays `[data1, data2, ...]`, then this is a list of arrays with the values of the histograms for each of the arrays in the same order. The dtype of the array *n* (or of its element arrays) will always be float even if no weighting or normalization is used.

bins

[array] The edges of the bins. Length nbins + 1 (nbins left edges and right edge of last bin). Always a single array even when multiple data sets are passed in.

patches

[*BarContainer* or list of a single *Polygon* or list of such objects] Container of individual artists used to create the histogram or list of such containers if there are multiple input datasets.

Other Parameters

****kwargs**

Patch properties

See also:

hist2d

2D histograms

Notes

For large numbers of bins (>1000), 'step' and 'stepfilled' can be significantly faster than 'bar' and 'barstacked'.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *weights*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

matplotlib.axes.Axes.hist2d

`Axes.hist2d`(*self*, *x*, *y*, *bins=10*, *range=None*, *density=False*, *weights=None*, *cmin=None*, *cmax=None*, *, *data=None*, **kwargs*)

Make a 2D histogram plot.

Parameters

x, y

[array-like, shape (n,)] Input values

bins

[None or int or [int, int] or array-like or [array, array]] The bin specification:

- If int, the number of bins for the two dimensions (nx=ny=bins).
- If `[int, int]`, the number of bins in each dimension (nx, ny = bins).
- If array-like, the bin edges for the two dimensions (x_edges=y_edges=bins).
- If `[array, array]`, the bin edges in each dimension (x_edges, y_edges = bins).

The default value is 10.

range

[array-like shape(2, 2), optional] The leftmost and rightmost edges of the bins along each dimension (if not specified explicitly in the bins parameters): `[[xmin, xmax], [ymin, ymax]]`. All values outside of this range will be considered outliers and not tallied in the histogram.

density

[bool, default: False] Normalize histogram. See the documentation for the *density* parameter of *hist* for more details.

weights

[array-like, shape (n,), optional] An array of values w_i weighing each sample (x_i, y_i).

cmin, cmax

[float, default: None] All bins that has count less than *cmin* or more than *cmax* will not be displayed (set to NaN before passing to imshow) and these count values in the return value count histogram will also be set to nan upon return.

Returns

h

[2D array] The bi-dimensional histogram of samples x and y. Values in x are histogrammed along the first dimension and values in y are histogrammed along the second dimension.

xedges

[1D array] The bin edges along the x axis.

yedges

[1D array] The bin edges along the y axis.

image

[*QuadMesh*]

Other Parameters

cmap

[Colormap or str, optional] A *colors.Colormap* instance. If not set, use rc settings.

norm

[Normalize, optional] A *colors.Normalize* instance is used to scale luminance data to `[0, 1]`. If not set, defaults to *colors.Normalize()*.

vmin/vmax

[None or scalar, optional] Arguments passed to the *Normalize* instance.

alpha

[`0 <= scalar <= 1` or `None`, optional] The alpha blending value.

****kwargs**

Additional parameters are passed along to the *pcolormesh* method and *QuadMesh* constructor.

See also:

hist

1D histogram plotting

Notes

- Currently `hist2d` calculates its own axis limits, and any limits previously set are ignored.
- Rendering the histogram with a logarithmic color scale is accomplished by passing a *colors.LogNorm* instance to the *norm* keyword argument. Likewise, power-law normalization (similar in effect to gamma correction) can be accomplished with *colors.PowerNorm*.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*, *weights*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.hist2d`

- sphx_glr_gallery_statistics_hist.py
- sphx_glr_gallery_scales_power_norm.py

Contours

Axes.clabel	Label a contour plot.
Axes.contour	Plot contours.
Axes.contourf	Plot contours.

matplotlib.axes.Axes.clabel

Axes.clabel(*self*, *CS*, *levels=None*, ***kwargs*)

Label a contour plot.

Adds labels to line contours in given *ContourSet*.

Parameters

CS

[*ContourSet* instance] Line contours to label.

levels

[array-like, optional] A list of level values, that should be labeled. The list must be a subset of `CS.levels`. If not given, all levels are labeled.

****kwargs**

All other parameters are documented in *clabel*.

Examples using matplotlib.axes.Axes.clabel

- sphx_glr_gallery_images_contours_and_fields_contour_demo.py
- sphx_glr_gallery_images_contours_and_fields_contour_label_demo.py
- sphx_glr_gallery_images_contours_and_fields_contourf_demo.py
- sphx_glr_gallery_misc_patheffect_demo.py
- sphx_glr_gallery_mplot3d_contour3d.py
- sphx_glr_gallery_mplot3d_contour3d_2.py
- sphx_glr_gallery_mplot3d_contourf3d.py

matplotlib.axes.Axes.contour

Axes.contour(*self*, **args*, *data=None*, ***kwargs*)

Plot contours.

Call signature:

```
contour([X, Y,] Z, [levels], **kwargs)
```

contour and *contourf* draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

Parameters

X, Y

[array-like, optional] The coordinates of the values in *Z*.

X and *Y* must both be 2-D with the same shape as *Z* (e.g. created via `numpy.meshgrid`), or they must both be 1-D such that `len(X) == M` is the number of columns in *Z* and `len(Y) == N` is the number of rows in *Z*.

If not given, they are assumed to be integer indices, i.e. `X = range(M)`, `Y = range(N)`.

Z

[array-like(N, M)] The height values over which the contour is drawn.

levels

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use *MaxNLocator*, which tries to automatically choose no more than *n+1* "nice" contour levels between *vmin* and *vmax*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns

QuadContourSet

Other Parameters

corner_mask

[bool, default: `rcParams["contour.corner_mask"]` (default: `True`)] Enable/disable corner masking, which only has an effect if *Z* is a masked array. If `False`, any quad touching a masked point is masked out. If `True`, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.

colors

[color string or sequence of colors, optional] The colors of the levels, i.e. the lines for *contour* and the areas for *contourf*.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. `'red'` instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value *None*), the colormap specified by *cmap* will be used.

alpha

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] A *Colormap* instance or registered colormap name. The colormap maps the level values to colors.

If both *colors* and *cmap* are given, an error is raised.

norm

[*Normalize*, optional] If a colormap is used, the *Normalize* instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

vmin, vmax

[float, optional] If not *None*, either or both of these values will be supplied to the *Normalize* instance, overriding the default color scaling based on *levels*.

origin

[{*None*, 'upper', 'lower', 'image'}, default: None] Determines the orientation and exact position of *Z* by specifying the position of `Z[0, 0]`. This is only relevant, if *X*, *Y* are not given.

- *None*: `Z[0, 0]` is at X=0, Y=0 in the lower left corner.
- 'lower': `Z[0, 0]` is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': `Z[0, 0]` is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from `rcParams["image.origin"]` (default: `'upper'`).

extent

[(x0, x1, y0, y1), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of Z[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of Z[0, 0], and (*x1*, *y1*) is the position of Z[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to contour.

locator

[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `contourf`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

Note: An existing *QuadContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call `QuadContourSet.changed()` is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *QuadContourSet* because it internally calls `QuadContourSet.changed()`.

Example:

```
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
    colors=['#808080', '#A0A0A0', '#C0C0C0'], extend='both')
cs.cmap.set_over('red')
cs.cmap.set_under('blue')
cs.changed()
```

xunits, yunits

[registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

antialiased

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *True*. For line contours, it is taken from `rcParams["lines.antialiased"]` (default: `True`).

nchunk

[int >= 0, optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of *nchunk* by *nchunk* quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the *antialiased* flag and value of *alpha*.

linewidths

[float or array-like, default: `rcParams["contour.linewidth"]` (default: `None`)] *Only applies to* *`contour`*.

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to `rcParams["lines.linewidth"]` (default: `1.5`).

linestyles

[{*None*, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] *Only applies to* *`contour`*.

If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from `rcParams["contour.negative_linestyle"]` (default: `'dashed'`) setting.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

hatches

[List[str], optional] *Only applies to* *`contourf`*.

A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Notes

1. *contourf* differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to *contour*.
2. *contourf* fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

```
z1 < Z <= z2
```

   except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

matplotlib.axes.Axes.contourf

Axes.**contourf**(*self*, **args*, *data=None*, ***kwargs*)

Plot contours.

Call signature:

```
contour([X, Y,] Z, [levels], **kwargs)
```

contour and *contourf* draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

Parameters

X, Y

[array-like, optional] The coordinates of the values in *Z*.

X and *Y* must both be 2-D with the same shape as *Z* (e.g. created via `numpy.meshgrid`), or they must both be 1-D such that `len(X) == M` is the number of columns in *Z* and `len(Y) == N` is the number of rows in *Z*.

If not given, they are assumed to be integer indices, i.e. `X = range(M), Y = range(N)`.

Z

[array-like(N, M)] The height values over which the contour is drawn.

levels

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use *MaxNLocator*, which tries to automatically choose no more than *n+1* "nice" contour levels between *vmin* and *vmax*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns

QuadContourSet

Other Parameters

corner_mask

[bool, default: `rcParams["contour.corner_mask"]` (default: `True`)] Enable/disable corner masking, which only has an effect if *Z* is a masked array. If `False`, any quad touching a masked point is masked out. If `True`, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.

colors

[color string or sequence of colors, optional] The colors of the levels, i.e. the lines for *contour* and the areas for *contourf*.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. `'red'` instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value *None*), the colormap specified by *cmap* will be used.

alpha

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] A *Colormap* instance or registered colormap name. The colormap maps the level values to colors.

If both *colors* and *cmap* are given, an error is raised.

norm

[*Normalize*, optional] If a colormap is used, the *Normalize* instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

vmin, vmax

[float, optional] If not *None*, either or both of these values will be supplied to the *Normalize* instance, overriding the default color scaling based on *levels*.

origin

[{*None*, 'upper', 'lower', 'image'}, default: None] Determines the orientation and exact position of *Z* by specifying the position of `Z[0, 0]`. This is only relevant, if *X*, *Y* are not given.

- *None*: `Z[0, 0]` is at X=0, Y=0 in the lower left corner.
- 'lower': `Z[0, 0]` is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': `Z[0, 0]` is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from `rcParams["image.origin"]` (default: `'upper'`).

extent

[(x0, x1, y0, y1), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of Z[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of Z[0, 0], and (*x1*, *y1*) is the position of Z[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to contour.

locator

[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `contourf`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

Note: An existing *QuadContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call `QuadContourSet.changed()` is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *QuadContourSet* because it internally calls `QuadContourSet.changed()`.

Example:

```
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
    colors=['#808080', '#A0A0A0', '#C0C0C0'], extend='both')
cs.cmap.set_over('red')
cs.cmap.set_under('blue')
cs.changed()
```

xunits, yunits

[registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

antialiased

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *True*. For line contours, it is taken from `rcParams["lines.antialiased"]` (default: `True`).

nchunk

[int >= 0, optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of *nchunk* by *nchunk* quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the *antialiased* flag and value of *alpha*.

linewidths

[float or array-like, default: `rcParams["contour.linewidth"]` (default: `None`)] *Only applies to* *`contour`*.

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to `rcParams["lines.linewidth"]` (default: `1.5`).

linestyles

[{*None*, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] *Only applies to* *`contour`*.

If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from `rcParams["contour.negative_linestyle"]` (default: `'dashed'`) setting.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

hatches

[List[str], optional] *Only applies to* *`contourf`*.

A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Notes

1. *contourf* differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to *contour*.
2. *contourf* fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

```
z1 < Z <= z2
```

   except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

Array

Axes.imshow	Display data as an image, i.e., on a 2D regular raster.
Axes.matshow	Plot the values of a 2D matrix or array as color-coded image.
Axes.pcolor	Create a pseudocolor plot with a non-regular rectangular grid.
Axes.pcolorfast	Create a pseudocolor plot with a non-regular rectangular grid.
Axes.pcolormesh	Create a pseudocolor plot with a non-regular rectangular grid.
Axes.spy	Plot the sparsity pattern of a 2D array.

matplotlib.axes.Axes.imshow

Axes.**imshow**(*self*, *X*, *cmap=None*, *norm=None*, *aspect=None*, *interpolation=None*, *alpha=None*, *vmin=None*, *vmax=None*, *origin=None*, *extent=None*, ***, *filternorm=True*, *filterrad=4.0*, *resample=None*, *url=None*, *data=None*, ***kwargs*)

Display data as an image, i.e., on a 2D regular raster.

The input may either be actual RGB(A) data, or 2D scalar data, which will be rendered as a pseudocolor image. For displaying a grayscale image set up the color mapping using the parameters `cmap='gray', vmin=0, vmax=255`.

The number of pixels used to render an image is set by the axes size and the *dpi* of the figure. This can lead to aliasing artifacts when the image is resampled because the displayed image size will usually not match the size of *X* (see /gallery/images_contours_and_fields/image_antialiasing). The resampling can be controlled via the *interpolation* parameter and/or `rcParams["image.interpolation"]` (default: `'antialiased'`).

Parameters

X

[array-like or PIL image] The image data. Supported array shapes are:

- (M, N): an image with scalar data. The values are mapped to colors using normalization and a colormap. See parameters *norm*, *cmap*, *vmin*, *vmax*.
- (M, N, 3): an image with RGB values (0-1 float or 0-255 int).
- (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

The first two dimensions (M, N) define the rows and columns of the image.

Out-of-range RGB(A) values are clipped.

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors. This parameter is ignored for RGB(A) data.

norm

[*Normalize*, optional] The *Normalize* instance used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling mapping the lowest value to 0 and the highest to 1 is used. This parameter is ignored for RGB(A) data.

aspect

[{'equal', 'auto'} or float, default: `rcParams["image.aspect"]` (default: `'equal'`)] The aspect ratio of the axes. This parameter is particularly relevant for images since it determines whether data pixels are square.

This parameter is a shortcut for explicitly calling *Axes.set_aspect*. See there for further details.

- 'equal': Ensures an aspect ratio of 1. Pixels will be square (unless pixel sizes are explicitly made non-square in data coordinates using *extent*).
- 'auto': The axes is kept fixed and the aspect is adjusted so that the data fit in the axes. In general, this will result in non-square pixels.

interpolation

[str, default: `rcParams["image.interpolation"]` (default: `'antialiased'`)] The interpolation method used.

Supported values are 'none', 'antialiased', 'nearest', 'bilinear', 'bicubic', 'spline16', 'spline36', 'hanning', 'hamming', 'hermite', 'kaiser', 'quadric', 'catrom', 'gaussian', 'bessel', 'mitchell', 'sinc', 'lanczos'.

If *interpolation* is 'none', then no interpolation is performed on the Agg, ps, pdf and svg backends. Other backends will fall back to 'nearest'. Note that most SVG renderers perform interpolation at rendering and that the default interpolation method they implement may differ.

If *interpolation* is the default 'antialiased', then 'nearest' interpolation is used if the image is upsampled by more than a factor of three (i.e. the number of display pixels is at least three times the size of the data array). If the upsampling rate is smaller than 3, or the image is downsampled, then 'hanning' interpolation is used to act as an anti-aliasing filter, unless the image happens to be upsampled by exactly a factor of two or one.

See /gallery/images_contours_and_fields/interpolation_methods for an overview of the supported interpolation methods, and /gallery/images_contours_and_fields/image_antialiasing for a discussion of image antialiasing.

Some interpolation methods require an additional radius parameter, which can be set by *filterrad*. Additionally, the antigrain image resize filter is controlled by the parameter *filternorm*.

alpha

[float or array-like, optional] The alpha blending value, between 0 (transparent) and 1 (opaque). If *alpha* is an array, the alpha blending values are applied pixel by pixel, and *alpha* must have the same shape as *X*.

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is deprecated to use *vmin*/*vmax* when *norm* is given.

origin

[{'upper', 'lower'}, default: `rcParams["image.origin"]` (default: `'upper'`)] Place the [0, 0] index of the array in the upper left or lower left corner of the axes. The convention (the default) 'upper' is typically used for matrices and images.

Note that the vertical axes points upward for 'lower' but downward for 'upper'.

See the *origin and extent in imshow* tutorial for examples and a more detailed description.

extent

[floats (left, right, bottom, top), optional] The bounding box in data coordinates that the image will fill. The image is stretched individually along x and y to fill the box.

The default extent is determined by the following conditions. Pixels have unit size in data coordinates. Their centers are on integer coordinates, and their center coordinates range from 0 to columns-1 horizontally and from 0 to rows-1 vertically.

Note that the direction of the vertical axis and thus the default values for top and bottom depend on *origin*:

- For `origin == 'upper'` the default is `(-0.5, numcols-0.5, numrows-0.5, -0.5)`.
- For `origin == 'lower'` the default is `(-0.5, numcols-0.5, -0.5, numrows-0.5)`.

See the *origin and extent in imshow* tutorial for examples and a more detailed description.

filternorm

[bool, default: True] A parameter for the antigrain image resize filter (see the antigrain documentation). If *filternorm* is set, the filter normalizes integer values and corrects the rounding errors. It doesn't do anything with the source floating point values, it

corrects only integers according to the rule of 1.0 which means that any sum of pixel weights must be equal to 1.0. So, the filter function must produce a graph of the proper shape.

filterrad

[float > 0, default: 4.0] The filter radius for filters that have a radius parameter, i.e. when interpolation is one of: 'sinc', 'lanczos' or 'blackman'.

resample

[bool, default: `rcParams["image.resample"]` (default: `True`)] When *True*, use a full resampling method. When *False*, only resample when the output image is larger than the input image.

url

[str, optional] Set the url of the created *AxesImage*. See *Artist.set_url*.

Returns

AxesImage

Other Parameters

****kwargs**

[*Artist* properties] These parameters are passed on to the constructor of the *AxesImage* artist.

See also:

matshow

Plot a matrix or an array as an image.

Notes

Unless *extent* is used, pixel centers will be located at integer coordinates. In other words: the origin will coincide with the center of pixel (0, 0).

There are two common representations for RGB images with an alpha channel:

- Straight (unassociated) alpha: R, G, and B channels represent the color of the pixel, disregarding its opacity.
- Premultiplied (associated) alpha: R, G, and B channels represent the color of the pixel, adjusted for its opacity by multiplication.

imshow expects RGB images adopting the straight (unassociated) alpha representation.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

matplotlib.axes.Axes.matshow

Axes.matshow(*self*, *Z*, ***kwargs*)

Plot the values of a 2D matrix or array as color-coded image.

The matrix will be shown the way it would be printed, with the first row at the top. Row and column numbering is zero-based.

Parameters

Z

[array-like(M, N)] The matrix to be displayed.

Returns

AxesImage

Other Parameters

****kwargs**

[*imshow* arguments]

See also:

imshow

More general function to plot data on a 2D regular raster.

Notes

This is just a convenience function wrapping *imshow* to set useful defaults for displaying a matrix. In particular:

- Set `origin='upper'`.
- Set `interpolation='nearest'`.
- Set `aspect='equal'`.
- Ticks are placed to the left and above.
- Ticks are formatted to show integer indices.

Examples using `matplotlib.axes.Axes.matshow`

- sphx_glr_gallery_images_contours_and_fields_matshow.py

matplotlib.axes.Axes.pcolor

`Axes.pcolor`(*self*, **args*, *shading=None*, *alpha=None*, *norm=None*, *cmap=None*, *vmin=None*, *vmax=None*, *data=None*, ***kwargs*)

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```
pcolor([X, Y,] C, **kwargs)
```

X and *Y* can be used to specify the corners of the quadrilaterals.

Hint: `pcolor()` can be very slow for large arrays. In most cases you should use the similar but much faster *`pcolormesh`* instead. See *Differences between pcolor() and pcolormesh()* for a discussion of the differences.

Parameters

C

[array-like] A scalar 2-D array. The values will be color-mapped.

X, Y

[array-like, optional] The coordinates of the corners of quadrilaterals of a pcolormesh:

```
(X[i+1, j], Y[i+1, j])       (X[i+1, j+1], Y[i+1, j+1])
                      +-----+
                      |     |
                      +-----+
   (X[i, j], Y[i, j])       (X[i, j+1], Y[i, j+1])
```

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the *Notes* section below.

If `shading='flat'` the dimensions of *X* and *Y* should be one greater than those of *C*, and the quadrilateral is colored due to the value at `C[i, j]`. If *X*, *Y* and *C* have equal dimensions, a warning will be raised and the last row and column of *C* will be ignored.

If `shading='nearest'`, the dimensions of *X* and *Y* should be the same as those of *C* (if not, a ValueError will be raised). The color `C[i, j]` will be centered on `(X[i, j], Y[i, j])`.

If *X* and/or *Y* are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2-D arrays, making a rectangular grid.

shading

[{'flat', 'nearest', 'auto'}, optional] The fill style for the quadrilateral; defaults to 'flat' or `rcParams["pcolor.shading"]` (default: `'flat'`). Possible values:

- 'flat': A solid color is used for each quad. The color of the quad (i, j), (i+1, j), (i, j+1), (i+1, j+1) is given by `C[i, j]`. The dimensions of *X* and *Y* should be one greater than those of *C*; if they are the same as *C*, then a deprecation warning is raised, and the last row and column of *C* are dropped.
- 'nearest': Each grid point will have a color centered on it, extending halfway between the adjacent grid centers. The dimensions of *X* and *Y* must be the same as *C*.
- 'auto': Choose 'flat' if dimensions of *X* and *Y* are one larger than *C*. Choose 'nearest' if dimensions are the same.

See /gallery/images_contours_and_fields/pcolormesh_grids for more description.

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] A Colormap instance or registered colormap name. The colormap maps the *C* values to colors.

norm

[*Normalize*, optional] The Normalize instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

vmin, vmax

[float, default: None] The colorbar range. If *None*, suitable min/max values are automatically chosen by the *Normalize* instance (defaults to the respective min/max values of *C* in case of the default linear scaling). It is deprecated to use *vmin*/*vmax* when *norm* is given.

edgecolors

[{'none', None, 'face', color, color sequence}, optional] The color of the edges. Defaults to 'none'. Possible values:

- 'none' or '': No edge.

- *None*: `rcParams["patch.edgecolor"]` (default: `'black'`) will be used. Note that currently `rcParams["patch.force_edgecolor"]` (default: `False`) has to be True for this to work.
- 'face': Use the adjacent face color.
- A color or sequence of colors will set the edge color.

The singular form *edgecolor* works as an alias.

alpha

[float, default: None] The alpha blending value of the face color, between 0 (transparent) and 1 (opaque). Note: The edgecolor is currently not affected by this.

snap

[bool, default: False] Whether to snap the mesh to pixel boundaries.

Returns

matplotlib.collections.Collection

Other Parameters

antialiaseds

[bool, default: False] The default *antialiaseds* is False if the default *edgecolors*="none" is used. This eliminates artificial lines at patch boundaries, and works regardless of the value of alpha. If *edgecolors* is not "none", then the default *antialiaseds* is taken from `rcParams["patch.antialiased"]` (default: `True`). Stroking the edges may be preferred if *alpha* is 1, but will cause artifacts otherwise.

****kwargs**

Additionally, the following arguments are allowed. They are passed along to the *PolyCollection* constructor:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	ndarray
capstyle	{'butt', 'round', 'projecting'}
clim	(vmin: float, vmax: float)
clip_box	*Bbox*

Table 84 – continued from previous page

Property	Description
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of rgba tuples
contains	unknown
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
norm	*Normalize* or None
offset_position	unknown
offsets	array-like (N, 2) or (2,)
path_effects	*AbstractPathEffect*
picker	None or bool or callable
pickradius	unknown
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

See also:

pcolormesh

for an explanation of the differences between pcolor and pcolormesh.

imshow

If X and Y are each equidistant, *imshow* can be a faster alternative.

Notes

Masked arrays

X, *Y* and *C* may be masked arrays. If either `C[i, j]`, or one of the vertices surrounding `C[i, j]` (*X* or *Y* at `[i, j]`, `[i+1, j]`, `[i, j+1]`, `[i+1, j+1]`) is masked, nothing is plotted.

Grid orientation

The grid orientation follows the standard matrix convention: An array *C* with shape (nrows, ncolumns) is plotted with the column number as *X* and the row number as *Y*.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.pcolor`

- sphx_glr_gallery_images_contours_and_fields_pcolor_demo.py
- sphx_glr_gallery_subplots_axes_and_figures_axes_margins.py

matplotlib.axes.Axes.pcolorfast

`Axes.pcolorfast`(*self*, **args*, *alpha=None*, *norm=None*, *cmap=None*, *vmin=None*, *vmax=None*, *data=None*, ***kwargs*)

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```
ax.pcolorfast([X, Y], C, /, **kwargs)
```

This method is similar to *pcolor* and *pcolormesh*. It's designed to provide the fastest pcolor-type plotting with the Agg backend. To achieve this, it uses different algorithms internally depending on the complexity of the input grid (regular rectangular, non-regular rectangular or arbitrary quadrilateral).

Warning: This method is experimental. Compared to *pcolor* or *pcolormesh* it has some limitations:

- It supports only flat shading (no outlines)
- It lacks support for log scaling of the axes.
- It does not have a have a pyplot wrapper.

Parameters

C

[array-like(M, N)] The image data. Supported array shapes are:

- (M, N): an image with scalar data. The data is visualized using a colormap.
- (M, N, 3): an image with RGB values (0-1 float or 0-255 int).
- (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

The first two dimensions (M, N) define the rows and columns of the image.

This parameter can only be passed positionally.

X, Y

[tuple or array-like, default: `(0, N), (0, M)`] *X* and *Y* are used to specify the coordinates of the quadrilaterals. There are different ways to do this:

- Use tuples `X=(xmin, xmax)` and `Y=(ymin, ymax)` to define a *uniform rectangular grid*.

  The tuples define the outer edges of the grid. All individual quadrilaterals will be of the same size. This is the fastest version.

- Use 1D arrays *X*, *Y* to specify a *non-uniform rectangular grid*.

  In this case *X* and *Y* have to be monotonic 1D arrays of length *N+1* and *M+1*, specifying the x and y boundaries of the cells.

  The speed is intermediate. Note: The grid is checked, and if found to be uniform the fast version is used.

- Use 2D arrays *X*, *Y* if you need an *arbitrary quadrilateral grid* (i.e. if the quadrilaterals are not rectangular).

  In this case *X* and *Y* are 2D arrays with shape (M + 1, N + 1), specifying the x and y coordinates of the corners of the colored quadrilaterals.

This is the most general, but the slowest to render. It may produce faster and more compact output using ps, pdf, and svg backends, however.

These arguments can only be passed positionally.

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] A Colormap instance or registered colormap name. The colormap maps the *C* values to colors.

norm

[*Normalize*, optional] The Normalize instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

vmin, vmax

[float, default: None] The colorbar range. If *None*, suitable min/max values are automatically chosen by the *Normalize* instance (defaults to the respective min/max values of *C* in case of the default linear scaling). It is deprecated to use *vmin*/*vmax* when *norm* is given.

alpha

[float, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

snap

[bool, default: False] Whether to snap the mesh to pixel boundaries.

Returns

AxesImage **or** *PcolorImage* **or** *QuadMesh*

The return type depends on the type of grid:

- *AxesImage* for a regular rectangular grid.
- *PcolorImage* for a non-regular rectangular grid.
- *QuadMesh* for a non-rectangular grid.

Other Parameters

****kwargs**

Supported additional parameters depend on the type of grid. See return types of *image* for further description.

Notes

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.pcolorfast`

- sphx_glr_gallery_images_contours_and_fields_pcolor_demo.py

matplotlib.axes.Axes.pcolormesh

Axes.**pcolormesh**(*self*, **args*, *alpha=None*, *norm=None*, *cmap=None*, *vmin=None*, *vmax=None*, *shading=None*, *antialiased=False*, *data=None*, ***kwargs*)

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```
pcolormesh([X, Y,] C, **kwargs)
```

X and *Y* can be used to specify the corners of the quadrilaterals.

Hint: *pcolormesh* is similar to *pcolor*. It is much faster and preferred in most cases. For a detailed discussion on the differences see *Differences between pcolor() and pcolormesh()*.

Parameters

C

[array-like] A scalar 2-D array. The values will be color-mapped.

X, Y

[array-like, optional] The coordinates of the corners of quadrilaterals of a pcolormesh:

```
(X[i+1, j], Y[i+1, j])       (X[i+1, j+1], Y[i+1, j+1])
                      +------+
                      |      |
                      +------+
   (X[i, j], Y[i, j])       (X[i, j+1], Y[i, j+1])
```

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the *Notes* section below.

If `shading='flat'` the dimensions of *X* and *Y* should be one greater than those of *C*, and the quadrilateral is colored due to the value at `C[i, j]`. If *X*, *Y* and *C* have equal dimensions, a warning will be raised and the last row and column of *C* will be ignored.

If `shading='nearest'` or `'gouraud'`, the dimensions of *X* and *Y* should be the same as those of *C* (if not, a ValueError will be raised). For `'nearest'` the color `C[i, j]` is centered on `(X[i, j], Y[i, j])`. For `'gouraud'`, a smooth interpolation is caried out between the quadrilateral corners.

If *X* and/or *Y* are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2-D arrays, making a rectangular grid.

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] A Colormap instance or registered colormap name. The colormap maps the *C* values to colors.

norm

[*Normalize*, optional] The Normalize instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

vmin, vmax

[float, default: None] The colorbar range. If *None*, suitable min/max values are automatically chosen by the *Normalize* instance (defaults to the respective min/max values of *C* in case of the default linear scaling). It is deprecated to use *vmin*/*vmax* when *norm* is given.

edgecolors

[{'none', None, 'face', color, color sequence}, optional] The color of the edges. Defaults to 'none'. Possible values:

- 'none' or '': No edge.

- *None*: `rcParams["patch.edgecolor"]` (default: `'black'`) will be used. Note that currently `rcParams["patch.force_edgecolor"]` (default: `False`) has to be True for this to work.
- 'face': Use the adjacent face color.
- A color or sequence of colors will set the edge color.

The singular form *edgecolor* works as an alias.

alpha

[float, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

shading

[{'flat', 'nearest', 'gouraud', 'auto'}, optional] The fill style for the quadrilateral; defaults to 'flat' or `rcParams["pcolor.shading"]` (default: `'flat'`). Possible values:

- 'flat': A solid color is used for each quad. The color of the quad (i, j), (i+1, j), (i, j+1), (i+1, j+1) is given by `C[i, j]`. The dimensions of *X* and *Y* should be one greater than those of *C*; if they are the same as *C*, then a deprecation warning is raised, and the last row and column of *C* are dropped.
- 'nearest': Each grid point will have a color centered on it, extending halfway between the adjacent grid centers. The dimensions of *X* and *Y* must be the same as *C*.
- 'gouraud': Each quad will be Gouraud shaded: The color of the corners (i', j') are given by `C[i', j']`. The color values of the area in between is interpolated from the corner values. The dimensions of *X* and *Y* must be the same as *C*. When Gouraud shading is used, *edgecolors* is ignored.
- 'auto': Choose 'flat' if dimensions of *X* and *Y* are one larger than *C*. Choose 'nearest' if dimensions are the same.

See /gallery/images_contours_and_fields/pcolormesh_grids for more description.

snap

[bool, default: False] Whether to snap the mesh to pixel boundaries.

Returns

matplotlib.collections.QuadMesh

Other Parameters

**kwargs

Additionally, the following arguments are allowed. They are passed along to the *QuadMesh* constructor:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a
alpha	float or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	ndarray
capstyle	{'butt', 'round', 'projecting'}
clim	(vmin: float, vmax: float)
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of rgba tuples
contains	unknown
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
norm	*Normalize* or None
offset_position	unknown
offsets	array-like (N, 2) or (2,)
path_effects	*AbstractPathEffect*
picker	None or bool or callable
pickradius	unknown
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

See also:

pcolor

An alternative implementation with slightly different features. For a detailed discussion on the differences see *Differences between pcolor() and pcolormesh()*.

imshow

If X and Y are each equidistant, *imshow* can be a faster alternative.

Notes

Masked arrays

C may be a masked array. If `C[i, j]` is masked, the corresponding quadrilateral will be transparent. Masking of X and Y is not supported. Use *pcolor* if you need this functionality.

Grid orientation

The grid orientation follows the standard matrix convention: An array C with shape (nrows, ncolumns) is plotted with the column number as X and the row number as Y.

Differences between pcolor() and pcolormesh()

Both methods are used to create a pseudocolor plot of a 2-D array using quadrilaterals.

The main difference lies in the created object and internal data handling: While *pcolor* returns a *PolyCollection*, *pcolormesh* returns a *QuadMesh*. The latter is more specialized for the given purpose and thus is faster. It should almost always be preferred.

There is also a slight difference in the handling of masked arrays. Both *pcolor* and *pcolormesh* support masked arrays for C. However, only *pcolor* supports masked arrays for X and Y. The reason lies in the internal handling of the masked values. *pcolor* leaves out the respective polygons from the PolyCollection. *pcolormesh* sets the facecolor of the masked elements to transparent. You can see the difference when using edgecolors. While all edges are drawn irrespective of masking in a QuadMesh, the edge between two adjacent masked quadrilaterals in *pcolor* is not drawn as the corresponding polygons do not exist in the PolyCollection.

Another difference is the support of Gouraud shading in *pcolormesh*, which is not available with *pcolor*.

Note: In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.pcolormesh`

- sphx_glr_gallery_images_contours_and_fields_pcolor_demo.py
- sphx_glr_gallery_images_contours_and_fields_pcolormesh_grids.py

- *Colormap Normalization*

matplotlib.axes.Axes.spy

Axes.spy(*self*, *Z*, *precision=0*, *marker=None*, *markersize=None*, *aspect='equal'*, *origin='upper'*, ***kwargs*)

Plot the sparsity pattern of a 2D array.

This visualizes the non-zero values of the array.

Two plotting styles are available: image and marker. Both are available for full arrays, but only the marker style works for `scipy.sparse.spmatrix` instances.

Image style

If *marker* and *markersize* are *None*, *imshow* is used. Any extra remaining keyword arguments are passed to this method.

Marker style

If *Z* is a `scipy.sparse.spmatrix` or *marker* or *markersize* are *None*, a *Line2D* object will be returned with the value of marker determining the marker type, and any remaining keyword arguments passed to *plot*.

Parameters

Z

[array-like (M, N)] The array to be plotted.

precision

[float or 'present', default: 0] If *precision* is 0, any non-zero value will be plotted. Otherwise, values of $|Z| > precision$ will be plotted.

For `scipy.sparse.spmatrix` instances, you can also pass 'present'. In this case any value present in the array will be plotted, even if it is identically zero.

aspect

[{'equal', 'auto', None} or float, default: 'equal'] The aspect ratio of the axes. This parameter is particularly relevant for images since it determines whether data pixels are square.

This parameter is a shortcut for explicitly calling *Axes.set_aspect*. See there for further details.

- 'equal': Ensures an aspect ratio of 1. Pixels will be square.
- 'auto': The axes is kept fixed and the aspect is adjusted so that the data fit in the axes. In general, this will result in non-square pixels.
- *None*: Use `rcParams["image.aspect"]` (default: `'equal'`).

origin

[{'upper', 'lower'}, default: `rcParams["image.origin"]` (default: `'upper'`)] Place the [0, 0] index of the array in the upper left or lower left corner of the axes. The convention 'upper' is typically used for matrices and images.

Returns

AxesImage **or** *Line2D*

The return type depends on the plotting style (see above).

Other Parameters

****kwargs**

The supported additional parameters depend on the plotting style.

For the image style, you can pass the following additional parameters of *imshow*:

- *cmap*
- *alpha*
- *url*

- any *Artist* properties (passed on to the *AxesImage*)

For the marker style, you can pass any *Line2D* property except for *linestyle*:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value
alpha	float or None
animated	bool
antialiased or aa	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
contains	unknown
dash_capstyle	{'butt', 'round', 'projecting'}
dash_joinstyle	{'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'd
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or List[int] or float or (float, float)
path_effects	*AbstractPathEffect*
picker	unknown
pickradius	float
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	{'butt', 'round', 'projecting'}
solid_joinstyle	{'miter', 'round', 'bevel'}
transform	*matplotlib.transforms.Transform*
url	str
visible	bool
xdata	1D array

Table 86 – continued from previous page

Property	Description
ydata	1D array
zorder	float

Examples using `matplotlib.axes.Axes.spy`

- sphx_glr_gallery_images_contours_and_fields_spy_demos.py

Unstructured Triangles

Axes.tripcolor	Create a pseudocolor plot of an unstructured triangular grid.
Axes.triplot	Draw a unstructured triangular grid as lines and/or markers.
Axes.tricontour	Draw contour lines on an unstructured triangular grid.
Axes.tricontourf	Draw contour regions on an unstructured triangular grid.

matplotlib.axes.Axes.tripcolor

Axes.**tripcolor**(*ax*, **args*, *alpha=1.0*, *norm=None*, *cmap=None*, *vmin=None*, *vmax=None*, *shading='flat'*, *facecolors=None*, ***kwargs*)

Create a pseudocolor plot of an unstructured triangular grid.

The triangulation can be specified in one of two ways; either:

```
tripcolor(triangulation, ...)
```

where triangulation is a *Triangulation* object, or

```
tripcolor(x, y, ...)
tripcolor(x, y, triangles, ...)
tripcolor(x, y, triangles=triangles, ...)
tripcolor(x, y, mask=mask, ...)
tripcolor(x, y, triangles, mask=mask, ...)
```

in which case a Triangulation object will be created. See *Triangulation* for a explanation of these possibilities.

The next argument must be *C*, the array of color values, either one per point in the triangulation if color values are defined at points, or one per triangle in the triangulation if color values are defined at triangles. If there are the same number of points and triangles in the triangulation it is assumed that color values

are defined at points; to force the use of color values at triangles use the kwarg `facecolors=C` instead of just `C`.

shading may be 'flat' (the default) or 'gouraud'. If *shading* is 'flat' and C values are defined at points, the color values used for each triangle are from the mean C of the triangle's three points. If *shading* is 'gouraud' then color values must be defined at points.

The remaining kwargs are the same as for *pcolor*.

Examples using `matplotlib.axes.Axes.tripcolor`

- sphx_glr_gallery_images_contours_and_fields_tripcolor_demo.py

matplotlib.axes.Axes.triplot

Axes.**triplot**(*ax*, **args*, ***kwargs*)

Draw a unstructured triangular grid as lines and/or markers.

The triangulation to plot can be specified in one of two ways; either:

```
triplot(triangulation, ...)
```

where triangulation is a *Triangulation* object, or

```
triplot(x, y, ...)
triplot(x, y, triangles, ...)
triplot(x, y, triangles=triangles, ...)
triplot(x, y, mask=mask, ...)
triplot(x, y, triangles, mask=mask, ...)
```

in which case a Triangulation object will be created. See *Triangulation* for a explanation of these possibilities.

The remaining args and kwargs are the same as for *plot*.

Returns

lines

[*Line2D*] The drawn triangles edges.

markers

[*Line2D*] The drawn marker nodes.

Examples using `matplotlib.axes.Axes.triplot`

- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_delaunay.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_user.py
- sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py
- sphx_glr_gallery_images_contours_and_fields_triinterp_demo.py
- sphx_glr_gallery_images_contours_and_fields_triplot_demo.py

matplotlib.axes.Axes.tricontour

Axes.**tricontour**(*ax*, **args*, ***kwargs*)

Draw contour lines on an unstructured triangular grid.

The triangulation can be specified in one of two ways; either

```
tricontour(triangulation, ...)
```

where *triangulation* is a *Triangulation* object, or

```
tricontour(x, y, ...)
tricontour(x, y, triangles, ...)
tricontour(x, y, triangles=triangles, ...)
tricontour(x, y, mask=mask, ...)
tricontour(x, y, triangles, mask=mask, ...)
```

in which case a *Triangulation* object will be created. See that class' docstring for an explanation of these cases.

The remaining arguments may be:

```
tricontour(..., Z)
```

where *Z* is the array of values to contour, one per point in the triangulation. The level values are chosen automatically.

```
tricontour(..., Z, levels)
```

contour up to *levels+1* automatically chosen contour levels (*levels* intervals).

```
tricontour(..., Z, levels)
```

draw contour lines at the values specified in sequence *levels*, which must be in increasing order.

```
tricontour(Z, **kwargs)
```

Use keyword arguments to control colors, linewidth, origin, cmap ... see below for more details.

Parameters

triangulation

[*Triangulation*, optional] The unstructured triangular grid.

If specified, then *x*, *y*, *triangles*, and *mask* are not accepted.

x, y

[array-like, optional] The coordinates of the values in *Z*.

triangles

[int array-like of shape (ntri, 3), optional] For each triangle, the indices of the three points that make up the triangle, ordered in an anticlockwise manner. If not specified, the Delaunay triangulation is calculated.

mask

[bool array-like of shape (ntri), optional] Which triangles are masked out.

Z

[array-like(N, M)] The height values over which the contour is drawn.

levels

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use *MaxNLocator*, which tries to automatically choose no more than *n+1* "nice" contour levels between *vmin* and *vmax*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns

TriContourSet

Other Parameters

colors

[color string or sequence of colors, optional] The colors of the levels, i.e., the contour lines.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. `'red'` instead of `['red']` to color all levels with

the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value *None*), the colormap specified by *cmap* will be used.

alpha

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] A *Colormap* instance or registered colormap name. The colormap maps the level values to colors.

If both *colors* and *cmap* are given, an error is raised.

norm

[*Normalize*, optional] If a colormap is used, the *Normalize* instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

origin

[{*None*, 'upper', 'lower', 'image'}, default: None] Determines the orientation and exact position of *Z* by specifying the position of `Z[0, 0]`. This is only relevant, if *X*, *Y* are not given.

- *None*: `Z[0, 0]` is at X=0, Y=0 in the lower left corner.
- 'lower': `Z[0, 0]` is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': `Z[0, 0]` is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from `rcParams["image.origin"]` (default: `'upper'`).

extent

[(x0, x1, y0, y1), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of Z[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of Z[0, 0], and (*x1*, *y1*) is the position of Z[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to contour.

locator

[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `tricontour`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

Note: An existing *TriContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call to *ContourSet.changed()* is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *TriContourSet* because it internally calls *ContourSet.changed()*.

---

xunits, yunits

[registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

linewidths

[float or array-like, default: `rcParams["contour.linewidth"]` (default: `None`)] The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to `rcParams["lines.linewidth"]` (default: `1.5`).

linestyles

[{*None*, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from `rcParams["contour.negative_linestyle"]` (default: `'dashed'`) setting.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

Examples using `matplotlib.axes.Axes.tricontour`

- sphx_glr_gallery_images_contours_and_fields_irregulardatagrid.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_demo.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_delaunay.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_user.py
- sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py
- sphx_glr_gallery_mplot3d_tricontour3d.py

matplotlib.axes.Axes.tricontourf

Axes.**tricontourf**(*ax*, **args*, ***kwargs*)

Draw contour regions on an unstructured triangular grid.

The triangulation can be specified in one of two ways; either

```
tricontourf(triangulation, ...)
```

where *triangulation* is a *Triangulation* object, or

```
tricontourf(x, y, ...)
tricontourf(x, y, triangles, ...)
tricontourf(x, y, triangles=triangles, ...)
tricontourf(x, y, mask=mask, ...)
tricontourf(x, y, triangles, mask=mask, ...)
```

in which case a *Triangulation* object will be created. See that class' docstring for an explanation of these cases.

The remaining arguments may be:

```
tricontourf(..., Z)
```

where *Z* is the array of values to contour, one per point in the triangulation. The level values are chosen automatically.

```
tricontourf(..., Z, levels)
```

contour up to *levels+1* automatically chosen contour levels (*levels* intervals).

```
tricontourf(..., Z, levels)
```

draw contour regions at the values specified in sequence *levels*, which must be in increasing order.

```
tricontourf(Z, **kwargs)
```

Use keyword arguments to control colors, linewidth, origin, cmap ... see below for more details.

Parameters

triangulation

[*Triangulation*, optional] The unstructured triangular grid.

If specified, then *x*, *y*, *triangles*, and *mask* are not accepted.

x, y

[array-like, optional] The coordinates of the values in *Z*.

triangles

[int array-like of shape (ntri, 3), optional] For each triangle, the indices of the three points that make up the triangle, ordered in an anticlockwise manner. If not specified, the Delaunay triangulation is calculated.

mask

[bool array-like of shape (ntri), optional] Which triangles are masked out.

Z

[array-like(N, M)] The height values over which the contour is drawn.

levels

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use *MaxNLocator*, which tries to automatically choose no more than *n+1* "nice" contour levels between *vmin* and *vmax*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns

TriContourSet

Other Parameters

colors

[color string or sequence of colors, optional] The colors of the levels, i.e., the contour regions.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. `'red'` instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value *None*), the colormap specified by *cmap* will be used.

alpha

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

cmap

[str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] A *Colormap* instance or registered colormap name. The colormap maps the level values to colors.

If both *colors* and *cmap* are given, an error is raised.

norm

[*Normalize*, optional] If a colormap is used, the *Normalize* instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

origin

[{*None*, 'upper', 'lower', 'image'}, default: None] Determines the orientation and exact position of *Z* by specifying the position of `Z[0, 0]`. This is only relevant, if *X*, *Y* are not given.

- *None*: `Z[0, 0]` is at X=0, Y=0 in the lower left corner.
- 'lower': `Z[0, 0]` is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': `Z[0, 0]` is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from `rcParams["image.origin"]` (default: `'upper'`).

extent

[(x0, x1, y0, y1), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of Z[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of Z[0, 0], and (*x1*, *y1*) is the position of Z[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to contour.

locator

[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `tricontourf`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

Note: An existing *TriContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call to *ContourSet.changed()* is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *TriContourSet* because it internally calls *ContourSet.changed()*.

---

xunits, yunits

[registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

antialiased

[bool, default: True] Whether to use antialiasing.

Notes

tricontourf fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

```
z1 < Z <= z2
```

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

Examples using `matplotlib.axes.Axes.tricontourf`

- sphx_glr_gallery_images_contours_and_fields_irregulardatagrid.py

Text and Annotations

Axes.annotate	Annotate the point *xy* with text *text*.
Axes.text	Add text to the axes.
Axes.table	Add a table to an *Axes*.
Axes.arrow	Add an arrow to the axes.
Axes.inset_axes	Add a child inset axes to this existing axes.
Axes.indicate_inset	Add an inset indicator to the axes.
Axes.indicate_inset_zoom	Add an inset indicator rectangle to the axes based on the axis limits for an *inset_ax* and draw connectors between *inset_ax* and the rectangle.
Axes.secondary_xaxis	Add a second x-axis to this axes.
Axes.secondary_yaxis	Add a second y-axis to this axes.

matplotlib.axes.Axes.annotate

Axes.**annotate**(*self*, *text*, *xy*, **args*, ***kwargs*)

Annotate the point *xy* with text *text*.

In the simplest form, the text is placed at *xy*.

Optionally, the text can be displayed in another position *xytext*. An arrow pointing from the text to the annotated point *xy* can then be added by defining *arrowprops*.

Parameters

text

[str] The text of the annotation. *s* is a deprecated synonym for this parameter.

xy

[(float, float)] The point *(x, y)* to annotate. The coordinate system is determined by *xycoords*.

xytext

[(float, float), default: *xy*] The position *(x, y)* to place the text at. The coordinate system is determined by *textcoords*.

xycoords

[str or *Artist* or *Transform* or callable or (float, float), default: 'data'] The coordinate system that *xy* is given in. The following types of values are supported:

- One of the following strings:

Value	Description
'figure points'	Points from the lower left of the figure
'figure pixels'	Pixels from the lower left of the figure
'figure fraction'	Fraction of figure from lower left
'axes points'	Points from lower left corner of axes
'axes pixels'	Pixels from lower left corner of axes
'axes fraction'	Fraction of axes from lower left
'data'	Use the coordinate system of the object being annotated (default)
'polar'	*(theta, r)* if not native 'data' coordinates

- An *Artist*: *xy* is interpreted as a fraction of the artist's *Bbox*. E.g. *(0, 0)* would be the lower left corner of the bounding box and *(0.5, 1)* would be the center top of the bounding box.
- A *Transform* to transform *xy* to screen coordinates.
- A function with one of the following signatures:

```
def transform(renderer) -> Bbox
def transform(renderer) -> Transform
```

  where *renderer* is a *RendererBase* subclass.

  The result of the function is interpreted like the *Artist* and *Transform* cases above.

- A tuple *(xcoords, ycoords)* specifying separate coordinate systems for *x* and *y*. *xcoords* and *ycoords* must each be of one of the above described types.

See *Advanced Annotations* for more details.

textcoords

[str or *Artist* or *Transform* or callable or (float, float), default: value of *xycoords*] The coordinate system that *xytext* is given in.

All *xycoords* values are valid as well as the following strings:

Value	Description
'offset points'	Offset (in points) from the *xy* value
'offset pixels'	Offset (in pixels) from the *xy* value

arrowprops

[dict, optional] The properties used to draw a *FancyArrowPatch* arrow between the positions *xy* and *xytext*.

If *arrowprops* does not contain the key 'arrowstyle' the allowed keys are:

Key	Description
width	The width of the arrow in points
headwidth	The width of the base of the arrow head in points
headlength	The length of the arrow head in points
shrink	Fraction of total length to shrink from both ends
?	Any key to *matplotlib.patches.FancyArrowPatch*

If *arrowprops* contains the key 'arrowstyle' the above keys are forbidden. The allowed values of `'arrowstyle'` are:

Name	Attrs
`'-'`	None
`'->'`	head_length=0.4,head_width=0.2
`'-['`	widthB=1.0,lengthB=0.2,angleB=None
`'|-|'`	widthA=1.0,widthB=1.0
`'-|>'`	head_length=0.4,head_width=0.2
`'<-'`	head_length=0.4,head_width=0.2
`'<->'`	head_length=0.4,head_width=0.2
`'<|-'`	head_length=0.4,head_width=0.2
`'<|-|>'`	head_length=0.4,head_width=0.2
`'fancy'`	head_length=0.4,head_width=0.4,tail_width=0.4
`'simple'`	head_length=0.5,head_width=0.5,tail_width=0.2
`'wedge'`	tail_width=0.3,shrink_factor=0.5

Valid keys for *FancyArrowPatch* are:

Key	Description
arrowstyle	the arrow style
connectionstyle	the connection style
relpos	default is (0.5, 0.5)
patchA	default is bounding box of the text
patchB	default is None
shrinkA	default is 2 points
shrinkB	default is 2 points
mutation_scale	default is text size (in points)
mutation_aspect	default is 1.
?	any key for *matplotlib.patches.PathPatch*

Defaults to None, i.e. no arrow is drawn.

annotation_clip

[bool or None, default: None] Whether to draw the annotation when the annotation point *xy* is outside the axes area.

- If *True*, the annotation will only be drawn when *xy* is within the axes.
- If *False*, the annotation will always be drawn.
- If *None*, the annotation will only be drawn when *xy* is within the axes and *xycoords* is 'data'.

****kwargs**

Additional kwargs are passed to *Text*.

Returns

Annotation

matplotlib.axes.Axes.text

`Axes.text`(*self*, *x*, *y*, *s*, *fontdict=None*, ***kwargs*)

Add text to the axes.

Add the text *s* to the axes at location *x*, *y* in data coordinates.

Parameters

x, y

[float] The position to place the text. By default, this is in data coordinates. The coordinate system can be changed using the *transform* parameter.

s

[str] The text.

fontdict

[dict, default: None] A dictionary to override the default text properties. If fontdict is None, the defaults are determined by *rcParams*.

Returns

Text

The created *Text* instance.

Other Parameters

****kwargs**

[*Text* properties.] Other miscellaneous text parameters.

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array an
alpha	float or None
animated	bool
backgroundcolor	color
bbox	dict with properties for *patches.FancyBboxPatch*
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color

Tab

Property	Description
contains	unknown
figure	*Figure*
fontfamily or family	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', '
fontproperties or font or font_properties	*font_manager.FontProperties* or `str` or `pathlib.Path`
fontsize or size	float or {'xx-small', 'x-small', 'small', 'medium', 'large',
fontstretch or stretch	{a numeric value in range 0-1000, 'ultra-condensed',
fontstyle or style	{'normal', 'italic', 'oblique'}
fontvariant or variant	{'normal', 'small-caps'}
fontweight or weight	{a numeric value in range 0-1000, 'ultralight', 'light',
gid	str
horizontalalignment or ha	{'center', 'right', 'left'}
in_layout	bool
label	object
linespacing	float (multiple of font size)
multialignment or ma	{'left', 'right', 'center'}
path_effects	*AbstractPathEffect*
picker	None or bool or callable
position	(float, float)
rasterized	bool or None
rotation	float or {'vertical', 'horizontal'}
rotation_mode	{None, 'default', 'anchor'}
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
text	object
transform	*Transform*
url	str
usetex	bool or None
verticalalignment or va	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
visible	bool
wrap	bool
x	float
y	float
zorder	float

Examples

Individual keyword arguments can be used to override any given parameter:

```
>>> text(x, y, s, fontsize=12)
```

The default transform specifies that text is in data coords, alternatively, you can specify text in axis coords ((0, 0) is lower-left and (1, 1) is upper-right). The example below places text in the center of the axes:

```
>>> text(0.5, 0.5, 'matplotlib', horizontalalignment='center',
...      verticalalignment='center', transform=ax.transAxes)
```

You can put a rectangular box around the text instance (e.g., to set a background color) by using the keyword *bbox*. *bbox* is a dictionary of *Rectangle* properties. For example:

```
>>> text(x, y, s, bbox=dict(facecolor='red', alpha=0.5))
```

matplotlib.axes.Axes.table

`Axes.table`(*ax*, *cellText=None*, *cellColours=None*, *cellLoc='right'*, *colWidths=None*, *rowLabels=None*, *rowColours=None*, *rowLoc='left'*, *colLabels=None*, *colColours=None*, *colLoc='center'*, *loc='bottom'*, *bbox=None*, *edges='closed'*, ***kwargs*)

Add a table to an *Axes*.

At least one of *cellText* or *cellColours* must be specified. These parameters must be 2D lists, in which the outer lists define the rows and the inner list define the column values per row. Each row must have the same number of elements.

The table can optionally have row and column headers, which are configured using *rowLabels*, *rowColours*, *rowLoc* and *colLabels*, *colColours*, *colLoc* respectively.

For finer grained control over tables, use the *Table* class and add it to the axes with *Axes.add_table*.

Parameters

cellText

[2D list of str, optional] The texts to place into the table cells.

Note: Line breaks in the strings are currently not accounted for and will result in the text exceeding the cell boundaries.

cellColours

[2D list of colors, optional] The background colors of the cells.

cellLoc

[{'left', 'center', 'right'}, default: 'right'] The alignment of the text within the cells.

colWidths

[list of float, optional] The column widths in units of the axes. If not given, all columns will have a width of *1 / ncols*.

rowLabels

[list of str, optional] The text of the row header cells.

rowColours

[list of colors, optional] The colors of the row header cells.

rowLoc

[{'left', 'center', 'right'}, default: 'left'] The text alignment of the row header cells.

colLabels

[list of str, optional] The text of the column header cells.

colColours

[list of colors, optional] The colors of the column header cells.

colLoc

[{'left', 'center', 'right'}, default: 'left'] The text alignment of the column header cells.

loc

[str, optional] The position of the cell with respect to *ax*. This must be one of the *codes*.

bbox

[*Bbox*, optional] A bounding box to draw the table into. If this is not *None*, this overrides *loc*.

edges

[substring of 'BRTL' or {'open', 'closed', 'horizontal', 'vertical'}] The cell edges to be drawn with a line. See also *visible_edges*.

Returns

Table

The created table.

Other Parameters

****kwargs**

Table properties.

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
alpha	float or None
animated	bool
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
contains	unknown
figure	*Figure*
fontsize	float
gid	str
in_layout	bool
label	object
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

Examples using `matplotlib.axes.Axes.table`

matplotlib.axes.Axes.arrow

`Axes.`**`arrow`**(*self*, *x*, *y*, *dx*, *dy*, ***kwargs*)

Add an arrow to the axes.

This draws an arrow from `(x, y)` to `(x+dx, y+dy)`.

Parameters

x, y

[float] The x and y coordinates of the arrow base.

dx, dy

[float] The length of the arrow along x and y direction.

width: float, default: 0.001

Width of full arrow tail.

length_includes_head: bool, default: False

True if head is to be counted in calculating the length.

head_width: float or None, default: 3*width

Total width of the full arrow head.

head_length: float or None, default: 1.5*head_width

Length of arrow head.

shape: ['full', 'left', 'right'], default: 'full'

Draw the left-half, right-half, or full arrow.

overhang: float, default: 0

Fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

head_starts_at_zero: bool, default: False

If True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

****kwargs**

Patch properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	float or None

Table 90 – continued from previous page

Property	Description
animated	bool
antialiased or aa	unknown
capstyle	{'butt', 'round', 'projecting'}
clip_box	*Bbox*
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
contains	unknown
edgecolor or ec	color or None or 'auto'
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	{'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
path_effects	*AbstractPathEffect*
picker	None or bool or callable
rasterized	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

Returns

FancyArrow

The created *FancyArrow* object.

Notes

The resulting arrow is affected by the axes aspect ratio and limits. This may produce an arrow whose head is not square with its stem. To create an arrow whose head is square with its stem, use *annotate()* for example:

```
>>> ax.annotate("", xy=(0.5, 0.5), xytext=(0, 0),
...             arrowprops=dict(arrowstyle="->"))
```

Examples using `matplotlib.axes.Axes.arrow`

- sphx_glr_gallery_text_labels_and_annotations_arrow_simple_demo.py

matplotlib.axes.Axes.inset_axes

Axes.**inset_axes**(*self*, *bounds*, *, *transform=None*, *zorder=5*, ***kwargs*)

Add a child inset axes to this existing axes.

Parameters

bounds

[[x0, y0, width, height]] Lower-left corner of inset axes, and its width and height.

transform

[*Transform*] Defaults to `ax.transAxes`, i.e. the units of *rect* are in axes-relative coordinates.

zorder

[number] Defaults to 5 (same as *Axes.legend*). Adjust higher or lower to change whether it is above or below data plotted on the parent axes.

****kwargs**

Other keyword arguments are passed on to the child *Axes*.

Returns

ax

The created *Axes* instance.

Warning: This method is experimental as of 3.0, and the API may change.

Examples

This example makes two inset axes, the first is in axes-relative coordinates, and the second in data-coordinates:

```
fig, ax = plt.subplots()
ax.plot(range(10))
axin1 = ax.inset_axes([0.8, 0.1, 0.15, 0.15])
```

(continues on next page)

(continued from previous page)

```
axin2 = ax.inset_axes(
        [5, 7, 2.3, 2.3], transform=ax.transData)
```

Examples using `matplotlib.axes.Axes.inset_axes`

- sphx_glr_gallery_subplots_axes_and_figures_zoom_inset_axes.py

matplotlib.axes.Axes.indicate_inset

Axes.**indicate_inset**(*self*, *bounds*, *inset_ax=None*, ***, *transform=None*, *facecolor='none'*, *edgecolor='0.5'*, *alpha=0.5*, *zorder=4.99*, ***kwargs*)

Add an inset indicator to the axes. This is a rectangle on the plot at the position indicated by *bounds* that optionally has lines that connect the rectangle to an inset axes (*Axes.inset_axes*).

Parameters

bounds

[[x0, y0, width, height]] Lower-left corner of rectangle to be marked, and its width and height.

inset_ax

[*Axes*] An optional inset axes to draw connecting lines to. Two lines are drawn connecting the indicator box to the inset axes on corners chosen so as to not overlap with the indicator box.

transform

[*Transform*] Transform for the rectangle coordinates. Defaults to `ax.transAxes`, i.e. the units of *rect* are in axes-relative coordinates.

facecolor

[color, default: 'none'] Facecolor of the rectangle.

edgecolor

[color, default: '0.5'] Color of the rectangle and color of the connecting lines.

alpha

[float, default: 0.5] Transparency of the rectangle and connector lines.

zorder

[float, default: 4.99] Drawing order of the rectangle and connector lines. The default, 4.99, is just below the default level of inset axes.

****kwargs**

Other keyword arguments are passed on to the *Rectangle* patch:

%(Rectangle)s

Returns

rectangle_patch

[*patches.Rectangle*] The indicator frame.

connector_lines

[4-tuple of *patches.ConnectionPatch*] The four connector lines connecting to (lower_left, upper_left, lower_right upper_right) corners of *inset_ax*. Two lines are set with visibility to *False*, but the user can set the visibility to True if the automatic choice is not deemed correct.

Warning: This method is experimental as of 3.0, and the API may change.

Examples using `matplotlib.axes.Axes.indicate_inset`

matplotlib.axes.Axes.indicate_inset_zoom

`Axes.indicate_inset_zoom`(*self*, *inset_ax*, ***kwargs*)

Add an inset indicator rectangle to the axes based on the axis limits for an *inset_ax* and draw connectors between *inset_ax* and the rectangle.

Parameters

inset_ax

[*Axes*] Inset axes to draw connecting lines to. Two lines are drawn connecting the indicator box to the inset axes on corners chosen so as to not overlap with the indicator box.

****kwargs**

Other keyword arguments are passed on to *Axes.indicate_inset*

Returns

rectangle_patch

[*patches.Rectangle*] Rectangle artist.

connector_lines

[4-tuple of *patches.ConnectionPatch*] Each of four connector lines coming from the rectangle drawn on this axis, in the order lower left, upper left, lower right, upper right. Two are set with visibility to *False*, but the user can set the visibility to *True* if the automatic choice is not deemed correct.

Warning: This method is experimental as of 3.0, and the API may change.

Examples using `matplotlib.axes.Axes.indicate_inset_zoom`

- sphx_glr_gallery_subplots_axes_and_figures_zoom_inset_axes.py

matplotlib.axes.Axes.secondary_xaxis

`Axes.secondary_xaxis`(*self*, *location*, *, *functions=None*, ***kwargs*)

Add a second x-axis to this axes.

For example if we want to have a second scale for the data plotted on the xaxis.

Parameters

location

[{'top', 'bottom', 'left', 'right'} or float] The position to put the secondary axis. Strings can be 'top' or 'bottom' for orientation='x' and 'right' or 'left' for orientation='y'. A float indicates the relative position on the parent axes to put the new axes, 0.0 being the bottom (or left) and 1.0 being the top (or right).

functions

[2-tuple of func, or Transform with an inverse] If a 2-tuple of functions, the user specifies the transform function and its inverse. i.e. `functions=(lambda x: 2 / x, lambda x: 2 / x)` would be an reciprocal transform with a factor of 2.

The user can also directly supply a subclass of *transforms.Transform* so long as it has an inverse.

See /gallery/subplots_axes_and_figures/secondary_axis for examples of making these conversions.

Returns

ax

[axes._secondary_axes.SecondaryAxis]

Other Parameters

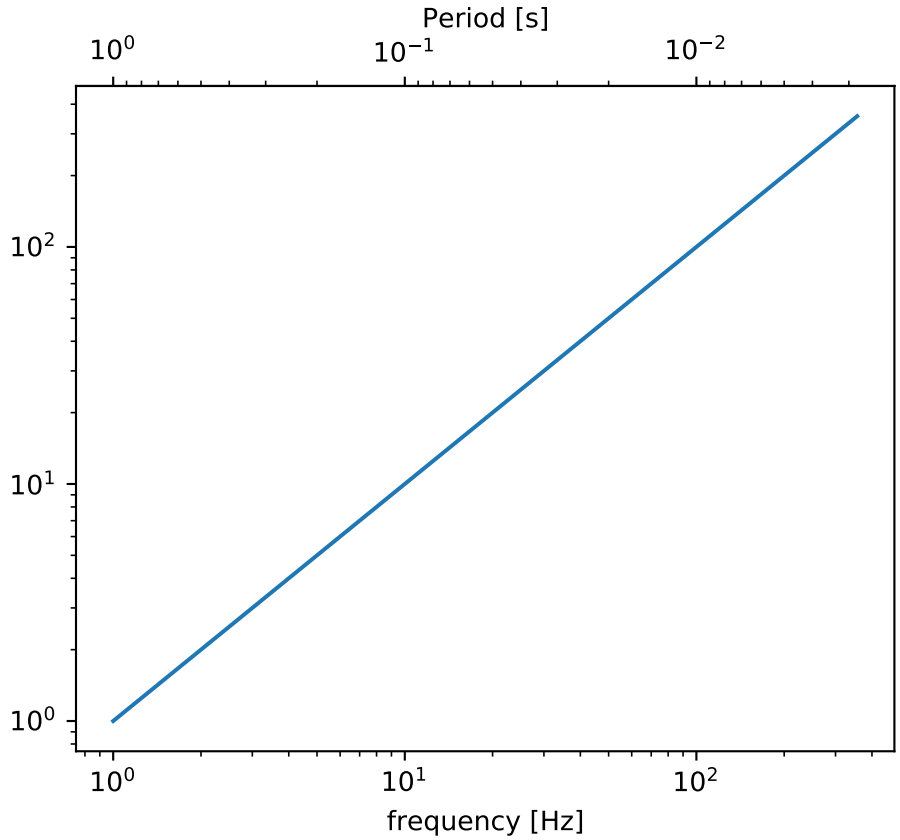
****kwargs**

[*Axes* properties.] Other miscellaneous axes parameters.

Warning: This method is experimental as of 3.1, and the API may change.

Examples

The main axis shows frequency, and the secondary axis shows period.



Examples using `matplotlib.axes.Axes.secondary_xaxis`

- sphx_glr_gallery_subplots_axes_and_figures_secondary_axis.py

matplotlib.axes.Axes.secondary_yaxis

`Axes.secondary_yaxis`(*self*, *location*, *, *functions=None*, ***kwargs*)

Add a second y-axis to this axes.

For example if we want to have a second scale for the data plotted on the yaxis.

Parameters

location

[{'top', 'bottom', 'left', 'right'} or float] The position to put the secondary axis. Strings can be 'top' or 'bottom' for orientation='x' and 'right' or 'left' for orientation='y'. A float indicates the relative position on the parent axes to put the new axes, 0.0 being the bottom (or left) and 1.0 being the top (or right).

functions

[2-tuple of func, or Transform with an inverse] If a 2-tuple of functions, the user specifies the transform function and its inverse. i.e. `functions=(lambda x: 2 / x, lambda x: 2 / x)` would be an reciprocal transform with a factor of 2.

The user can also directly supply a subclass of *transforms.Transform* so long as it has an inverse.

See /gallery/subplots_axes_and_figures/secondary_axis for examples of making these conversions.

Returns

ax

[axes._secondary_axes.SecondaryAxis]

Other Parameters

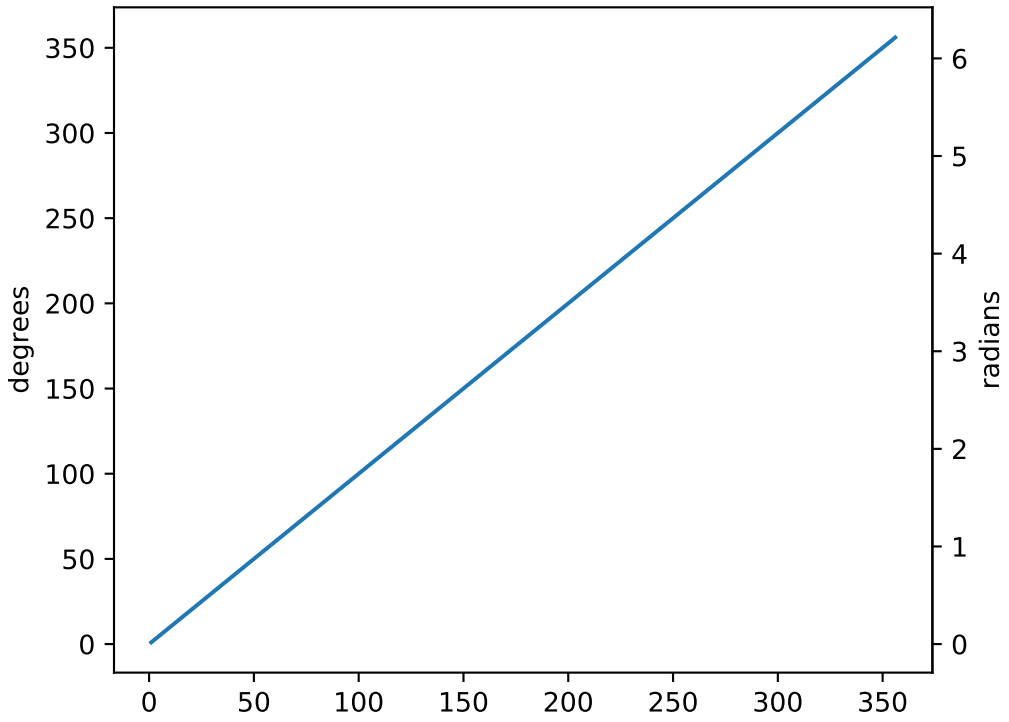
****kwargs**

[*Axes* properties.] Other miscellaneous axes parameters.

Warning: This method is experimental as of 3.1, and the API may change.

Examples

Add a secondary axes that converts from radians to degrees



Examples using `matplotlib.axes.Axes.secondary_yaxis`

- sphx_glr_gallery_subplots_axes_and_figures_secondary_axis.py

Fields

Axes.barbs	Plot a 2D field of barbs.
Axes.quiver	Plot a 2D field of arrows.
Axes.quiverkey	Add a key to a quiver plot.
Axes.streamplot	Draw streamlines of a vector flow.

matplotlib.axes.Axes.barbs

Axes.**barbs**(*self*, **args*, *data=None*, ***kw*)

Plot a 2D field of barbs.

Call signature:

```
barbs([X, Y], U, V, [C], **kw)
```

Where *X*, *Y* define the barb locations, *U*, *V* define the barb directions, and *C* optionally sets the color.

All arguments may be 1D or 2D. *U*, *V*, *C* may be masked arrays, but masked *X*, *Y* are not supported at present.
